

1. The combination of vertical cylinder C, piston D E, cross-head F, and longitudinal levers G G, substantially as and for the purpose set forth.

2. The combination of the cylinder C, piston D E, cross-head F, and two sets of levers, G G H H, substantially as and for the purposes set forth.

164,864. HYDRANTS. John G. Murdock, Cincinnati, Ohio. [Filed Apr. 26, 1875.]

Brief.—The hydrant has a moving waterway, operated by the mechanisms shown. A slidable ring surrounds the stock, fastened to it by suitable means, and imparting finish and stability to the hydrant. The valve-bridge and ports are cast with the shell, as shown. The wasteway communicates with a perforated sediment-chamber situated below the hydrant.

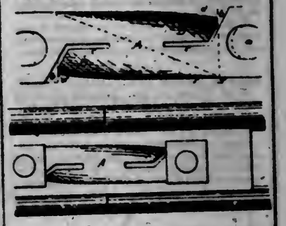
1. The slidable and chambered collar or curb S s, surrounding the stock B, and adapted to contain a filling, T, as and for the purpose stated.

2. The combination of bent lever or handle W, pivoted to the head at X, and having a cam, w, which engages with lugs f f' of the yoke J, said yoke being depressed, so as to shut off the water, by a spring, p, coiled around a stem, Y, in the manner set forth.

3. In combination with the perforated or slotted base A E or A E' E', the perforated sediment-chamber V v v', as and for the object stated.

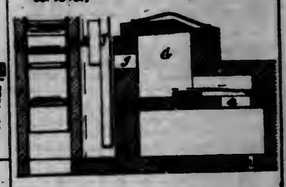
4. The valve-bridge O and ports o o', cast with the shell N, as and for the purpose set forth.

The combination of the lever I, having arms c e and d d, with the lifters G G, having extensions e e, whereby to trip the lifters, when the lever is caused to drop by a derangement of the governor, and thus to disconnect the lifters from the valve-rods and close the valves, substantially as set forth.



164,865. CAR-COUPLINGS. Nils Nilson, Minneapolis, Minn. [Filed Jan 21, 1875.]

1. The combination of the draw-bar B, having the head C and catches C', with the double-acting spring E, between sliding collars e e', substantially as and for the purpose shown and described.



2. The combination of a recessed draw-head, C', with the projecting beveled catches C', pivoted to the sides thereof, so as to be thrown into or out of operation, substantially as and for the purpose before set forth.

164,866. NUT-LOCKS. William P. Olden Springfield Ill. [Filed Nov 23. 1874.]

A nut-lock consisting of the plate A, having the arms B formed by the slots b c, said arms being bent into a concave or spoon shape, as and for the purpose set forth.

164,869. TREMOLOS FOR REED-ORGANS. R. W Pain, New York, N. Y., assignor to R. P. Needham & Son, same place. [Filed Mar 26. 1875.]

The combination with the swell-chamber G, having an opening, g, in its side, of the revolving tremolo-wheel J, arranged outside of the swell-chamber, and the whole constructed substantially as described, whereby the air is alternately partially shut in and let out of the swell-chamber by the revolution of the said wheel, as set forth.

164,870. CLAMPS FOR DENTAL RUBBER DAMS. Delos Palmer, New York, N. Y. [Filed Aug. 31, 1874.]

Brief.—The perforations for inserting the forceps, in placing and removing the clamp, are formed in lugs turned over from a part of the clamp itself.

The dental clamps A, having the projecting ears c, constructed substantially as described.

164,871. TREMOLOS FOR ORGANS. William D. Parker, Worcester, Mass., assignor of one-half his right to Gustavus W. Ingalls, same place. [Filed Apr. 20, 1875.]

1. A valve to operate as a tremolo, when constructed to play freely up and down through its air passage or opening, and applied to the reed-chamber in the manner substantially as

164,867.

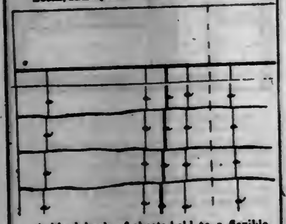
164,871.

1. The combination of the wrench-handle A with interior oil-chamber B, having passage b, the screw J, with valve a, and the outlet d, all substantially as and for the purpose herein set forth.

2. The stationary head E, provided with a T-shaped or dovetailed groove, fitting over the end of the stem, the two parts secured by means of a screw, D, substantially as and for the purpose set forth.

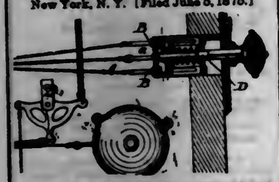
2. A free valve, *f*, and its opening, *i*, in combination with the fan *m*, and adjustable weights *n*, the whole arranged to operate substantially as set forth.

3. A free tremolo-valve, made out of the same piece of metal as its frame, in the manner and for the purpose substantially as set forth.



164,872. STOVE-PIPE ELBOWS. John F Piehl, Richmond, Ind., assignor of part of his right to John H McIntyre and James B. Taylor, same place, and George Krick, Philadelphia, Pa. [Filed Dec. 23, 1874.]

Brief.—A smooth continuous surface is produced on both sides of the shorter curved wall. No pockets are left on the inside for the accumulation of soot or condensed moisture.



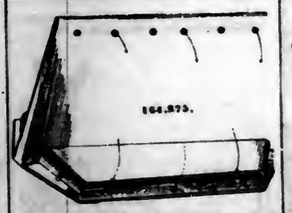
A crimped stove-pipe elbow having the crimps or folds of the shorter curved wall upon the inside of the pipe folded entirely downward, and presenting a smooth and continuous surface on both the out and in side, substantially as and for the purpose described.

164,873. BLANK-BOOKS. Ira Reynolds, Dayton, Ohio, assignor to Reynolds & Reynolds, same place. [Filed May 31, 1875.]

A blank-book of sheets held to a flexible cover by a line of stitching through the center, with the ruled spaces consecutively changing from inside to cover, so that the ruling shall register, or nearly so, when the book is closed, substantially as herein set forth.

164,874. BELL-PULLS. Wm. Richardson, New York, N. Y. [Filed June 5, 1875.]

1. A bell-pull or handle constructed, and operating substantially as described, to operate at will either of two or more bells.

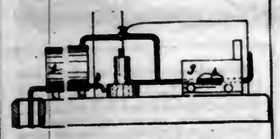


2. The combination, substantially as herein shown and described, of a pull or handle arranged to operate separately two or more bells, and an indicator arranged to give an audible report for the purpose of guiding the operator at night in the adjustment of the pull to operate the particular bell required.

3. In combination with the sliding and rotating spindle D, provided with the lip *c*, the series of slides, E, having the bell-wires attached thereto.

4. In combination with the spindle, arranged to operate as described, the dial-plate D, and pointer I.

164,875. WASH-BOILERS. John Bleth, Lansing, Iowa. [Filed Mar. 11, 1875.]



Brief.—The clothes are kept clear of the perforated lateral flanges of the fountain by means of an interposed plate extending entirely over said perforations.

The combination, with an ordinary wash-boiler attachment consisting of the vertical chamber perforated at its top, and provided with lateral perforated flanges at its bottom, of the guards or shields projecting from the body of the vertical chamber, and entirely covering the lateral perforated flanges, substantially as and for the purpose described.

164,876. APPARATUS FOR SUPPLYING GAS AS A FUEL TO METALLURGIC FURNACES. William Rogers, Loochburg, assignor to himself and T. J. Burchfield, Allegheny, Pa. [Filed June 3, 1874.]

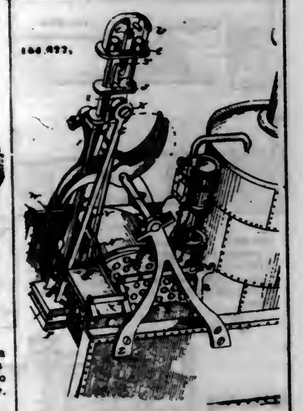
Brief.—The gas is passed through the water-trap to free it from moisture, then through a heating chamber, and finally to the furnace or fire-chamber, where it is burned in lieu of coal. An air pump between the water-trap and heating chamber adds air to the gas.

1. The process of treating gas from oil wells or gas-generators for use as fuel in furnaces used for manufacturing iron or steel, consisting in passing the gas through a reservoir to eliminate watery particles, then subjecting it to heat, and finally conducting it into the fire-chamber with or without the injection of air, substantially as herein described.

2. The combination of the reservoir A and heater *g*, with the furnace *m*, substantially as herein described and for the purpose set forth.

164,877. ROAD-RAMMERS. Abbott Q. Ross, Cincinnati, Ohio. [Filed Apr. 12, 1875.]

Brief.—A road roller and rammer, in which the rammers have a vertical rising and falling motion, and also a swinging motion, the upper ends of the swinging rammers being secured to trunnions with spring-cushions, guided by sliding heads upon vertical guideways. To throw the rammers forward or backward in the direction in which the machine is traveling, and thereby permit them to rest on the ground while the machine is progressing, until each time as they are again raised and lowered, a series of adjustable springs are employed, which are made to bear upon either side of the falling rammer-rods, depending upon the direction traveled. When not to be used, the rammers are suspended by tilting spring-hooks. The rammer-head is grooved, and a saw-toothed shoe, with ribs corresponding to said grooves, is slipped on the heads and secured by a set-screw. The peripheries of the rollers are provided with concavities.



1. The combination of sliding head J H and swinging rammers F G, operating substantially as and for the purpose specified.

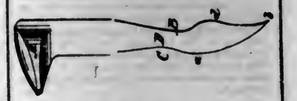
2. In combination with the swinging rammers F G, the spring V or W operating substantially as and for the purpose specified.

3. In combination with the swinging-rammers F G, the alternating springs V W, operated substantially as and for the purpose specified.

4. The combination of rammer-hook S, pivoted hook T, spring *t'*, and cross-shaft U, substantially as and for the purpose specified.

5. In combination with the rammer-heads F the cylinder N, spring *n*, and plunger *n'*, operating substantially as and for the purpose specified.

6. The combination of cylinder N, spring *n*, plunger *n'*, and lever *o*, connected and operating substantially as and for the purpose specified.

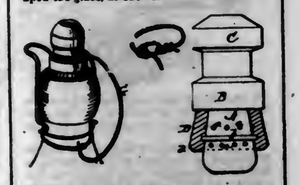


7. The rammer-head F constructed with grooves *f*, for attachment of interchangeable shoes, substantially as and for the purpose specified.

8. The shoe or spade *e d*, having projecting teeth *e*, substantially as and for the purpose specified.

9. The combination of sliding head J *l*, trunnion-shaft I, and rubber springs L, operating substantially as and for the purpose specified.

10. The roller or rollers B having concavities or circular indentations *b*, substantially as and for the purpose specified.

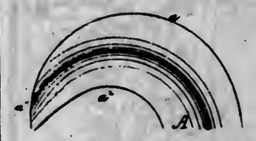


164,878. SPIKES. George N Sanders, New York, N. Y. [Filed May 6, 1875.]

The improved curve-spike A D, with the neck D, formed by the two depressions B and C, and with the convex bevel *a b*, substantially as and for the purposes described.

164,879. BOTTLE-STOPPERS OR CORKS FOR BOTTLES. John Schrink, Toledo, Ohio. [Filed May 10, 1875.]

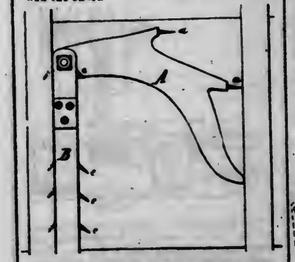
Brief.—The stopper consists of a glass body and rubber gasket. The gasket is held in place by the central collar and the projections upon the glass, as shown.



1. The glass stopper A, provided with top C and center collar B, and having its lower part made conical and provided with spurs or teats *a a*, and circumferential bead *b*, substantially as and for the purposes herein set forth.

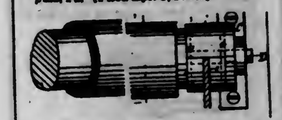
2. In a bottle-stopper the conical rubber gasket D, having its lower edge *d* beveled, as shown, in combination with the core A, substantially as and for the purposes herein set forth.

161,866. TOBACCO-KNIVES. E. T. Shelton, Laurel Grove, Va. [Filed Dec. 28, 1874.]



Brief.—The knife and handle form a letter S. The curved blade has a dulled portion upon its outer end, so that the leaves may not be cut in pushing the convex side through a stalk to split it.

A tobacco-knife, having the curved blade A, with push-cutting edge *a*, draw-cutting edge *a'*, and intermediate bleat edge *a''*, constructed and arranged as and for the purpose specified.



164,861. PLANKING-SETS FOR SHIP-CARPENTERS. Edward Sloan, Trenton, Mich. [Filed Dec. 30, 1874.]

Brief.—The clamp consists of a curved dog, having on its extremity and convex edge several spiked serrations, and at its heel a pivoted draw-bar, two of the sides of which are provided with short spikes, and the free end of the same with an overlapping offset. Planks are set against the edges of the preceding ones by placing the dog between two of the ribs of the vessel being planked, and driving a wedge between the free edge of the plank and the offset.

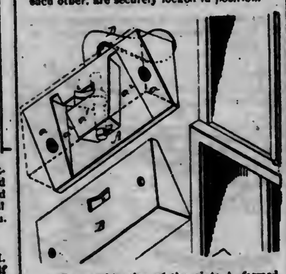
The planking-set herein described, consisting of the dog A having the serrations *a*, and pivoted to the draw-bar B, which is provided with spikes *c* and offset *b* and the wedge C, all substantially as and for the purpose set forth.

164,862. CURTAIN-FIXTURES. William H. Sparks, Camden, N. J., assignor of one-half his right to Thomas D. Coulston, Philadelphia, Pa. [Filed Apr. 8, 1875.]

1. The case G, having a cam, *g*, on its periphery, and a pivot-hole, *f*, in combination with the pivot D, having eccentric flanges *e* and *e'*, and the bracket C, having a shoulder, A, for holding the curtain B in its adjusted position, substantially as set forth.

2. The case G, having the slot *c* in its periphery, in combination with the cord F for tripping the cam *g*, to admit of the winding up and unwinding of the curtain, substantially as set forth.

164,863. BEDSTEAD-FASTENINGS. George Sweet, Williamsport, Pa. [Filed Jan. 6, 1875.]



Brief.—The two parts of the socket-iron are secured in the post-mortise by a wedging action of their inner beveled ends on each other, and the peculiar form of the hook-iron shown adapts it to be readily inserted in the end of the rail, and to be secured more firmly therein.

1. The bedstead socket-irons A A in two parts, the separate parts having their inner ends made with corresponding bevels adapted to fit together and their outer ends with diverging bevels, substantially as and for the purposes set forth.

2. The hook-iron B, constructed of the form substantially as described, for the purposes set forth.

164,864. FASTENERS FOR THE MEETING-RAILS OF SASHES. William B. Swallow, Flemington, N. J., assignor of one-third his right to Andrew T. Connet, same place. [Filed May 19, 1875.]

Brief.—A shell or case formed in two wedge-shaped halves, provided with dovetailed projections and corresponding grooves or recesses, is mortised between the meeting-rails, one-half on either side. Through the center of one of these passes a vertical shaft, having an outwardly-projecting crank-handle, and a short arm engaging with an inclined slot on the opposite half, whereby the plates, when slid into each other, are securely locked in position.

1. The combination of the plate A, formed with the wedge-shaped parts *a a*, center dovetailed wedge *a'*, and grooves *a'' a'''*, and the plate B, formed with the wedge-shaped parts *b b*, center dovetailed recess *b'*, and wedges *b'' b'''*, substantially as and for the purposes herein set forth.

2. In combination with the plates A and B, constructed as herein described, the shaft *d* with handle D, and arm *i*, and the inclined slot *x* in the plate B, as and for the purposes herein set forth.

164,865. HEEL-SHAVES. Nathan A. Swett, Westbrook, Me. [Filed May 13, 1875.]

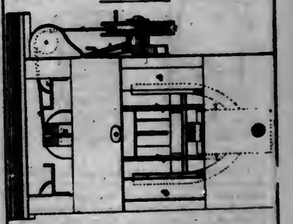
1. The heel-shave stock A, having handles A' A' set at equal but opposite angles, substantially as shown, and for the purpose described.

2. A heel-shave stock, A, arranged obliquely with reference to its handles A' A', substantially as shown, and for the purpose described.

3. In a heel-shave the combination of a curved oblique blade, B, with the stock A and handles A' A', substantially as shown and described.

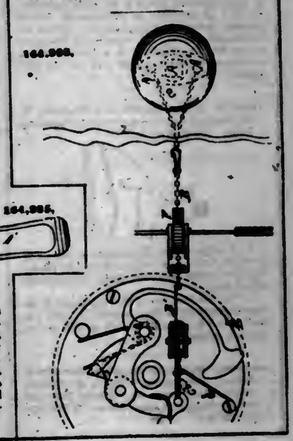
164,866. RAILWAY-SWITCHES. J. Walker, Vincennes, Ind. [Filed Feb. 8, 1875.]

Brief.—A railway switch in which a trough with divergent sides is employed, in combination with crank-arms and levers for shifting the movable rails; said trough being operated upon by projecting arms on a rotating cylinder placed upon the front of the locomotive-truck. The cylinder-arms are arranged at different angles on the shaft.



1. The combination, with the main rails A, side rails B, and switch-rails A*, of the divergent clutch-bar E, having side flanges *a a*, as described, elbow-levers F, connecting-bar O, levers C C, and sliding-bar M, all constructed and arranged substantially as and for the purposes herein set forth.

2. The combination of the shaft B, with studs and rollers *b b*, set at varying angles, the connecting-rod K and lever L, all arranged on a locomotive to operate the divergence clutch-bars, as and for the purposes set forth.



164,867. WATER-ELEVATORS. W Walter, Latrobe, Pa. [Filed May 11, 1875.]

Brief.—Two rods suspended from the center block above, and having their lower ends notched, engage with pins projecting from the sides of the discharge of the bucket, when it is near its highest elevation; when completing its elevation, tilts and empties the bucket.

The combination of the bucket B, slides *b*, rods *f*, pins *d*, and guides *a*, substantially as described.

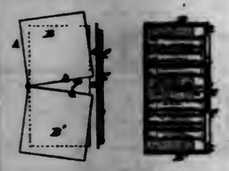
164,868.

164,888. BURGLAR-ALARMS. James A. Weed, Binghamton, N. Y., assignor to H. H. Doubleday, Washington, D. C. [Filed May 3, 1875.]

Brief.—By connecting or disconnecting the chain which connects the bell mechanism with the spindle of the lock, the device may be used as a burglar-alarm, to be operated by turning the lock-spindle or opening the door, or as a door-bell only.

1. The combination, with the chain c^2 and chain or link B^1, of the guide d, substantially as set forth.

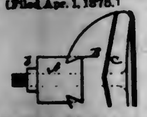
2. The combination, with the tripping-lever C, of the chains c^1 B c a, link B^1, spindle A, lever A', and the detachable fastening a', whereby the bell E may be used as a door bell only, or as a door-bell and burglar alarm, substantially as set forth.



3. The combination, with the lever A', the striking mechanism, and the connecting-chains, of the pulley F, by which the opening of the door serves to operate the alarm, substantially as set forth.

164,889. SHOE-NAILS. Hosea F. Whidden, South Abington, Mass. [Filed June 5, 1875.]

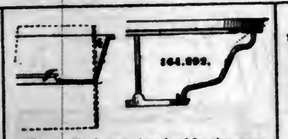
A shoe-nail having a serrated shank and a frusto-conical head elongated, substantially as described.



164,890. CARTRIDGE-BOXES. Martin V. B. White, Albany, N. Y., assignor of one-half his right to J. Martin, same place. [Filed Mar. 2, 1875.]

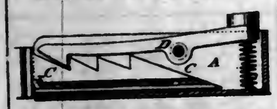
1. In combination with the stationary cylindrical cartridge-block F, and the revolving front side C, provided with the opening D and slide E, the casing consisting of the segmental pieces B B^1, having the rims c, and secured to the pieces A A^1, substantially as and for the purpose set forth.

2. The case, comprised by the rear pieces A A^1 and segmental pieces B B^1, having projecting lips or flanges c, in combination with a detachable revolving front piece C, having an adjustable opening, and capable of being removed for the insertion of a block holding cartridges, substantially as and for the purpose set forth.



164,891. BRAKE-BLOCKS FOR WAGONS. V. Westerhold and Hexander Calz, Hamburg, Iowa. [Filed Apr. 1, 1875.]

1. A wagon-brake block made in two parts, in combination with bolts and nuts for clamping the leather between them, substantially as set forth.

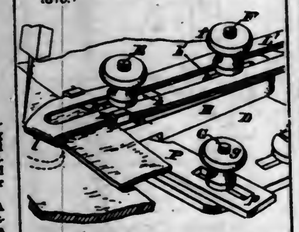


2. The combination of the brake-bar A, bifurcated brake-block B C, leather D, bolts a c, and nuts b b, all substantially as and for the purpose set forth.

164,892. MODES OF MAKING SHEET-METAL SIGNS. Samuel B. Wilmot, Bridgeport, Conn., assignor to the Wilmot Manufacturing Company, same place. [Filed Apr. 10, 1875.]

The within-described mode of forming rings for supporting lamp-shades, the same consisting in first bringing the strip into the form of a hoop, and then subjecting said hoop to pressure in a die of the desired shape, as herein shown and described, for the purpose specified.

164,893. HAME-FASTENERS. H. J. Wilson, Mason, Mich. [Filed May 17, 1875.]

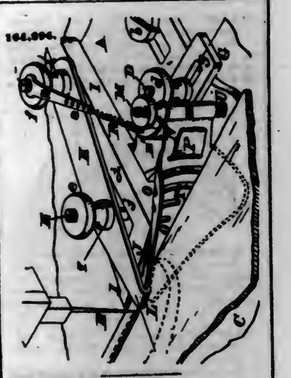


The combination of the sheath A, with its bead or guide i, and the toothed slide C, with its groove x, substantially as and for the purpose herein set forth.

164,894. SHOT-CARTRIDGES. R. D. Wilcox, Shreveport, La. [Filed Mar. 2, 1875.]

The combination, with a metallic loading shell or tube for breech-loading shot-guns, of an undivided, continuous, and detachable lining of paper, substantially as and for the purpose described.

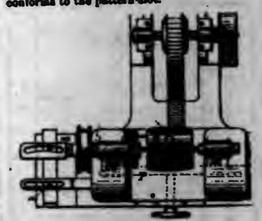
164,895. SEWING-MACHINE BINDERS. Georg Wiesler, Cincinnati, Ohio. [Filed Apr. 29, 1875.]



In combination with the bed-plates A, retaining devices E e F f G g P p, and wedge-block H h h', the slotted plates L M, L' M' l, and slidable gage-bar N, as and for the purpose stated.

164,896. SEWING-MACHINE ATTACHMENTS FOR SEWING-MACHINES. Georg Wiesler, Cincinnati, Ohio. [Filed Apr. 29, 1875.]

Brief.—A binder attachment consisting of a bed-plate, to which is adjusted a slotted wedge-shaped block, with a concave bearing on the end nearest the needle. Underneath the aforesaid bed-plate is fastened an edge-turner or lip, and a corresponding one is secured to the upper side of the wedge-block by the same common adjusting devices, one of which serves to regulate the longitudinal action of a slotted shackle upon the wedge-block, the other being connected with a tension-spring, which acts upon a vertically-slotted guide.



1. In combination with the bed-plate A and the lipped bars K L K' L', the wedge-block I j j', and retaining device D d, E e, F f, and G g, as and for the purpose specified.

2. In combination with the concave bearing J and the edge-turners or lips L L', the guide O M and tension-spring S, as and for the object herein designated.

164,897. MACHINES FOR GRINDING PULLEYS. Aurin Wood, Worcester, Mass. [Filed Dec. 5, 1874.]

Brief.—The supporting-carriage is centrally pivoted, and is provided with a projecting arm, in which is a pattern-slot, engaging with a stud fixed in a slide on the bed of the machine. The carriage, in transverse movement, conforms to the pattern-slot.

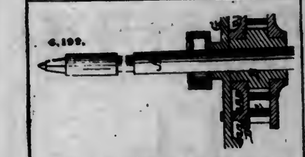
The combination of a supporting-carriage for the pulley, having a longitudinal and transverse movement, and a pattern, P', to impart a predetermined oscillating movement to the supports M M', and a grinding-wheel, B', the combination and arrangement being substantially such as described.

REISSUES.

6,491. ARGAND GAS-BURNERS. E. P. Gleason, New York, N. Y. Patent No. 72,167, dated Dec. 17, 1867. [Filed Sept. 24, 1870.]

Brief.—The lever operates as an index of the position of the valve.

1. A valve or stopper provided with screw-threads, or a device by means of which the valve is opened and closed by a partial turn or shifting movement, as described.



2. In an argand gas-burner, the lever D, as described, by means of which the adjustment of the valve is effected, and as an indicator of the valve's opening.

3. In an argand gas-burner, the combination of the inlet, the valve, and the lever D, substantially as described.

6,492. MILL-SPINDLES. John A. Hafner, Pittsburg, Pa. Patent No. 140,093, dated Dec. 30, 1873. [Filed May 31, 1875.]

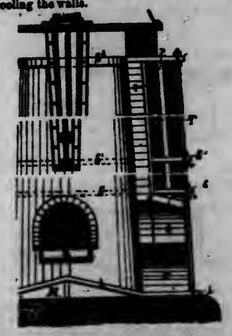
Brief.—A bolt keyed to the spindle is passed centrally through two circular plates, partially lying between them, and having around it, to connect them with the plates, a spiral spring. A leg on it also enters a recess in the top plate.

6,489.

1. The combination of the hub B, having the leg i, and the plate D, provided with the groove d, having stop x, substantially as and for the purposes herein set forth.

2. The grooved plate D, having the projections b, in combination with the plate E, spring C, hub B, and spindle A, substantially as shown.

6,493. FLY-TRAPS. James M. Harper, El Paso, Ill. Patent No. 131,096, dated Sept. 3, 1872. [Filed May 15, 1875.]

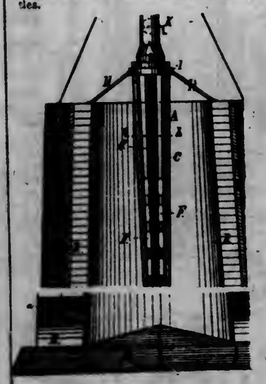


1. The concave base-block H, having extensions z and shoulders s, in combination with the cylinder A and its cone B, substantially as described.

2. The base H, having passages a in its periphery and a concavity inside thereof, in combination with cylinder A, substantially as described.

6,494. LIMEKILNS. William S. Sampson, New York, N. Y., assignor of one-half interest to Homer S. Beardsley, same place. Patent No. 140,415, dated Apr. 7, 1874. [Filed Jan. 21, 1875.]

Brief.—The bond-plates are perforated to allow circulation through the air-space for cooling the walls.

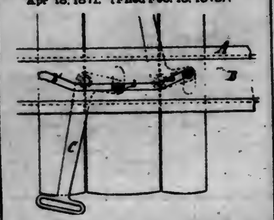


1. In a furnace or kiln designed for the calcining of lime, the roasting of ores, and the burning of cement and plaster, or similar materials, the combination of the cone-shaped bond-plate L at the bottom of a furnace or kiln, the series of bond-plates B, B^1, B^2, and B^3, more or less in number, all provided with the slots or openings V, with the horizontally-divided sections of the masonry, composing the walls G and G^1, the whole rigidly tied together by means of a series of tie-rods T, and nuts v, all substantially as and for the purposes as herein shown and described.

2. In a furnace or kiln, the walls of which are divided into a series of horizontal sections by means of bond-plates, and constructed as herein described, the air-space P formed between each walls from apex to base, as and for the purposes as set forth.

6,495. LIMEKILNS. William S. Sampson, New York, N. Y., assignor of one-half interest to Homer S. Beardsley, same place. Patent No. 140,415, dated Apr. 7, 1874. [Filed Apr. 10, 1875.]

Brief.—The central draft-flue is extended upward by the dampered smoke-stack. The downwardly-tapering form of the flue tends to relieve it from friction when the lime settles.



1. In a perpetual furnace or kiln arranged and adapted for the calcining of lime, the roasting of ores, the burning of cement and plaster, and other similar materials, said furnace or kiln being provided with one or more fire-chambers and ash-pits in its circumference near its base, the combination, with such furnace or kiln and its fire-chambers, of a centrally-suspended draft-flue, made tapering from top to bottom, and by means of which the heat, gases, and flame are drawn from the fire-chambers, through the charge of stone or ore, toward the center of the furnace or kiln to such flue, and escaping therefrom substantially as and for the purposes herein shown and set forth.

2. A draft-flue to be suspended in a furnace or kiln arranged for the calcining of lime, roasting of ores, &c., made tapering from its apex to its base, provided with longitudinal flanges C, having returning flanges B constructed in the sections B, B^1, B^2, and B^3, the whole combined, arranged, and operating substantially as and for the purposes as herein shown and described.

3. In combination with a draft-flue, suspended in a furnace or kiln, as herein described, the smoke stack or chimney J provided with damper K, arranged and operating as and for the purposes as set forth.

6,496. BELT-SHIFTERS. Wm. H. H. Simm, Newark, N. J. Patent No. 113,939, dated Apr 18, 1871. [Filed Feb. 15, 1875.]

1. The inclines b^1 b^2 on the movable piece B, in combination with the connections, guides for guiding the belts, and adapted to shift them in succession from one pulley to another with a simple movement of the shifter B, substantially as herein specified.

2. The connecting part b of the slot b b^1 b^2 in the movable piece B, adapted to hold the belts firmly in position when they are not in the act of being shifted, as herein specified.

6,497. CASKET-HANDLES. C. Strong, Winsted, Conn., assignor to the Strong Manufacturing Company. Patent No. 126,500, dated May 7, 1872. [Filed May 24, 1875.]

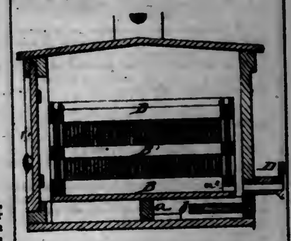
Brief.—The handle is composed of an inner tube of cheap strong metal, and an outer one of soft metal placed over or cast upon it, and variously ornamented.

1. The construction of the bar or hand-piece by employing two tubes, in combination with the swinging levers C C, substantially as and for the purpose set forth.

2. The tubular hand piece, Fig. 2, having shoulders a a formed upon its ends to adapt it to a firm connection with the swinging levers C C and the ornamental tips D D, substantially as herein shown and described.

6,498. BENCH-PLANES. Leonard Bailey, New Britain, Conn. Patent No. 67,396, dated Aug. 6, 1867. [Filed June 13, 1874.]

Brief.—The plane-stock is formed in two sections, each provided with a throat for the iron. To compensate for the unequal wear of one part upon the other the upper section is made longitudinally adjustable upon the other. The plane-iron is adjusted by means of a cap-plate provided with an aperture near its upper end, a pivoted bifurcated lever, and an annularly grooved thumb-nut working upon a vertical screw, the relative position of the adjusting device and cap-plate being always the same, while the relations of it and the plane-iron can be varied as the iron wears away.



1. The combination and arrangement of the two parts a b of the stock together by means of the clamp-screws d s running through the slots f, as described, whereby each parts may be adjusted with reference to each other and clamped together, as and for the purpose specified.

2. The combination of the screw s, nut n, lever m, and the plane-stock, substantially as described.

3. The combination of the nut n, lever m, and plate h with the plane-iron, substantially as described.

4. The combination of the plane-iron, plate h, and lever m, substantially as described.

6,499. BIRD-HIVES. Edson Getty, Garden City, Minn. Patent No. 161,606, dated Apr 6, 1876. [Filed May 18, 1875.]

1. The extended entrance D, forming passage a^1, in combination with the sections having passages a^2, and the chamber a and tube b, leading into the chamber a, and the entrance for the rays of light, all as and for the purposes set forth.

2. The sections, substantially as described, having passages *d d*, in combination with the reversible board G and case A, as and for the purposes set forth.

3. The sections B, provided with a perforated frame around the top, with blocks *f*, in combination with the board H, with cut corners and chambers *e*, perforations *e'*, and open edge *d*, forming a bee-feeder and a honey board, all as and for the purposes set forth.

6,502. STOVES. Alexander Hamilton, Creston, Iowa, assignor of one-half interest to Asa Beadle and Benj. Hartung. Patent No. 156,730, dated Nov 10, 1874. [Filed May 24, 1874.]

Brief.—For burning straw, hay, leaves, and other light substances in a compressed state.

The combination, with the fire chamber C and vertically adjustable grate K, of the press follower B rising to the top of said chamber, to receive the fuel thereinto, and operate as and for the purpose described.

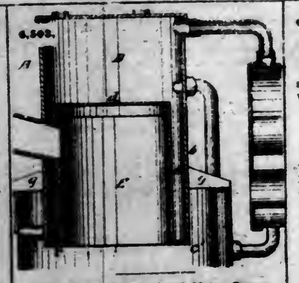
6,503. STEAM-BOILERS. Martin W. Shapley, Binghamton, N. Y. Patent No. 147,497, dated Feb. 10, 1874. [Filed June 8, 1875.]

Brief.—The horizontal and vertical flues are readily cleaned by removing the detachable fire section.

1. The combination of the boiler, constructed substantially as described, and the conical fire-box, with the cross and upright tubes and jacket and chamber, as and for the purpose set forth.

2. The combination of the boiler composed of parts *a a'*, and the cross and upright tubes opening into the chamber *c*, with the removable jacket, whereby the tubes may be quickly and easily cleaned by removing the jacket, substantially as described.

6,502. MANUFACTURE OF PAPER-BOARDS. Benj. F. Field, Beloit, Wis. Patent No. 105,790, dated July 26, 1870. [Filed July 10, 1874.]



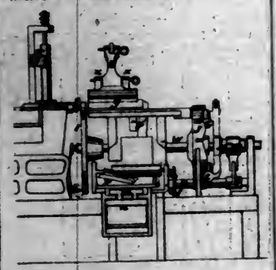
The combination of a machine for making paper-board continuously from pulp with a machine or attachment for applying to such board in the process of its manufacture, and by means of paste and pressure, a sheet of this lining-paper previously made.

6,503. FURNACES. William B. Barton, Kewanee, Ill. Patent No. 100,178, dated Jan. 26, 1870. (Filed Apr. 17, 1875.)

1. The boiler A, fire-box B, chute F, and legs or supports *g*, in combination with the boiler B forming the space *e'*, for the passage of heat and smoke, and furnishing a support for the boiler A, substantially as and for the purposes specified.

2. The combination of the single upright boiler A, water-jacket or boiler B, and horizontal boiler C, the upper boiler connected to horizontal boiler C with suitable pipes, all constructed and operating substantially as and for the purposes specified.

6,504. CIDER-MILLS. Saml Maios, Cincinnati, Ohio. Patent No. 52,583, dated Feb 13, 1866; reissue No. 5,877, dated May 19, 1874. [Filed May 11, 1875.]



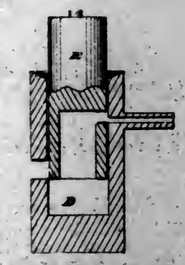
1. The crushing-rollers H G, provided with cylindrical segments I, ribs J, and grooves K, substantially as and for the purpose specified.

2. In combination with the crushing-rollers H and G and break-roller E, the gear-wheels F F' F'', with interdental spaces, whose bottoms *f* are chamfered or sloped outward, substantially as and for the purpose specified.

3. The herein-described relative arrangement between the gear-wheels and crushing-rollers—that is to say, having at least one rib of one roller register with a tooth on its gear-wheel, while at least one groove in the other roller registers with a space between two adjacent teeth of its gear-wheel, all substantially as and for the purpose specified.

6,505. TYPE-CASTING MACHINES. John A. T. Overend, San Francisco, Cal. Patent No. 136,091, dated Feb. 18, 1873. [Filed May 13, 1875.]

Brief.—The cast type are carried from the matrices between smoothing-planes, and delivered in a finished condition.

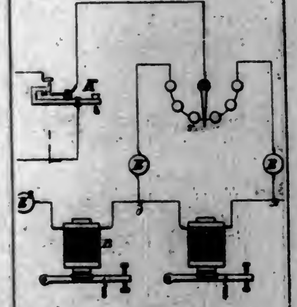


1. The sliding plate N, arranged as described, so as to carry the type between the rubbers P P, in combination with the carrier I, clamp L, and table K, constructed and operated substantially as and for the purpose set forth.

2. The cam J and the arm U, constructed and operated substantially as described, for the purpose of giving the carrier I, the mold *g* and the matrix *f* a side movement, and making a tight joint.

6,506. TYPE-CASTING MACHINES. John A. T. Overend, San Francisco, Cal. Patent No. 136,091, dated Feb. 18, 1871. [Filed May 13, 1875.]

Brief.—A pump for forcing hot metal in small jets by a plunger, which acts without valves.



The pump-cylinder D, provided with an opening to admit the liquid to the pump without the use of valves, in combination with the piston E, chambered as shown, substantially as herein described.

6,507. MONUMENTS. Jas. Sharkey, Brooklyn, N. Y. Design No. 7,416, dated May 5, 1874. [Filed June 5, 1875.]

The design for a monument, in which the tablets and pedestal are curved, in connection with said surmounted by arches E resting on ornamental trusses F, substantially as shown and described.

6,508. DUPLEX TELEGRAPHS AND CIRCUITS THEREFOR. Jos. B. Stearns, Boston, Mass., assignor to the Western Union Telegraph Company. Patent No. 132,932, dated Nov. 12, 1872. [Filed Mar. 20, 1875.]

Brief.—"Bridge duplex" circuits arranged to pass currents of sending station around receiver of such station.

1. A duplex telegraph having a receiving instrument placed between the main line and an artificial line, and a connection from the transmitting-key to both sides of the receiving instrument, so that such receiving-instrument is may be at a neutral point with reference to the electric pulsations produced at that station, substantially as set forth.

2. A duplex telegraph containing a receiving-instrument placed at a neutral point, and an electro-magnet in the artificial line, substantially as set forth.

3. The combination of the receiving-instrument with the resistances R R' R'', in the manner and for the purpose set forth.

4. The combination of the receiving-instrument and the resistances R R' R'' with a series of smaller resistances, r, as and for the purpose set forth.

5. The combination of the receiving-instrument A with the electro-magnet B, as and for the purpose set forth.

HELIOTYPE RELIEF PROCESS. JAMES R. OSGOOD & CO. BOSTON

OFFICIAL GAZETTE

OF THE

United States Patent Office.

VOL. 7.—NO. 26. TUESDAY, JUNE 29, 1875. PRICE { $6,00 per year—single. $5,00 per year in clubs.

The OFFICIAL GAZETTE is published on Tuesday of each week, from the United States Patent Office. The subscription price for 1875 is six dollars per year for single subscribers; five dollars per year to clubs of not less than five sent at one time, and which will be mailed free of postage to separate addresses if desired. Subscriptions will commence and terminate with the year. All orders should be addressed to the Commissioner of Patents, Washington, D. C.

COMMISSIONER'S DECISIONS.

FREDERICK W. DAHNE.—*Interlocutory Appeal.*

Appeal from the Principal Examiner in the matter of the application of Frederick W. Dahne for Letters Patent for "IMPROVEMENT IN PROCESS OF EXTRACTING GOLD FROM ORES," &c.—*Decided May* 26, 1875.]

Descriptions and claims must be unambiguous; but the Office neither prescribes nor proscribes any particular form or phrase.

SPEAR, *Acting Commissioner:*

The Examiner's objections are made against the form of the claims, or, rather, against certain words used in the claims. I do not understand him to say that the claims are ambiguous; that any doubt exists in his mind as to the nature of the invention claimed, whether it be a process or manufacture. Indeed he appears at one time to have rejected them upon their merits, thereby certainly implying an understanding of their import. He objects simply that they contain certain tabooed words—words which have been prohibited in claims of all descriptions, and which may not be used, no matter what the subject-matter described.

He speaks of the "recognized practice of the Office discountenancing this form of claim." I do not think it proper to say that the recognized practice of the Office discountenances any particular form of claim. The mere form itself is of little or no consequence; and it is impossible to decide that, because the form is bad in one case, it will be bad in every other. It is the uniform practice of the Office to discountenance in a particular case any form of claim which does not set forth clearly the nature of the invention, but leaves in uncertainty the thing which is to be patented.

I would not be understood as counseling any relaxation of vigilance on the part of the Examiner in scrutinizing the form of claims in cases that come before him for examination. It is as important that the invention should be clearly described and distinctly claimed as that it should be now. A patent may be as certainly void for ambiguity as for lack of novelty; but it is essential that the Office should not be hampered by any false traditions that certain words and phrases in the language are not, under any circumstances, to be used in claims. There is no foundation for such traditions. The decisions of the Commissioner afford no basis for them, but, on the contrary, plainly contradict them. Thus in the *ex-parte* case of *Hoppes*, (OFFICIAL GAZETTE, vol. 2, p. 4,) the then Acting Commissioner, considering a claim, which was, in substance, "increasing the area of the water-surface," &c., held that it was not "indeterminate in substance," as the Examiner had supposed, and that it was not functional, as was held in *ex-parte Simonds*, C. D., 1870, where claims made in participial form had been less guardedly condemned; but he sustained the Examiner on the true ground that in that connection, and in relation to the subject matter under consideration, the claim was not in such "clear, concise, and exact terms" as the law required.

In the case of *The Collins Company*, (OFFICIAL GAZETTE, vol. 2, p. 617,) the Commissioner said, referring to the words "substantially as described:"

There is no artificial significance to be set up for them by which they are to be considered either as desirable or dangerous. There is no objection whatever to their use where they make sense.

Again, in the case of *Daniel F. Haasz* the same doctrine was stated with great force and distinctness. The Commissioner said:

I know of no rule or reason for prescribing or proscribing the use of any particular word or phrase in connection with a specification or claim.

From the very nature of the case no rule can be given of general application, either in relation to words or phrases, or anything else by which the exercise of his own judgment and intelligence and careful and critical analysis can be dispensed with by the Examiner in the examination of each particular case, with reference to the clearness or ambiguity of the claims.

In the present case the alleged invention appears to be a process, and the cases cited by the Examiner to sustain his action are not therefore pertinent to this, for they

both relate to manufactures, and in the case of Mayall the objection was simply against an ambiguity of the claim. The leading phrase in the claim was "the employment of canvas," and that, in connection with the other parts, was held to be such as to leave it doubtful whether the claim was for a process or a manufacture. The objection was not primarily to the word "employment," but to the ambiguity which arose from the word used in that connection; and now, without any regard to that case, the question arises in this, as it did in that, whether or not this claim is clear and precise. For my own part, having read the specification, I think there can be little doubt as to what the claim in this case (I speak of the first) is intended to cover. To avoid all possibility of error, however, it might be well to prefix to the claim the words "in the process for extracting gold from ores," to which phrase I understand applicant to make no objection.

The second claim appears to me unobjectionable as it stands, so far as form is concerned. These processes may be old, or they may be impracticable or inoperative. Of these matters I have no means of judging, and, indeed, am not called upon to judge at this time. Only the form of the claim in relation to clearness or ambiguity is to be considered. The expression "continuous use," in its connection with the other parts of the claim, and in the light of the specification, is intelligible. Unquestionably applicant is claiming a process. If that be an invention and new, the claim should be allowed, and, with the addition suggested above, both claims should be examined upon their merits to determine the patentability of the alleged invention.

DECISIONS OF THE COURTS.

U. S. CIRCUIT COURT—DISTRICT OF MASSACHUSETTS.

DAVID M. WESTON *et al. vs.* NATHANIEL C. NASH *et al.*

[*In equity.—Before* SHEPLEY, *J.—Decided April*, 1875.]

The fifth claim of reissued patent of David M. Weston for "Improvement in Centrifugal Machines for Draining Sugar," &c., dated January 14, 1868, (original dated April 9, 1867,)—viz: "The construction of the openings I in the bottom of the cylinder in such machines, and the valve J for the purpose of closing the same, substantially as described"—is not limited to such centrifugal machines only as are constructed in all respects like those described in the specification.

The term "such machines" in this claim means such centrifugal machines as are so constructed as to admit of the application and operation of the claimed devices in substantially the described mode and by substantially the described means.

The unauthorized use of complainants' openings and valve would be an infringement if used in centrifugal machines, to which they could be usefully applied by reason of there being an unobstructed space at the bottom of the machine, into which the sugar could fall, although the cylinders were not suspended as shown in the patent.

The Weston invention is not anticipated by the device shown in the British patent of Hardman, of 1843, in which the openings in the bottom plate of the rotary cylinder are closed by a disk or plate held up against them while the machine is in operation by a nut and spring, and simply lowered, without being removed, so as to leave a free and unobstructed space, when the sugar is to be discharged.

Nor by the Alliott machine, described in English patent of February 3, 1851, in which the bearings of the shaft and its foundations are directly under the cylinder, so as to render impossible a free and unobstructed space below the cylinder into which the sugar may be discharged.

Although defendants' valve is operated by turning on the shaft, and, in this respect, may be an improvement upon the valve of the patent, which moves up and down on the shaft, this is not a substantial difference. It is but another form of the same device, with the same mode of operation, so far as the operation is concerned to which the whole device relates—that of discharging through the bottom of the cylinder the purged contents of the charge.

[*George L. Roberts*, for complainants.
James B. Robb, for defendants.]

SHEPLEY, *J.*:

Letters patent, reissue No. 2,845, issued January 14, 1868, to David M. Weston, for improvement in centrifugal machines for draining sugar and other substances.

Centrifugal machines had been long known and used prior to the date of his invention for the purpose of separating liquid from solid constituents when mechanically intermixed in the same masses. A metallic drum, with its cylindrical periphery perforated to form a strainer to retain the solid matter while permitting liquids to escape when subjected to centrifugal action, was so arranged and operated as to rotate with great velocity on its axis. The cylindrical strainer was surrounded by a casing, which received and carried off the liquids thrown through the apertures of the strainer. When used for purging sugar from the menstruum of sirup or molasses in which it had been crystallized by boiling, the mass of sirup and sugar was introduced into the rotary perforated cylinder or basket and revolved at a high rate of speed. The centrifugal force in a few minutes eliminated all the sirup through the sieve, leaving the crystals of the sugar standing in a perpendicular wall around the inner surface of the cylindrical sieve.

The invention of Weston embraced two contrivances, one to obviate the tendency of the basket to vibrate in its bearings when carrying an unbalanced load, and the other means for the rapid and easy removal of the sugar from the basket after it had been purged from the sirup.

The inquiry in the present case relates to the complainants' mode of—

construction of the cylinder, by means of which the contents of the same may be more readily discharged than by the method usually employed; and consists in forming openings in the bottom of the cylinder around the shaft, which are closed by a valve or cover, as will be more particularly described.

The method usually employed to discharge the sugar had been to take it out of the same opening at the top of the cylinder through which the sirupy mass had been introduced to be operated upon. Weston constructed openings in the bottom of the cylinder, in the annular space surrounding the shaft, and between the shaft and the perpendicular wall of the sugar. These openings are closed by a movable cover, which surrounds the shaft, and is formed with a sleeve extending upward around the shaft a sufficient height to prevent any liquid matters that may be put into the cylinder from escaping between the valve and the shaft. The valve with its sleeve slides loosely up and down on the shaft which it surrounds. After the materials contained in the revolving cylinder have been acted upon, and the liquids separated and discharged through the

apertures in the sides by the centrifugal force thus created, the valve is raised, sliding upward freely on the shaft, out of the way, and the contents of the cylinder are discharged through the openings in the bottom.

The centrifugal cylinder in the Weston machine is suspended from a flexible elastic bearing, which supports the rotating parts of the machine and its contents in such a manner as to permit them to revolve about an axis, varying in position according to the weight of the material in motion. The rotary cylinder is actuated on a hollow shaft, which is supported and runs upon a spindle or axle within it suspended from the elastic bearing above. These contrivances for suspending and rotating the cylinder, which form a separate and important portion of the Weston improvements, are not in controversy in this case, and are only alluded to in this connection from the incidental connection they have with the means of discharging the cylinder, by reason of the fact that this mode of suspending the cylinder leaves a free and unobstructed space beneath the openings in the bottom of the cylinder, so that, when the contents are discharged through the openings, they fall by gravity entirely clear of the machine.

The claim in the patent is as follows:

5. The construction of the openings I in the bottom of the cylinder in such machines, and the valve J, for the purpose of closing the same, substantially as described.

The words "in such machines" in this claim undoubtedly refer to centrifugal machines. It is claimed by respondents that they refer to such centrifugal machines only as are constructed in all respects like those described in the specification. This, I think, is too narrow a construction of the claim. The true construction of the claim is that which makes it coextensive with the invention. "Such machines" means such centrifugal machines as are so constructed as to admit of the application and operation of the claimed devices in substantially the described mode and by substantially the described means. The unauthorized use of the complainants' openings and valve would be an infringement if used in centrifugal machines, to which they could be usefully applied by reason of there being an unobstructed space at the bottom of the machine into which the sugar could fall, although the cylinders were not suspended from a flexible elastic bearing like that described in the complainants' patent. The claim covers the application to centrifugal machines, so constructed in other respects as to be adapted to the application and proper working of the patented devices hereafter named, of openings in the bottom of the cylinder and a valve for closing such openings, such openings and such valves being constructed substantially as described.

The British patent granted to Hardman October 5, 1843, shows a bottom plate with openings or valves for the discharge of the sugar. A disk or plate is kept up against the under side of the bottom, so as to close the openings when the machine is in operation, by means of a nut and spring, and by the same means is withdrawn after the operation is completed, giving vent to the discharge-valves. There is no evidence that this Hardman machine ever went into practical use. It did not possess any advantage in construction over the centrifugal machines in the use of which the sugar was discharged by lifting it over the top of the basket. The evidence proves that it would take more than double the time to discharge the sugar in this mode than by the old way of discharging it over the top, and ten times as long as to discharge from the Weston centrifugal cylinder. It differs from the Weston contrivance in the essential particulars of being without a practically unobstructed place for the discharge of the sugar. The plate, when withdrawn as far as possible from the openings, still remains directly under them, so much so as to obstruct the free discharge of the sugar. This is an important element in the operation, for the crystals of sugar, when first discharged, are moistened on their surface with some adhering sirup, and do not glide or fall freely away from inclined planes, but accumulate and remain at rest. The manipulation of the nut from below the cylinder and the keeping the plate clear from the falling mass below the cylinder, while, at the same time, the operator must be concentrating the sugar over the openings from the upper side of the bottom plate, would be attended with great difficulty and inconvenience; and various other differences make this an impracticable contrivance.

Many of these observations apply with equal force to the Alliott patent, (also an English patent, granted February 3, 1851,) though in some particulars the Alliott device more nearly resembles that of Weston. But the Alliott cylinder had the bearings of the shaft and its foundations directly under the cylinder; consequently there was no free unobstructed space below the cylinder into which the sugar could be discharged. A funnel is arranged in the pan or casing to receive the sugar, and this is too contracted to allow the sugar to flow freely through it. The cylinder must be rotated to bring the hole over the funnel, and held there while the sugar is being discharged; otherwise the sugar would fall into the sirup in the pan. Without the aid of the drawings or a model it is not very easy to point out intelligibly all the differences between the Hardman and Alliott devices and the invention of Weston; but an inspection of models and drawings exhibits readily to the eye not only the diversities between Weston's device for discharging the sugar and those which preceded it, but also shows the impracticability of both Hardman's and Alliott's. This entire failure of either of those devices to accomplish the result aimed at by them and arrived at in the Weston device is proved by the fact that, while there is no evidence that either Hardman's or Alliott's device went into practical use, the Weston device has been almost universally adopted in this country, and extensively in Great Britain, France, and Germany, and to a very considerable extent in all sugar-producing countries.

The proof of infringement in this case depends upon the question whether the valves and openings of the defendants are substantially like those of the complainants in construction and operation, differing only in form.

The Weston and Hepworth devices for discharging the sugar are alike in the following characteristics of construction and mode of operation: Each has central openings around the shaft, through which the sugar is discharged into a space below it practically free and unobstructed. These apertures in each are opened and closed from the interior of the basket, and not from below the bottom. Each has a central opening through

the bottom of the casing or curb to permit the discharge of the sugar into a receptacle below the machine. The apertures in both are opened and closed by a central valve surrounding the shaft, extending above the surface of the liquid mass when introduced into the machine. The construction and mode of operation in discharging is substantially the same, differing only in the manner of opening and closing the valves, by turning the Hepworth valve on the shaft, while the Weston valve is raised and lowered. This is not a substantial difference, even if it be an improvement. It is but another form of the same device, with the same mode of operation, so far as the operation is concerned to which the whole device relates—that of discharging through the bottom of the cylinder the purged contents of the charge.

Decree that defendants infringe the fifth claim of complainants' patent, and for injunction and account.

U. S. CIRCUIT COURT, SOUTHERN DISTRICT OF NEW YORK.

WILLIAM WICKE *vs.* HENRY AND BARBARA KLEINKNECHT.

[*In equity.—Before* BLATCHFORD, *J.—December*, 1874.]

Where a machine was licensed for use in a particular territory:

Held, that the use of it, by subsequent purchasers, in territory other than that for which it was licensed, was unlawful.

The mere fact that the agent of the patentee, after the transfer of the machine to the unlicensed territory, demanded of the purchasers the back royalties due upon it, conferred no right to use it outside the territory named in the license.

[*A. V. Briesen*, for complainant.
J. Van Santvoord and *F. Forbes*, for defendants.]

[This was an action brought by the complainant, as assignee of certain territory under the patent of George Wicke, granted to the latter June 16, 1863, for a "box-nailing machine." The facts were as follows: The complainant, by assignment, acquired the exclusive right under said patent for the State of New York. The remaining territory was owned by the original patentee, but the complainant was his attorney authorized to collect royalties and grant licenses for said territory. Under this power of attorney he licensed one Oppel to use one of the patented machines in Newark, New Jersey. Oppel sold this machine to the defendants, who took the same to New York, and there used it. Suit was brought, and defendants pleaded an implied license, which they claim they derived from the complainant through his demand on them for payment of certain royalties due from Oppel at the time he sold the machine.]

BLATCHFORD, *J.*:

The evidence in this case leaves no doubt that the plaintiff is entitled to a decree. By the purchase by one of the defendants from Oppel of the machine in question, and by the transfer from Oppel to such defendants of the rights of Oppel under the written license given by George Wicke to Oppel, neither of the defendants acquired any right to use such machine in the territory belonging to the plaintiff under the patent.

The plaintiff was the agent of George Wicke in respect to the license to Oppel, and he never demanded any license fee from either of the defendants, in respect of any other use of the machine than a use of it under and in accordance with the terms of the license to Oppel, which did not embrace a use of it in territory owned by the plaintiff.

Oppel had no right to use the machine in the plaintiff's territory, and could convey none. The plaintiff has given no license, direct or indirect, express or implied, to either of the defendants to use the machine in his territory.

DESIGNS PATENTED DURING THE WEEK.

[Each Design bearing date June 29, 1875.]

8,428 to 8,439, inclusive.—Carpets.—ROBERT ALLAN, Yonkers, N. Y., assignor to ALEXANDER SMITH & SONS' CARPET COMPANY, same place. Applications filed June 19, 1875. Term of patents 3½ years each.

8,440.—Piano-Stools.—GEORGE W. ARCHER, Rochester, N. Y. Application filed December 22, 1874. Term of patent 7 years.

8,441.—Stoves.—WILLIAM BURROWS, New York, N. Y., assignor to J. L. MOTT IRON WORKS, same place. Application filed June 5, 1875. Term of patent 7 years.

8,442.—Dish of Pottery-Ware.—THOMAS H. COPELAND, Geddes, N. Y., assignor to ONONDAGA POTTERY COMPANY, same place. Application filed June 14, 1875. Term of patent 3½ years.

8,443.—Card of Buttons.—GEORGE P. FARMER, Brooklyn, N. Y., assignor to ERASMUS C. PRATT and JOHN H. PRATT, England, and GEORGE P. FARMER, New York, N. Y. Application filed May 7, 1875. Term of patent 14 years.

8,444 and 8,445.—Carpets.—HEINRICH F. GOETZE, Boston, Mass., assignor to THE ROXBURY CARPET COMPANY, same place.—Cases N and M. Applications filed June 21, 1875. Term of patents 3½ years each.

8,446 and 8,447.—Printing-Types.—CARL EMIL HEYER, Boston, Mass.—Cases A and B. Applications filed June 5, 1875. Term of patents 3½ years each.

8,448.—Coffin-Plates.—WILLIAM PARKIN, Taunton, Mass., assignor to REED & BARTON, same place.—Case L. Application filed May 27, 1875. Term of patent 7 years.

8,449.—Advertising-Lantern.—FRANCIS L. PISCH, New York, N. Y. Application filed May 22, 1875. Term of patent 7 years.

LABELS REGISTERED DURING THE WEEK.

[Each certificate bearing date June 29, 1875.]

259.—Title: "**Liquid of Borates Compound.**"—CHARLES G. AM ENDE, Hoboken, N. J. Application filed June 24, 1875.

260.—Title: "**Anderson's Toothache Specific.**"—CHRISTIAN ANDERSON, Dayton, Ohio. Application filed June 12, 1875.

261.—Title: "**The Dress-Reform Corset-Waist and Skirt-Supporter.**"—GEORGE FROST and GEORGE H. PHELPS, Boston, Mass. Application filed June 16, 1875.

262.—Title: "**Home Made Shirt.**"—JOHN HARRINGTON & Co., Boston, Mass. Application filed June 17, 1875.

263.—Title: "**Warranted 12 Yards.**"—LEISLER & SOMMERHOFF, New York, N. Y. Application filed June 26, 1875.

COPIES OF SPECIFICATIONS AND DRAWINGS.

Persons desiring copies of all specifications and drawings of any particular class of patents can purchase them at the rate of ten cents each, and have them mailed, free, to their address, as soon as possible after the patents are issued, by leaving a deposit of not less than three dollars with the Commissioner of Patents. The index of classes for subscribers, date of September, 1871, is furnished gratis to any applicant.

In ordering copies of any drawing or specification, the name of the inventor and patentee, the title of the invention, and the date of the patent must be given; and for any search required in consequence of the omission of any of these data a charge of one dollar may be made. So in ordering a copy of an assignment, the liber and page of the record, as well as the name of the inventor, must be given; otherwise an extra charge will be made for the time consumed in making any search that may become necessary.

Copies of the specifications and drawings of design patents will be furnished by the Patent Office at the cost of making them. All orders should be addressed to the Commissioner of Patents, Washington, D. C.

APPLICATION FOR EXTENSION.

UNITED STATES PATENT OFFICE,
Washington, D. C., May 19, 1875.

On the petition of ANN JENNETTE HATHAWAY, of Milwaukee, Wis., executrix of JOSHUA HATHAWAY, deceased, authorised by act of Congress approved February 18, 1875, praying for the extension of a patent granted to the said JOSHUA HATHAWAY, on the 3d day of April, 1860, for an Improvement in Devices for Converting Reciprocating into Rotary Motion,

It is ordered that the testimony in the case be closed on the 20th day of July next; that the time for filing arguments and the Examiner's report be limited to the 30th day of July next; and that said petition be heard on the 4th day of August next.

Any person may oppose this extension.

J. M. THACHER, *Commissioner.*

INDEX OF INVENTIONS PATENTED JUNE 29, 1875.

	Class No.	No. of Patent.
Addressing machine, E. Longley	117	164,925
Air compressors, valve and box for, Reynolds and Miller	2	165,120
Anchor, W. A. Currier	137	164,975
Anchor, A. Smith	137	165,036
Bale tie, W. P. Elliott	7	165,081
Band fastener, E. Dresser	146	165,079
Basket, stave, S. H. Wheeler	169	165,045
Basket, wicker, U. S. Wolf	63	165,047
Beame and tubes, machine for making hollow, L. Hahn	103	165,094
Bed bottom, spring, J. C. Anderson	62	164,957
Bedstead, invalid, Deneof and Wilkin	62	165,075
Beer, &c., compound for preserving, W. Zinsser	19	165,145
Beer with gas, apparatus for charging, J. C. Kennedy	1	165,004
Belt coupling, G. A. Manning	81	165,016
Bessemer converter, A. S. Dunning	85	164 982
Bit, expansible, F. Willig	29	164,953
Bit, wood boring, G. L. Holt	29	164,999
Blacking bottles, combined stopper and paddle for, H. D. Forbes	16	164 912
Blast apparatus, hot, H. Essex	85	165,084
Boiler for ranges, stoves, &c., upright, Lawton and Gibson	154	165,105
Boiler, steam, E. D. Leavitt, Jr	148	165,006
Boilers, covering for steam, W. Peters, (reissue)	149	6,516.
Boilers, feed water heater for steam, J. Armstrong	148	164,959
Boot and shoe, T. Powell, (reissue)	16	6,522
Boot and shoe rands, die for cutting, C. H. Brigham	16	164,963
Boot and shoe toe protector, R. and J. Evitt	16	165,085
Boots and shoes, machine for crimping leather for, S. W. Jamison, (reissue)	16	6,525
Bottle carrier, soda, A. F. Knorp	1	165,005
Bottle, dropping, C. C. Garrett	156	165,091
Bottle, measuring, F. S. Baldwin	156	165,054
Bottles, combined stopper and paddle for blacking, H. D. Forbes	16	164,912
Bottles, instrument for extracting corks from, Page and Fahy	68	164,931
Brewers' use, washing machine for, F. Cramme	19	164,906
Bung and bush, W. Johnson	40	165,001
Burner for electrical gas lighting, S. Gardiner, Jr.	64	165,090
Burner for heating purposes, gas, W. R. Hanks	64	165,095
Burner, lamp, T. D. Parsons	90	164,932
Burning hay, straw, leaves, &c., A. Hamilton	154	164,993
Bustle, C. O. Crosby	80	165,069
Butter boxes, preparing veneers for, S. F. Spaulding	35	165,945
Camera stand, F. M. Spencer	111	165,038
Can, air tight, S. Joyce	58	165,003
Canes, &c., bone handle for, J. Harvey, (reissue)	105	6,513
Cap, reversible, M. Fox	76	164,987
Car brake, Aldrich and Huggins	122	164,955
Car brake, S. P. Littlefield	122	165,008
Car coupling, W. H. Bodenhamer	122	164,961
Car coupling, C. E. Ramage	122	165,025
Car replacer, W. Elms	120	165,082
Car starter, Bailey and Pool	122	165,052
Car starter, G. S. Curtis	122	165,070
Carbureter, J. R. Allen	27	165,050
Carpet stretcher, E. P. Shaffer	62	165,032
Carpet stretcher and holder, D. Peters	62	165,022
Carriage seat, C. K. Mellinger	31	165,016
Cartridge cases, machine for necking, B. Payne, (reissue)	32	6,520
Cartridge cases, necking, B. Payne, (reissue)	32	6,521
Catch for cupboards, &c., C. G. Schneider	93	164,941
Casting plow points, G. Wiard	33	165,046
Casting propeller wheels, flask for, Swift and List	33	165,039
Centrifugal machine, G. Dinkel	155	165,077
Chimney cowl, A. J. Robinson	106	165,028
Chuck, planer, Pronty, Cees, and Taft	100	164,934
Churn, rotary, Felt and Child	45	165,086
Churn, rotary, J. J. Shelton	45	165,033
Cigar mold, N. Du Bral	160	164,981
Cigar tip cutter and watch charm, combined, E. F. W. Eisenmann	160	164,984

	Class No.	No. of Patent.
Clutch, friction, I. Arnold	67	164,898
Cock, stop, A. Snyder	167	164 944
Cooler, milk, W. H. Johnson	45	165,102
Corks from bottles, instrument for extracting, Page and Fahy	88	164,931
Corn stalk cutter, A. C. Smith	73	165,128
Cotton compress, J. J. Cahoon	7	164,903
Cotton openers, beater for, J. E. Crane	28	165,066
Cotton pickers, beater for, G. E. Taft	28	164,948
Crimping machine, S. W. Jamison, (reissue)	16	6,526
Culinary grater, E. Woodward	88	165,143
Cultivator, T. F. and W. Vandegrift	43	165,136
Cultivator, corn, A. F. Batcheller	43	164,960
Dial, gage, Crosby and Meady	148	164,908
Dredger, pneumatic, W. Smith	51	165,035
Drier and baker, W. P. Corsa	48	164,974
Drill, steam rock, J. C. Githens	124	164,990
Drills, chuck for rock, J. C. Githens	124	164,991
Drip trough for ice boxes, Dyer and Powell	58	164,963
Drying apparatus, L. K. Fuller	48	165,088
Egg and fruit box covers, fastening for, W. Weis	63	165,044
Engine, air hand, C. W. Riley	2	165,027
Engine, electro magnetic, T. Chutaux	59	165,064
Engine, fire, J. Bean	118	165,056
Engine governor, steam, J. C. Hoadley	69	164,917
Engine governor, steam, G. C. Sims	69	164,942
Engine, steam, D. K. West	150	165,139
Eyelet, T. Garrick, (reissue)	23	6,512
Fats, separating, C. M. Creeson	26	164,907
Feed cutter, E. Wagoner	59	165,138
Feed cutter, T. Webb	59	165,043
Fence wire, D. C. Stover	52	164,947
Fence wires, implement for stretching, J. F. Duffy	52	164,910
Filling hook for weaving hair cloth, J. Turple	95	164,949
Fire arm, breech loading, O. Schneeloch	18	165,031
Fire brick, manufacture of, J. P. Alexander	30	165,049
Fire irons, stand for, E. A. Jackson	62	165,101
Fire place, W. Tweeddale	154	165,134
Flower pot, J. S. Johnson	63	165,000
Food preserver, C. Brown	154	164,964
Foot rest, Edgcomb and Gore	62	164,911
Fork and skewer pull, combined, E. W. Andersen	44	164,956
Fork and skimmer, combined, A. B. Nott	88	165,117
Fruit drier, A. J. Reynolds	48	165,121
Fruit picker, J. Bailey	63	165,053
Furnace and range, combined hot air, L. G. Hallberg	154	164,916
Furnace and stove, E. Hawkes	154	164,995
Furniture caster, J. T. Codman	24	164,973
Fuse, electric, C. L. Kalmbach	50	164,921
Gage dial, Crosby and Meady	148	164,908
Gas from petroleum, apparatus for manufacturing illuminating, J. McClarty	27	165,012
Gas lighting, burner for electrical, S. Gardiner, Jr.	64	165,090
Gas, scrubber and condenser for illuminating, W. J. White	27	165,141
Gateway, S. L. Fisher	52	164,986
Glove stretcher, D. S. Hayward	38	165,096
Grain drill, E. D. Mead	133	165,015
Grain tally, A. K. Munson	159	165 021
Harness hame, A. H. Cresap, Jr	72	165,067
Harrow, J. Mastern	73	165,108
Harvester, L. B. Stilson, (reissue)	75	6,524
Harvester cutter, T. R. Arnold	74	164,958
Harvester pitman, guide, and holder, E. F. Herrington, (reissue)	74	6,514
Harvester rake, J. S. Marsh	74	164,926
Hat and cap, Isidor and Hein	76	165,100
Head block, J. F. Cook	130	165,065
Heater for steam boilers, feed water, J. Armstrong	148	164,959
Heating and ventilating public buildings, A. P. Pitkin	154	165,933
Heating apparatus, steam, I. C. Richardson	147	164,935
Heating purposes, gas burner for, W. R. Hanks	64	165 095
Hen's nest, J. P. Clement	116	164,971
Hinges, covering plate for, H. T. Blake	24	165,061
Hook, snap, G. Reynolds	23	165,122
Hoppie, J. Shive	144	165,127
Horses, toe weight and quarter boot attachment for, H. D. McKinney	144	165,014
Horseshoe blank bar, H. H. Gilmore	60	164,914
Hose, hydraulic, J. M. Stone	81	164,946
Hub, A. Rimes	31	164,936
Ice boxes, drip trough for, Dyer and Powell	58	164,963
Ironing board, G. E. Hollister	91	164,998
Jar lifter, W. W. Brower	88	164,968
Key hole guard, J. Goldstein	93	164,992
Knife, tobacco, Lane and Cullom	160	165,104
Ladle, Curtis and Rowley	88	165,071
Lamp chimney, G. Niedermair	90	165,116
Lamp fount, E. Brown	90	164,965
Lamp, gas fitter's, J. D. Galloway	64	165,089
Lantern, reservoir street, A. H. Watkins	64	165,142
Lathing, securing metallic, J. W. Hoyt	4	164,919
Leather, treatment of, H. Smith	92	165,129
Lock for doors, W. Unverragt	93	165,041
Locks, catch plate for bag, W. Roemer	93	164,939
Locomotive for burning hydrocarbon, J. M. Goodwin	149	164,915
Locomotives, exhaust mechanism for, W. Stamp	94	165,130
Loom, J. M. Linscott	95	164,934
Match safe, H. C. Wilcox	90	165,142
Measuring packaged fabrics, S. C. Talcott	37	165,131
Moldings, machine for polishing, J. A. Dayton	173	165,073
Motion, apparatus for transmitting and regulating, J. Zengel	67	165,144
Oil tank extinguisher, R. Dittrich	107	165,078
Oiler, Bohm, Stuhr, and Joecken	87	164,962
Ore, treating, D. Mindeleff, (reissue)	99	6,519
Organ, reed, Bach and Berg	106	164,900
Organs, &c., manufacture of key boards for, M. Pratt	106	165,024
Paddle wheel, J. Salter	139	165,029
Painter's use, Dreamer for, I. Hayes	90	164,996
Paper barrel, J. W. Jarboe, (reissue)	109	6,515
Paper box, J. R. VanVechten	109	165,137
Paper cutter, rotary, A. Judson	109	164,920
Paper folding, covering, and pasting machine, C. Chambers, Jr	117	164,904
Paper folding machine, W. Daniels	117	164,977
Paper folding machine, W. and C. Daniels	117	164,978
Pavement, composition, J. P. Cranford, (reissue)	110	6,511
Pencil case, W. I. Ludlow	146	165 009
Pencils, rubber eraser for lead, J. B. Blair, (reissue)	146	6,510
Photographic head rest, F. M. Spencer	111	165,037
Photographic vignetting machine, C. C. Merrill	111	165,017
Photographs, burnisher for, E. R. Weston	111	165,140
Piano stringing device, A. G. Gardner	112	164,988
Picture frame, J. T. Robertson	62	164 937
Pipe, smoking, C. J. Jonasson	160	165 002
Pitman, J. R. Taylor	67	165,040
Planes, guide for bench, H. P. Taylor	29	165,132
Planing machine, wood, J. S. Graham	173	164,989
Planters, check row attachment for corn, M. Newton	133	165,115
Plow, L. B. White	114	164,951
Plow, L. B. White	114	164,952
Plow points, casting, G. Wiard	33	165,046
Plow, sulky, G. Moore	114	164,929
Pocket books, clasp for, L. Messer	146	165,110
Polishing machines, feeding device for, J. A. Dayton	173	165,074
Posts, metal cap for, J. Davenport	52	164,979
Press, brick and soap, J. H. Hearn	20	164,997
Press, cotton, S. Dike	7	164,980
Press, hay and cotton, J. L. De Witt	7	165,070
Press, hay and straw, L. Kirk	7	164,922
Propeller wheels, flask for casting, Swift and List	33	165,039
Pump governor, C. W. Mills	69	165,112
Punch, E. J. Brooks	146	165,062
Radiator, steam, E. F. Osborne	147	165,118
Radiators, valve for steam, J. W. Faxon	147	164,985
Railway, pneumatic, R. R. Gregg	120	165,092
Reflector, heat, L. B. Woolfolk	154	165,048
Rein holder, M. Cain	31	164,970
Revolvers, safety catch for, C. W. Hopkins	123	165,098
Riveting machine, R. H. Tweddell	100	165,135
Roofing, metallic, S. T. G. Morsell	126	165,113
Row lock, M. F. Davis	13	165,072
Rubber eraser for lead pencils, J. B. Blair, (reissue)	146	6,510
Saw frame, buck, C. A. Hurlburt	131	165,099
Saws, handle for crosscut, E. Andrews	23	165,051
Scale and balance stand, R. Murdoch	132	165,114
Scale beam, W. T. Robinson	132	164,938
Shears, manufacture of, O. Norton	44	164 930
Shoe and glove buttoner, G. Stackpole, (reissue)	23	6,523
Show case, W. B. Smith	54	165,034
Sieve, Epeneter and Grahl	170	165,083
Skirt supporter, C. P. Clark	80	164 905
Slate, C. C. Shepherd	146	165,126
Sleigh runner frames, device for bending, J. W. and E. W. Karn	125	165,103
Sole edge machine, C. D. Bigelow	16	165,060
Spark arrester, C. L. Eastman	91	165,080
Spring setting machine, A. J. Fisk	31	165,087
Steamboat staging, A. J. Bell, (reissue)	137	6,509
Steel, apparatus for casting, Critchlow and Kidd	85	165,068
Stove grate, J. Moore, Jr	154	165,030
Stove, heating, J. K. Babcock	154	164,899
Strap handle, package, S. L. Harrell	24	164,994
Table, extension, J. F. Martin	62	165,107
Table, folding, E. J. Marsters	91	164,966
Table, ironing, J. L. Brown	62	164,976
Table, parlor, F. H. Cutler	108	165,109
Tag machine, H. D. Mentzel	38	164,943
Tailor's measure, F. B. Smith	38	165,026
Tailor's measuring apparatus, A. H. Richey	46	164,913
Teeth, artificial, W. H. Gates	50	165,063
Telegraph, dial electric, C. T. Chester	50	164,940
Telegraph, train, A. Ryder	50	165,035
Telegraph wire coupling, Barbour and Page	160	165,104
Tobacco knife, Lane and Cullom	160	6,517
Tobacco machine, plug, J. L. Jones, (reissue,	31	164,969
Tongue support, G. W. Burnside	70	165,124
Tool holding device, A. G. Rykert	143	165,123
Toy chromatrope, T. J. W. Robertson	31	164,950
Trace fastener, W. Wells	143	165,023
Trap, self setting animal, J. C. Porter	67	165,007
Treadle, foot, D. E. Lillie	38	6,518
Trimming, G. E. King, (reissue)	156	165,133
Truss, M. Turley	165	165,093
Umbrella, G. G. Griswold	165	165,106
Umbrella handle, H. G. Mackinney	118	165,119
Valve, relief, T. T. Prosser	31	164,902
Velocipede, W. Bush	166	164,928
Ventilating halls, &c., P. Mihan		

	Class No.	No. of Patent.
Vehicle hood, W. H. Rowe	31	165,125
Vehicle hub, J. C. Hendry	31	165,097
Vessels, air port for, J. S. Wilson	137	164,954
Wash stand, M. P. Brown	62	164,967
Washing machine, L. Becker	91	165,058
Washing machine for brewer's use, F. Cramme	19	164,906
Watch case spring and catch, I. N. Hopkins	36	164,918
Water channels, preventing the obstruction of, L. H. Beebe	82	165,059
Water sprinkling nozzle, C. H. Miller	167	165,111
Water wheel, E. B. Cope	168	164,909
Water wheel, turbine, W. Mercer	168	164,927
Weather boarding, H. L. Clippenger	30	164,972
Weaving hair cloth, filling hook for, J. Turple	95	164,949
Windmill, G. Lamby	118	164,923
Windmill, J. McGovern	118	165,013
Windmill, J. Sanders	118	165,030
Wire stretcher, H. Miles	52	165,019
Wood bending machine, W. Briggs	176	164,901
Wood, bit for boring, G. L. Holt	29	164,999
Wringer, L. Becker	91	165,057
Yarn, case for exhibiting, H. J. Millmann	62	165,018

INDEX OF PATENTEES TO WHOM PATENTS WERE GRANTED JUNE 29, 1875.

	Patent No.
Abbott, N. B., assignee, (reissue)	6,511
Aldrich, M. V., and G. F. Huggins, Car brake	164,955
Alexander, J. P., Manufacture of fire brick	165,049
Alexander, T. H., assignee, (reissue)	6,519
Allen, J. R., Carburetor	165,050
Anderson, E. W., Combined fork and skewer pull	164,956
Anderson, J. C., Spring bed bottom	164,957
Andrews, E., Handle for crosscut saws	165,051
Arnold, I., Friction clutch	164,898
Arnold, T. R., Harvester cutter	164,958
Armstrong, J., Feed water heater for steam boilers	164,959
Austin, T. N., assignee	164,936
Babcock, J. K., Heating stove	164,899
Bach, N. S., and M. P. Berg, Reed organ	164,900
Bailey, G. S., and H. Pool, Car starter	165,052
Bailey, J., Fruit picker	165,053
Baldwin, F. S., Measuring bottle	165,054
Barbour, S. M., and F. A. Page, Telegraph wire coupling	165,055
Barney, S. E., assignee	165,069
Bass, J. P., assignee	165,140
Batcheller, A. F., Corn cultivator	164,960
Bay State Shoe and Leather Company, assignee	165,060
Bean, J., Fire engine	165,056
Becker, L., Wringer	165,057
Becker, L., Washing machine	165,058
Beebe, L. H., Preventing the obstructions of water channels	165,059
Bell, A. J., Steamboat staging, (reissue)	6,509
Berg and Bach	164,900
Bigelow, C. D., Sole edge machine	165,060
Blair, J. B., Rubber eraser for lead pencils, (reissue)	6,510
Blake, H. T., Covering plate for hinges	165,061
Bodenhamer, W. H., Car coupling	164,961
Bohm, H. E., H. Stuhr, and P. J. Joecken, Oiler	164,962
Bowen, G. H., assignee	165,117
Briggs, W., Machine for bending wood	164,901
Brigham, C. H., Die for cutting boot and shoe rands	164,963
Brooks, E. J., Punch	165,062
Brower, W. W., Jar lifter	164,968
Brown, C., Food preserver	164,964
Brown, E., Lamp fount	164,965
Brown, J. L., Ironing table	164,966
Brown, M. P., Wash stand	164,967
Bryant, T. H., assignee	164,904
Burnside, G. W., Tongue support	164,969
Bush, W., Velocipede	164,902

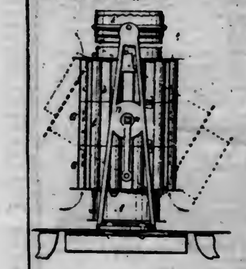
TITLES, DRAWINGS, AND CLAIMS

OF

PATENTS GRANTED JUNE 29 1875

164,900. FRICTION-CLUTCHES. I. Arnold, Fitchburg, Mass. [Filed June 9, 1875.]



Brief.—The short arms of the levers engage in the slots of the ring-segments, and operate to expand them to clutch the pulley, or to reduce the diameter of the clutch, and release the same.

The pivoted ring-segments C C, provided with the slots *d* and *d'*, in combination with the adjustable levers F and sleeve H, provided with the beveled arms *i i*, all constructed to operate substantially in the manner described, and for the purpose set forth.

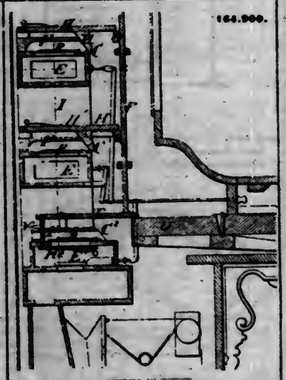
164,900. HEATING-STOVES. J. K. Babcock, Phelps, N. Y. [Filed Mar. 22, 1875.]

Brief.—Kindlings can be put on top of the fuel in the fire-pot, a duplicate grate inserted, and the fire-pot inverted, when the kindlings and fuel can be ignited.

1. The inversible fire-pot or cylinder, having a detachable grate, J, for heating-stoves, composed of one or more annular sections, G, of vertical air-flues *i*, and provided with suitable trunnions *n*, substantially as and for the purposes shown and described.

2. In combination with the inversible fire-pot, and pipe E, the vertically-adjustable pipe-section F, operating conjointly, substantially as and for the purposes set forth.

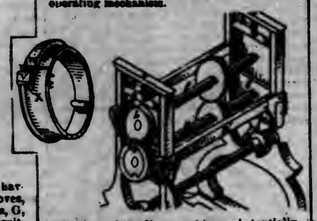
3. In combination with the inversible fire-pot, provided with a detachable grate, J, constructed and arranged to be operated substantially as shown and described, the detachable ash-box A, as and for the purposes set forth.



164,900. REED-ORGANS. Nicolas Svendsen Bach and Martin Paulsen Berg, Boston, Mass. [Filed Apr. 20, 1875.]

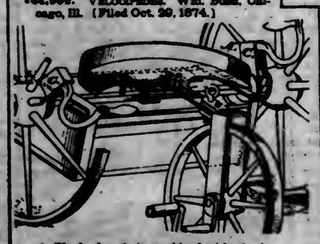
1. In a reed-organ, the combination of a vertical series of reed-cells, C C C, with the independent sound-board B, arranged near to, but not in contact with, the reed-board or the wind-passages, substantially as described.

2. The combination of the horizontal reed-cells C C C, wind-boxes E E', and flues I I J with the bellows of a reed-organ, when constructed and arranged substantially as described.



3. The combination of the bevled reed-tubes F, valves H H', levers H', rods P, levers T, pins V, and keys U, substantially as and for the purpose specified.

164,900.



164,901. MACHINES FOR BENDING WOOD. William Briggs, Ashburnham, Mass., assignor to Geo. C. Winchester, same place. [Filed Apr. 6, 1875.]

Brief.—Blanks for chair-staff or hoops that have been previously steamed can be bent by means of a former of irregular form, provided upon its exterior edge with a socket and tapering flange, and upon its inner surface with one or more splines, corresponding with grooves upon the outer edge of a face-plate, upon which the former is arranged, and a cam, the periphery of which conforms reversely with the former, in connection with suitable operating mechanism.

In a wood-bending machine substantially such as described, the former N, provided with the socket X and tapering flange W, combined to operate with the cam L, shafts C D, and plate M, substantially as and for the purpose set forth.

164,902. VELOCIPEDE. Wm. Bush, Chicago, Ill. [Filed Oct. 20, 1874.]

1. The brakes A A, combined with the levers C, substantially as and for the purposes set forth.

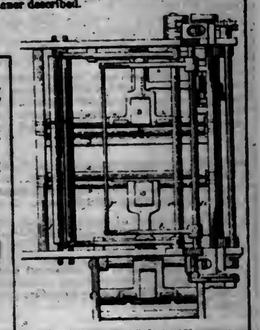
2. The seat D, attached to and combined with the bridge and axle, substantially as and for the purposes set forth.

3. The method of propelling a vehicle by the lever attachments to the rear wheels, and a crank attachment to the front wheel, singly or combined, substantially as and for the purpose set forth.

164,903. COTTON-COMPRESSORS. J. Joseph Cahoon, Memphis, Tenn., assignor of one-fourth his right to Thos. H. Cahoon, Cleveland, Ohio. [Filed May 24, 1875.]

Brief.—Along each edge of the faces of the upper and lower platens are right angular-shaped blocks, hinged at the angle outside. Pressure of the bale on the platens causes also the closing in of the blocks with side pressure thereon, the upper and lower series interlocking.

1. The bale-compress consisting of the platens A and the jaws B hinged thereto, whereby a bale interposed between the two platens is, by forcing the platens together, simultaneously pressed both laterally and vertically, substantially as and for the purpose described.



2. The combination, with the platens A, of jaws B hinged thereto, the said jaws upon the upper platen formed, as respects the jaws upon the lower platen, so that they will mesh together as the platens approach each other, substantially as and for the purpose described.

3. The combination, with the platen A and hinged jaws B, of locos pins D, whereby the jaws are automatically opened, substantially as and for the purpose described.

164,904. MACHINES FOR FOLDING COVERING, AND PASTING PAPER. C. Chambers, Jr., Philadelphia, Pa. [Filed June 11, 1873.]

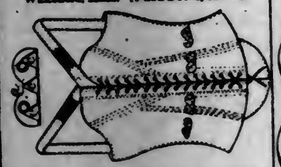
Brief.—Adapted for folding a sheet of paper and a cover separately, and uniting the two to form a pamphlet.

1. In a machine for folding and pasting paper, the adjustable paste-fountain C, in combination with the paste-blade F, and the mechanism for operating the same, all as constructed and arranged that they may be adjusted together for the purpose of adapting the machine to paste the various sizes of paper it is designed to fold, all substantially in the manner described.

HELIOTYPE RELIEF PROCESS. JAMES R. OSGOOD & CO. BOSTON

2. The adjustable slotted strip G applied to the feed-table in the line of the back fold of the sheet, as and for the purpose stated.

3. The paste-blade F, with its shaft D and arms E, all constructed and operating as specified, in combination with the rod I and turning-guide J, as and for the purpose specified.

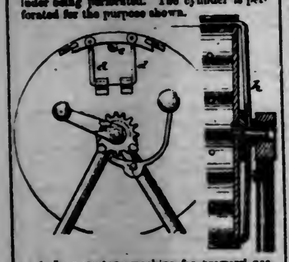


4. In combination with paste-blade F, the stripper H for holding down the sheet during the operation of the paste-blade, as set forth.

5. The paste-box B, provided with the serrated paste-blade *j*, and rollers *r r* for operating the same, as described and represented.

6. The combination of a paste-box with the arm carrying the folding-blade of a folding-machine, in the manner described and shown.

7. In combination with a paper folding and pasting machine, the supplemental frame A', with its table, drop-roller, paste-box, and guides, arranged as described, for the purpose of supporting, feeding, and pasting the covering-sheets, in the manner specified

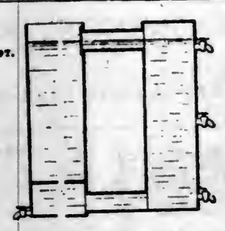


164,905. SKIRT-SUPPORTERS. C. P. Clark, Wakefield, Mass. [Filed Dec. 1, 1874.]

A skirt-supporter consisting of the vertical serrations *a*, horizontal portion *b*, and vertical portion *c* adapted to be attached to a corset, substantially as described, for the purpose specified.

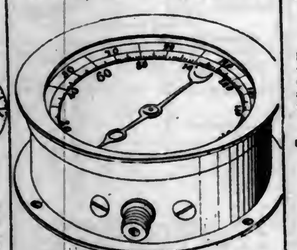
164,906. WASHING-MACHINES FOR BREWERS' USE. Friedrich Oramme, New York, N. Y. [Filed Apr. 27, 1875.]

Brief.—A corrugated metallic cylinder having suitable door and journals. From the hollow journal extend pipes to near the periphery of said cylinder, and thence longitudinally through the same, the portions within the cylinder being perforated. The cylinder is perforated for the purpose shown.



1. In a washing-machine for brewers' use, the revolving cylinder A, provided with the hollow journal *c*, and the pipes *h h* leading therefrom to near the periphery of the cylinder, and then longitudinally through the same, the portions within the cylinder being perforated, all substantially as and for the purposes herein set forth.

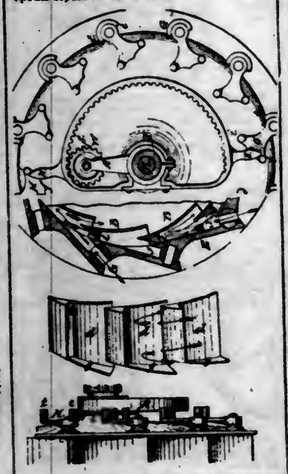
2. The combination, with the perforated revolving cylinder A, of the door or damp D, flanged castings *b b*, hinged arms *d d*, and button *e*, as and for the purposes herein set forth.



164,907. PROCESSES OF SEPARATING FATS. Charles M. Cresson, Philadelphia, Pa., assignor to Robert P. Deehert, trustee, same place. [Filed June 1, 1874.]

The within-described process of separating fats and oils into their component parts—that is to say, by means of convective currents of warm liquid at such low temperatures as will insure the separation of the component part of the fat desired without destructive chemical action, and without producing secondary products, as set forth.

164,907.

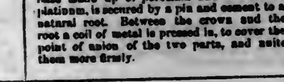


164,908. GAGE-DIALS. George H. Crosby, East Somerville, and Albert C. Moody, Charlestown, Mass. [Filed June 3, 1875.]

A steam or vacuum gage dial made of waterproofed card or leather board, *papier maché*, or equivalent material, substantially as described.

164,909. WATER-WHEELS. E. B. Cope, West Chester, Pa. [Filed Apr. 27, 1875.]

Brief.—A series of chutes and buckets so constructed that the percussion-face of each bucket shall be at right angles, or nearly so, to the direction of the water impinging upon it. The front of the bucket is in the form of a wedge, with the edge forward, the back of the wedge forming the percussion-face of the bucket, the object being to secure the full force of the water due to its impact or percussion. The gates are so constructed and arranged that they open and close the chutes or spouts separately or in pairs.



1. The bucket having its front part made wedge-shaped, and tail *d g* curved, as shown, to form a central and downward discharge, substantially as shown and described.

2. The combination of the tapering gate O, straight opening *f*, arms O, projections *i i*, shoulders *i i*, chute J, and guides E E, substantially as and for the purpose set forth.

3. The combination of shaft S, wheel W, segment R, bands N and P, arms O and H, pins *i i* and *l l*, and gates O, substantially as and for the purpose hereinbefore set forth.

164,910. IMPLEMENTS FOR STRETCHING FENCE-WIRES. J. F. Duffy, Chicago, Ill., assignor of one-half his right to N. Schroeder, same place. [Filed May 27, 1875.]

The lever or handle A, consisting of the bars *c c*, united by means of the perforated web *c'*, and provided at one end with a forked reel, and at the other with the prongs C C, arranged as shown, substantially as specified, and for the purposes set forth.

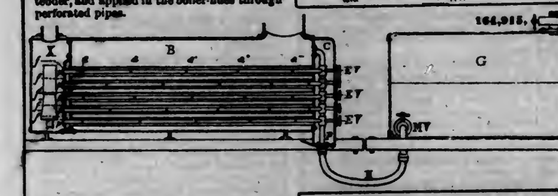
164,911. FOOT-RESTS. Geo. W. Edgecomb, Lima, and Henry A. Gore, Goshen, Ind. [Filed Feb. 16, 1875.]

A foot-rest, consisting of the standards A A, slipper-case B, provided with the hooks *c c* and the top-piece D, the standards A A, having suitable apertures formed therein for the reception of the hooks, the whole being combined and arranged substantially as shown and described.

164,912. ARTIFICIAL TEETH. W. H. Gates, Philadelphia, Pa. [Filed Sept. 1, 1874.]

Brief.—A vertically open shell of a peculiar configuration, and having the perimeter of its base made up of porcelain and a band of platinum, is secured by a pin and cement to a natural root. Between the crown and the root a coil of metal is pressed in, to cover the point of union of the two parts, and unite them more firmly.

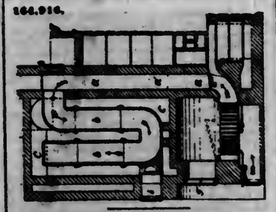
164,913. GOVERNORS FOR STEAM-ENGINES. J. C. Hoadley, Lawrence, Mass., assignor to the J. C. Hoadley Company, same place. [Filed May 22, 1875.]



164,914. HORSESHOE-BLANK BARS. Henry H. Gilmore, Cambridgeport, Mass. [Filed Feb. 12, 1875.]

As an improved manufacture, a horseshoe-blank bar, rolled with or having a transverse section, substantially as shown at *a b c d e f* in Fig. 2, in which case the outer edge of the bar, in part, is square to the tread, as shown at *e f*, and below such slopes, as shown at *f c*, inward to an obtuse angle with the lower surface of the bar.

164,915. LOCOMOTIVES FOR BURNING HYDROCARBON. John M. Goodwin, Cleveland, Ohio. [Filed June 29, 1874.]



Brief.—The gas is carried in a tank on the tender, and applied in the boiler-flues through perforated pipes.

1. The combination with boiler B, provided with suitable air-chamber C and flues *f f*, of a gas-tank, G, hose or connection H, and pipes P P P P, with orifices *a a a*, substantially as and for the purposes set forth.

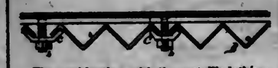
2. The combination with boiler B, flues *f f*, and gas-tank G, of pipes P P P P, orifices *a a a*, and suitable valves working in the pipes P P in the air-chamber C, whereby the supply of gas to any series of burners may be governed or cut off entirely, substantially as and for the purposes set forth.

164,916.

The links *h h' h'*, in combination with the sleeves *c c* and the sliding plate *k*, all substantially as set forth herein.

164,917. WATCH-CASE SPRINGS AND CATCHES. Isaac N. Hopkins, Lockport, assignor of one-half his right to G. H. Shattuck, Medina, N. Y. [Filed Apr. 17, 1875.]

Brief.—New spring may be inserted without removing the catch for cover, the catch being attached to the push-pin.



1. A plain spring, A, having the nib *a* for raising the cover near its center, in combination with the catch C, attached to and moving with the thumb-piece *h*, as and for the purpose shown and described.

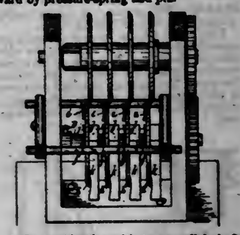
2. The pin *f*, sleeve *h*, catch *g*, screw *e*, and spring A, combined and arranged substantially as described.

3. The combination, with a push-pin, of a catch for the lid attached thereto, and a lifting-spring, substantially as set forth.

164,918. MODES OF SECURING METALLIC LATHING. J. W. Hoyt, Springfield, Mass. [Filed Oct. 20, 1874.]

Brief.—The lathe are corrugated and perforated, and are held to the furrings by means of metal clamps secured by bolts and nuts.

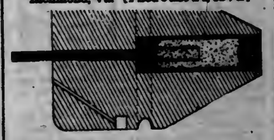
The combination, with the metallic lathing B, of the clamps C, bolts *b*, secured in the furring, and nuts *c* for holding said clamps and lathing together, constructed and arranged substantially in the manner specified.



164,919. COMBINED STOPPERS AND PADDLES FOR BLACKING-BOTTLES. Henry D. Forbes, Cambridge, Mass. [Filed Apr. 14, 1875.]

The combination of the elastic annular disk E with the paddle-stopper H B, substantially as described, and for the purpose set forth.

164,920. ROTARY PAPER-CUTTERS. Asaf Judson, Newark, N. J., assignor of one-half his right to D. Howard Judson, same place. [Filed June 9, 1875.]

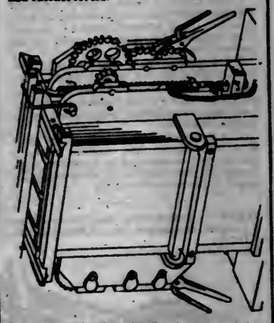


Brief.—Lower series of knives are held loosely on shaft, and their tops inclined inward by pressure-spring and pin.

1. In combination with two parallel shafts and a series of disk paper-cutters fixed on one of them, a series of disk cutters on the other shaft, and revolving therewith, but adapted to be adjusted to an inclination to the plane of revolution of the other series, substantially as and for the purpose set forth.

2. In combination with the shaft D and its loosely-attached cutters B, the springs *f*, guide-pins *i*, and stops *k*, applied and operating relatively to the cutters, substantially as and for the purpose described

164,921. ELECTRIC FUSES. C. L. Kalmbach, Richmond, Va. [Filed June 24, 1874.]

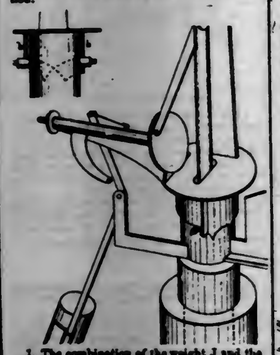


1. A fulminate primer constructed by sealing a glass vial containing the fulminate of mercury hermetically in a chambered wooden block, substantially as set forth.

2. In combination with the firing-wires, a quill within which the ends of the wires are adjusted in proper relation to one another, substantially as set forth.

164,922. HAT AND STRAW PRESSES. Lewis Kirk, Rising Sun, Md. [Filed May 12, 1875.]

Brief.—The platen has at each end a rack made in sections, attached to wrought-iron backing, and hinged to the platen to permit swinging longitudinally. Raised by gearing and ratchet-levers.

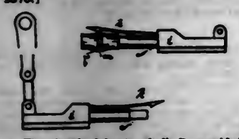


1. In combination with the platen A and the rack-bars *j*, the plate-link connection *i* forming two pivotal joints, but restraining of the swaying of the platen, to adjust itself to unequal strain, to a movement in the plane of said link only, as and for the purpose described.

HELIOTYPE RELIEF PROCESS. JAMES R. OSGOOD & Co. BOSTON
HELIOTYPE RELIEF PROCESS. JAMES R. OSGOOD & Co. BOSTON

2. In combination with the press the rack-bars *j*, composed of the wrought-iron back *m*, and the short cast-iron rack-sections *n* riveted to said back, and interlocked at their junction or ends *o*, as and for the purpose described and represented.

164,923. WINDMILLS. G. Lasby, Broadhead, Wis. [Filed Dec. 22, 1874.]

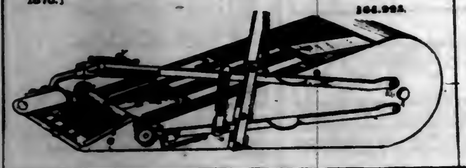


Brief.—The tubular form of the cams performs the double office of adjusting the windmill and shedding rain, so that no ice can accumulate around the shaft on the inside of the vane. The cams are provided with stops or lateral projections, to operate as cheeks to the wheel in its reciprocating horizontal motion.

1. The combination of the weight J and the adjustable vertical shaft D, provided with tubular or cylindrical cams *b b* at the top thereof, and the said vane, substantially as and for the purpose hereinbefore set forth.

2. The combination and arrangement of the said stops *q* with the said inner projection P of the said vane, substantially as and for the purpose hereinbefore set forth.

164,924. LOOMS. John M. Linscott, Buxton, assignor of one-half his right to Frank E. Jordan, Portland, Me. [Filed Mar. 12, 1875.]



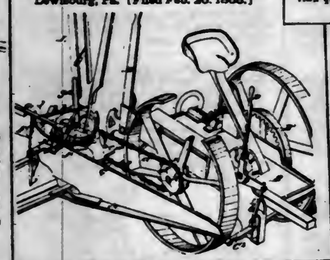
1. The shuttle *l*, having bulb *F*, provided with a groove, *m*, and combined with the shuttle-arms *j j*, and spring-clutches *k k*, all operating together, substantially as and for the purposes set forth.

2. The combination of shuttle-arms *j j*, having spring-clutches *k k*, and the shuttle *l*, constructed as described, with levers *n n* and *q q*, arms *p p*, cranks *r r*, and eccentric gears *s* and *t*, all operating together, substantially in the manner described.

3. In combination with the lay *b*, the arms *d*, the crank-shaft *c*, and eccentric gears *s f*, the shuttle *l*, constructed as described, shuttle-arms *j j*, and clutches *k k*, all operating together in the manner set forth.

164,925. ADDRESSING-MACHINES. Miles Longley, Cincinnati, Ohio. [Filed Jan. 16, 1875.]

1. In a machine for addressing papers and other packages, the combination of a spring for returning the movable shear-blade to its open position after it has been closed down upon the fixed blade, a lever for operating the movable shear-blade, another lever for operating the feed and pasting rollers, a slotted link for connecting the lever which operates the shear to the one which operates the rollers, two rollers for feeding the label-strip to the shear, a roller for pasting said strip and for sliding in carrying it forward, and shears for cutting the same, the parts being arranged to operate substantially as and for the purpose set forth.



2. The combination of the lever N, the socket P, spring *d*, arm K, and movable blade J, whereby said blade is kept in position while being used, substantially as set forth.

3. The combination, in a machine for addressing papers, of two feeding-rollers and a pasting-roller, said pasting-roller being operated by the feed-rollers, and arranged between them and the slip-cutting mechanism, whereby it is made to act as an auxiliary feed-roller, substantially as set forth.

4. The hinged and flanged guide B, in combination with the feed-rollers, substantially as and for the purpose set forth.

5. The removable paste-reservoir D, having a neck for extending to the paste-roller, and a serrated mouth, in combination with a pasting-roller, substantially as set forth.

164,926. HARVESTER-RAKES. J. S. Marsh, Lewisburg, Pa. [Filed Feb. 26, 1866.]

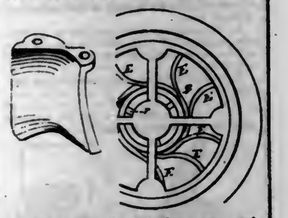
1. The combination of the continuously-revolving crown-wheel, carrying rake and reel arms, with the standard G, as and for the purpose described.

2. The rake attached to the revolving hub or wheel H by means of the bar g^1, bent backward from the line of attachment, for the purpose of depositing the gavel farther from the standing grain, substantially as described.

3. The rake and reel arms pivoted at their inner ends to the hub or crown-wheel H by means of the screw heads or bars fitting into suitable cavities in said hub or wheel, substantially as described.

4. The standard G, for supporting the revolving rake and reel, having one leg connected to the platform, and the other leg connected to the drag-bar and straddling the connection between the finger-bar, platform, and drag-bar, substantially as described.

5. The arrangement of the pivoted rake-head K and the angular spring-lever *j j* and rake-arm g^1, in the manner and for the purpose described.

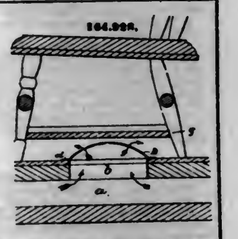


6. The spring-guide J^1, applied to the cam-rail J, substantially as described.

7. The laterally-adjustable blade L', applied to a beater-arm, for the purpose set forth.

8. The vertically-adjustable secondary reel or beater arm L'', in combination with arm L, substantially as described.

164,927. TURBINE WATER-WHEELS. Wm. Mercer, Christiana, Pa. [Filed Apr. 8, 1876.]

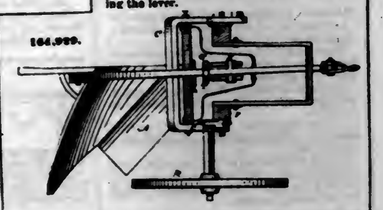


Brief.—On the lower side of a circular plate a series of buckets are secured, and they are of such form that when placed together their inner curvature forms a continuous inside wall for the wheel, while the outside curvature is such that when the water is on, it produces an upward tendency, and relieves the pressure on the step, thereby lessening the friction.

1. The buckets E of the form shown and described, so that when placed together their inner curvature shall form the wall of the wheel, as specified.

2. The wheel, substantially as herein described, consisting of the buckets E, plate D, ring *g*, and bolts *r*, as set forth.

164,928.



164,929. VENTILATING HALLS, &c. Patrick Mihan, Cambridgeport, Mass. [Filed Apr. 23, 1875.]

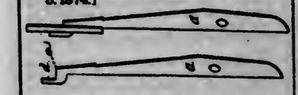
Brief.—The air is distributed under each seat. The distributing-cups have their upper parts perforated for the passage of the air, and their lower portions plain, to prevent entrance of dust. Above each cup is arranged a deflecting-plate.

In a system of ventilating halls, &c., substantially as described, an air-supplying chamber, *a*, located beneath the floor, and provided with a supply-port, *b*, opening under each seat, a distributing-cup, D, disposed over the supply-port, and a deflector, *g*, arranged over the said cup, the whole being combined and arranged in manner as shown and described.

164,930. SULEY-PLOWS. Gilpin Moore, Rock Island, Ill. [Filed Mar. 20, 1875.]

Brief.—The plow-beam has transitions, which rest upon wedge-shaped ribs of the carrying-plate inclined in opposite directions. By sliding the beam longitudinally, the plow is tilted to either side. The arch of the axle is horizontal, and its arms of unequal length, the frame resting upon it, one side in front and the other in rear of the center line, to balance the weight of frame and driver while operating the lever.

---



1. In combination with a plow-beam and carrying-plate, the wedge-shaped projections I, inclined in opposite directions, to tilt the plow laterally, substantially as shown and specified.

2. In a sulky-plow, the crank-axle C, having the arms *c c'* arranged and pivoted to the arch or frame F, and connected with and supporting the axle of the wheels E E eccentrically, substantially in the manner and for the purposes described.

3. The plate G, having the projections *e e' e' e'* and inclines I, and hinged to the arms *c c'* of the crank-axle C, substantially as shown, and for the purposes specified.

4. The combination, with the beam B, of the plate G, provided with inclines I and projections *e e'*, substantially as and for the purpose set forth.

164,930. MANUFACTURE OF SHEARS. Otis Norton, New Britain, Conn. [Filed Sept. 5, 1874.]

As an improvement in the art of attaching the blades of scissors and shears to their handles, the construction of the handle with the hook or tag *d* and shoulder *d'*, and the blade with the mortice *e*, for more conveniently retaining the parts in their proper relative positions preparatory to welding.

164,931. INSTRUMENTS FOR EXTRACTING CORKS FROM BOTTLES. Wm. C. D. Page and John L. Fahy, East Cambridge, Mass., assignors to John L. Fahy, same place. [Filed Oct. 22, 1874.]

1. Our improved bottle-cork extractor, substantially as described, consisting of the spear A, shoulders *b d*, head B, and the series of hooked prongs C C C C, arranged and combined as set forth and shown.

2. The combination of the spear A, shoulder *b*, head B, and prongs C, arranged as specified.

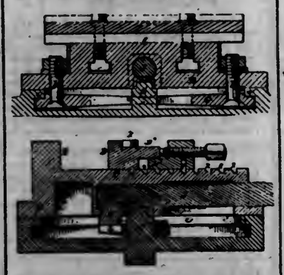
164,932. LAMP-BURNERS. T. D. Parsons, Bristol, Conn., assignor of one-half his right to Geo. B. Reed, same place. [Filed May 17, 1875.]

Brief.—The larger scroll, embracing the smaller, furnishes a stop when the plates are at right angles.

1. The plate C, provided with a scroll, E, in combination with the plate D, provided with the scroll F, substantially as and for the purpose set forth.

2. In a lamp-burner, the base A, and chimney-holder B, united by a hinge composed of the plates C D, provided with the scrolls E F, constructed and arranged to operate substantially as and for the purpose set forth and specified.

164,933. HEATING AND VENTILATING PUBLIC BUILDINGS. Alfd. P. Pitkin, Hartford, Conn. [Filed Jan. 26, 1875.]

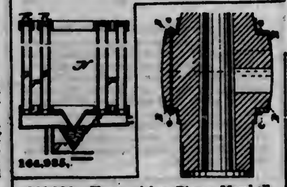


Brief.—Fresh air is admitted by means of the adjusters or registers, which are placed below the heating-pipes under each seat.

The heating-pipes *f*, combined with seats *g* and floors *a*, having apertures or openings *e*, and with the adjusters *c* opening into air-space *d*, the whole forming a system of heating and ventilation, and constructed and operating substantially as set forth.

164,934. PLANER-CHUCKS. A. B. Prouty, Loring Coes, and Geo. C. Taft, Worcester, Mass.; said Coes and Taft assignors to said Prouty. [Filed Dec. 19, 1873.]

Brief.—Two levers, G, are attached to the upper plate B by screws *b*. When it is desired to lock the upper and lower plates together, the inner ends of said levers are pressed against the lower plate by a cam or other mechanism attached to the upper plate. The locking-piece N is adjusted in position by the pawl-bar P working in the notches R, and the movable jaw D is adjusted by means of the set-screws in the locking-piece N



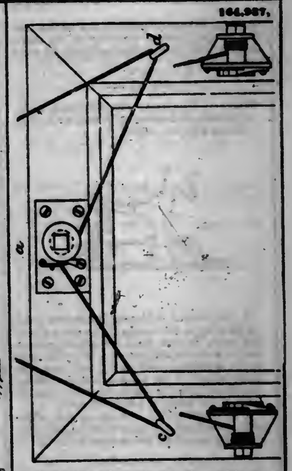
1. The combination, with the movable jaw D and grooved work-bed C, of the locking-piece N, dog or catch bar F, and set-screws O, substantially as and for the purpose set forth.

2. The combination of the bottom plate A and top plate B, with the bolts *b*, levers G, and mechanism for depressing said levers against the bottom plate, substantially as shown and described.

164,935. STEAM-HEATING APPARATUS. I. C. Richardson, Nashua, N. H. [Filed Mar. 27, 1875.]

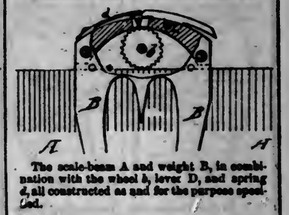
Brief.—The transverse flue forms a receptacle for condensed water, and thereby arrests the passage of incoming steam directly across the base-chamber, and deflects it upward into the concentric chambers.

The radiators N, composed of the concentric chambers O O, separated by annular air-spaces P P, and held in position by flanged and grooved rings E E and the transverse-angled flue S, combined with the tubes M T and boiler B, substantially as described, for the purpose specified.



164,936. HUBS. Adam Rimes, Marshall, Mich., assignor of one-half his right to T. N. Austin, same place. [Filed Apr. 3, 1875.]

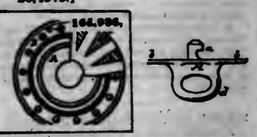
The combination of band B formed of two conical bands of different diameters united by a vertical web, all in one piece, with a wooden hub and bolts *c*, substantially as set forth.



164,937. PICTURE-HANGERS. J. Toure Robertson, New York, N. Y. [Filed Jan. 20, 1875.]

1. A picture-frame provided with the cord-catches *c d* and the tightening-barrel *e*, the latter secured in any position by a pawl and ratchet, as and for the purpose described.

2. A picture-frame having the cord-mounts *c f* placed one on each side thereof, as shown, and held from revolution by a pawl and ratchet, for the purpose described.



164,938. SCALE-BEAMS. W. T. Robinson, Huntsville, Tex. [Filed May 14, 1875.]

The scale-beam A and weight B, in combination with the wheel *b*, lever D, and spring *d*, all constructed as and for the purpose specified.

164,939. CATCH-PLATES FOR BAG-LOCKS. Wm. Roemer, Newark, N. J. [Filed May 20, 1876.]

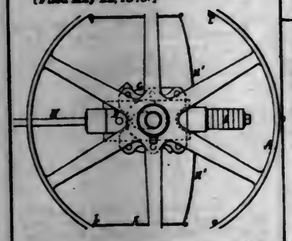
A catch-plate for bag-locks consisting of the plate A, catch *c*, perforated lips *b b*, and bent handle *d*, made in one piece of metal, substantially as described.

164,940. TRAIN-TELEGRAPHS. A. Ryder, Oakland, Cal. [Filed Jan. 18, 1876.]

Brief.—Designed for use with that class of signals in which the breaking of an electric circuit extending from end to end of the train sounds a signal upon the engine.

The plugs or pistons E moving in the case A A, and provided with a guiding-slot, *c*, and spring *e*, so that after the plug has been drawn back the swing-arms cause the two ends of

the cable to become resulted, and perfect contact be had between the wires of the cable, substantially in the manner as herein set forth and specified.

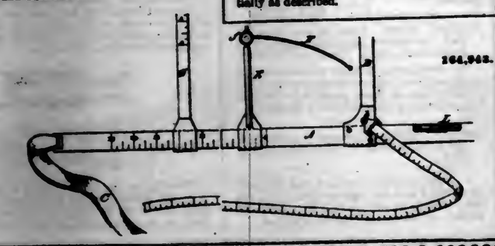


164,941. CATCHES FOR CUPBOARDS, &c. Christian G. Schneider, Washington, D. C. [Filed Apr. 24, 1875.]

1. The plate A, with rear depressions *b* and an opening, *a*, continuous of the space *a'*, and the catch B, with head *c*, operating-piece *d*, neck *e*, and solid axial pintle *f*, in combination with the spring *g*, said spring, head, and piece being outside of the plate A, and the pintle *f* introduced into the rear depressions from the front of the plate, as herein set forth.

2. The combination, with the catch B, of the back plate A and rear plate C, with lips *h*, substantially as and for the purpose set forth.

164,942. GOVERNORS FOR STEAM-ENGINES. G. C. Sims, Lawrence, Mass., assignor to the J. C. Hoadley Company, same place. [Filed May 22, 1875.]



1. In combination with the eccentric F, its tubular shaft, and the carrier or slide D thereof, applied to the fly-wheel, and provided with the weight, as described, the spring H', fastened at its middle to the slide, and at its ends connected to the fly-wheel, all being substantially as shown and described.

2. In combination with the spring H' and its connection-arms K K, the fly or band wheel, provided with the two sets of hooks L L L' L', and the slide D, provided with the mortises in its two heads for reception of the spring, as specified.

164,943. TAILORS' MEASURES. F. B. Smith, Washington, D. C. [Filed June 2, 1874.]

The tailor's measure, consisting of the flexible blade A provided with level L, and having at ends a suitable strap and buckle, detachable arm B, pivoted tape-line T, graduated arm G, and arm E, with adjustable curved arm F, all constructed and arranged substantially as shown and described.

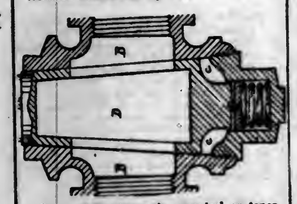
164,944.

164,945. PREPARING VENEERS FOR BUTTER-BOXES. Stephen F. Spaulding, Jericho, Conn. [Filed Sept. 8, 1874.]

Brief.—Boils the veneers in brine before making into boxes, to remove any extractive matters which would affect the taste of the butter.

The process of treating wooden butter-boxes to remove any extractive matter which would affect the taste of the butter, said process consisting of boiling the wood in brine, substantially in the manner and for the purposes set forth.

164,946. HYDRAULIC HOSE. Jos. M. Stone, North Andover, Mass. [Filed Mar. 18, 1875.]



1. The process of making hose by first forming a tube of canvas covered with India-rubber prepared for vulcanizing in the usual way, and then winding upon the outside thereof a helical strip of canvas also prepared for vulcanizing, the parts being united by cement, and the whole then vulcanized in the usual way.

2. The hose described, consisting of the convolute foundation and the helical exterior cover, the whole being vulcanized, substantially as described.

164,947.

164,948. STOP-COCKS. August Snyder, Allegheny, Pa. [Filed Apr. 16, 1875.]

Brief.—The plug is tapered, and is held in its seat by a spring and step. The small port of the casing is open, so that the plug may be loosened from its seat by a blow.

In a rotary stop-cock, a conical or taper seat, open at its smaller end, in combination with a plug, D, having its turning head at the smaller end, and a spring, *c*, and step *e* at its larger end, whereby not only can the cock be loosened by a blow or pressure on its smaller end, but also will operate with a minimum of friction, and be pressed to its seat by the spring under the varying diameters caused by wear and regrinding, substantially as set forth.

164,949. WIRE FENCES. Daniel C. Stover, Freeport, Ill. [Filed May 22, 1875.]

Brief.—An acute-ovoid plate of wrought-iron is slotted at one side to pass upon the wire, when the slot is tamped at its outer extremities. The wire, being heated, takes the form of slot after tamping.

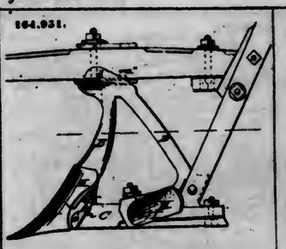
1. The barb *a*, for a wire-fence, having an opening, *b*, upon one side, and projecting points *c d* upon each side of each opening, as formed that the barb can be secured to the wire by hammering or pressing one or both points upon the wire, substantially as specified.

2. The process herein described of securing the barbs to the wire by first heating the wires and applying the barbs thereto while the wire is hot, substantially as and for the purposes specified.

164,950. PREPARING VENEERS FOR BUTTER-BOXES. Stephen F. Spaulding, Jericho, Conn. [Filed Sept. 8, 1874.]

Brief.—Boils the veneers in brine before making into boxes, to remove any extractive matters which would affect the taste of the butter.

The process of treating wooden butter-boxes to remove any extractive matter which would affect the taste of the butter, said process consisting of boiling the wood in brine, substantially in the manner and for the purposes set forth.



164,951. PLOWS. Lewis B. White, Norfolk, Va., assignor to himself and S. R. White, same place. [Filed May 8, 1875.]

Brief.—Devices for changing the pitch of the horizontal cutters, and for securing the parts together without passing the bolts through the wearing-surface.

164,952.

164,952. PLOWS. Lewis B. White, Norfolk, Va., assignor to himself and S. R. White, same place. [Filed May 8, 1875.]

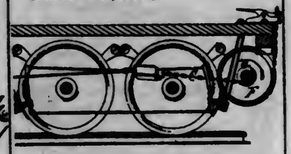
Brief.—The shoe or flange of the reversible land-side is made thicker at one end, so as to fit reversely after being worn down. Devices for adjusting the beam and handles.

1. The tapering concave flange *d*, formed on the lower edge of the frame B, in combination with the reversible double-pointed land-side C, provided with tapering flanges *h*, made thicker on one end than on the other, substantially as and for the purpose specified.

2. The frame B, provided with flanges *a' a'* and edge *f'*, in combination with the slotted and corrugated wedge B and handles P, all as and for the purpose herein specified.

3. The casting S, having recessed and slotted projection *f'*, flanges or ribs *i' i'*, slot *r''*, and slot for bolts *t*, in combination with handles P, beam A, and block *h*, all as and for the purpose set forth.

164,953. EXPANSIBLE BITS. Fredk. Willig, Joliet, Ill. [Filed Apr. 17, 1875.]

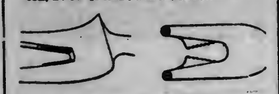


Brief.—An auxiliary cutting-bit is pivoted in a transverse dovetail recess in the auger-shaft, and, by means of a set-screw operating at the upper part of the shaft, can be adjusted to bore holes of any size consistent with the size of the auger.

The shaft *c*, provided with the dovetail *c* and center-pin *i*, in combination with the part *a*, having the slot *a* and set-screw *g*, and provided with a cutting-lip, and pivoted to the shaft *c*, and operating in the dovetails *c* and *a*, in the manner and for the purpose specified.

164,954. AIR-PORTS FOR VESSELS. Joseph Shields Wilson, Philadelphia, Pa. [Filed Apr. 16, 1875.]

The combination of the recessed ring A, the flush-cover C, the hinged cross-bar D, the bolt E, and sunken nut G, for the purpose of closing the man-hole on the opposite side to the cross-bar, substantially as herein described.



164,955. CAR-BRAKES. Martin V. Aldrich and Geo. F. Huggins, East Saginaw, Mich. [Filed June 16, 1875.]

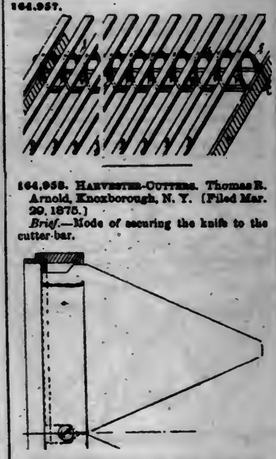
1. The shaft *a*, journal under the platform of a car, the pulley F, chain G, and a stop, in combination with the interlocked elastic stirrups H H, and the tension-chain of a car-brake, substantially as described.

2. The interlocked stirrups H H, inclosing an elastic block, I, in combination with the tension-chain of a car-brake, substantially as described.

164,956. COMBINED FORKS AND SKEWER-PULLS. Edward W. Anderson, Washington, D. C. [Filed June 16, 1875.]

1. A fork having claws, teeth, or biting-edges adapted to extract skewers from meat, substantially as specified.

2. A fork having teeth or biting-edges extending inwardly at the base of the tines, substantially as specified.



164,957. SPRING BED-BOTTOMS. James C. Anderson, Pittsburg, Pa. [Filed July 6, 1874.]

Brief.—The hoop-springs are held in place at the bottom by the cross-bars, and at the top they are connected to the slats and to transverse stay-springs by rivets. The bars within the hoops prevent their being compressed far enough to become set or broken.

The hoop or O spring E, in combination with the cross-bars B C, the frame A, the stay-spring F, and slats D, the whole being constructed and arranged substantially in the manner and for the purposes herein set forth.

164,958. HARVESTER-CUTTERS. Thomas R. Arnold, Knoxborough, N. Y. [Filed Mar. 29, 1875.]

Brief.—Mode of securing the knife to the cutter-bar.

The combination of grooved knife-bar, knives, shouldered at the rear edge and recessed at the rear corners, the clamping-bar, and the fastening-screws, as and for the purpose specified.

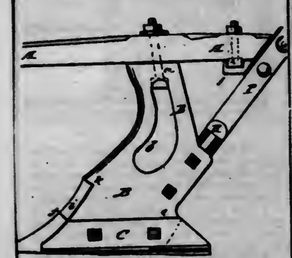
164,959. FEED-WATER HEATERS FOR STEAM-BOILERS. Jas. Armstrong, Toledo, Ohio. [Filed Mar. 4, 1875.]

1. The feed-water heater and purifier, constructed as hereinbefore set forth, having a chamber in which the water is heated, a purifying-chamber communicating with the heating-chamber by an opening in the lower portion of its shell, a series of partitions crossing the purifying-chamber, extending alternately from the bottom of said chamber upward to near its top, and from its top downward below the tops of said upwardly-projecting partitions, and a pipe for drawing off the water after having passed over the last partition, whereby the sediment in the feed-water is deposited according to its weight upon the bottom of the heating-chamber, between the shell of the heating-chamber and the first partition in the purifying-chamber, and upon the bottom of the purifying-chamber between the partitions.

2. The combination of the purifying-chamber, partitions therein for directing the flow of the water, and cloth or absorbent material, arranged substantially as described, in contact with the water flowing through the chamber, whereby grease is caught without passing the water through filtering material.

3. The combination of the purifying-chamber, a series of partitions crossing the chamber and projecting alternately from the bottom of the chamber upward to near its top, and from the top downward below the tops of the upwardly-projecting partitions, and a filter, extending between the last two partitions and supported thereby, through which the water passes on its way to the pipe by which it leaves the chamber, these members being constructed and operating substantially as set forth.

164,931.



1. The standard B, curved base C, and brace D, as shown, in combination with the curved weeder-stock G, the adjoining surface being provided with teeth or corrugations, as and for the purpose described.

2. The standard B, curved brace C, brace D, and weeder-stock G, the adjoining surfaces being provided with teeth or corrugations, in combination with the wings H H, having curved shoulders *a*, bolt-holes *f*, teeth *i i*, reversible blades I, the inner ends having segmental racks A, all as and for the purpose specified.

3. The plow share or points J, provided with a projection running back along the base, and secured thereto, and having the recessed ears, in combination with the mold-boards K, having dovetailed slides *m* to receive the bolts *n*, whereby the share and mold-boards are secured firmly in place without any bolt or bolts passing through the surface of the plow, all constructed as and for the purpose specified.

164,932. PLOWS. Lewis B. White, Norfolk, Va., assignor to himself and S. R. White, same place. [Filed May 8, 1875.]

Brief.—The shoe or flange of the reversible land-side is made thicker at one end, so as to fit reversely after being worn down. Devices for adjusting the beam and handles.

1. The tapering concave flange *d*, formed on the lower edge of the frame B, in combination with the reversible double-pointed land-side C, provided with tapering flanges *h*, made thicker on one end than on the other, substantially as and for the purpose specified.

2. The frame B, provided with flanges *a' a'* and edge *f'*, in combination with the slotted and corrugated wedge B and handles P, all as and for the purpose herein specified.

3. The casting S, having recessed and slotted projection *f'*, flanges or ribs *i' i'*, slot *r''*, and slot for bolts *t*, in combination with handles P, beam A, and block *h*, all as and for the purpose set forth.

164,933. EXPANSIBLE BITS. Fredk. Willig, Joliet, Ill. [Filed Apr. 17, 1875.]

Brief.—An auxiliary cutting-bit is pivoted in a transverse dovetail recess in the auger-shaft, and, by means of a set-screw operating at the upper part of the shaft, can be adjusted to bore holes of any size consistent with the size of the auger.

The shaft *c*, provided with the dovetail *c* and center-pin *i*, in combination with the part *a*, having the slot *a* and set-screw *g*, and provided with a cutting-lip, and pivoted to the shaft *c*, and operating in the dovetails *c* and *a*, in the manner and for the purpose specified.

164,934. AIR-PORTS FOR VESSELS. Joseph Shields Wilson, Philadelphia, Pa. [Filed Apr. 16, 1875.]

The combination of the recessed ring A, the flush-cover C, the hinged cross-bar D, the bolt E, and sunken nut G, for the purpose of closing the man-hole on the opposite side to the cross-bar, substantially as herein described.

164,935. CAR-BRAKES. Martin V. Aldrich and Geo. F. Huggins, East Saginaw, Mich. [Filed June 16, 1875.]

1. The shaft *a*, journal under the platform of a car, the pulley F, chain G, and a stop, in combination with the interlocked elastic stirrups H H, and the tension-chain of a car-brake, substantially as described.

2. The interlocked stirrups H H, inclosing an elastic block, I, in combination with the tension-chain of a car-brake, substantially as described.

164,936. COMBINED FORKS AND SKEWER-PULLS. Edward W. Anderson, Washington, D. C. [Filed June 16, 1875.]

1. A fork having claws, teeth, or biting-edges adapted to extract skewers from meat, substantially as specified.

2. A fork having teeth or biting-edges extending inwardly at the base of the tines, substantially as specified.

164,937. SPRING BED-BOTTOMS. James C. Anderson, Pittsburg, Pa. [Filed July 6, 1874.]

Brief.—The hoop-springs are held in place at the bottom by the cross-bars, and at the top they are connected to the slats and to transverse stay-springs by rivets. The bars within the hoops prevent their being compressed far enough to become set or broken.

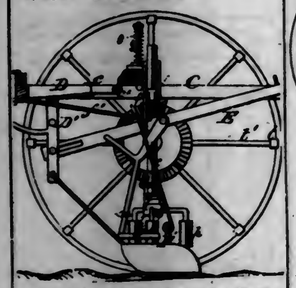
The hoop or O spring E, in combination with the cross-bars B C, the frame A, the stay-spring F, and slats D, the whole being constructed and arranged substantially in the manner and for the purposes herein set forth.

164,938. HARVESTER-CUTTERS. Thomas R. Arnold, Knoxborough, N. Y. [Filed Mar. 29, 1875.]

Brief.—Mode of securing the knife to the cutter-bar.

The combination of grooved knife-bar, knives, shouldered at the rear edge and recessed at the rear corners, the clamping-bar, and the fastening-screws, as and for the purpose specified.

164,939. FEED-WATER HEATERS FOR STEAM-BOILERS. Jas. Armstrong, Toledo, Ohio. [Filed Mar. 4, 1875.]



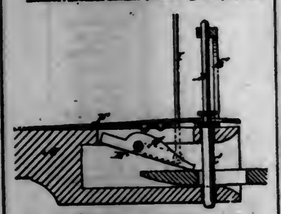
1. The feed-water heater and purifier, constructed as hereinbefore set forth, having a chamber in which the water is heated, a purifying-chamber communicating with the heating-chamber by an opening in the lower portion of its shell, a series of partitions crossing the purifying-chamber, extending alternately from the bottom of said chamber upward to near its top, and from its top downward below the tops of said upwardly-projecting partitions, and a pipe for drawing off the water after having passed over the last partition, whereby the sediment in the feed-water is deposited according to its weight upon the bottom of the heating-chamber, between the shell of the heating-chamber and the first partition in the purifying-chamber, and upon the bottom of the purifying-chamber between the partitions.

2. The combination of the purifying-chamber, partitions therein for directing the flow of the water, and cloth or absorbent material, arranged substantially as described, in contact with the water flowing through the chamber, whereby grease is caught without passing the water through filtering material.

3. The combination of the purifying-chamber, a series of partitions crossing the chamber and projecting alternately from the bottom of the chamber upward to near its top, and from the top downward below the tops of the upwardly-projecting partitions, and a filter, extending between the last two partitions and supported thereby, through which the water passes on its way to the pipe by which it leaves the chamber, these members being constructed and operating substantially as set forth.

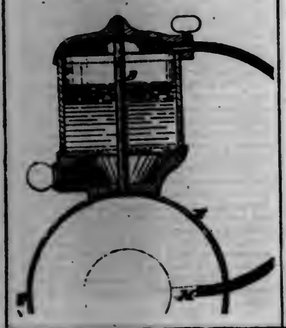
164,960. CORN-CULTIVATORS. Alexander F. Batchelor, Cedar Falls, Iowa. [Filed Apr. 24, 1875.]

Brief.—The wheels and the vertical shafts of the rotary plows may be adjusted at various distances apart. The plows are raised by handles pivoted at their front ends, and at their centers linked to the plow-shafts, and also suspended by spring-connections from the axle. The plows have rolling cleaners operated by a curved segment-rack attached by rigid hangers to the handles.



1. Longitudinally-adjustable axles *a*, in combination with laterally and vertically adjustable spindles G hung from the axle B, substantially as described.

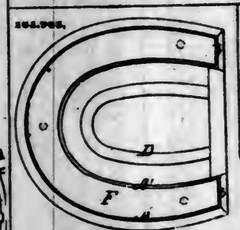
2. Handles E, adjustably pivoted to frame D', and connected to the spindles G, in combination with the suspension-links *c*, rods *e*, and spring *d*, substantially as described.



3. In combination with the revolving plows *h*, the rolling-cleaners *p*, and the segment-rack J, substantially as described.

164,961. CAR-COUPLINGS. Wm. H. Bodenhamer, Xenia, Kans. [Filed Apr. 17, 1875.]

The spring F, placed on top of draw-head, and provided with subjacent notch J, combined with a tripper, G, arranged on crank of shaft H, as and for the purpose specified.

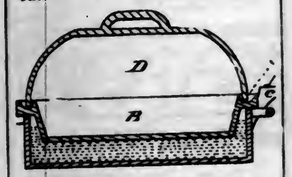


164,962. CHAIRS. Henry S. Bowman, Herman Stahr, and Peter J. Jacobus, Cleveland, Ohio. [Filed May 15, 1875.]

1. The combination of the clamping-band E with the oil-cup and feed-tube, substantially as specified.

2. The clamping-band, secured to the cup by the bolt D, which fastens the parts of the cup together, substantially as specified.

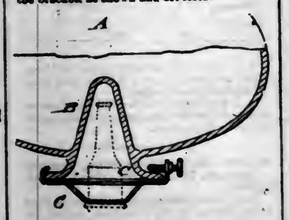
164,963.



164,963. DIES FOR CUTTING BOOT AND SHOE BANDS. Chas. H. Brigham, Marlborough, Mass. [Filed Feb. 27, 1875.]

In an apparatus for cutting boot-rands for boots and shoes, the combination of a series of semicircular cutters, A A', and cutters *b b*, and spring-ejector F, adapted to cut at one operation rands varying in size, substantially as described.

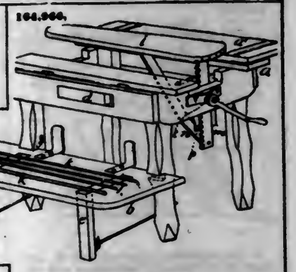
164,964. FOOD-PRESERVERS. C. Brown, Hartford, Conn. [Filed May 26, 1875.]



Brief.—The moisture condensed on the inside of the cover runs down to the channel, and thence through an opening into the vessel below.

In combination with the vessels A B and cover D, the channel *c'* and springs *e* and *g*, substantially as described

164,965. LAMP-FOUNTS. Edward Brown, New York, N. Y. [Filed May 15, 1875.]

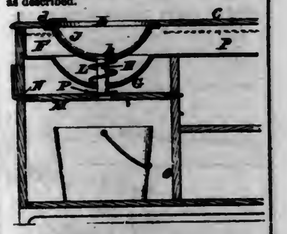


The combination, with the globe-bracket, of the lamp-fount A, provided with the thin circular outwardly and downwardly projecting flange C around the inner conical cavity B, a space being left between the flange and body of the fount to receive the fastening-screw of the bracket, as shown and set forth.

164,966. IRONING-TABLES. John L. Brown, Boston, Mass., assignor of one-half his right to William F. Robinson, same place. [Filed Oct. 22, 1874.]

Brief.—A table with folding leaf in the center, under which is an ironing-board that may be raised by a vertical rack and pinion. On one side of the table is detachable leaf with legs, that may be used for a wash-bench.

164,966.

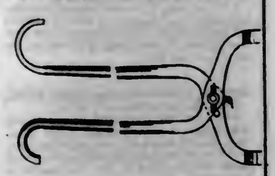


1. The combined kitchen-table, ironing-board, and wash-bench, above described, and consisting of the table *a a'*, ironing-board *l*, detachable and reversible leaf *b*, hinged legs *c c*, and stripe *k*, arranged and operating as above set forth.

2. The combination of the ironing-board *l*, rack and pinion *m n*, and brace *n*, with the guides *e p*, substantially as and for the purpose set forth above.

164,967. WASH-STANDS. M. P. Brown, Lexington, Mo. [Filed May 14, 1875.]

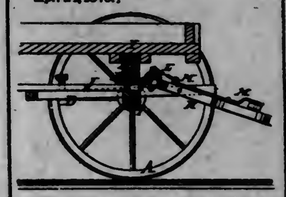
Brief.—The wash-basin is filled to any desired limit by depressing it in the concealed tank. The basin may be shifted vertically or horizontally, or rotated axially. The waste-pipe is opened by turning the rocking beam, the same being provided with a diaphragm, as described.



1. In combination with the stand A and its inclosed tank F, the shiftable wash bowl or basin J, adapted to be filled from said tank by the described motion therein, and to be emptied substantially in the manner explained.

2. The described combination of tank F, pit G, stand-pipe H A, gasket I, vertically-shiftable bowl J K, and elevating-spring L, as and for the purpose set forth.

3. The combination of rocking beam M N *n* N', diaphragm P, and spring-catch S *s*, as and for the objects stated.



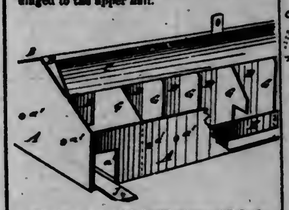
4. The combination of case A, hinged leaf *a a'* O E, and hinged lid D *d d'*, when located above the tank F and basin J, as and for the purpose herein set forth.

164,968. JAR-LIFTERS. Wm. W. Brown, New York, N. Y. [Filed Feb. 13, 1875.]

As a new article of manufacture, a jar-lifter consisting of two rods made adjustable at the point of intersection, B, and bifurcated below, forming the legs B' B', which carry rubber-faced arc-jaws C C, made fast to the inside of their lower ends, as shown and described.

164,969. VEHICLE-TONGUE SUPPORTS. G. W. Burnside, Prairieburg, Iowa. [Filed Apr. 24, 1875.]

The combination of the hook-plate K, chain L, pulley N, and adjustable piece O with the king-bolt I, the sliding hammer-strap M, connected with the whiffletree, and the tongue H, substantially as herein shown and described.



164,970. BED-BOTTOMS. Michael Cain, Neversink, N. Y. [Filed Sept. 23, 1874.]

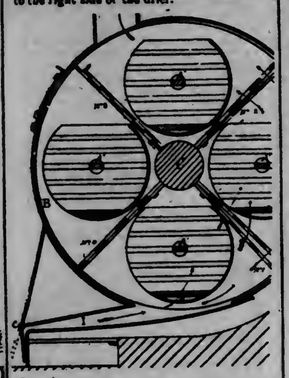
As an improvement upon the patent granted to J. J. Robinson March 31, 1871, the combination of the plates *c*, screw-bolt *e*, jaws *d*, tongue-piece *g*, and spring *h*, all to operate as and for the purposes described.

164,971. HINGE NUTS. Julia P. Clement, Williamston, S. C. [Filed Apr. 17, 1875.]

Brief.—The eggs can only be taken out by raising the lower half of the roof, which is hinged to the upper half.

The box A, provided with the roof B C, the openings *a' a'*, and the division-boards D E G, to form the nest-spaces F, and the passages H I, substantially as herein shown and described.

164,972. WEATHER-BOARDINGS. Hugh L. Clippenger, Martinsburg, W. Va. [Filed May 19, 1875.]

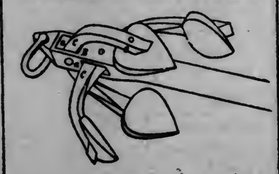


In the construction of weather-board, the ogee mold *c*, in combination with the interlapping tongues *d d*, arranged to more effectually shed the water, substantially as described.

164,973.

164,973. DRIERS AND BAKERS. W. P. Corse, Milford, Del. [Filed Jan. 26, 1875.]

Brief.—While the drier revolves the swinging trays are always in proper position. The automatic damper closes by gravity when at the highest position, and the hot air is forced to the right side of the drier.

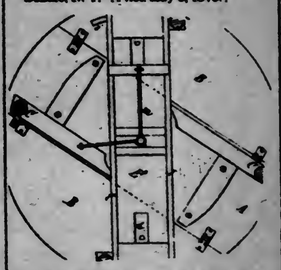


1. A vertically-revolving drier and baker having a series of tray-holders pivoted and counter-weighted, as shown and described, to maintain the trays in a horizontal position.

2. The registering screen or partition operating automatically, substantially as and for the purpose described.

3. The air-passage I, opening or entrance door *c*, and flue *b*, in combination with the drier H, substantially as and for the purpose described.

4. In a drier or baker, the combination of the swinging tray-holders, the self-registering and automatic partitions or screens, and the air and smoke passages, substantially as and for the purpose described.

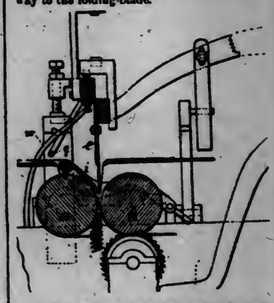


164,975. ANCHORS. William A. Currier, Newburyport, Mass. [Filed Apr. 6, 1875.]

1. An anchor having two throat-pieces or connecting-bars, U C, pivoted in the crown and working independently of each other, substantially as and for the purpose hereinbefore set forth.

2. The combination of the crown B, having the two mortises *a a*, with the throat-pieces U C, each having one or both of the flukes removable, substantially as and for the purpose hereinbefore set forth.

164,976. PARLOR-TABLES. Fred H. Cutler, Buffalo, N. Y. [Filed May 5, 1875.]



1. The combination, with the bed A, hinged leaves B B, and legs C C, of the swinging frame E, provided with legs D D at diagonal corners, and pivoted to the bed, so as to form a support for the leaves when open, and a support for the bed when closed, substantially as hereinbefore set forth.

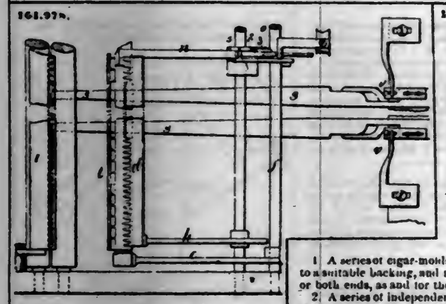
2. The combination, with the bed A, leaves B B, fixed legs C C, and connected swinging legs D D, of the spring *m*, for automatically opening the swinging legs when the leaves are raised, substantially as hereinbefore set forth.

3. The combination, with the bed A, leaves B B, fixed legs C C, and swinging legs D D, of the spring-catch *l*, and releasing-arm *k*, substantially as and for the purpose hereinbefore set forth.

164,977. PAPER-FOLDING MACHINES. Wm. Daniels, Brooklyn, N. Y. [Filed Apr. 10, 1875.]

Brief.—Perforates the sheet at the line of fold, so that it can be easily separated. Provides the knife with a guard to shield the hand of the operator. The paper is supported, while being perforated, on fingers which give way to the folding-blade.

1. In a machine for folding paper, the combination, with the folding-blade, *c*, of an independent blade with penetrating-points to perforate the sheet in the line of the fold, but previous to the folding operation, substantially as set forth.

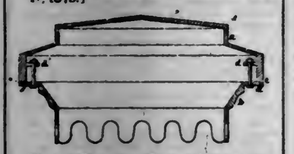


2. The supporting-fingers *f* and perforating-knife *e*, in combination with the folding-blade and actuating mechanism in the paper-folding machine, substantially as set forth.

3. The guard-bar *g* and actuating-cams *w*, in combination with the perforating-knife *e* and the folding-blade, substantially as set forth

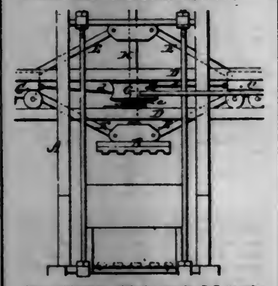
164,978. PAPER-FOLDING MACHINES. Wm. Daniels and Charles Daniels, Brooklyn, N. Y. [Filed June 18, 1875.]

Brief.—The plate acts as a holder, stripper, and hand-protector, and is operated by the projection upon the knife-arm fitting into the leg on the knife-shaft, so as to cause the holder and knife to move together, except when the holder is resting upon the paper, the projection having been lifted from the leg. The knife perforates the sheet, and the tongues, which are provided with cutting-edges, sever it completely when the second fold is made.



164,978.

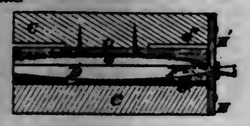
1. The combination, with the perforating-knife *d* and plate *f*, forming a holder, a guard, and a cleaner, of the wedge *e* and its actuating-lever, substantially as and for the purposes set forth.



2. The tongue *s*, provided with a suitable cutting-edge, *r*, combined with the folding mechanism, and applied between the first and second folds to separate the paper, as specified.

164,979. METAL CAPS FOR POSTS. John Davenport, Stamford, Conn. [Filed Apr. 17, 1875.]

The metallic post-cap B, made in two parts, *a b*, jointed at *c*, and provided with fastening-bolts C, passing through flange *d* and lugs *d'* as and for the purpose described.



164,980. COTTON-PRESSES. Solon Dike, Detroit, Mich. [Filed Dec. 24, 1874.]

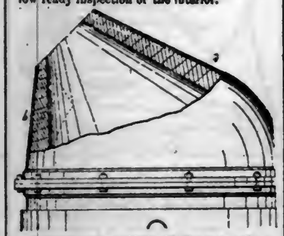
In combination with the trucks C C, toggle-levers E E, follower B, and vertical guide-rod H, the drum G having recess *i*, the bolts *a a*, cords *d d*, and lever I, all substantially as and for the purposes herein set forth.

164,981. CIGAR-MOLDS. N. Du Brul, Cincinnati, Ohio. [Filed May 26, 1875.]

Brief.—The molds are made flexible at the ends, in order to make the cigar burn and draw free. The backing serves as a gage to limit the movement of the free ends of the mold.

1. A series of cigar-molds centrally attached to a suitable backing, and made flexible at one or both ends, as and for the purpose set forth.

2. A series of independent matrices or cigar-molds, centrally attached to a suitable backing, and made flexible at one or both ends, as and for the purpose set forth.

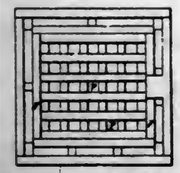


3. A cigar-mold having a kerf or groove at the back near the ends of the compressing-surfaces, for the purpose described and set forth.

4. In combination with a cigar-mold made flexible at one or both ends, the solid backing *e''*, affording a guard or stop, substantially as set forth.

5. The guide or guard-plates H H', applied to the cigar-mould on each side of the kerf F, as and for the purpose specified and set forth.

164,982. BESSEMER CONVERTERS. Almon S. Dunning, Joliet, Ill. [Filed May 8, 1875.]

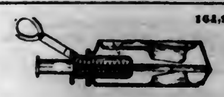


Brief.—The nose of the converter is a straight continuation of the front side, to dispense with the angle, and so save the lining, prevent loss of metal by overflowing, and allow ready inspection of the interior.

A converter provided with the perpendicular inside face *b*, as and for the purpose specified.

164,983. DEEP-TROUGHS FOR ICE-BOXES. Isaac T. Dyer and Geo. Powell, Streator, Ill. [Filed Apr. 20, 1875.]

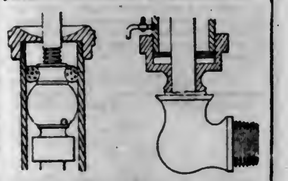
Brief.—As constructed and individually removable.



The removable troughs P, provided with closed ends *m*, and overlapping each other, in combination with guide-plates *r*, bearers T S, discharge-trough K, and ice-box, as and for the purpose set forth.

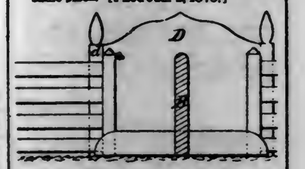
164,984. COMBINED CIGAR-TIP CUTTERS AND WATCH-CHARMS. Emil F. W. Eisenmann, New York, N. Y. [Filed June 5, 1875.]

Brief.—The locket carries a cutting-knife, which can be operated by pressure upon the stem under its ring, to sever the tip, the two meeting sides or edges of the locket forming a stationary cutter.



164,981.

A watch-charm locket, having the cigar-tip cutter applied in the manner substantially as and for the purpose described.



164,985. VALVES FOR STEAM-RADIATORS. James W. Faxon, Boston, Mass. [Filed Apr. 24, 1875.]

Brief.—Cold air is expelled through the space surrounding the valve-stem, and afterward steam is allowed to escape at the same point.

The combination, with the interior steam-pipe and valve, of the outer tube, cap, and standard, constructed and applied with relation to each other and to the pipe and valve, as described, to allow the cold air to pass out and steam to escape into the apartment, and to catch and retain the water of condensation.

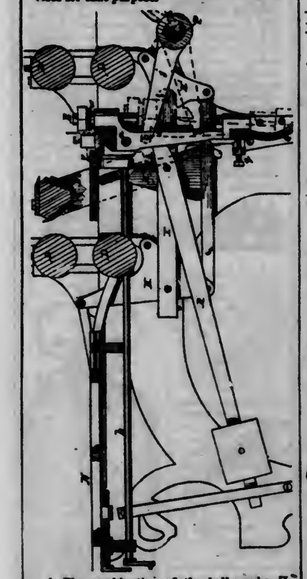
164,986. GATEWAYS. Simeon L. Fisher, Prinfield, Ill., assignor of two-thirds his right to Webster Huey and T. W. Cowles, same place. [Filed Jan. 2, 1875.]

The combination, with a passage-way in a fence, of the close fronts D E, connected together by the central partition B, one of the fronts being within and the other without the fence, and extending beyond the passage-way, whereby a double short turn is made at each side of the partition B, substantially as and for the purpose described.

164,987. REVERSIBLE CAPS. Morris Fox New York, N. Y. [Filed June 5, 1875.]

A reversible cap composed of double-folded rear crown-section B, supplementary swinging front crown-piece C, and double-folding front piece D, arranged substantially in the manner and for the purpose set forth.

164,988. PIANO-STRINGING DEVICES. A. G. Gardner, New Orleans, La. [Filed Sept. 30, 1874.]



164,922.

As an improvement in stringing devices for piano-fortes the wrest-plank bridge C of steel, and having the flanges *d e*, in combination with the sounding-board-bridge agraffe A B, the latter plate B of which is provided with the flanges 1 2, when all said parts are constructed and arranged substantially as and for the purpose set forth.

164,989. WOOD-PLANING MACHINES. J. S. Graham, Rochester, N. Y. [Filed Jan. 13, 1875.]

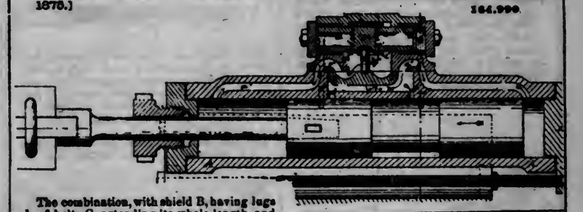
Brief.—The weights which hold down the pressure-rolls are made to exert their force equally upon them through a system of shafts, bell-cranks, and levers. The matching-heads are also elevated and depressed by means of an oscillating shaft provided with suitable devices for that purpose.

1. The combination of the bell-cranks H and H', feed-rollers D and D', and suitable connecting-links, and the common adjusting-handle P, screw-shaft, and table N, operating substantially as set forth.

2. The combination of the yielding fulcrum-bar I, weighted lever R, bell-cranks H and H', feed-rollers D and D', and suitable connecting-links, operating substantially in the manner described.

3. The combination of the bell-cranks H, H', and H,'' suitably linked to each other and to the rollers D and D' and cutter-head E, and the adjusting-handle P and table N, whereby said rollers and cutter-head may be simultaneously adjusted.

4. In combination with the independent matcher-frame F, the sleeve S, and its eccentric supporting-shaft *p*, and connecting-bars *j*, arranged to operate conjointly for the purposes set forth.



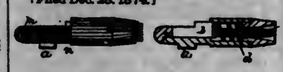
5. The chip-breaker T, provided with the lips *v*, and detachably hung upon the matcher-shaft E as an axial center, in combination with the spring *t* and frame F, substantially as and for the purposes shown and described.

6. The matcher-frame F, carrying the matcher-shaft E, in combination with the gears upon the adjusting-screw *a* and rod *b*, as and for the purposes shown and described.

7. The matcher-frame F, resting in the curved grooves *o*, and so arranged as to receive its horizontal and vertical movements by means of the lever *s* and cam or eccentric *j*, whereby the said frame is retained in a vertical or nearly vertical position at all times, as shown and described.

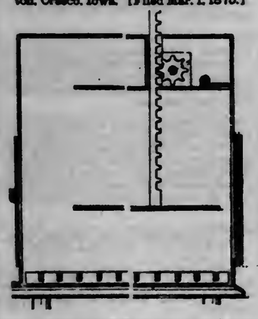
164,990. STEAM ROCK-DRILLS. Joseph C. Githens, New York, N. Y. [Filed Apr. 17, 1875.]

164,990.



The combination, with shield B, having lugs *b*, of bolts C, extending its whole length, and the cross-bar D, to which the turning mechanism is attached, all arranged substantially as and for the purpose specified.

164,991. CHUCKS FOR ROCK-DRILLS. Jos. C. Githens, New York, N. Y. [Filed May 15, 1875.]

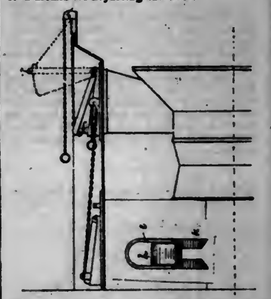


The combination of the grooved and notched key B, and the U-bolt D, with the grooved enlarged end of the piston-rod A, substantially as herein shown and described.

164,992. KEY-HOLE GUARDS. Jacob Goldstein, Chicago, Ill., assignor of one-half his right to Raphael Phillipson, same place. [Filed Dec. 28, 1874.]

A key-hole protector provided with the stem *m*, having a guard, *c*, and shoulder *n*, in combination with a sliding bar or bolt, *b*, and spring *d*, all substantially as and for the purpose specified.

164,993. METHODS OF BURNING HAY, STRAW, LEAVES, &c. Alexander Hamilton, Oreseo, Iowa. [Filed Mar. 1, 1875.]



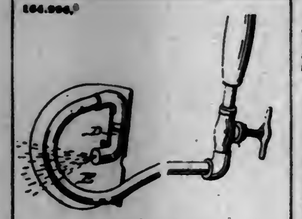
The process of burning in a stove straw, hay, leaves, and analogous material while under pressure, as set forth.

164,994. PACKAGE STRAP-HANDLES. S. L. Harrell, Chicago, Ill., assignor of one-half his right to T. E. Bryant, same place. [Filed Mar. 26, 1875.]

The package strap-handle, herein described, consisting of the curved rigid bar A, enlarged laterally, and mortised at its ends, and provided with depending pivots *e e*, adapted to take into, or bear upon, the flexible and slotted bar C, in combination with said bar and straps D D and E, all constructed and arranged substantially as specified.

164,995. FURNACES AND STOVES. Ezra Hawkes, Boston, Mass. [Filed May 28, 1874.]

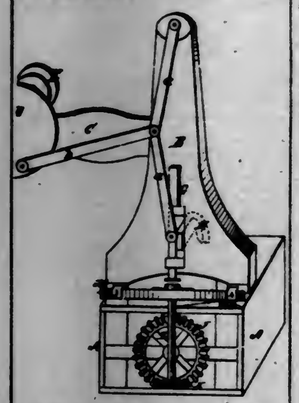
Brief.—The chain and notched bracket afford means for adjusting the door.



In combination with the door having the side flanges, and applied to the mouth of the fire-pot, as described, the adjusting linked chain with its pulley *h*, and its bracket *i*, the latter being notched at *k* to adapt it to arrest and hold any link of the chain, as and for the purpose set forth.

164,996. BREAKERS FOR PAINTERS' USE. Ivory Hayes, Philadelphia, Pa. [Filed May 15, 1875.]

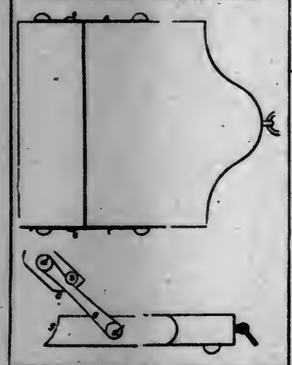
Brief.—The shield is provided with an orifice for supplying air to the flame.



The combination, in a breaming implement, burning gas or vapor, substantially as described, of the flame-protector E, with the jet-burner D, substantially constructed as and for the purpose hereinbefore set forth.

164,996. [illegible]

164,997. BRICK AND SOAP PRESSES. Jacob H. Sears, Marshalltown, Iowa. [Filed Mar. 23, 1875.]



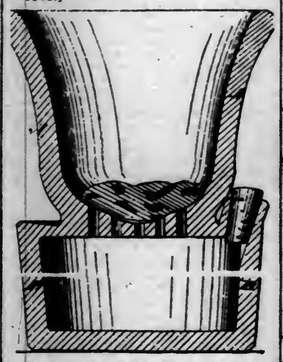
Brief.—The reciprocating motion of the plunger rotates and holds the table, carrying the molds, at the point required, to subject the substances in the molds to the action of the descending plunger.

1. The combination of frame A, post B, arm C, wheels D and E, connecting-link b, toggle-joint a a, and plunger G, when arranged substantially as and for the purposes shown and described.

2. The plunger G, carrying the cam h and rack c, the sector A, and bevel-gear wheel J on the shaft f, the pinion K and table M on the shaft J, and the spring-latch n on the frame A, arranged and combined substantially as and for the purposes shown and described.

164,998. IRONING-BOARDS. G. B. Hollister, Kalamazoo, Mich. [Filed May 1, 1875.]

The shirt-ironing board, having the concave edge g, the concave cam-clamp c, rotating on its own pivots, the pivoted connecting arms e, and the stops s, constructed and arranged as specified.



164,999. BITS FOR BORING WOOD. G. L. Holt, Springfield, Mass. [Filed July 30, 1874.]

Brief.—The bit consists of a detachable screw-threaded head or socket, and a rod provided at one end with an enlargement, upon which is a screw-thread for securing it in the head, and at the other with a sharp reamer-point. Two spiral grooves, having sharp edges, extend from the point along a portion of the length of the rod.

The combination of the rod f, provided with the sharp-edged grooves e, the sharp reamer-point c, and the enlarged threaded part a, and the threaded head or socket-piece s, all constructed and arranged as herein set forth

164,000. FLOWER-POTS. Joe Sephus Johnson, Somerville, Tenn. [Filed Mar. 20, 1875.]

As a new article of manufacture, an earthen flower-pot, consisting of body A, hollow base B, and perforated partition, all made up in one piece, as shown and described.

165,001. BUNGS AND BUSHES. Wm. Johnson, Ossuikee, Wis. [Filed Mar. 18, 1875.]

Brief.—The bung consists, substantially, of two pieces. When the two conical metallic earthens are brought closer together the rubber between them is made to form a conical ring, having its base pressed tightly against the bush.

A bung consisting of cone-shaped pieces B and D, in combination with rubber C and nut E, sunken in piece D, substantially as described.

165,002. SMOKING-PIPES. C. J. Jonasson, Warren, Pa. [Filed May 8, 1875.]

Brief.—The stem is hinged to the bowl, so that when not in use the pipe can be folded into a small compass.

1. The combination of the hinged stem with the bowl of the pipe, as shown and described.

2. The stem and bowl, connected by a ball-and-socket joint, and the pivoted fastening-link C, arranged to lock the parts together by engaging with a projecting portion of the bowl, all combined as shown and described.

165,003. AIR-TIGHT CANS. Stephen Joyce, New York, N. Y. [Filed Mar. 13, 1875.]

The described combination of body A, having top flare G and ears I, with two-part cover C D and rubber band F, for the purpose specified.

165,004. APPARATUS FOR CHARGING BEER WITH GAS. John C. Kennedy, Chicago, Ill., assignor of one-half his right to H. Kiley, Toledo, Ohio. [Filed June 4, 1875.]

Brief.—The gas passes to the cask from the regulating-chamber of the generator, said chamber being provided with a flexible diaphragm and mechanism to regulate the flow of gas therein. At the upper part of the generator there is a dial to indicate pressure of the gas in the main case and regulating-chamber.

1. In combination with the main case A, the depending tubes D and F, tube D provided with the open-ended tube d internally arranged and communicating with the chamber of the main case, as specified.

2. In combination with the main case A, the inner case E, adapted to receive the ingredients from which the gas is generated, and arranged to form the reservoir receiving the gas between it and the walls of the main case, as specified.

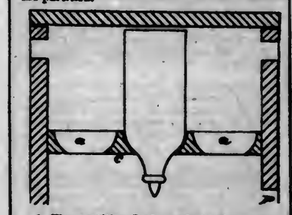
3. The elastic band f, arranged to close the openings e in tube F, the ends of the band connected by a strip of paper or other material, which will allow the band to disengage itself from the tube when saturated by the water in case E, as and for the purpose specified.

4. In combination with cap G, provided with the indicating-dial g, the elastic diaphragm H', spring P', and cap M, carrying the indicator R, arranged to graduate and determine the flow of gas into the equalizing-chamber, as specified.

5. The indicator R, substantially connected to cap M, whereby the same is adjusted to correspond with the tension of spring P', relative to the figures on the dial, as specified.

165,005.

165,006.



6. The soft-rubber or flexible valve m, arranged within the metal ring n, and attached to stem m', in combination with the inverted conical valve-seat n', as specified.

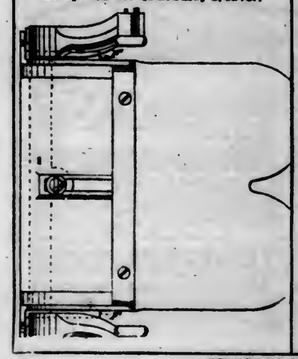
7. The combination of tubes T and T', arranged to communicate with the equalizing-chamber J, and interior of the main case A, and the mechanism for actuating the indicator-hands, whereby the pressure of gas in the main case and equalizing-chamber is indicated respectively on one dial-plate, as specified.

5. In combination with the main case the cup O, provided with the elastic diaphragm H', plate O', spindle r, and spring r', arranged to indicate the pressure of gas in the main case, as specified.

165,005. SODA-BOTTLE CARRIERS. Albert F. Knorp, San Francisco, Cal. [Filed May 26, 1875.]

Brief.—The box has a single partition with concave openings, so that the bulge of the bottle fits firmly therein, and the need of a second support is dispensed with. The box has suitable cover, and a waste-space below the partition.

1. The partition C of a soda-bottle carrier, having the tapering hole c, with its concave side, which is made to fit the shoulder of the bottle, substantially as and for the purpose described.



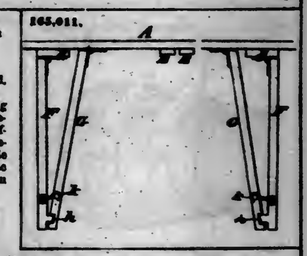
2. A case or carrier for soda-bottles, having the single partition C, with its tapering concave holes c, and provided with the opening P below the partition, substantially as and for the purpose described.

165,006. STEAM-BOILERS. R. D. Loevitt, Jr., Cambridge, Mass. [Filed Jan. 13, 1876.]

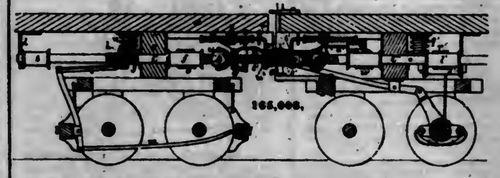
1. The combination and arrangement of a set of two or more boilers in two tiers, each lower boiler being connected with an upper one by two rows of water-legs, one of them attached to the top of the lower boiler and toward the side of the upper one, and the other row attached to the bottom of the upper boiler and toward the side of the lower one, substantially as described.

2. The combination with the lower boiler of two duplicate rows of water-legs, each duplicate series operating as described, and each being connected with a separate boiler of the upper tier, substantially as described.

165,007. FOOT-TREADLES. Daniel H. Ellis, Lockport, N. Y. [Filed May 6, 1875.]



A treadle foot-plate, B, having a rib, F, on each edge, as and for the purpose specified.

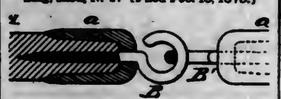


165,008. CAR-BRAKES. Silas P. Littlefield, Lynn, Mass. [Filed May 22, 1875.]

Brief.—Brakes operated by nut traveling on screw-shaft, which is rotated by brakeman through crank and rope. Shafts of different cars coupled so as to permit independent vertical and lateral motion, while transmitting rotation. Device for automatic breaking of car if disconnected on down grade.

165,011.

165,009.



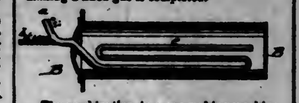
1. In combination with the shafts c c' and their coupling-spindles t g', provided with a catch-lever, and constructed substantially as described, the spring s', the slide-cap S', and the system of levers s' P', applied to the spindle t and the truck, as set forth.

2. The spring u and its chain or cord u', in combination with the shaft c, provided with mechanism, as described, for setting the brakes up to the wheels, such mechanism consisting of the rod m, lever k, furnished arm i, nut h, screw g, barrel e, chain or rope o, barrel f, and the hand-wheel shaft q.

3. In combination with the shaft C and the car-wheel axle, the mechanism applied thereto for revolving the shaft c', to effect stopping the car on a descending grade, such mechanism consisting of the barrel f', its ratchets v w', the pawls o' g', and the mechanism, as described, for throwing either pawl into or out of action with its ratchet, this latter mechanism being the shafts x' c', arms s', teeth d', caps s' f', slide g', levers h' P', and springs h' P', all being arranged and applied substantially as specified.

165,010. BELT-COUPLINGS. Geo. A. Manning, Rice, N. Y. [Filed Feb. 13, 1875.]

In combination with the compressed ends of a belt, the ferrules a, the adjustable screw-hook B, and adjustable screw-eye B', substantially as shown and described.

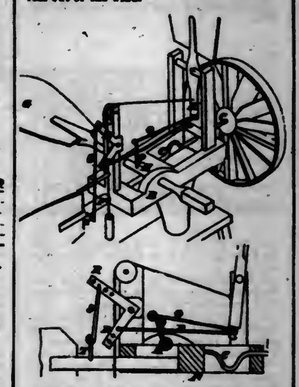


In testimony that I claim the above I have hereunto subscribed my name in the presence of two witnesses.

165,012. FOLDING TABLES. E. J. Marsters, Stockton, Cal. [Filed May 17, 1875.]

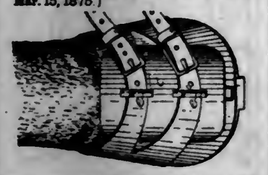
The table A with its legs F, and angularly hinged braces G with the lugs h and slot i, and the hooks k, the whole constructed to operate substantially as and for the purpose herein described.

165,013. APPARATUS FOR MANUFACTURING ILLUMINATING-GAS FROM PETROLEUM. J. McClarty, Racine, Wis. [Filed Mar. 13, 1876.]



Brief.—The steam-pipe enters the oil-pipe near its place of entrance to the retort. The oil and steam pass together through a coil in the retort. The semi-fixed gas from the first retort passes through pipes to near the back ends of other retorts, where the process of making a fixed gas is completed.

The combination, in a gas-making machine, of the oil-supply pipe a, steam-pipe b, coil c, and retort B, with a bench of gas-retorts, provided with pipes f g g', as and for the purpose specified.



165,014. WINDMILLS. Joseph McGovern, Modesto, Cal. [Filed May 3, 1875.]

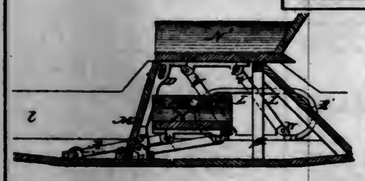
Brief.—The hinged vertical vane is connected directly with the tail-vane and side vane. Any increase in the wind will act upon the vertical vane, and by its connections turn the other vanes, and throw the mill more or less out of the wind.

The vanes E, G, and J, mounted as shown, together with the connecting-rods O, P, and R, the arms Q and T, and the bell-crank lever K, whereby power is transmitted directly from the hinged vane J to each of the vanes E and G, substantially as herein described.

165,014. TOE-WEIGHTS AND QUARTER-BOOT ATTACHMENTS FOR HORSES. Henry D. McKinney, Jonesville, Wis. [Filed Mar. 15, 1875.]

The weight C provided with loops *c c* and spur *c*, in combination with the socket *b* in the shoe and the fastening-straps, substantially as herein shown and described, and for the purposes set forth.

165,015. GRAIN-DRILLS. Edwin D. Mead, Shortsville, N. Y. [Filed Nov. 21, 1874.]



Brief.—Within and transversely to the concave feed-wheel is fitted the adjustable semicircular cut-off, for graduating the flow of seed without changing the speed of the wheel.

The semicircular cut-off C, with its lever A, in combination with the concave feed-wheel E, for regulating the flow of seed, substantially as set forth.

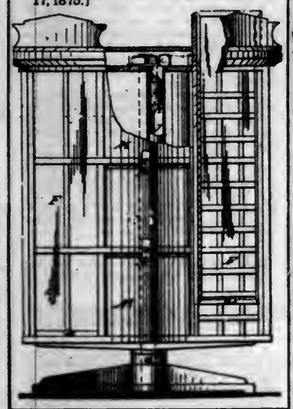
165,016. CARRIAGE-SEATS. Christian K. Mellinger, Harrisburg, Pa., assignor of two-thirds his right to Henry C. Shaffner and Lehman & Riegel, same place. [Filed Jan. 28, 1875.]

Brief.—Adapts seats to fold under one another.

1. The sill-iron K Q, in combination with the stump joist D S, as and for the purpose set forth.

2. The sill-iron K Q, in combination with the hinged stump-joint D S, and the full-sweep panel M, substantially as set forth.

3. The extended stump-joint D S O', in combination with the latch F, keeper h, and the full-sweep panel M, substantially as and for the purpose set forth.

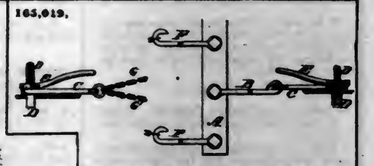


4. The rear-cast sill-iron L X, having the double-bow extension and slot R R', in combination with the supports V V', as and for the purpose set forth.

165,017. PHOTOGRAPHIC VIGNETTING-MACHINES. Chester C. Merrill, Port Jervis, N. Y. [Filed Feb. 20, 1875.]

The vignette B, having apertures H, serrated opening D and colored border E, combined with suspended name-plate G, as and for the purpose specified.

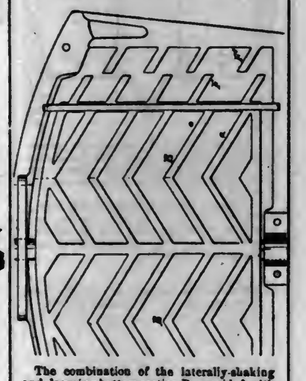
165,018. CASES FOR EXHIBITING YARN. H. J. Millmann, Milwaukee, Wis. [Filed Apr. 17, 1875.]



1. The combination, in a show-case, of glass doors sliding in ways up and down through the top, the weights J, and the cords I sliding in tubular recesses H, all arranged substantially as and for the purposes specified.

2. In a show-case, the compartments E, having transparent doors in front, and subdivided into sub-compartments F, as and for the purposes set forth.

3. In a show-case having compartments E, the intermediate angular boxes *m*, arranged as and for the purpose specified.



165,019. WIRE-STRETCHERS. Henry Miles, Springdale, Iowa. [Filed Apr. 10, 1875.]

165,020.

The combination of the lever A, the three hooks B F F, the two chains G, and the two clamps C D E with each other, substantially as herein above and described.

165,020. STOVE-GRATES. Jonathan Moore, Jr., Brooklyn, N. Y., assignor to J. L. Mott Iron-Works, New York city. [Filed Apr. 17, 1875.]

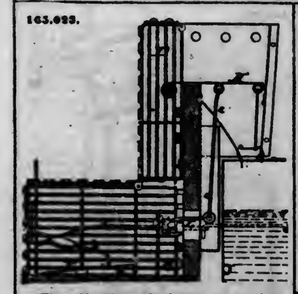
The combination of the laterally-shaking and dumping bottom section B, provided with clinker-breaking points F, with the stationary top section, having breaking-points F', as and for the purpose set forth.

165,021. GRAIN-TALLIES. A. K. Munson, Marysville, Kans. [Filed June 20, 1874.]

Brief.—An adjustable gate or striker, which can be raised or lowered in order that the grain may be struck off more or less closely, according as the weight of the grain is more or less.

The combination of the adjustable striker D with the box A and measure B, substantially as herein shown and described.

165,022.

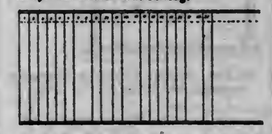


165,022. CARPET STRETCHERS AND HOLDERS. D. Peters, Cincinnati, Ohio. [Filed May 5, 1875.]

As a new article of manufacture, the carpet stretcher and holder herein described, consisting of the handle A, double-pronged iron B, having toothed ends *b b*, and the bent prong D, all constructed as shown, and for the purpose set forth.

165,023. SELF-SETTING ANIMAL-TRAPS. John C. Porter, New York, N. Y. [Filed Sept. 17, 1874.]

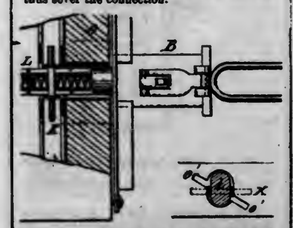
Brief.—The trap is closed by a tilting platform. It is reset by means of another tilting platform, which precipitates the victim into a tank.



165,023.

The self-setting animal-trap, composed of the sliding gate C, tilting platform E, arm *b*, weighted platform H, rod *c*, lever L, and the tank J, all arranged for operation substantially as herein shown and described.

165,024. MANUFACTURE OF KEY-BOARDS FOR ORGANS, &c. Milon Pratt, Deep River, Conn. [Filed Oct. 14, 1874.]



Brief.—To avoid "side sawing."

As an improvement in the manufacture of key-boards for musical instruments, the preliminary preparation of the pieces for the bodies of the sharp keys, of substantially the width of the sharp spaces in the desired scale, and then gluing said sharp-key pieces to the pieces for the natural keys at the outer ends only—that is, from the front ends of the natural keys to the line where the front ends of the sharp keys will fall, substantially as described.

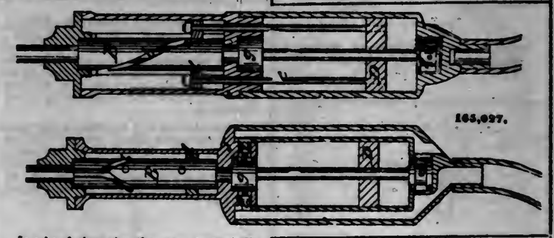
165,025. CAR-COUPLINGS. C. B. Pamage, Sherman, Tex., assignor to himself and W. Heyde, same place. [Filed Oct. 17, 1874.]

Brief.—When the draw-head is turned by a car leaving the track, it will pull out, and thus sever the connection.

1. The combination of the draw-head B, shank or rear extension L, and draft-bar K, with the car timber or beam O, provided with an oblique slot, O', as and for the purpose described.

2. The angle-plate or spring I in combination with the draw-head, substantially as and for the purposes described.

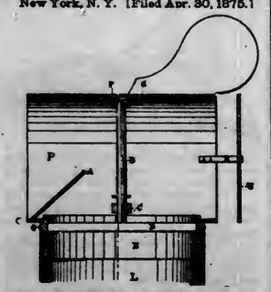
165,026. TAILORS' MEASURING APPARATUS. Albt. H. Richey, Lebanon, Pa. [Filed Jan. 20, 1875.]



Brief.—A tailor's measuring apparatus provided with shifting-arms with registers thereon, which are first correctly adjusted to the body, and afterward transferred to the material as a guide for cutting the same.

In combination with the main arm D, the vibrating arms A, B, and C, slide F, and horizontal bar H, provided with appropriate scales and registers, and with open hooks for connecting the parts together, all constructed and arranged, substantially as and for the purpose specified.

165,027. AIR HAND-ENGINES. C. W. Riley, Philadelphia, Pa. [Filed Mar. 27, 1875.]

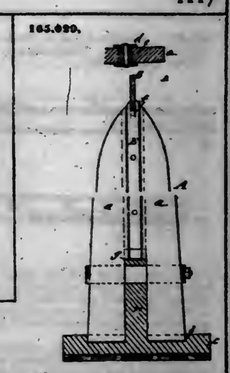


Brief.—A double spiral bar and two rotary valves are rigidly secured to the operating-tool. The rotary valves govern the induction and eduction of steam to a reciprocating piston, while the piston, by means of intermediate mechanism, serves to rotate the drill.

165,027.

In a hand air-engine, the rotary tool-spindle B, having oblique grooves *b b*, in combination with the yoke *d*, having a feather, *c*, and connected with the piston D, valves *g g'*, and induction and eduction ports, substantially as described.

165,028. CHIMNEY-COWLS. A. J. Robinson, New York, N. Y. [Filed Apr. 30, 1875.]

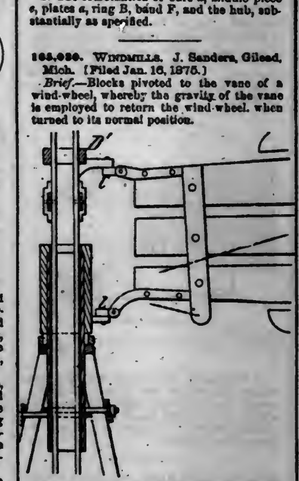


1. A chimney-cowl in which is combined the hood P, provided with the inclined partition A, shield H, and socket G in its top, and cross-bar C near its bottom; a vertical shaft, B; a collar E, constructed to fit within the exhaust-pipe L, and having the cross-bar D, all substantially as shown and described.

2. The combination of the exhaust-pipe L, the collar E, constructed to fit within the said pipe, and provided with the cross-bar D, the hood provided with a circular opening, fitting over the collar E, and a vertical shaft, B, resting on the cross-bar D, and fitting a socket in the top of the hood, all substantially as described.

3. The collar E, constructed to fit the pipe L, and having the peripheral rib *e*, to limit its insertion in said pipe, and a cross-bar, D, to support the vertical shaft, which supports the revolving hood, the whole being constructed and combined as and for the purpose described.

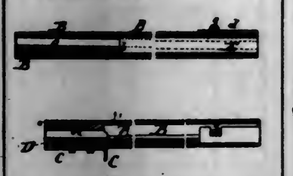
165,029. PADDLE-WHEELS. James Salter, Brooklyn, E. D., N. Y. [Filed May 8, 1875.]



1. Taper-pointed paddles of continuous or entire plates, in combination with an outer stay-ring, B, constructed substantially as specified.

2. The plates *a*, arms E, hub C D, ring B, and band or yoke F, combined and arranged substantially as specified.

3. The combination of bars *d*, middle piece *e*, plates *a*, ring B, band F, and the hub, substantially as specified.

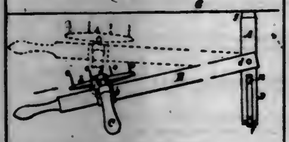


165,030. WINDMILLS. J. Sanders, Gilead, Mich. [Filed Jan. 16, 1875.]

Brief.—Blocks pivoted to the vane of a wind-wheel, whereby the gravity of the vane is employed to return the wind-wheel, when turned to its normal position.

The blocks *l l*, pivoted to projections on the arm D', and also pivoted to the inner ends of the vane, in combination with the chain *n* and pulleys *p p'*, by means of which the vane rises and descends as it swings around, substantially as described.

165,031. BREECH-LOADING FIRE-ARMS. Otto Schneeloch, Williamsburg, N. Y. [Filed Jan. 16, 1875.]

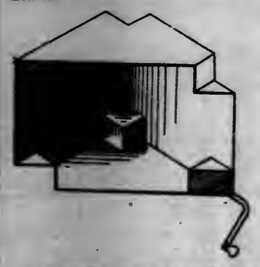


1. In combination with the barrel B of a breech-loading fire-arm, the secondary interior barrel A, made with a bore which is eccentric to the bore of the main barrel, substantially as and for the purpose herein shown and described.

2. The secondary barrel A, provided with a cartridge-extractor, D, and combined with the extractor C of the main barrel B, substantially as and for the purpose set forth.

3. The tube E, placed in the main barrel B, in combination with the secondary barrel A, as specified.

165,032. CARPET-STRETCHERS. Edward P. Shaffer, Rochester, N. Y. [Filed Apr. 17, 1874.]

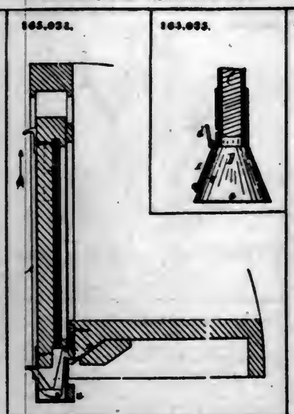


1. In combination with the head A, clamping-dog D, and lever B, the cushion *g*, as and for the purpose set forth.

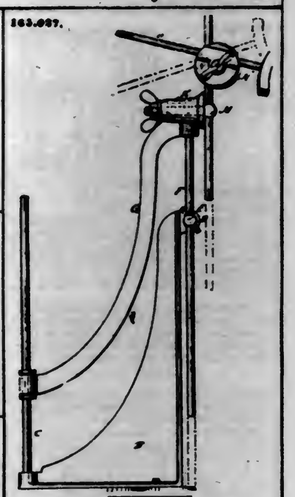
2. In combination with the pivoted lever B, having a vertical axis, the sliding clasp *b*, having the tooth-head *h* hinged or otherwise attached thereto, substantially as and for the purpose set forth.

165,033. ROTARY CHURNS. J. J. Shelton, Washington, Mo. [Filed June 22, 1875.]

Brief.—The corners being re-entrant present edges and surfaces to milk, increasing the action. The blocks set in the corners at the axles serve to render the churn-body symmetrical.



A rectangular churn body rotating upon angles situated at two diagonally-opposite corners, those corners being re-enforced by blocks set in, inside the churn body, the remaining corners being re-entrant, as and for the purpose specified.

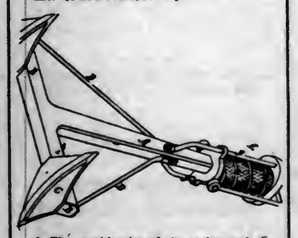


165,034. SHOW-CASES. William B. Smith, New York, N. Y. [Filed May 1, 1875.]

In a show-case, in combination with the sliding door provided with the strip C, the packing-strip D, for keeping the case dust-tight, as described.

165,035.

165,037.



165,036. PNEUMATIC DREDGERS. William Smith, Chicago, Ill. [Filed Feb. 19, 1875.]

Brief.—A boat with a suction-pump and flexible non-collapsible pipe, provided at its lower end with a weighted nozzle, having an opening in its side above the lower end, and covered by a valve that is operated by a cord from above.

In combination with the pump A, the flexible non-collapsible pipe C, provided with the weighted nozzle D, having the opening *c* formed through its side above the lower end, and provided with valve E and cord *f*, all arranged to operate as and for the purpose specified.

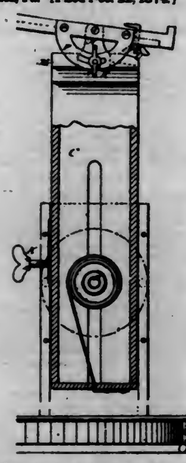
165,038. ANCHORS. Amos Smith, Bangor, Me. [Filed Oct. 1, 1874.]

1. The combination of the anchor and the surge-reliever E, directly applied to it, all being substantially as described and represented.

2. The combination and arrangement of the guard and guide rods *g g* with the anchor and the surge-reliever E, applied to such anchor, as specified.

3. The anchor having the double-pointed flukes C C arranged with its arms B B, and such arms arranged with the stock A, all substantially as described.

4. The arrangement and combination of the guard-braces D D with the arms B B, the stock A, and the double-pointed flukes C C, arranged as set forth.



165,039. PHOTOGRAPHIC HEAD-RESTS. F. M. Spencer, Mansfield, Pa. [Filed Dec. 22, 1874.]

Brief.—The particular arrangement of the uprights and brace permits of an adjustment of parts that is adapted to suit the different height of persons.

1. A head-rest consisting of the uprights B C, attached to the base A, the rods F L, and brace G, combined and arranged substantially as described.

2. In combination with the head-rest, constructed substantially as described, the clamping devices K, H, D, M, and N', as and for the purposes set forth.

165,040. CAMERA-STANDS. F. M. Spencer, Mansfield, Pa. [Filed Dec. 22, 1874.]

1. A camera-stand having an adjustable standard composed of the pieces B and C, the one sliding within the other, and provided with a spring G, shaft D, pulley E, and strap F, all arranged as described, for the purpose set forth.

2. In a camera-stand constructed substantially as described, the adjustable table or rest O, supported on the standards N N, and provided with the slotted half-circles P, thumb-screw S, bolt R, and hook T, substantially as specified, and for the purposes set forth.

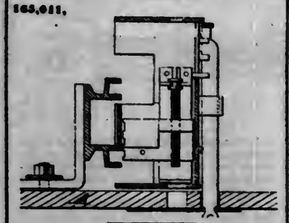
165,041. FLASKS FOR CASTING PROPELLER-WHEELS. Rufus B. Swift and Thos. J. List, Cleveland, Ohio. [Filed Mar. 29, 1875.]

1. A flask for casting propeller-wheels, the blade portion composed of a cope, A, and drag B, constructed substantially as described, the said blade portion A B made adjustable with respect to the hub portions, whereby the pitch or lead of the blade may be altered without altering the flask, substantially as and for the purposes described.

2. In a flask for casting propeller-wheels, the combination, with the cope and drag A B, respectively, of corresponding neck and hub portions, adjustable substantially as described, whereby the mold for the blades, necks, and hubs, is formed complete by uniting the separate flasks, substantially as for the purpose described.

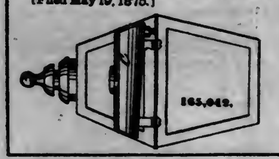
3. The cope A, drag B, and end pieces C C', constructed and connected together with adjustable joints, substantially as and for the purpose described.

4. The double reversible pedestal, adapted for wheels of different sizes, substantially as and for the purpose described.



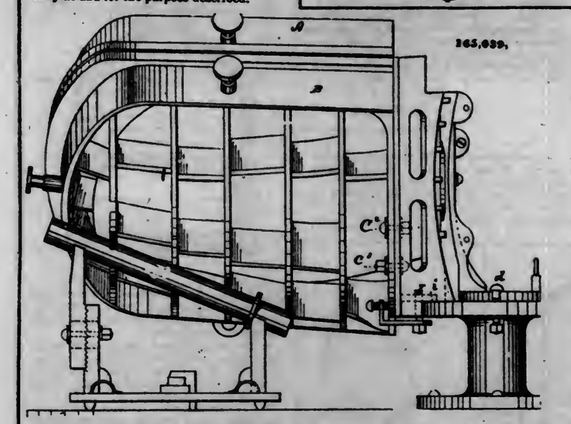
5. The combination, with the pedestal, of studs I in connection with slots *i* in the flask, whereby the flask is readily adjusted to its proper position, substantially as and for the purpose described.

6. The combination, with the adjustable flask, of the adjustable undersetth support, substantially as and for the purpose described.



7. The combination, with the blade and end portions of the flask, of intermediate circular, revolving, slotted washers C', substantially as and for the purpose described.

8. The combination, with the blade-pattern, of the wedges L, bolts M, plates *w*, and nuts *w'*, whereby the blade-pattern is held firmly in place during the ramming of the drag, without the use of the follow-board, substantially as and for the purpose described.



165,041.

165,042. RESERVOIR FOR STREET-LANTERNS. Albt. H. Watkins, Boston, Mass. [Filed May 19, 1875.]

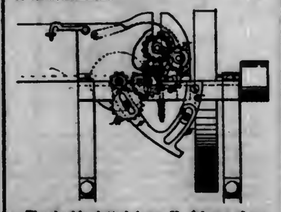
165,039.

165,044. PITMEN. John R. Taylor, Eagle Point, Ill. [Filed Apr. 26, 1874.]

Brief.—The pitman is pivoted to a short beam resting on the frame, that has its other end connected to the sickle-bar by a ball-and-socket joint, the boxing of which is adjusted by a bolt having one side of its head inclined, acting, when the bolt is tightening, on an inclined surface.

The combination of an adjustable slotted bearing-block, having an inclined notch, a fixed bearing-block, an adjustable bolt provided with an inclined or tapering head, and a locking-bolt for the adjustable bearing, all the parts being constructed and relatively arranged in respect to a pitman and its connections, in the manner herein set forth.

165,045. LOCKS FOR DOORS. Wm. Universagt, Memphis, Tenn., assignor to himself and I. A. Chase, same place. [Filed May 22, 1875.]



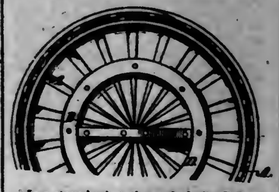
1. The sliding tumbler, having adjustable front plate to be set to varying distances from safe-door by screw-bolt and set-key, substantially as set forth.

2. The sliding tumblers having side projecting lugs at rear part, in combination with the controlling slide-piece passing to the outside of safe-door for changing position of tumblers, for the purpose set forth.

The tapering reservoir C, having its outlet end of larger area in cross-section than its opposite end, and its bottom inclined down toward the outlet, substantially as and for the purpose described.

165,046. FEED-CUTTERS. Thomas Welsh, Elyria, Ohio. [Filed Jan. 18, 1875.]

Brief.—An intermediate pinion between the crank-shaft and the train, by which the rollers are revolved, is suspended on a lever having its fixed end sleeved upon the crank-shaft, and its remote end, which is slotted for adjustment, held by a set-screw at the place of its attachment.



The double-slotted lever N, fulcrumed on shaft J, provided with pinion M, and adjustable on fixed plate Q, as and for the purpose set forth.

165,044. FASTENINGS FOR EGG AND FRUIT BOX COVERS. Wendelin Weis, St. Paul, Minn. [Filed May 1, 1875.]

As an improvement in fastenings for egg and fruit box covers, the combination of the recessed side strips of the lid, provided with double-acting band-spring hooks, with staples of the outer side strips of the box, substantially as and for the purpose set forth.

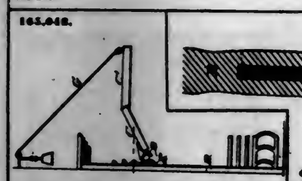
165,043. STAVE-BASKETS. S. H. Wheeler, Niles, Mich. [Filed Oct. 22, 1873.]

In a stave-basket, the arched ribs B B, arranged across the center of the basket-bottom, one above and one below said bottom, united together and to the points of the staves interposed between them by nails, in combination with upper and under hoops D D and staves A A, as and for the purposes specified.

165,046. CASTING PLOW-POINTS. George Wiard, East Avon, N. Y., assignor of one-half his right to C. W. Hough, same place. [Filed May 11, 1875.]

Brief.—To facilitate casting, a recess is formed in the pattern near the intersecting point of the converging flanges on the rear side. A bridge or support is formed in the mold, corresponding to the recess in the pattern, to strengthen or brace the tip of the wedge-shaped portion. It also furnishes an escape for the air and gases.

A plow-point provided on its rear side with flanges B B' and notch *d*, substantially as and for the purpose hereinbefore set forth.



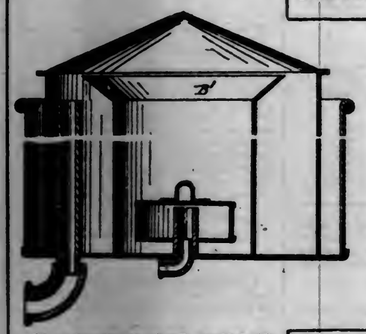
165,047. WICKER-BASKETS. U. S. Wolf, Otto, Ind. [Filed Sept. 12, 1874.]

The wicker-basket A, having exterior and interior sides *a* and *b* tapering to its bottom, in combination with the handle D, wedge-shaped at both ends, and inserted between the walls *a b*, and extending to the bottom of the basket, rivets D, applied near the bottom of the basket with overlapping washers, and willow wrapping C, substantially as and for the purpose set forth.

165,048. HEAT-REFLECTORS. L. B. Woolfolk, Lexington, Ky. [Filed Dec. 17, 1874.]

165,048.

In combination with the heat-reflector, composed of the two surfaces O O', forming an obtuse angle with each other, the hinge D, support G, and frame E, sustaining the reflector in position for use, or permitting it to be raised up, substantially as described.



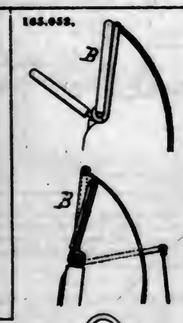
165,049. PROCESSES IN THE MANUFACTURE OF FIRE-BRICK. J. P. Alexander, Akron, Ohio. [Filed Apr. 30, 1875.]

1. The process of the manufacture of fire-brick, consisting in thoroughly separating white pebble from sand and other substances in conglomerate rock, pulverizing the same, thoroughly mixing or kneading with from five to forty per cent. of fire-clay, molded, and subjected to heavy pressure in steel molds, then drying and burning in kilns in a very high degree of heat, as and for the purposes set forth.

2. The compound herein described for the manufacture of fire-brick, consisting of pure pulverized white pebble and fire-clay, prepared and compounded in the proportions substantially as and for the purpose described.

165,050. CARBURETERS. John R. Allen, Pittsburg, Pa. [Filed May 31, 1875.]

Brief.—A small air-chamber or float in the bottom of the carburetor fits over the end of the air-induction pipe, and distributes air through its perforated bottom to the hydrocarbon oil.

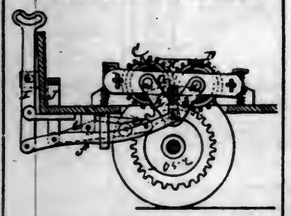


The carbureting-chamber B, provided with an open flaring mouth, B', to prevent the escape of hydrocarbon liquid, in combination with outer chamber A, forming an intervening annular water-space, as and for the purposes set forth.

165,051. HANDLES FOR CROSSCUT-SAWS. B. Andrews, Williamsport, Pa. [Filed Dec. 6, 1872.]

Brief.—The handle has a longitudinal cylindrical central opening, to receive a straining-rod, the lower part of which forms a hook, and the upper part has a left-hand screw-thread cut upon it, and at right angles to said opening another opening, in which is placed a round-ended nut, having a corresponding screw-thread. The saw is attached to the handle by means of a slot formed in the plate near its end, to receive the hooked part of the rod, in connection with a chambered and adjustable cap, provided with a slot, in which the heel of the saw rests, and ferrule having shoulders and a tapering neck to fit said cap. By turning the handle to the right the saw is firmly clamped in place.

165,052.



1. The combination, in a handle for crescent-saws, of the straining-rod F, with its upper end cut with left hand threads, and a corresponding threaded nut, C, substantially as set forth.

2. The movable cap E, provided with a central opening and a groove upon one side of the same across its greatest diameter, substantially as set forth

165,053. CAR-STARTERS. Gilbert S. Bailey, Chicago, Ill., and Harris Pool, Monroe, Wis. [Filed Mar. 9, 1875.]

Brief.—Devices for throwing into gear cog-wheels on spring-drums. Recoil starts car.

In combination with the movable frame G, carrying the cog-wheels C D, the lever I, connecting-rod *f*, arms *h h*, foot-lever J, links *e e*, and arm *i*, all constructed and arranged to operate substantially as and for the purposes herein set forth.

165,054. MEASURING-BOTTLES. Frank S. Baldwin, Philadelphia, Pa. [Filed May 27, 1875.]

Brief.—A measuring-bottle so constructed that a given portion only of its contents can be poured out each time the bottle is tilted, and having a registering device to the number of times the bottle is tilted.

1. A measuring-bottle, in which a perforated bottom, G, is combined with a flexible diaphragm, I, substantially in the manner and for the purpose described.

2. The combination of the bottle, its perforated bottom, and flexible diaphragm with the detachable mouth-piece B, with which a circuitous passage is formed, substantially as and for the purpose described.

3. The combination of the exterior tube *c* of the mouth-piece B with the spiral passage *b*, tube E, and inverted cup F, all substantially as set forth.

4. The combination of the bottle, its perforated bottom, the annular base H and adjustable disk or plate J.

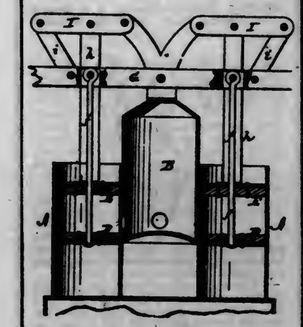
5. The combination of the flexible diaphragm, the pallet-lever L, and pallet-wheel K with mechanism substantially as described, through the medium of which motion is communicated by the diaphragm to the said lever.

6. The combination of the pallet-wheel K, having figures arranged in tens, and in a circle with a plate, J, having an opening, *f*, and marks and figures indicating units on the edge of the opening, as and for the purpose set forth.

165,055. TELEGRAPH-WIRE COUPLINGS. Samuel M. Barbour and Frank A. Page, Philadelphia, Pa.; said Page assignor to said Barbour. [Filed Apr. 20, 1874.]

A block of metal having two apertures for the passage of the wires, and provided with shouldered chambers adapted to retain the ends of the wires after they are bent back upon themselves, as set forth and described.

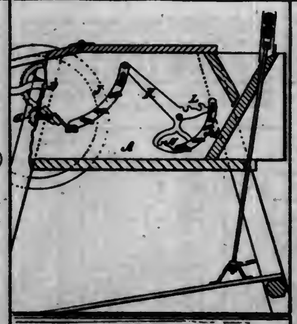
165,056. FRUIT-PICKERS. James Bailey, Farmington, Me. [Filed Jan. 2, 1875.]



Brief.—The picking device consists of wire jaws operated by a cord extending along the handle of the implement. The moving jaw is of less diameter than the stationary one, and is retracted by means of a spring. The staff or handle is inclosed in the flexible tube through which the fruit is conveyed to the basket.

1. In a fruit-picker, the combination, with the loop *c*, of movable wire jaw C, hinged to the lower rail of a fixed wire jaw, B, and adapted to be vibrated through and into the same, substantially as specified.

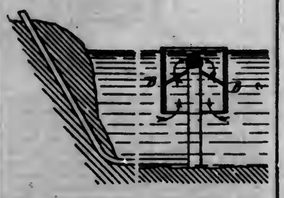
2. The pole A, arranged within the tube E, substantially as and for the purpose specified.



165,056. FIRE-ENGINES. John Bean, Hudson, Mich., assignor of three-fourths his right to Aaron Chandler and L. D. Ralesback, Davenport, Iowa, and R. A. Bean, Hudson, Mich. [Filed Apr. 23, 1875.]

Brief.—A solid and a valved piston in each cylinder are operated by a combination of levers that give to the solid one half the stroke of the other.

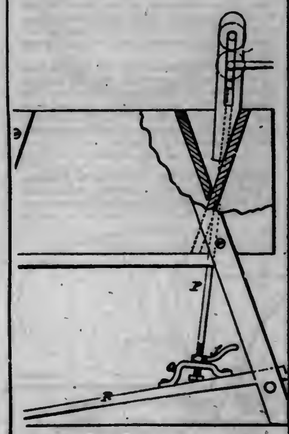
1. The arrangement of the double levers G and I I in combination with the buckets D and E and connecting-rods *f h i*, for the purposes herein set forth.



2. The combination of the cylinders A A and air-chamber B with their inlets and outlets, as described, the buckets D E in each cylinder, and the double levers G and I I, with connecting-rods *f*, h, and *i*, all substantially as and for the purposes herein set forth.

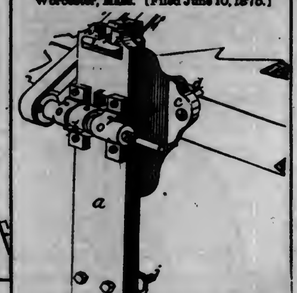
The combination of the pivoted levers K K, having extensions L and segments N, with the compound reciprocating rubbers J and the adjustable rubbers M, substantially as and for the purpose described.

165,059. PREVENTING THE OBSTRUCTION OF WATER-CHANNELS. Lewis H. Beebe, Hudson, Mich. [Filed Dec. 7, 1874.]



Brief.—A strainer is attached to the end of a supply-pipe, and surrounded by a box or casing extending considerably below the strainer, and above the surface of the water in the basin or reservoir.

The combination, with the opening of a channel through which water is drawn from a river or reservoir, of a box or casing, B, extending to a point below the said opening, and to a point above the surface of the water, all substantially as and for the purpose set forth.



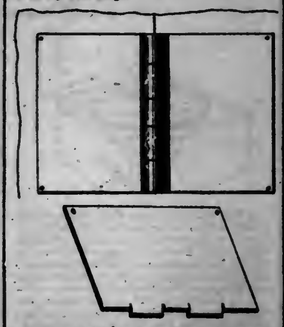
165,057. WRINGERS. L. Booker, York, Pa. [Filed May 26, 1875.]

Brief.—The journals of the lower roll are connected with a rod, screw-threaded at its lower end, and bearing against a lever, which is pivoted at one extremity to the tub, and rests upon the floor at the other. Screwing down upon the nut throws part of the weight of the tub upon the rod, which transmits the pressure to the rolls.

The combination, with the body of the washer and the bearings of the adjustable wringer-roll, of the vertical rod P, the strap Q, lever R, and adjusting-nut *f* substantially as and for the purpose described.

165,058. WASHING-MACHINES. L. Booker, York, Pa. [Filed May 18, 1875.]

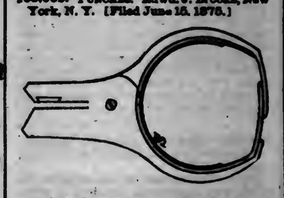
1. A device for hammering the sole-edges of boots and shoes, consisting of a bench-bracket hanger, a, provided with a support or rest, *i*, for the work, and a spring-hammer, *e*, automatically operating to deliver the blows upon the sole-edge, through a guide, *h*, by means of a power-driven cam-shaft, *n*, attachment to the bracket, substantially as herein specified.



2. The combination, in a power device for hammering the sole-edges of boots and shoes, of a spring trip-hammer, *e f*, with an adjusting-screw, *i*, and rubber cushion *s*, whereby the hammer may be adjusted to project more or less through and beyond its guide, and the noise from the blows avoided, as herein set forth.

3. The combination, in a power device for hammering the sole-edges of boots and shoes, of a spring trip-hammer, *e f*, attached to its carrying bracket-hanger *a*, with screws *j j*, for adjusting the spring to increase or diminish the force of the blow delivered upon the sole-edges, as set forth.

4. The combination, in a power-machine for hammering the sole-edges of boots and shoes, of a rest, *i*, for the sole of the work, a face-support, h^2, in the guide-head, for the edge of the sole, and the hammer *e*, operating through a guide-opening, h^1, upon the sole-edge, substantially as herein set forth.

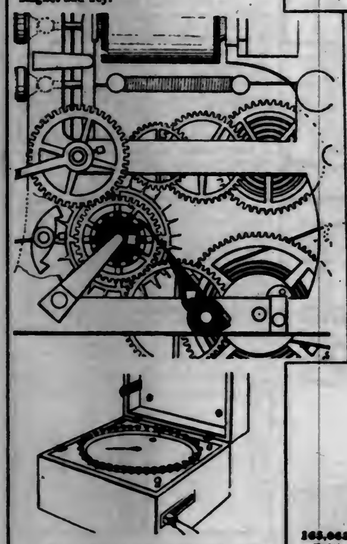


165,061. COVERING-PLATES FOR HINGES. Henry T. Blake, New Haven, Conn. [Filed Mar. 29, 1870.]

Brief.—A thin sheet-metal plate is formed with bent tongues upon its inner edge, which engage with and pass beneath the corresponding parts of the knuckle of a hinge. The covering-plate is then bent over, and its opposite edge or corners secured by small tacks or other suitable fastenings—the method furnishing a simple and inexpensive covering for the ordinary butt-hinge.

The herein-described covering-plate for butt-hinges, consisting of a thin plate of sheet metal, with bent tongues upon its edge, to pass beneath the parts of the knuckle of the hinge, to secure the inner edge, combined with means, substantially as described, to secure the opposite edge, all substantially as set forth.

165,062. PUNCHES. Edwd. J. Brooks, New York, N. Y. [Filed June 16, 1875.]



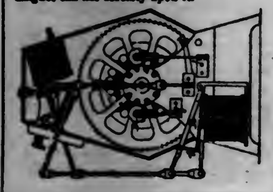
1. A hand-punch, having its handles formed into a closed suspension-loop, by overlapping extensions of the same, substantially as herein illustrated and described.

2. A hand-punch, with overlapping extension-handles, provided upon their inner surfaces with grooves and indentations, as shown, for the purpose set forth.

3. In combination with the overlapping extension-handles, provided with grooves and indentations, as shown, the spring S, for the purpose stated.

165,063. DIAL ELECTRIC TELEGRAPHS. C. T. Chester, Englewood, N. J. [Filed Mar. 30, 1875.]

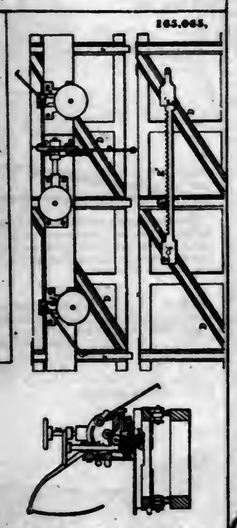
Brief.—One train, controlled by electro-magnetic escapement, actuates pointer, another, controlled by the keys, the transmitting break-wheel, both brought to a common axis, N. On lid of containing-box is placed ordinary key and bell-magnet. Leg on lid, when closed, taking on switch, breaks circuit to dial-magnets, and closes circuit to bell-magnet and key.



1. The combination of a shaft turning within a fixed tube or sleeve, and another hollow or tubular shaft turning without the said fixed tube, with mechanically-driven trains of wheels, for the purpose of causing independently-driven shafts, wheels, or devices to revolve upon a common axis of motion.

2. In connection with electric telegraphic circuits, the combination of two independent motors, carrying, respectively, a circuit-breaking device, and recording or receiving devices controlled by a magneto-escapement, and so arranged that the shaft governing the motion of the circuit-breaking device and the shaft causing the recording devices shall have a common axis of motion for the purpose of electro-telegraphy, substantially as set forth.

3. In combination with any electro-telegraphic apparatus contained in a box, wherein two or more devices having separate magnets may be alternately called into use, an attachment fastened to and moving with the lid of the box, and a switch or commutator within the box, so that the movement caused by the opening or closing of the box shall cause connections with the circuit to be made alternately with one or the other magnets, substantially in the manner and for the purposes hereinbefore described.



164,664. ELECTRO-MAGNETIC ENGINES. Theophile Chetsenx, Paris, France. [Filed May 26, 1875.]

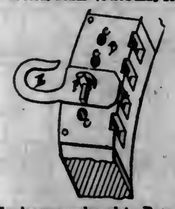
Brief.—The two parts of the armature are acted upon successively, the lower drawing down the upper to a point where the electro-magnet can act forcibly upon it.

In an electro-magnetic engine, the armature-lever E, constructed in two parts, hinged at one end to the frame of the apparatus, one part being connected at its opposite end to the connecting-rod S of the walking-beam, and the other provided with a hook, *k*, adapted to work within the first-mentioned part, substantially as herein specified.

165,665.

165,665. HEAD-BLOCKS. John F. Cook, Baltimore, Md., assignor to George Page & Co., same place. [Filed May 10, 1875.]

Brief.—The log-beam, to which the log is indirectly secured, is moved laterally of the carriage on which it rests by means of diagonal slides provided with longitudinal grooves for the reception of suitable rollers projecting from the under side of the cross-heads. The set-nuts are adjustable independently of the log-beam, which can be moved laterally in two ways



1. The log-beam B, cross-heads and rack E F, grooved diagonal slides D, rollers r, pinion *l*, and shaft *l*, combined substantially as and for the purposes specified.

2. The combination of the log-beam B, frame *m*, shaft *i*, pinion *k*, gears *n* *n'*, and handle F, whereby the log-beam can be moved laterally on two ways, substantially as herein described.

3. The log-beam B, provided with the slides *d*, and spirally-toothed racks A, in combination with the set-nuts C, having the worm-wheels *e*, and spirally-toothed pinions *g*, substantially as and for the purposes specified.

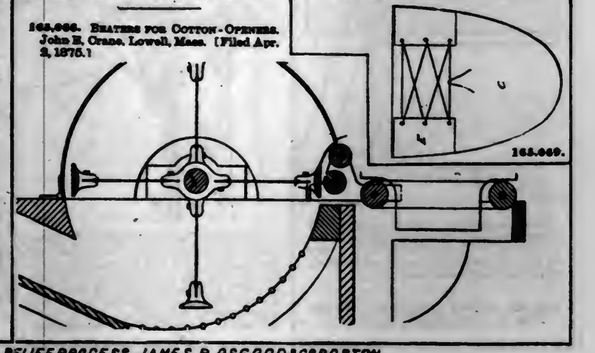
The combination of the beater-blades and the spring-arms, the two being connected together as described, so that the blades may be allowed to yield by the spring action of the arms, and the striking edges to cant or turn and strike at all times in the same circle, substantially as set forth.

165,667. HARNESS-HAMES. A. H. Creasap, Jr., Trenton, Tenn. [Filed May 15, 1875.]

1. The hame angular plate B, as shown, provided with the recesses *a*, holes *c*, and the double-bearing lips *b*, constructed as described, and applied for the purpose set forth.

2. The combination of the hame A having the recesses *a*, and row of bolt-holes *c*, the plate B, constructed and applied as described, and the bolt F, as and for the purpose set forth.

165,666. APPARATUS FOR CASTING STEEL. Thomas Critchlow and James Kidd, Baldwin, Pa. [Filed June 16, 1875.]



Brief.—The molten metal, being placed in a closed hopper, is allowed to fall through a circular opening into the mold below, and in which a vacuum is maintained.

1. The combination, with a flask in which a vacuum is maintained, of the closed hopper C, provided with a valve, the valve-opening constructed to allow the molten metal to flow into the flask in a thin stratum, for the purposes set forth.

2. The combination, with the flanged base B, of the flask A, provided with the air-pipe I, and annular shoulder near the top, the hopper C, with closed top and flanged base and valve-opening E, and the circular valve *a*, connected to the vertical sliding sleeve D, all substantially as set forth.

165,668. BUSTLES. Chauncey O. Crosby, New Haven, Conn., assignor to Leonard Winship and Saml. E. Barney, same place. [Filed May 31, 1875.]

165,669.

165,669. BEATERS FOR COTTON-OPENERS. John E. Crane, Lowell, Mass. [Filed Apr. 2, 1875.]

1. The bustle frame, formed from wire, or other suitable material, and consisting of the transverse upper part A, and the vertical or body-supporting part B, substantially as described.

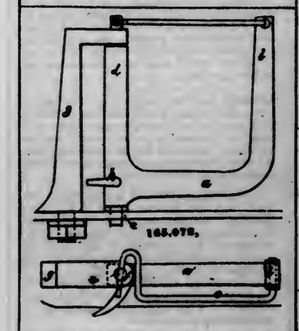
2. A bustle consisting of the frame A B, constructed as described, and the pocket C, combined and arranged substantially as and for the purpose set forth.

3. In combination with the distending frame A B, and the pocket C, the flaps E E, and means, substantially such as described, for adjusting the said flaps to extend or contract the bustle.

4. The distending frame and pocket C of a bustle, combined with the flap D, substantially as and for the purpose described.

165,670. CAR-STARTERS. George S. Curtis, Chicago, Ill. [Filed Feb. 16, 1875.]

Brief.—Draft forces cam against collar on hub, and so turns wheel. Collar made in two sections, so as to be easily attached and detached.

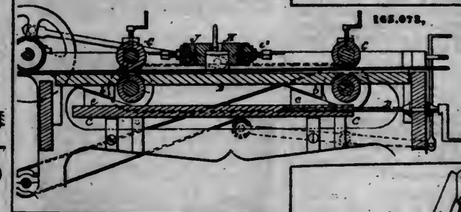


The combination of the axle B, collar D, made in two parts, and having hubs *a* *a*, stirrups E E, horizontal lever G, pivoted to the stirrups, and having eccentric *b*, the chain *d*, pulley H, and sliding draw-bar I, substantially as and for the purposes set forth.

165,671. LADLES. Stephen Curtis and R. H. Bowley, New York, N. Y. [Filed Nov. 2, 1874.]

As an article of manufacture, a ladle consisting of a bowl of an internally-enameled lining or body of hard metal to retain its proper shape, and an external covering of soft metal spun over and upon the lining or body, and secured thereon by bending its upper edge down over the edge of the lining-piece and enameled lining, as and for the purpose herein shown and described.

165,672. ROWLOCKS. Michael F Davis, Portland, Me. [Filed Apr. 7, 1874.]



1. The combination of the brace or arm *g*, affixed to the boat, with the rowlock *a* *b* *d*, and pivoted or hinged top piece *c*, hook *h*, and stud *i*, substantially in the manner and for the purposes set forth.

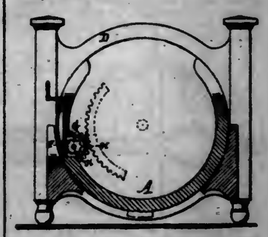
2. In combination with a rowlock, substantially as described, the spur *k*.

165,673. MACHINES FOR POLISHING MOLDINGS. John A. Dayton, Brooklyn, N. Y. [Filed May 7, 1875.]

Brief.—In a machine for polishing articles of varying thickness, the polishing rubber or pad can be adjusted to the inequalities of the article being polished by means of a vertically-adjustable bed, in connection with a reciprocating carrier provided with an oscillating polishing-stock, to which the rubber or pad is attached. The work is fed to the polisher by means of two sets of feed-rolls, covered with india-rubber, one set at either end of the bed, which are journaled in bearings attached to the bed, so as to rise and fall therewith. The lower rolls protrude through openings in the bed sufficiently far to engage with the work.

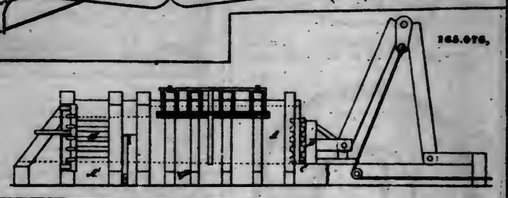
165,673.

1. The combination, with the reciprocating carrier H, provided with the polishing-stock A, and pivoted within a carrying-frame, J, whereby the said carrier and its polishing-stock may be oscillated within the carrying-frame in a direction transverse to its line of travel, as and for the purpose specified.



2. The combination, with the reciprocating polisher, of the bed B, having inclined planes *b*, and the vertically-adjustable rollers G G, of the frame C, having the inclined planes *a*, and the operating screw D, for adjusting said frame to elevate or lower the bed B, substantially as described.

165,674. FEEDING DEVICES FOR POLISHING-MACHINES. John A. Dayton, Brooklyn, N. Y. [Filed May 7, 1875.]



The polishing device consisting of a hollow stock for holding the polishing material, having a removable top and perforated bottom, to the latter of which a perforated pad is secured, the perforations in the stock being adapted to be opened and closed by means of a sliding gate, operated by a lever extending through the top, in order to distribute the material to the surface of the article being polished, substantially as described.

165,675. INVALID-BEDSTEADS. J. Deneeff and Felix Wilkin, Liege, Belgium. [Filed Apr. 10, 1875.]

The combination, with the swinging bed A and fixed frame D, of a stationary rack, I, attached to the frame, and a toothed wheel, H, a horizontal shaft, G, a pinion, K, and a worm, F, attached to and moving with the swinging bed, for oscillating said bed on its longitudinal axis, as herein shown and described.

165,676.

165,676. HAY AND COTTON PRESSES. John L. De Witt, Gardner, Ill., assignor of one-half his right to Nelson La Force, same place. [Filed Oct. 23, 1874.]

Brief.—The follower C is grooved on both faces, and serves alternately as a follower and platen. The spring-catch allows the follower to pass forward, but effectually bars its backward movement.

1. The combination, with press-box A and reciprocating head B, of loose pieces C, serving successively as follower and platen, in the manner described.

2. The combination, with unfastened follower C, of spring-catches E, having rear inclined and perpendicular front face, as and for the purpose specified.

165,677. CENTRIFUGAL MACHINES. George Dinkel, Jersey City, N. J., assignor to F. O. Matthiessen & Wiechers Sugar-Refining Company, same place. [Filed May 17, 1875.]

A revolving drum or basket for centrifugal machines, constructed with perforated walls of a continuous polygonal shape, substantially as described, whereby a perfect and uniform draining of the mass is effected, and enabling the flat outer sides of the molded mass to be cut more economically, as set forth.

165,678. EXTINGUISHERS FOR OIL-TANKS. Robt. Dittrich, Pittsburg, Pa. [Filed Apr. 26, 1875.]

Brief.—A steam-pipe, surrounded part way by another pipe, has its issue above the level of the oil in the tank. The pipe has its terminus inside a metallic cap filled with water. Another cap surmounts the first. The steam issuing from the annular orifice is diffused equally, and extinguishes the fire.

The apparatus for extinguishing fires in tanks by the introduction of steam, consisting of the pipes A *a* and cups B C, the former adapted to contain water, substantially as described.

165,079. BAND-FASTENERS. Edwin Dresser, Cambridge, assignor to Cambridgeport Dairy Company, Cambridgeport, Mass. [Filed Feb. 3, 1875.]

Brief.—A plate having a prong at each end has a bar struck from its center and bent downward, thus forming a slot to receive and clasp the ends of the band.

A fastener, A, for holding the ends of elastic and other bands, provided with a slot, *c*, and retaining-bar *b*, substantially as and for the purpose herein specified.

165,080. SPARK-ARRESTERS. Charles L. Eastman, Concord, N. H. [Filed Apr. 8, 1875.]

1. The combination, with the main smoke stack or flue, of a continuing flue, formed substantially as shown and described, to carry the contents of said smoke-stack from the perpendicular line of ascent thereof to the opposite side of descent thereof, upon a circle or curve, and from thence upon a diminished circle or curve to the points of discharge.

2. The combination of a smoke stack or flue for a locomotive or other engine, with a return pipe or pipes connecting with the fire-box of the engine and the pipes for the discharge of the smoke, steam, and gases, arranged with respect to each other, substantially as shown and described, so that any reaction from the expansion of the steam shall be upward and in the direction of said discharge-pipes for the smoke, steam, and gases, and downward and through the said return pipe or pipes for the sparks, cinders, and unconsumed fuel, substantially as described.

3. The deflector, in combination with such smoke stack or flue, the discharge-pipe, and return pipe or pipes to the fire-box of the engine, substantially as described.

165,081. BALE-TIES. William P. Elliott, Wilmington, N. C., assignor to himself and James Magie Fonshee, same place. [Filed Jan. 21, 1875.]

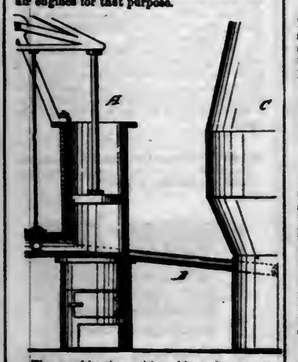
A wire bale-tie constructed in approximately the form of a figure 8, with crossed central portions, and ends bent inward, so that they will be drawn over the band by the effect of its own draft or pressure, as explained.

165,082. CAR-REPLACERS. William Elms, Dover, assignor to Alfred S. Varney, Old Town, Me. [Filed Jan 9, 1875.]

Brief.—A car-replacer consisting of two blocks having inclined ends, one block being flat on top, and the other beveled with a slope toward the adjacent main rail.

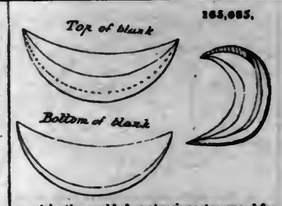
1. The block A in a car-replacing device, beveled at one or both ends, and upon one side, *b*, as described and shown.

2. In combination with said block A, the block B; beveled at one or both ends, and having its top somewhat higher than the top of the rail, as and for the purpose set forth.



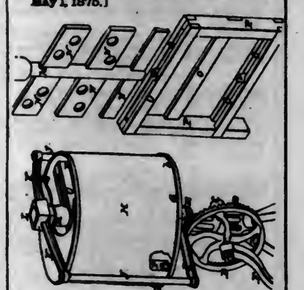
165,083. SIEVES. John Epeneter and Carl B. Grahl, Council Bluffs, Iowa. [Filed Apr. 6, 1875.]

The removable round sieve-bottom, consisting of the rim C, with the flange *d* bent outward and downward, and the wire-cloth D, fastened therein by a double fold, in combination with the exterior hoop A, provided with flange B and bead *a*, substantially as and for the purposes herein set forth.



165,084. HOT-BLAST APPARATUS. H. Essex, Meadville, Pa. [Filed Dec. 11, 1874.]

Brief.—Makes a hot blast for blast and cupola furnaces by using the exhaust of hot-air engines for that purpose.



The combination, with a blast-furnace or cupola, C, of one or more hot-air engines, A, and one or more pipes, B, connecting the exhaust of the engines with the furnace or cupola, for the purposes herein set forth.

165,085. TOE-PROTECTORS FOR BOOTS AND SHOES. Robert Britt and John Evitt, Baltimore, Md. [Filed June 5, 1875.]

A leather molded or struck-up toe-guard for boots and shoes, made from a blank of crescent form, having its curved edges skived on opposite sides, and with its inner thin curved edge intact, and molded into form, as described.

165,086. ROTARY CHURNS. Hannibal Felt, Odin, and P. P. Child, Carlyle, Ill. [Filed May 1, 1875.]

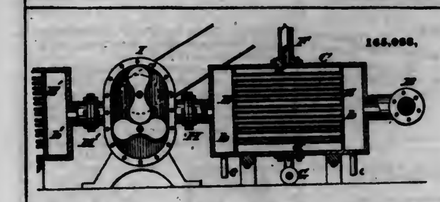
1. The combination of the driving-gear D E F, rotating frame J K, dasher M N O P, cream-vessel G, and stand A B H, substantially as set forth.

2. The dasher constructed with a rotary frame, M N, having bearings in a removable frame, O P, substantially as set forth.

3. The combination of dasher, constructed as set forth, with the cream-vessel having lugs Q, as and for the purpose set forth.

165,087. SPRING-SETTING MACHINES. Asa J. Fisk, Akron, Ohio, assignor of one-half his right to Henry H. Bugg, same place. [Filed May 20, 1875.]

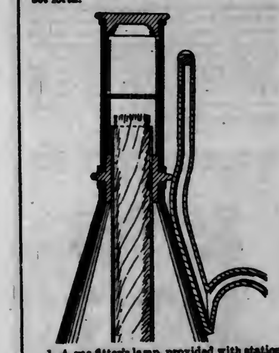
Brief.—For setting the shorter leaves, while hot, to the longer inner leaf, which latter is supported in the center upon a table, concave side downward, with ends confined after being sprung downward beyond their normal position.



The combination of jointed levers A and B with adjustable grooved wheels E E', substantially as described, whereby the said wheels are caused to approach each other by moving the levers toward each other, as and for the purpose specified.

165,088. DRYING APPARATUS. L. K. Fuller, Brattleborough, Vt. [Filed May 17, 1875.]

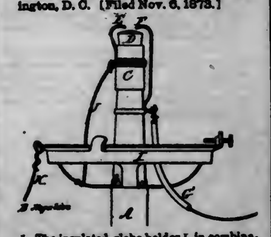
Brief.—Air is drawn through pipes surrounded by running water, to condense its moisture. It is then heated and passed into the drier, from which it passes again to the condenser and to the heater.



1. The within-described apparatus for devaporizing and heating the air of a drying-chamber, consisting essentially of a condenser, C, a blower, I, a heater, D, and pipes B B', constructed and arranged to operate in the manner substantially as shown, and for the purposes set forth.

2. For use in the process of devaporizing the air of drying chambers or kilns, the combination of a condenser, C, and blower, I, substantially as specified.

165,089. GAS-FITTERS' LAMPS. Joseph D. Galloway, Philadelphia, Pa. [Filed May 22, 1875.]



Brief.—The lamp has at the side a stationary blow-pipe, formed in the shape of a handle, a flexible pipe being swiveled thereto, as shown. The wick-tube is closed by a white-lead box, forming a cap-piece, for the purpose set forth.

1. A gas-fitter's lamp, provided with stationary blow-pipe at the side of the same, formed in the shape of a handle, in connection with a flexible air-tube swiveled thereto, substantially as and for the purpose set forth.

2. The combination of the wick-tube of the lamp with the closing white-lead box, serving as cap-pieces of the same, substantially as described.

165,090. BURNERS FOR ELECTRICAL GAS-LIGHTING. Samuel Gardiner, Jr., Washington, D. C. [Filed Nov. 6, 1873.]

1. The insulated globe-holder I, in combination with the wires J and K, the one connecting with one burner, A, through its electrode F, and the other with the next succeeding burner by the electrode F, with the said holders in the circuit throughout the series of burners, substantially as described.

2. The negative electrode E, as a part of, and a prolongation of, the separate metallic nipple C, and in combination with the burner-tip D, substantially as and for the purposes herein set forth.

3. The combination, with the burner and the metallic globe-holder I, of the wires J K, connecting said globe-holder with the negative electrode E and the insulated wire G' of the positive pole passing through and beneath the globe-holder, whereby a single burner may be lighted through the medium of said globe-holder, as herein set forth.

165,091. DROPPING-BOTTLES. Charles C. Garrett, Calvert, Tex., assignor of one-half his right to L. M. Openheimer, same place. [Filed Mar. 27, 1875.]

The bottle A, having eduction fluid-groove *d* and induction air-aperture *e*, and a stopper, B, having an eduction-groove, *c*, and an induction air-groove, *c*, combined and arranged substantially as and for the purpose specified.

165,092. PNEUMATIC RAILWAYS. Rollin R. Gregg, Buffalo, N.Y. [Filed Mar. 16, 1874.]

Brief.—The tube is composed of longitudinal stringers, cross-ties and planks forming the bottom, from which springs the arched shell, composed of planks, tongued and grooved, and fastened by clamping-bands. The stringers form a continuous guard by the side of the rails, to keep the train on the track. Water-guards J protect the timbers from wet. The propelling-diaphragm fits and nearly fills the tube, and is made in sections hinged on a line passing nearly through the center of area, but so that the slight excess of pressure on one side may hold them closed. By opening a valve in the section this preponderance is reversed, so that the segments open and stand edgewise to the line of force, thus relieving the pressure on the diaphragm to any desired extent. The valve-doors of the tunnel are made tight by rubber.

1. A pneumatic-railway tube formed of the longitudinal stringers O O, with cross-ties A A, and planks *b b* bolted thereto, in combination with the circular arched shell composed of the pieces *d d* and bands *e e*, constructed and arranged as and for the purposes set forth.

2. In combination with the track, the stringers O' O' forming a continuous guard the entire length of the road, to prevent the wheels jumping the track, as set forth.

3. In combination with the segmental sections A A, the auxiliary valves *i i*, arranged and operating substantially as and for the purpose shown and described.

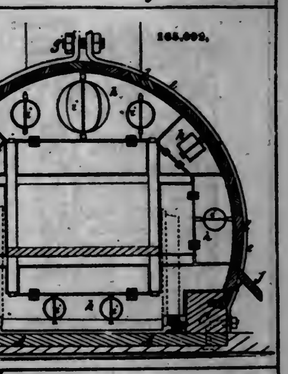
4. In combination with the curved sides *d d* and longitudinal stringers C C, the inclined water-guard J, as and for the purpose set forth.

5. The angular ribs *f f* in combination with the flat rubber strips *l l*, for excluding air from the pneumatic tube when the doors L L are closed, substantially as set forth.

6. A diaphragm for a pneumatic-railway car, portions of which are formed of hinged sections A A, substantially as and for the purpose set forth.

165,093. UMBRELLAS. G. G. Griswold, New York, N. Y. [Filed Feb. 19, 1875.]

1. The slotted hollow top notch or ring A, having its slots *a* constructed as described, and formed with locking corrugations *c* on its upper edge, substantially as specified.



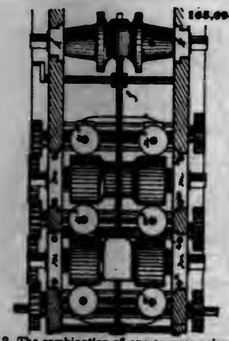
2. The cap D, having locking indentations *d*, in combination with the slotted hollow top notch or ring A, having corrugations *c* on its upper edge, essentially as described.

3. The split-barrel G of the runner, constructed with annular corrugations *g* at its opposite ends or throughout its length, in combination with the wire-rings A, applied internally or externally thereto, substantially as described.

4. The combination of the upper annular corrugations *g* of the runner with the slotted hollow notch or ring A' and the stretchers H, essentially as specified.

5. The trough-shaped ribs B, indented from the outside, as at *a*, in combination with the stretchers H, constructed to receive the internal projections formed by said indentations within them, to unite the ribs and stretchers, substantially as shown and described.

6. The spring L, having hook *n* on its free end applied to the surface of the stick, in combination with the hole *l*, of enlarged size, on the one side of the stick, essentially as specified.



165,094. MACHINES FOR MAKING HOLLOW BEAMS AND TUBES. Ignatius Hahn, Pittsburg, Pa. [Filed Mar. 9, 1875.]

Brief.—Three pairs of vertical rolls, independently adjustable laterally at both ends; two pairs of intermediate horizontal rolls, whose operative surfaces are regulated, as to length, by screw-collars; a pair of circularly-grooved welding-rolls, and two or more mandrels. A skelp is first passed through the welding-rolls and over a round mandrel, which welds the joint, and then successively through the other rolls and over other mandrels, by which the tube—at first cylindrical—is gradually converted into a rectangular or other angled tube.

1. A series of two high horizontal plain rolls, and one or more pairs of vertical plain rolls, arranged in line, and combined with a pair of welding-rolls, substantially as and for the purpose specified.

165,094.

2. The combination of one or more pairs of horizontal rolls with one or more pairs of vertical rolls, any two or all of the rolls being provided with universal couplings, the coupling spindles whereof are adjustable and provided with suitable devices, by which they are retained in a parallel position at all times, substantially as and for the purpose specified.

3. The combination of one or more pairs of two high horizontal plain rolls with one or more pairs of vertical plain rolls, and with a mandrel located centrally of the rolls, substantially as and for the purpose specified.

4. In a mill for rolling metals, the combination of two rolls, one or both of which are provided with universal couplings and coupling-spindles, the coupling-spindles being journaled in adjustable boxes, which preserve the parallelism of the coupling-spindles, substantially as and for the purpose specified.

5. In combination with the rolls having threaded shafts, the adjustable collars and jam-nuts, substantially as and for the purpose specified.

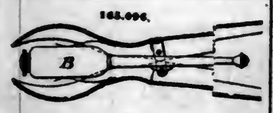
6. In combination with rolls having oscillating boxes *r r* and universal couplings *w w'*, the right-and-left-hand-threaded bolt *s*ⁿ and independent screws *t t*, for the purpose specified.

7. The combination of two rolls, one or more of said rolls having universal couplings *w w'* and oscillating boxes *r*, substantially as and for the purpose specified.

165,095. GAS-BURNERS FOR HEATING PURPOSES. Wm. B. Hanks, Wellesley, Mass., assignor to Samuel G. Reed, same place. [Filed Dec. 22, 1874.]

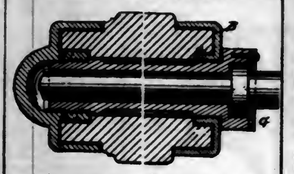
Brief.—A central gas-passage encircled by a series of air-passages parallel therewith.

The combination of the tube *a* with the removable end ring *f*, having a central gas-passage and a series of air-passages encircling the gas-passage, and leading into a chamber, substantially as described.



165,096. GLOVE-STRETCHERS. David S. Hayward, New York, N. Y. [Filed June 11, 1875.]

1. A glove-stretcher composed of tubular or hollow sections, substantially as and for the purpose specified.



2. The combination of a glove-stretcher with a powder-receptacle, B, either elastic or non-elastic, attached to said stretcher, and arranged to operate in connection therewith, in such a manner that the powder may be ejected in the interior of the glove while the jaws of the stretcher are expanded therein.

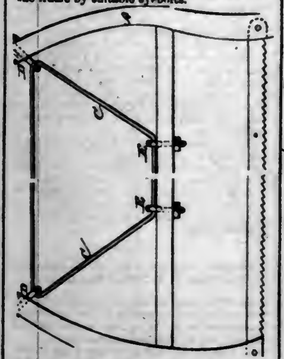
3. The spring device shown in Fig. 4, consisting of the spring *h* and hinging-piece *f f*, made in one piece, and perforated at *i i* to receive the hinging-rivet *e*, substantially as shown.

165,096.

165,097. VEHICLE-HUBS. John C. Heaney, Boston, Mass. [Filed May 6, 1875.]

The combination, with the wooden hub A, of the metallic bands or caps B and C, provided with interior and exterior flanges, as shown and described, and for the purposes herein set forth.

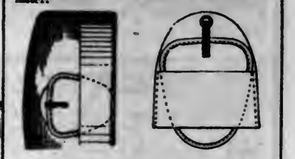
165,098. SAFETY-CATCHES FOR REVOLVERS. Charles W. Hopkins, Norwich, Conn., assignor of one-half his right to Merwin, Hulbert & Co., New York, N. Y. [Filed June 7, 1875.]



1. In a revolver fire-arm, a locking device on the anterior of the hammer, constructed to operate with the axial pin of the cylinder, as and for the purpose described.

2. The combination of the axial pin A, provided with the annular notches *s s'*, the stop-lever *d*, and the locking-pin C on the hammer B, as and for the purpose described.

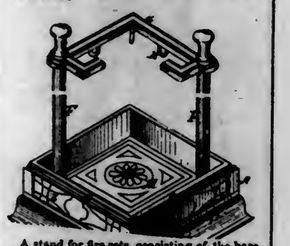
165,099. BUCK-SAW FRAMES. Charles A. Hurlburt, Ypsilanti, Mich. [Filed May 6, 1876.]



Brief.—The saw-blade is strained by means of a continuous metal rod attached to the upper ends of the side pieces and cross-bar of the frame by suitable eyebolts.

In a saw-frame, the combination of the continuous rod C, with the eyebolts E E and D D, and bars A A, and cross-bar B, constructed and arranged to operate as shown and described, and for the purposes specified.

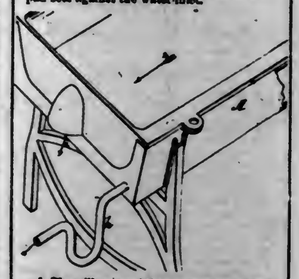
165,100. HATS AND CAPS. Moritz Isidor and Ferdinand Hein, New York, N. Y. [Filed June 2, 1875.]



Brief.—The ear-protectors are connected to the inside of a hat or cap by a retracting-spring, and slide in a pocket formed between the sweat-band and side crown. They may be also connected to an independent guide-frame, in the same manner as they are to the hat, the frame, in turn, being connected to the latter.

1. The combination of a supporting guide-frame with an ear-protector which slides in said frame, and with a spring which forms the connection between the ear-protector and the frame, all constructed and operating substantially in the manner shown and described.

2. The combination of an ear-protector and a connecting-spring with a pocket constructed in a head-covering, said ear-protector adapted to be vertically moved in and out of the pocket, substantially as described.

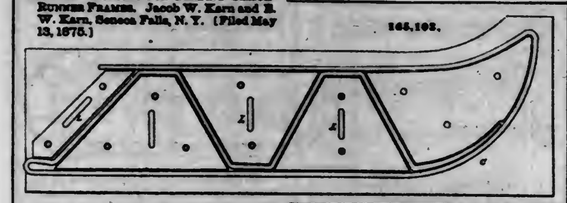


165,101. STANDS FOR FIRE-IRONS. Edwin A. Jackson, New York, N. Y. [Filed July 5, 1873.]

A stand for fire-sets, consisting of the base A, constructed as specified, having the tile floor M, the standards F F, and cross-piece or rest G, all as and for the purpose herein set forth.

165,102. MILK-COOLERS. Wm. H. Johnson, Delhi, N. Y., assignor of one-half his right to H. A. Pitcher and F. A. Ray, same place. [Filed May 31, 1875.]

Brief.—The connected metallic milk-pan sets into one end of the water-vat, and has an overhanging outlet. The outlet of the vat regulates the height of the water by turning in its screw-threaded bearing. An ice or cream pan sets against the water-inlet.

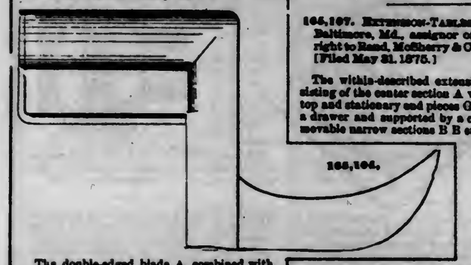


1. The milk-pan and the water-vat combined, the discharging end of the pan forming the major part of the discharging end of the vat, and fitted by a tight joint upon the end portion of the vat, and the pan having its discharge-passage outside of the vat, above the bottom of the same, substantially as described.

2. The combination of the flanged ice or cream box, the water-vat and the milk-pan, all constructed substantially in the manner shown and described.

3. The combination of the adjustable regulating bent pipe *h*, water-vat A, and milk-pan B, substantially as and for the purpose described.

165,103. DEVICES FOR BENDING SLEIGH-RUNNER FRAMES. Jacob W. Karn and B. W. Karn, Seneca Falls, N. Y. [Filed May 13, 1875.]

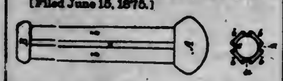


165,103.

The base-plate G, provided with holes, in combination with the detachable segmental plates having dowel-pins O and handles L, substantially as and for the purpose described.

165,104. TOBACCO-KNIVES. Alfred Lane and J. H. Cullom, Charlotte, Tenn. [Filed July 12, 1874.]

Brief.—The handle is of a single piece of wood, with two parts at right angles to each other. In the end of one part the blade is secured in a slot, and the other is furnished with a metallic guard for the finger. The knife is to be used first for splitting open the stalk, and then for cutting it off.



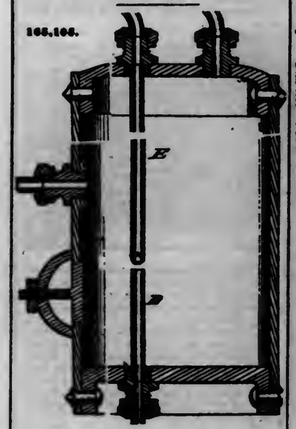
The double-edged blade A, combined with the guarded handle, whose two parts, of same piece of wood, are at right angles with each other, all as and for the purposes described.

165,105. UPRIGHT BOILERS FOR RANGES, STOVES, &c. James Lawton and James A. Gibson, Cincinnati, Ohio. [Filed Aug. 14, 1874.]

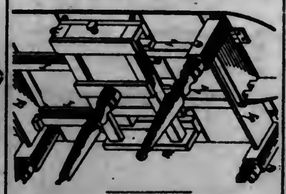
The combination, in an upright boiler, of feed-pipe E and heater-pipe D, the pipe E being placed directly over pipe D, as for the purpose set forth.

165,106. UMBRELLA-HANDLES. Herbert G. Mackinney, North Attleborough, Mass., assignor to Albert J. Smith, Hervey Hoestis, and Herbert G. Mackinney, same place. [Filed June 15, 1875.]

The handle, composed of the two series of flanged strips *a b*, the socketed body or tube *c*, the cap ring B, and the socketed knob A, all constructed, combined, and arranged substantially as described.



165,107. EXTENSION-TABLES. J. F. Martin, Baltimore, Md., assignor of one-half his right to Rand, McSherry & Co., same place. [Filed May 31, 1875.]

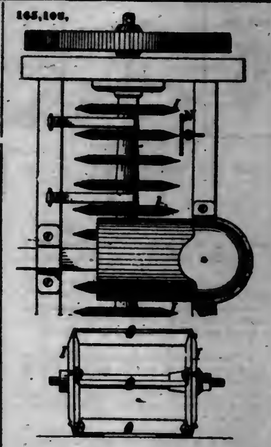


The within-described extension-table, consisting of the center section A with stationary top and stationary end pieces G G, containing a drawer and supported by a central leg, the movable narrow sections B B supported upon

165,104.

legs D D and side pieces E E, and the slides I I connected to the sections B B, and movable directly under the stationary top of the central section and over the drawer, all constructed substantially as set forth.

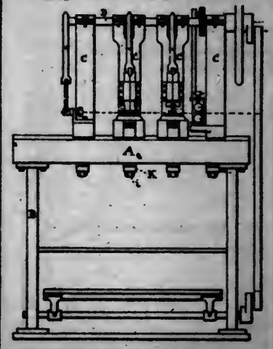
165,106.



165,108. HARROWS. John Masters, West Alexandria, Ohio. [Filed Apr. 17, 1876.]

Brief.—The frame consists of a rectangular parallelogram mounted on wheels, and having a tongue secured to the front and rear beams at their middle. Two sets of slotted hangers depend from the frame, and in these are boxes, which easily move up and down, and in which are mounted revolving shafts. Upon these shafts are placed at short intervals, separated by thimbles, cutting and revolving disks. By removing all but the two outer disks on each shaft, and bolting to these a series of cutting-knives, a stalk-cutter is produced. Adjustable markers are attached to the rear beam of the frame.

165,109.



1. In combination with the outer collars I and J of each section, the cutters O O, adapted to be secured at their ends to said collars, and having their cutting-edges upon a line with the peripheries of the same, substantially as and for the purpose shown.

2. In combination with the main frame of the harver, the check-row markers E and M, pivoted to or upon the rear side of said frame, and capable of being brought into or removed from contact with the ground, substantially as and for the purpose set forth.

165,109. TAG-MACHINES. H. D. Mentzel, Baltimore, Md. [Filed Mar. 23, 1876.]

Brief.—The parts are made interchangeable and adjustable for different-sized tags.

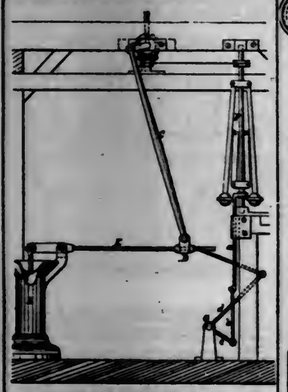
The longitudinally-grooved shaft D, carrying the punch, cutter-shear, and intermittent feed-actuating mechanism, undergrooved stands C, bed A, having the raised edges fitting the grooved stands, and stand-securing devices K and *i*, all combined and operating substantially as and for the purposes herein specified.

165,110. CLASPS FOR POCKET-BOOKS. I. Messer, New York, N. Y. [Filed May 20, 1875.]

The cap B, provided with a radiating tail, *c*, and laterally-projecting arms *c*, said tail and arms being made out of one and the same piece of sheet metal with the cap, in combination with a chamber, *b*, formed in the supporting-plate A, and with a spring, *f*, and stud *d*, all constructed and operating substantially in the manner shown and described.

165,110.

165,111.



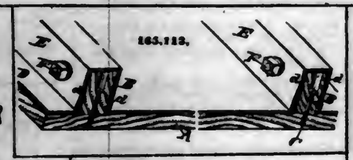
165,111. WATER-SPRINKLING NOZZLES. C. H. Miller, Buffalo, N. Y. [Filed June 6, 1874.]

Brief.—By turning the rose-head upon the jet tube, so that the water-passages in the former will register with corresponding passages in the latter, either a spray or a jet, or a spray and jet combined, may be thrown.

1. The center B, in combination with tube A, substantially as and for the purposes described.
2. The movable closely-fitting outer cover L for said center B and tube A, substantially as and for the purposes specified.
3. The combination of the openings or holes *c*, *o*, and K in the center B with the openings or holes *n* and *r* and the cavity *x* in the outer cover L, for the purposes described.
4. The movable outer cover L and center B as a shut-off, when arranged and combined substantially as described.

166,112. PUMP-GOVERNORS. C. W. Mills, Rochester, N. Y. [Filed Mar. 20, 1875.]

Brief.—The vertical windmill-shaft connects by pulleys and belt to a common governor; also, by crank-shaft and connecting-rod, to a sliding block on the pump-lever. The governor, by rods and levers, connects with the slide, and by its own action adjusts it on the pump-lever, giving the mill more or less work, as the wind is stronger or lighter.

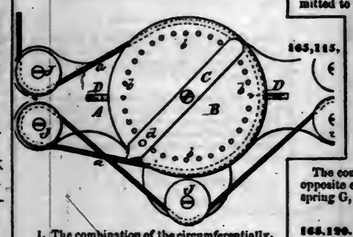


1. The combination, substantially as herein set forth, of lever E, slide D, rod C, and governor F, with the necessary connecting devices, all arranged to automatically increase or decrease the stroke of a pump.
2. The combination of slide D, pump-lever B, crank-rod C, rocker-shaft O, with its arms and connecting-rods *a b c d e*, for the purpose substantially as described.

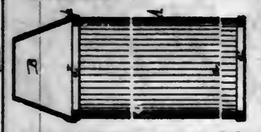
166,113. MINERALIZED ROOFINGS. Samuel T. G. Mowell, Washington, D. C. [Filed June 18, 1875.]

The combination of the sheathing A, vertical ribs B, roof-sheets D, vertically-upturned edges *d*, the sheet-metal caps E, and through-bolts F, all as herein described, for the purposes set forth.

165,112.



165,112. SCALE AND BALANCE STANDS. R. Murdoch, Baltimore, Md. [Filed Aug. 31, 1874.]



1. The balance-stand herein described, consisting of the removable U-shaped base B, removable upright C, horizontal arm E, provided with the vertically-adjustable hook-rod *b*, from which the scale-beam J is suspended, and the removable arms F G and H I, constructed and operating as and for the purposes set forth.
2. The removable upright C, having the arm E, provided with the vertically-adjustable hook-rod *b*, for suspending and adjusting the scale-beam J, as set forth.

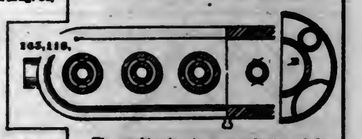
165,115. CHECK-ROW ATTACHMENTS FOR CORN-PLANTERS. Madison Newton, Kentland, Ind. [Filed June 17, 1875.]

1. The combination of the circumferentially-grooved wheel E, provided with a concentric series of holes, *b*, and the adjustable eccentric bar C, for the purposes herein set forth.
2. The combination of the grooved wheel E, with holes *b*, adjustable eccentric *c*, cord *a*, and pulleys J, all arranged on a frame, A, to operate the handles D D of a corn-planter, substantially as and for the purposes herein set forth.

166,116. LAMP-CHIMNEYS. George Niedermair, Chicago, Ill., assignor of one-half his right to Charles Kopp, same place. [Filed Apr. 20, 1875.]

The combination of the chimney A, composed of separate glass rods *a*, secured in metallic channel-rings, with the glass cone B, substantially as described and shown.

165,117. COMBINED FORKS AND SKIMMERS. Aaron B. Nott, Fairhaven, Mass., assignor of part of his right to D. Frawley, Wm. J. Frawley, O. H. Bowen, and W. Bonneville, same place. [Filed Dec. 26, 1874.]



The fork A, having a slot, *c*, in its handle, in combination with the perforated skimmer B, pivoted in said slot, and provided with a shank, *e*, having a cam, *p*, and spring, *r*, substantially as described, and for the purposes set forth.

165,118. STEAM-RADIATORS. R. F. Osborne, St. Paul, Minn. [Filed May 31, 1875.]

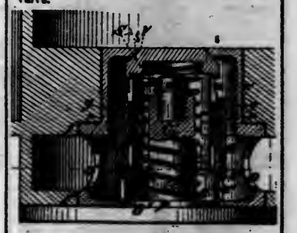
Brief.—The annular steam-space between the steam and air tubes is divided into cells by the small tubes or diaphragms.

165,116.

The combination, in a steam-heater, of the exterior tubes C and the interior tubes D, having the intervening chamber or space between the two divided into a series of passages, for creating a circulation of steam in the said space, substantially as and for the purpose described.

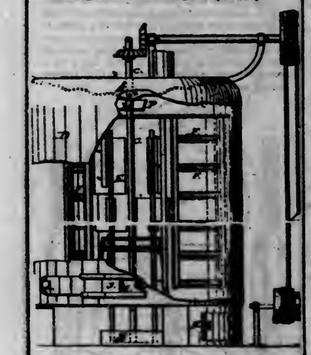
165,119. RELIEF-VALVES. Trent T. Prosser, Chicago, Ill. [Filed Mar. 1, 1875.]

Brief.—Within the valve case are placed cores, to which is fastened a spring. Screws pass through the valves into said cores, by means of which the tension of the spring is increased or diminished to resist a greater or less degree of pressure. When the pressure of the fluid exceeds the tension of the spring, the valves are opened, and the excess permitted to escape.



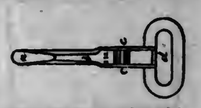
165,115.

The combination of the valves E, arranged opposite each other within the coupling, and spring G, as and for the purpose specified.



166,120. VALVES AND BOXES FOR AIR-COMPRESSORS. George H. Reynolds and James Miller, New York, N. Y., assignors of one-half their right to C. H. Delamater and G. H. Robinson, same place. [Filed Apr. 26, 1875.]

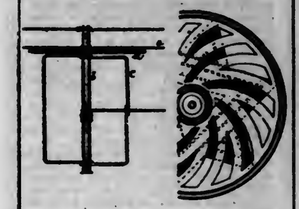
Brief.—The valve is provided with cutting-edges, and the valve-guide with grooves, to prevent sticking. The spring-guide has a rubber cushion in the upper port, to cushion the valve.



1. The combination of the hollow cylindrical valve V, having the scraping openings, with the outer cylindrical seat G, constructed with grooves *g*, having scraping edges, all substantially as described.
2. The bonnet B having the disk *p*, in combination with the valve-box C C', having the valve-seat *s* and lower opening O', in which the disk *p* fits, the valve-spring guide G' rising from the said disk C, and provided at its upper end with a spring, S', and the valve V arranged over said guide, all substantially as and for the purpose described.

165,121. FRUIT-DRIERS. A. J. Reynolds, Chicago, Ill. [Filed June 25, 1875.]

1. In a fruit-drier, a condenser extending centrally through the entire length of the dry-house, and also filling, or nearly filling, the top thereof, substantially as and for the purposes herein set forth.
2. The revolving shelf-frame F, in combination with the fans E, operated by hollow shaft C, for the purposes herein set forth.
3. The combination of the shelf-frame F and fans E with the furnace K and condenser A C, substantially as and for the purposes herein set forth.
4. The combination of the drip-pan P with the condenser A and hollow shaft C, substantially as and for the purposes herein set forth.

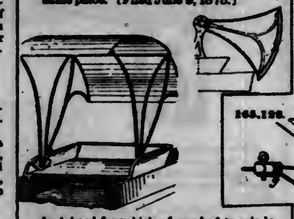


165,122. SNAP-HOOKS. George Reynolds, Unionville, Conn. [Filed May 21, 1875.]

1. The sliding hook *g*, in combination with the recessed tongue *b*, whereby the said tongue may be opened, closed, and locked, in the manner and for the purpose specified.
2. The slide *c*, with its hook *g*, in combination with the recess *b'*, upon the rear end of the tongue *b*, and a spring, *e*, placed within the hollow rear chamber of a snap-hook, for opening, closing, and locking the tongue, substantially as herein described.

165,123. TOY CHROMATROPES. Thos. J. W. Robertson, Washington, D. C. [Filed Apr. 27, 1875.]

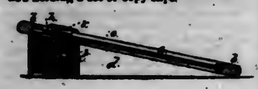
Brief.—In connection with the stem of a whirling toy, loose disks, colored or marked, are employed, and a skeleton disk arranged to be secured to the tapered point of the stem, so as to leave room between for the light to strike the surface of the outer disks.



1. The combination of a spindle or disk, having a device by which it may be continuously revolved alternately in opposite directions, with a skeleton chromatropic disk and a loose disk or disks suitably colored and arranged to revolve independently of said skeleton chromatropic disk, substantially as set forth.
2. In combination with a skeleton chromatropic disk, having a device to give it a positive alternating revolving motion, a colored loose disk, card, or plate, arranged to revolve independently of the skeleton disk, substantially as set forth.
3. The combination of the disk *a*, firmly secured to spindle *b*, loose handle *c*, cord *d*, and the colored loose disk *e*, substantially as described.
4. The combination of the subject matter of the last claim with a skeleton chromatropic disk arranged to be secured to spindle *b* and move therewith, substantially as set forth.

166,124. TOOL-HOLDING DEVICES. Alvaro G. Eybert, Attica, N. Y. [Filed Mar. 11, 1875.]

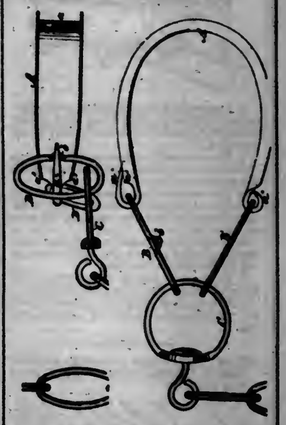
1. The combination of the swiveled bent rod D, ball-end socket-joint clamp E, grinding-rod F, and a tool-holder, G, substantially as and for the purpose described.
2. In combination with the tool-holder G, the adjustable tool-clamp H, having the pieces *j j*, legs *k k*, pivoted jaws *l l*, wedges *n n*, and springs *s s*, all as and for the purpose specified.



165,125. HOODS FOR VEHICLES. William H. Rowe, Washington, D. C., assignor of one-half his right to Quinton Corwine, same place. [Filed June 9, 1875.]

1. A hood for vehicles formed of two independent sections, one of said sections being hinged and arranged to be thrown to the front or rear of the other section, substantially as described.
2. The hood, formed of two separate sections, arranged as above described, and hinged to the body or seat of the vehicle, so that both sections may be thrown back of the seat, substantially as and for the purpose set forth.

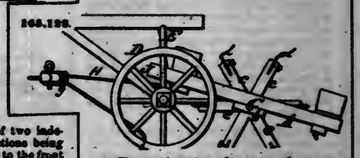
166,126. SLATES. Chas. C. Shepherd, Passaic, N. J. [Filed Nov. 24, 1874.]



Brief.—A slate and portable desk combined, and holding a set of copy-slips.

1. The slate *a* and frame *b*, with the box *c*, projecting below the plane of the slate to form a support, and the movable copy-slate *d*, all combined and arranged substantially as and for the purposes set forth.
2. The combination, with a slate-frame, of the spring *i*, strip or tape *v*, incline *c*, and movable copy-slat *d*, substantially as set forth.

Dated November 19, 1874.

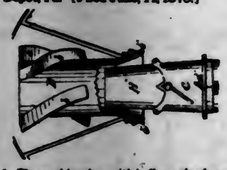


166,127. HOPPLES. John Shive, Centre Hill, Ark. [Filed May 27, 1875.]

A hopple, formed of one unjointed arc-piece shouldered at *c'*, and the three links B C B, constructed and connected as and for the purpose specified.

166,128. CORN-STALK CUTTERS. Albert C. Smith, Fort Madison, Iowa, assignor of one-half his right to T. B. Jackson, same place. [Filed Mar. 13, 1875.]

Brief.—A pair of wheels, an arched axle-tree, a tongue, and braces constitute the frame-work of the machine. The stalk-cutter, consisting of a shaft with radial arms, armed with knives, and mounted upon a rectangular frame, is secured to the arched axle-tree by a single link. Boxes are mounted upon the frame for increasing the weight by means of stones or other matter. Hooks to straighten the stalks upon the ground are attached to the double-tree.



1. The combination of a cutter-frame, A, transporting-carriage D E, and link G, loosely connecting the frame and the carriage, whereby the former is allowed to oscillate on its draft-axis to adapt itself to the inequalities of the soil, substantially as specified.
2. The cutter-bearing frame A, provided with laterally-adjustable arms J, in combination with the crank-arm E of a transporting-carriage, substantially as specified.

166,129. TREATMENT OF LEATHER. Hugh Smith, Newark, N. J. [Filed Dec. 16, 1874.]

Brief.—First compound: Glue, starch or flour, and glycerine, with any suitable coloring material. Second compound: Gum-shellac, India-rubber, and glycerine, with naphtha as a solvent.

As an improvement in the art of treating leather, the compounds composed of the ingredients named, in about the proportion given, for the purpose specified.

165,120. EXHAUST MECHANISMS FOR LOCOMOTIVES. William Stamp, Susquehanna Depot, Pa. [Filed June, 14, 1875.]

1. The combination, with boiler and exhaust-pipes a a, of the tube C, provided with adjustable spring-plates D D, as and for the purpose described.

2. The combination, with plates D D in tubes C, of the intermediate cam-shaft, as and for the purpose set forth.

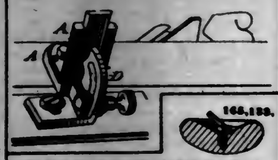
3. The described combination of doubled spring-plate D, grooved cross-bar F, and detachable pin G to hold the spring, in the manner specified.

4. A tube, C, provided with spring, cam-shaft, and pin d, made in two half-sections, as and for the purpose described.

5. The pipe B, having the external spiral flanges b, as and for the purpose set forth.

6. The nozzle H, having one or more internal spiral flanges, as and for the purpose specified.

165,121. MEASURING PACKAGED FABRICS. Emmi. C. Talcott, Ashtabula, Ohio. [Filed July 3, 1875.]

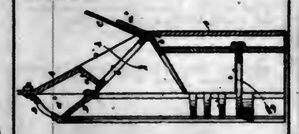


As an improvement in the art of measuring fabrics, indicating in graduated numbers the yards the belt contains, the numbers being printed, stamped, or otherwise arranged upon or in the edge of the fabric, and on the yard folds thereof, substantially as and for the purpose specified.

165,122. GUIDE FOR BENCH-PLANES. H. P. Taylor, Minerva, Ohio, assignor to himself and F. A. Painter, same place. [Filed May 26, 1875.]

Brief.—The double adjustable guide can be readily set to any angle, and to any part of the face of the plane, so that the whole width of the bit can be used, and the true face of the plane preserved by means of a rectangular plate having a dovetail groove in its under side, adjustably attached to the side of the plane, and to which is pivoted a slotted and graduated quadrantal piece, which can be set to any angle by a single set-screw, and is attached to the beveled guide-strip by a slotted base-plate.

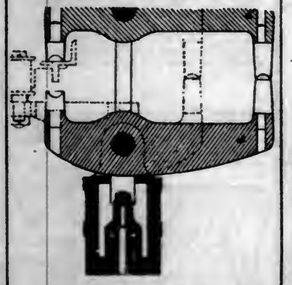
The combination of plate A, slide C, single set-screw C', and quadrant D, all constructed and arranged as and for the purpose specified.



165,123. TRUSSES. Marshall Turley, Council Bluffs, Iowa. [Filed Apr. 16, 1875.]

Brief.—A coil-spring carries a sponge-covered pad, and is secured by a boat portion of its base, so as to slide upon the body-belt.

The conical spiral spring B, having a concavo-convex pad, covered with sponge, secured to one end as described, the other end being formed into a D-shaped loop, as set forth, by means of which the pad may be attached to the belt; A, and slide freely on the same, substantially as and for the purposes herein specified.



165,124. FIRE-PLACES. Wm. Tweeddale, Brooklyn, N. Y., assignor to J. L. Mott Iron-Works, New York city. [Filed Mar. 6, 1875.]

The combination of the back plate A, inclined forward at the top, forward and outward at the sides, and provided with an opening, a^1, and flanges a^2 a^3, the middle plate B, inclined forward at the sides and top, and provided with an opening, b^1, the front plate D, secured to the middle and back plates, and the damper C, all constructed and relatively arranged as herein set forth.

165,125. RIVETING-MACHINES. Ralph H. Tweddell, Sunderland, Great Britain, assignor to Wm. Sellers, Philadelphia, Pa. [Filed June 26, 1872.]

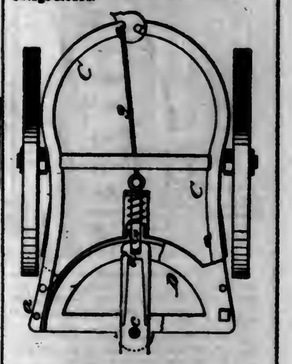
Brief.—The machine is portable, and consists of a riveting-die and holder, one or the other attached to and moved by a piston in a cylinder that communicates with an accumulator through the medium of a valve, not self-acting, but moved by the operator. It operates without a blow, with uniform pressure, that may be modified, prolonged, or discontinued at will, but which heads the rivet at one single progressive movement.

1. The combination of a cylinder and a piston, a riveting-die and a holder, an inlet and an outlet valve, and an accumulator, the combination being and operating substantially as set forth.

2. The combination of a cylinder and a piston, a riveting-die and a holder, a retracting-cylinder, and an accumulator, the combination being and operating substantially as set forth.

3. The combination of the compressing-cylinder, its piston, and two levers, one carrying a die and the other a holder, substantially as set forth.

4. The combination of a compressing-cylinder, its piston, two levers, and an adjustable connection, substantially as and for the purposes set forth.



5. The combination of two levers of the third order, provided with ball-and-socket supports at one end, and a die and a holder at the other, substantially as and for the purposes set forth.

6. The flexible self-packing hydraulic-pressure cylindrical-joint connection, substantially as described, and shown in Figs. 9 and 16.

7. The flexible self-packing hydraulic-pressure ball-and-socket-joint connection, substantially as described, and shown in Figs. 9 and 16.

165,126. CULTIVATORS. Theodore F Vandegrift and William Vandegrift, Wabash, Ind., assignees of one-half their right to O. Wade, same place. [Filed May 1, 1875.]

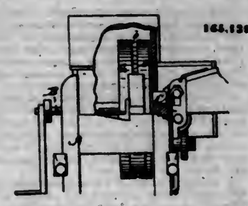
Brief.—A box or double cross-piece connects the curved frame. Between its members the tongue is pivoted, and held rigid by a spring-catch. When released the tongue swings around.

The frame C, provided with bounds a a, formed of a single piece, in combination with the box D, recessed and pivoted tongue E, spring-latch g, and lever d, substantially as described, and for the purpose set forth.

165,127. PAPER BOXES. J. R. Van Vechten, Brooklyn, N. Y. [Filed June 11, 1875.]

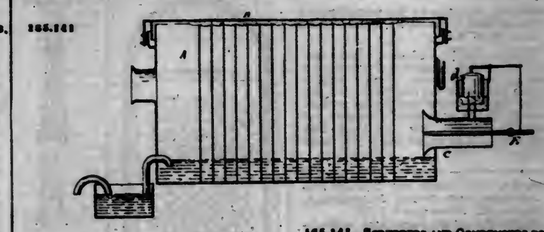
A paper box having its body composed of a tube, A, and its head of a separate piece, B, supported, re-enforced, and secured to the body by means of the crimped and tarsel in portion c, and having the central portion of the head countersunk within said portion c, substantially as shown and described.

165,128. FEED-CUTTERS. Elijah Wagoner, Westminster, Md. [Filed Mar. 17, 1875.]



Brief.—A cutting and grinding disk revolves upon a horizontal shaft. On the cutting side this shaft carries a pinion, which connects with other gear-wheels, and gives motion to a smooth lower feed-roller and an upper flexible shaft, which revolves an upper fluted feed-roller. The material thus presented to the knives is cut and delivered through openings to the grinding side of the revolving disk, where the surface-teeth act by concert with corresponding teeth on a fixed plate. The fixed plate is cut away to permit the escape of the cut feed, and to facilitate the removal of the cutting-wheel with its shaft.

1. In combination with the corrugated yielding feed-roller I, the journal i, having square tenon s, the operating-pinion y', shaft h of the operating-pinion, having also square tenon s, and the connecting-shaft p, having square recesses or sockets in its ends, substantially as and for the purposes herein set forth.



2. The combination of the revolving disk D, provided with slots e', knives E, and teeth or projections b, and the circular stationary toothed plate G, having a cut or opening, substantially as and for the purposes herein set forth.

3. The arrangement of the guard or fender I, secured to the frame A, with relation to the disks D and G, as and for the purposes set forth.

165,140. BURNISHERS FOR PHOTOGRAPHS. Emile R. Weston, Bangor, Me., assignor to J. P. Bass, same place. [Filed Apr. 8, 1874.]

In a burnishing-machine, the flange C, projecting downward from the burnisher-supporting plate A, substantially as described and shown.

165,141. SCRUBBERS AND CONDENSERS FOR ILLUMINATING-GAS. William H. White, Brooklyn, N. Y., assignor of two-thirds his right to Charles E. Nellson and Henry M. Martin. [Filed May 1, 1875.]

Brief.—The screens are set vertically, and are separately adjustable and removable.

1. The process of scrubbing, condensing, and purifying crude gas, which consists in passing it through a number of screens, having their orifices relatively arranged as described, said screens being placed vertically, so that the impurities shall collect upon the surfaces of the screens and present a moist and dripping surface to the passing gas, and attract further impurities until their accumulation causes them to trickle down, all substantially as described.

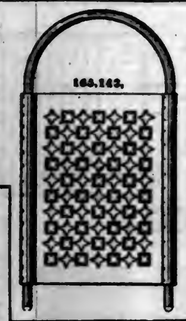
2. The process of preventing the deposit of the light-giving elements of illuminating-gas by condensation, which consists in scrubbing the crude gas by passing it through a number of screens in a closed case, the friction and pressure generating heat, substantially as described.

3. The process of cleaning the scrubber by passing steam through the same automatically when required.

4. The combined scrubber, condenser, and purifier, consisting of a box having inlet and outlet pipes for gas, and provided with vertical screens, as described.

5. The case A, packing F, and removable top B, sealed, as described.

6. The combination of the scrubber, the steam-pipe E, entering the scrubber, and provided with a suitable valve, and the gas-inlet pipe C, as and for the purpose described.

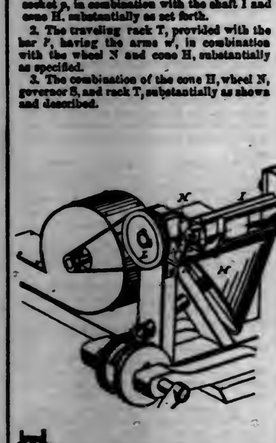


7. The combination of the pressure-gage on the scrubber with the valve in the steam-pipe described, for the purpose of automatically regulating the supply of steam, as set forth.

165,142. MATCH-SAFES. Horace C. Wilcox, West Meriden, Conn., assignor to the Meriden Britannia Company, same place. [Filed June 17, 1875.]

The case A, constructed to form the match-receiver B, and the space for waste below, combined with the hinged cover C, in connection with the device for closing the said waste-space, substantially as described, so that the opening and closing of the cover correspondingly opens and closes the waste-space beneath.

165,142. CULINARY GRATERS. Erastus Woodward, Charlestown, Mass. [Filed June 12, 1872.]



As an article of manufacture, a grater constructed as above described, consisting of a thin metallic plate having its edges rolled to receive the ends of the wire handle, and provided with rectangular perforations punched through from opposite sides alternately, and each alternate perforation being placed diagonally of the plate, as and for the purpose set forth.

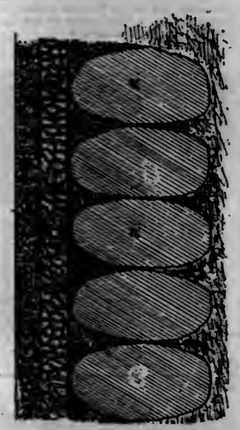
165,144. APPARATUS FOR TRANSMITTING AND REGULATING MOTION. Joseph Rengel, Quincy, Ill. [Filed Apr. 6, 1875.]

Brief.—The motion transmitted to the device to be operated is automatically reversible, by means of the traveling rack engaging with the pinion upon the main gear-wheel shaft

1. The wheel N, provided with the ball and socket *p*, in combination with the shaft I and cone H, substantially as set forth.
2. The traveling rack T, provided with the bar F, having the arms *w*, in combination with the wheel N and cone H, substantially as specified.
3. The combination of the cone H, wheel N, governor S, and rack T, substantially as shown and described.

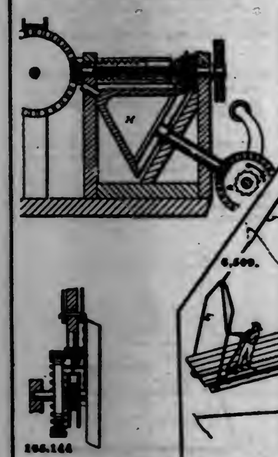
165,143. COMPOUNDS FOR PRESERVING BEER, &c. Wm. Risser, New York, N. Y. [Filed June 9, 1875.]

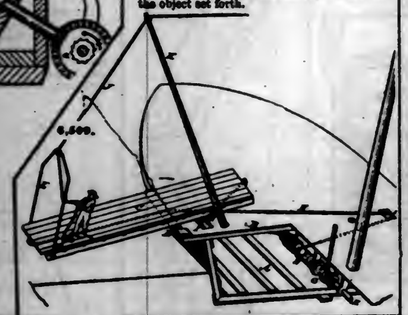
A compound for preserving beer and other liquids from souring, made of salicylic acid and bicarbonate of soda mixed together, substantially in the manner and about in the proportion set forth.



6,510. RUBBER HOLDERS FOR LEAD-PENCILS. John B. Blair, Philadelphia, Pa., assignor, by mesne assignments, to the Rubber Tip Pencil Company, New York city. Patent No. 66,982, dated July 23, 1867. [Filed Apr. 1, 1875.]

Brief.—Combines with a lead-pencil a solid elastic erasive head, provided with a longitudinal socket to receive and grasp the end of the pencil.





1. The combination, with a pencil or other similar article, of a solid elastic erasive head, provided with a socket longitudinally in the same, to receive and grasp one end of the pencil or other similar article, or a tenon extending from it, substantially in the manner and for the purpose shown and described.
2. A solid elastic erasive head for a lead-pencil or other similar article, provided with a socket to receive one end of the lead-pencil or other similar article, or a tenon extending from it, and made with projecting erasive surfaces or swells, substantially in the manner and for the purpose set forth.
3. The combination of a stem tapering down to a sharp edge, or nearly so, with a solid elastic erasive head for a lead-pencil or other similar article, said stem being provided with a socket to receive one end of the lead-pencil or other similar article, or a tenon extending from it, while the head is made with projecting erasive surfaces or swells, substantially in the manner and for the purpose set forth.
4. The combination, with a pencil, of a solid elastic erasive head, made with projecting erasive surfaces or swells, and provided with a socket longitudinally to receive and grasp one end of the pencil or other similar article, or a tenon extending from it, substantially as shown and described.

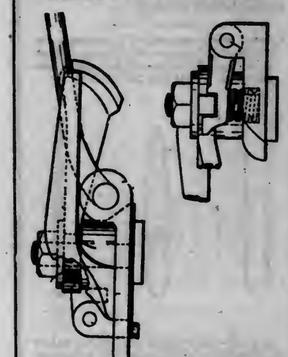
6,511. COMPOSITION PAVEMENTS. John P. Cranford, Brooklyn, N. Y., assignor, by mesne assignments, to himself and Nathan B. Abbott. Patent No. 86,139, dated Mar. 23, 1869. [Filed Apr. 2, 1875.]

1. The method herein described of surfacing old pavement, by cleaning the surface of such pavement, applying a bituminous composition, and subjecting the same to heavy pressure, substantially as set forth.
2. The method herein described of surfacing old pavement by cleaning the surface of such pavement, coating the same with liquid bitumen, applying a bituminous composition, and subjecting the same to a heavy pressure, substantially as specified.

6,509.

REISSUES.

6,509. STEAMBOAT-STAGING. A. J. Ball, Ashland, Ky., assignor, by mesne assignments, to Carson Mudge, E. K. Converse, John A. Stevenson, J. W. Noyes, Frank Gaiennie, George B. Sears, and Lizzie D. Clarke, administratrix of Thos. L. Clarke, deceased. Patent No. 31,147, dated Jan. 22, 1861; extended seven years. [Filed June 14, 1875.]

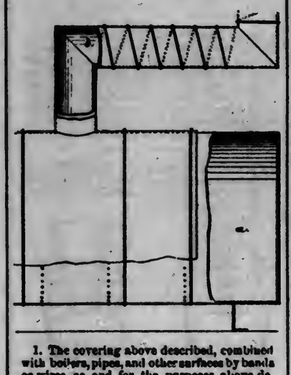


1. In combination with a gang plank or staging, a suitable supporting crane or mast and a hoisting and lowering mechanism, substantially as described.
2. The arrangement of staging C, perch-windlass B F G H I, and supporting apparatus J K L, the whole being constructed and operating together, substantially as and for the object set forth.

6,512. BONE HANDLES FOR CANES, &c. Jos. Harvey, Philadelphia, Pa., assignor to Harvey & Ford. Patent No. 66,580, dated July 9, 1867. [Filed Apr. 10, 1875.]

1. A bone handle for parasols, umbrellas, and canes, consisting of longitudinal sections C, fastened substantially as described.
2. A bone handle for parasols, umbrellas, and canes, made of end sections B D and median sections C C, connected by ferrules E E, as shown and described.

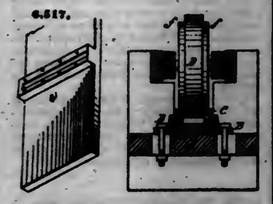
6,514. HARVESTER-FINGER GUIDES AND HOLDERS. Ephraim F. Herrington, West Hoosick, N. Y. Patent No. 153,436, dated July 28, 1874. [Filed Feb. 8, 1875.]



1. A pitman-guide mounted upon the clip, substantially as hereinbefore set forth.
2. The combination, substantially as hereinbefore set forth, of the clip or base, the holding arm or horn, and the guide pivoted to the clip.
3. The combination, substantially as hereinbefore set forth, of the clip, post, a holding arm or horn, a pivoted guide, and the spring stop or catch to hold the guide in position.
4. The combination, substantially as hereinbefore set forth, of the clip, the post, the pivoted guide, its arm, and the spring-stop acting on the arm.

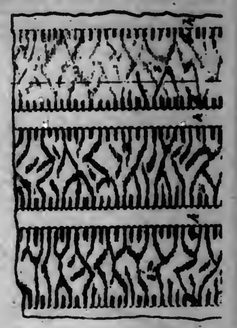
6,515. PAPER BARRELS. John Wm. Jarboe, Green Point, N. Y., assignor, by mesne assignments, to J. F. Seiberling, trustee. Patent No. 76,771, dated Apr. 14, 1868. [Filed June 9, 1874.]

1. A cask or barrel made of paper, as a new article of manufacture.
2. The body or cylinder of a cask or barrel made of paper, in combination with heads or ends, and stiffening bands or hoops applied thereto, substantially as described.
3. The heads of the barrel made of paper, and provided with flanges or rims for stiffening and strengthening the heads, and for uniting the same to the ends of the body or cylinder, as described.
4. The body of a cask or barrel made of paper, in combination with heads of stiffer material.



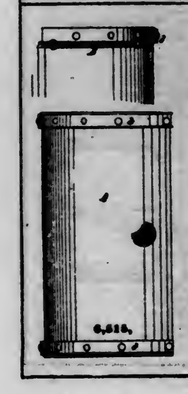
6,516. COVERINGS FOR STEAM-BOILERS. Horatio D. Jarves, Boston, Mass., assignee, by mesne assignments, to William Peters. Patent No. 36,322, dated Aug. 26, 1862. [Filed June 5, 1875.]

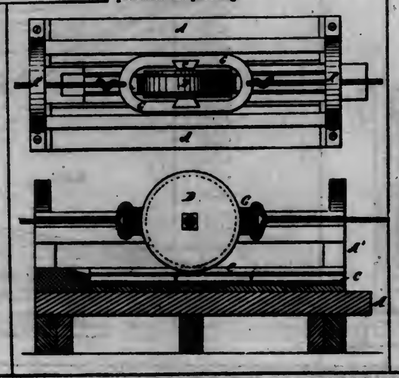
1. The covering above described, combined with boilers, pipes, and other surfaces by bands or wires, as and for the purposes above described.
2. Asbestus and suitable animal or vegetable fiber or material or mineral substances combined, and combined with and applied to boilers, pipes, and other surfaces, as and for the purposes above described.



6,517. PLUG-TOBACCO MACHINES. John L. Jones, Oxford, N. C. Patent No. 141,562, dated Aug. 6, 1873. [Filed Jan. 21, 1875.]

Brief.—The trough confines the tobacco from lateral expansion, and the knives from endwise movement, the latter severing the mass into plugs, while the plate that carries them performs the pressing.





1. The combination of a trough, C, for receiving and holding the tobacco, a mechanism for pressing or packing the same in the trough, and a series of cutting-knives, operated by the pressing mechanism, for severing the tobacco into the desired size while under pressure, substantially as described.
2. The combination, in a machine for making plug-tobacco, of a trough, a supplemental removable bottom, *a*, thereto, a plate carrying a series of cutting-knives, and a pressing mechanism, substantially as described.
3. The combination of a trough, C, for receiving and holding the tobacco, a traveling weight for pressing the tobacco in the trough, and a series of knives operated by said weight, whereby the plug is formed, pressed, and cut simultaneously, substantially as described.
4. The combination, with the trough C, of wheel D, provided with shoulders or flanges *f f*, and arranged in vertically-movable bents in a horizontally-moving frame or carriage, substantially as described.

6,518. TENDERS. George B. King, New York, N. Y., assignor to F. A. Kurzheedt, same place. Patent No. 62,492, dated Feb. 26, 1867; reissue No. 3,001, dated June 28, 1868. [Filed Apr. 20, 1875.]

1. The new article of manufacture herein described, consisting of two rows of plaiting, two of fluting, and one of puffing, arranged with reference to each other as described.
2. The new article of manufacture consisting of the combination or arrangement on one piece of fabric of a series of two or more strips of fluted puffing, substantially as described, each of such strips consisting of two rows of plaiting, two of fluting, and one of puffing, arranged with reference to each other as described.
3. The new article of manufacture consisting of the combination or arrangement on one piece of fabric of a series of two or more strips of fluted puffing, substantially as described, each of such strips consisting of two rows of plaiting, two of fluting, and one of puffing, arranged with reference to each other as described, the flattened or plaited rows between each strips being doubled and stitched by tapes or narrow strips of goods stitched near each flattened portions.

4. A strip of muslin or other fabric having a row of plaiting on each edge, and on the inner side of each of said rows a row of fluting, the said rows of fluting being separated from each other by puffed, gathered, wrinkled, or wavy material, and the four rows being arranged with reference to each other as described.

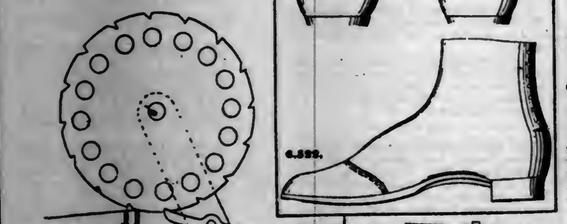
5. A piece of muslin or other fabric having two rows of flattened gathering or plaiting, and two of fluting, bordering upon a strip having a fullness greater than that produced merely by the fluting or gathering of the fabric, substantially as described.

6,519. PROCESSES OF TREATING ORES. D. Mindeleff, Washington, D. C., assignor to himself and T. H. Alexander, same place. Patent No. 152,300, dated June 23, 1874. [Filed June 19, 1875.]

Brief.—Heats the ore in a closed retort, through which a stream of marsh-gas (CH_4) is passed, by which means the sulphur, oxygen, &c., are removed.

1. The process, herein described, of reducing metals contained in gold, silver, copper, lead, or zinc ores or metals, in combination with non-metallic substances, by the combined effects of heat and marsh-gas, substantially as herein set forth.

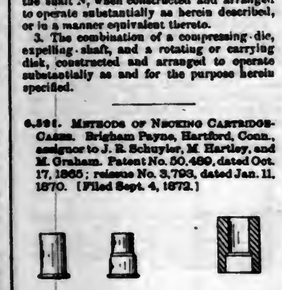
2. The method, herein described, of treating alloys of silver by-first dissolving in sulphuric acid, then converting the sulphate of silver into chloride of silver by an addition of chlorids of sodium, then treating with marsh-gas and heat, substantially as herein set forth.



6,520. MACHINES FOR NECKING CARTRIDGE-CASES. Brigham Payne, Hartford, Conn., assignor to J. R. Schuyler, M. Hartley, and M. Graham. Patent No. 50,490, dated Oct 17, 1865; reissue No. 3,793, dated Jan. 11, 1870. [Filed Sept. 4, 1872.]

Brief.—A horizontal intermittingly-rotating disk with a series of pockets near the edge, in which the shells to be necked are placed; a hollow former or die that is forced down around the open end of the shell to contract its diameter, and a stationary rod that arrests the upward movement of the shell when the former is withdrawn, and thus removes the shell from the die.

1. The reciprocating plunger D, provided with the tubular die m, said die having its interior so formed as to permit the shell to protrude up into it as the latter is compressed, as herein set forth.

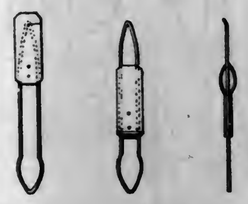


2. The combination of the tubular die m and the shaft N, when constructed and arranged to operate substantially as herein described, or in a manner equivalent thereto.

3. The combination of a compressing-die, expelling-shaft, and a rotating or carrying disk, constructed and arranged to operate substantially as and for the purpose herein specified.

6,520.

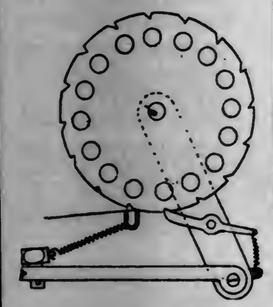
6,521. METHODS OF NECKING CARTRIDGE-CASES. Brigham Payne, Hartford, Conn., assignor to J. R. Schuyler, M. Hartley, and M. Graham. Patent No. 50,490, dated Oct. 17, 1865; reissue No. 3,793, dated Jan. 11, 1870. [Filed Sept. 4, 1872.]



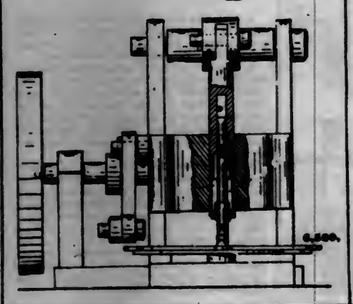
As my improvement in the art of manufacturing metallic cartridge-cases, a process of necking or reduction of a portion of the shell to a lesser diameter, executed by a hollow die and the application of force to drive the case partly into the die, (or, as the equivalent thereof, to drive the die upon and around the case,) and thus forces said case to contract in its diameter, substantially as herein set forth.

6,522. BOOTS AND SHOES. Thomas Powell, Martinsville, Ind., assignor to C. Hersome. Patent No. 50,030, dated Sept. 19, 1865. [Filed June 12, 1875.]

6,522.

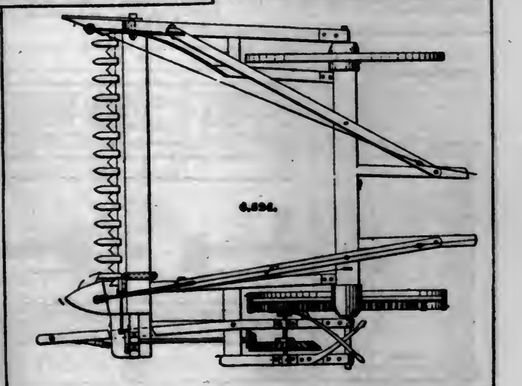


6,523. SHOE AND GLOVE BUTTONERS. C. Stackpole, Elizabeth, N. J., assignor to C. D. Collard. Patent No. 101,546, dated Mar. 30, 1870. [Filed May 26, 1875.]



A double-end buttoner fitted with a sliding handle, substantially as described, for the purpose specified.

6,524. HARVESTERS. Lyman B. Stilson, Minneapolis, Minn., assignor to himself and August Leich. Patent No. 99,990, dated Oct. 6, 1869. [Filed Apr. 1, 1875.]



Brief.—The finger-bar is hinged to a gear-frame at one end, and to a supporting-arm at the other, and is located in front of the driving and supporting wheels, so that it can rise and fall at either end independent of the other.

6,524.

6,525.

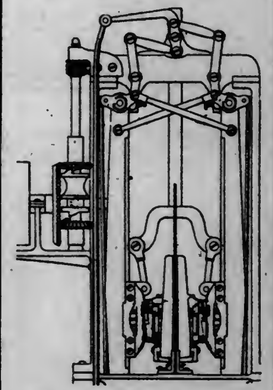
6,524.

1. A shoe or gaiter having a vertical and horizontal opening at the rear, the front portions overlapping the back portion, and so curved about the ankle by a suitable fastening passing across the back, substantially as described.

2. A shoe or gaiter the exterior of which is formed with a vertical opening at the rear and horizontal openings at the sides thereof, substantially as set forth.

3. A shoe or gaiter having an external vertical and horizontal opening at the rear part thereof, and a tongue or back stitched below and forward of the horizontal opening, substantially as set forth.

4. A shoe or gaiter having a vertical and horizontal opening at the rear part thereof, and a folding tongue or back, substantially as described.



5. A gaiter or shoe with front portions overlapping the back portion, the said front terminating in flaps at the rear part of the foot, formed by the horizontal and vertical cuts, substantially as described.

6. In a shoe or gaiter, the combination of a folding back with two independent flaps extending back from the front, and divided from the counter.

7. In a shoe or gaiter, the combination of a folding back with two independent flaps extending back from the front, and fastening together outside of the back.

A gear-frame vibrating about the main axle, and having one end of the finger-bar hinged thereto and propelled over the ground thereby, in combination with an independently-vibrating thrust-arm, connected to and carrying forward the other end of the finger-bar, whereby each end of the cutting apparatus, which is arranged in front of the main carrying-wheels, and cuts the grass between said wheels, is free to rise and fall independently, substantially as set forth.

6,525. MACHINES FOR CRIMPING LEATHER FOR BOOTS AND SHOES. Samuel W. Jamison, Newark, N. J., assignor, by mesne assignments, to the S. W. Jamison Boot and Shoe Crimping Machine Company, New York city. Patent No. 139,717, dated June 10, 1873. [Filed June 18, 1875.]

1. The crimping-jaws, each formed with a projecting beak or point, and inwardly beveled on each side thereof, substantially as shown and described, so that when the jaws descend the material, when first acted on, shall bag the beaks or points only of the jaws, without clinging to the beveled sides.

2. In a machine or apparatus for crimping leather for boot and shoe fronts, a crimping-jaw, the acting face of which is provided, between the toe and leg portions, and at the point where it crimps the leather over the bend in the tree or form, with upwardly-curved corrugations, arranged substantially as described, to concentrate or crowd the leather toward the heel or lower rear point of the boot-front during the descent of the jaw, substantially as herein shown and set forth.

3. A crimping-jaw for crimping boot and shoe fronts, formed with a projecting beak or point, and inwardly beveled on each side thereof, and provided with upwardly-curved corrugations, with or without toe and leg corrugations, substantially as herein shown and described.

4. A crimping-jaw constructed with toe and leg portions, and with a central part provided with upwardly-curved corrugations, substantially as described, the said central part being of such relative dimensions to the toe and leg portions that, during the descent of the jaw, it will have traversed only about one-half the boot and shoe front when the toe and leg portions of the jaw are about to release or quit the same.

5. In a crimping-jaw for crimping boot and shoe fronts, the combination of the central upwardly-curved corrugations with toe and leg corrugations, formed substantially as shown and described, so as to divert from the heel or lower point of the front of the material on each side of said central corrugations, for the purposes set forth.

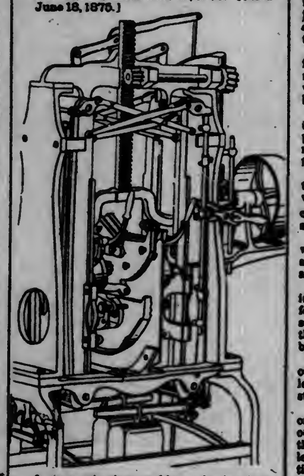
6. In a crimping-machine, the combination, with the crimping tree or form, of a series of pairs of jaws, which act in succession on the material to be crimped, and a corresponding series of adjustably-weighted levers, by which the pressure of each pair of jaws upon the material may be regulated independently of the others, substantially as set forth.

7. In a crimping-machine, a series of pairs of independently-adjustable jaws, each pair of which jaws exercises upon the material to be crimped a yielding pressure, induced by adjustably-weighted levers, substantially as set forth.

8. In a crimping-machine, the combination, with the crimping-jaws, of finishing-jaws, following said crimping-jaws, and acting on the crimped front as it leaves the latter set of jaws, substantially as shown and described.

9. The finishing-jaws, having such a contour as to fit or come in contact simultaneously at all points of their lower edges with the toes or the crimped front thereon, and arranged immediately above the crimping-jaws, to take hold of the crimped front before it is entirely released by the crimping-jaws, substantially as shown and set forth.

10. The finishing-jaws, formed substantially as described, with toe and leg portions, which may be adjusted or set out more or less to conform to irregularities in the thickness of the crimped front.



11. In combination with the crimping-jaws and finishing-jaws, the hinged independent ways, upon which said sets of jaws respectively slide, and the independent and separate systems of levers, connecting-rods, and weights for drawing together said ways, substantially as shown and described.

12. The combination, with the finishing-jaws, of mechanism, substantially as described, for setting them at different distances apart to accommodate different thicknesses of leather, and for maintaining their parallelism when thus adjusted.

13. The combination, with the crimping-jaws and their hinged ways, of independent hinged ways, and finishing-jaws sliding thereon, the said crimping-jaws and finishing-jaws being so connected that, while moving together up and down, the jaws of either set may move laterally apart independently of and without interference with the other set.

14. In combination with the finishing-jaws, jointed at their lower ends to their supporting-brackets, the devices herein described for connecting the upper ends of said jaws to their brackets, and the levers, whereby said devices may be operated to tilt the said jaws toward or away from each other, as desired, substantially as and for the purposes shown and set forth.

6,526. CRIMPING-MACHINES. Samuel W. Jamison, Newark, N. J., assignor to the S. W. Jamison Boot and Shoe Crimping Machine Company, New York city. Patent No. 99,906, dated Feb. 15, 1870. [Filed June 18, 1875.]

1. In a crimping-machine, crimping-jaws whose pressure upon the material to be crimped is induced by a system of levers, adjustably weighted, as described, to regulate the degree of pressure exercised by the jaws, substantially as set forth.

2. The combination of the following elements—namely, crimping-jaws, levers adjustably weighted to regulate the degree of pressure exercised by the jaws, and a treadle mechanism—whereby this pressure may be relieved in whole or in part, substantially as herein shown and set forth.

3. In a crimping-machine, the combination of a system of levers, adjustably weighted to regulate the degree of pressure, and crimping-jaws, adjustable to and from one another independently of said system of levers, substantially as set forth.

4. In a crimping-machine, the combination, with the crimping-jaws, the crimping form or tree, and the driving mechanism, of the stop mechanism, whereby the motion of the working parts is automatically arrested at a time when the jaws are above and out of contact with the form, substantially as and for the purposes set forth.

5. The combination, in a crimping-machine, of the sliding cross-head, which carries the crimping-jaws, with the tripping-rod, clutch, and system of gearing for transmitting motion to said cross-head under the arrangement, substantially as described, whereby the movement of the cross-head may be reversed or arrested at pleasure, as set forth.

6. The combination of the reversing gears and clutch, by which motion is communicated to the sliding cross-head with the large and small gear-wheels which impart movement to said reversing-gears, substantially as described, so that the cross-head shall be caused to ascend more rapidly than it descends, for the purposes stated.

7. The crimping-jaws arranged to move upon two axes, the one horizontal the other vertical, substantially in the manner set forth, so that they may be tilted or rocked endwise to conform to the position of the crimping-form, and may also vibrate upon a vertical axis to allow for inequalities in the material to be crimped.

8. The combination, with the laterally-vibrating jaws, of stops or set-screws to limit the vibration of the jaws and to hold them in close contact with any portion of the leather to be crimped, substantially in the manner as shown and set forth.

9. The combination of the crimping-jaws, the set-screws, and slotted-plate by which it is supported, and the socketed plate and spindle by which said slotted-plate is held in position, substantially as shown and set forth.

10. The combination, with the crimping-jaws, of the double-helical cam-disks, the brackets provided with corresponding cams, and the set-screws or spindles and nuts for maintaining said parts in position under the arrangement, substantially as described, so that the jaws may be set and held at a greater or less distance apart to conform to the thickness of the material to be crimped.

11. In a crimping-machine, an adjustable form or tree arranged so that the toe can be more or less elevated, in order to crimp at various angles, according to the shape of the leather or other material operated on.

12. The combination, with the adjustable tree or form of crimping-jaws oscillating in a plane parallel with the tree, so that said jaws may be adjusted to conform to whatever position the tree may occupy, as set forth.

13. The adjustable tree or form, arranged so that it shall move in the arc of a circle, of which the pivot or point of oscillation of the crimping-jaws is the center, substantially as set forth.

14. In a crimping-machine the combination, with crimping jaws or plates, of a laterally-adjustable crimping form or tree, substantially as set forth.

15. The combination, with the tree or crimping-form of laterally self-adjusting brackets for supporting the same, substantially as described, so as to equalize or distribute evenly the pressure of the jaws upon the leather on both sides of the form.

16. The combination, with the crimping-jaw of the sliding-clamp or corner-stretcher and lever and cam for operating the same, substantially as set forth.

17. The combination, with the hinged ways of a system of levers operated by a treadle or otherwise to spread said ways, so as to relieve the pressure and strain of the jaws on the leather or form whenever necessary, substantially as shown and set forth.

18. The combination, with the hinged ways, of the set-screws and pointers or gages for limiting the movement and determining the parallelism of the ways, substantially as set forth.

HELIOTYPE RELIEF PROCESS. JAMES R. OSGOOD & CO. BOSTON

DIGEST OF DECISIONS

OF THE

COMMISSIONER OF PATENTS

AND

DECISIONS OF UNITED STATES COURTS

IN THE MATTER OF

PATENTS AND TRADE-MARKS.

OFFICIAL GAZETTE—January—June, 1875.

DIGEST OF DECISIONS.

[Court decisions indicated by an asterisk, (*).]

ABANDONED CASES.

(See Practice, 4.)

ABANDONED EXPERIMENTS.

There is a distinction to be made, in ascertaining priority of invention, between an abandoned experiment and a perfected invention.

[Case vs. Hastings, 557.

ABANDONMENT.

(A) In general.

(B) Under the statute.

(A) *In general.*

Cummings applied for a patent in April, 1855, and was rejected in 1856. He filed a new application in 1864, and the patent was then granted. The invention went into public use in 1859. *Held*, that where successive applications are made in the procuration of a patent, where there is no proof of actual abandonment, the subsequent application will be deemed a continuation of the first.

[*Goodyear Dental Vulcanite Co. *et al.* vs. Geo. Willis, 41.

(See Construction of Specifications and Patents, 3; Diligence, 2.)

(B) *Under the statute.*

1. Where an applicant for patent had filed his application in 1855, and after its rejection had withdrawn it, and it afterward became abandoned by operation of the 3d proviso of the 35th section of the act of July 8, 1870: *Held*, that the applicant was barred from prosecuting a new application for patent for the same invention, an application being analogous to an action at law to establish a right of property, and the statute being in the nature of a statute of limitations upon the right of action.

[A. Mills, 961.

2. The word "abandoned" in the body of the proviso referred to applies to the application alone; but in the last clause the word "abandonment" has a wider signification, referring both to the application and the invention.

[A. Mills, 961.

3. The practical utility of some inventions will appear upon inspection; but complicated machinery often requires actual use to demonstrate its success. The statute should not be so applied that such a test would prevent the grant of a patent unless applied for within two years from the time it was made.

[Baldwin vs. Bigelow, 1011.

(See Experimental Use.)

AFFIDAVITS.

When an application is made for a patent upon a device which is shown in an abandoned application, the Office will ascertain, if practicable, whether the invention has gone into public use, and will receive affidavits to that effect, *ex parte*, if necessary.

[Rouse and Stoddard, 169.

AMENDMENTS.

(See Pleadings and Practice, 5, 7, 8, 11.)

APPEAL.

The circumstances of the appeal to the Supreme Court in the case of Gardner vs. Goodyear Dental Vulcanite Company (3 Patent Office Gazette, 295) considered.

[*Goodyear Dental Vulcanite Co. vs. Geo. Willis, 41.

(See Practice, 7.)

ARTICLES OF MANUFACTURE.

(See Manufactures, 1, 2.)

ASSIGNMENTS AND ASSIGNEES.

1. The power of assignment under the statute has been so construed by the courts as to confine it to the transfer of an entire patent, an undivided part thereof, or the entire interest of the patentee, or undivided part thereof, within and throughout a certain specified portion of the United States.

[*Littlefield and Jagger vs. Perry, 964.

2. One holding such an assignment is an assignee within the meaning of the statute, and may prosecute in the circuit court any action that may be necessary to protect his rights under the patent.

[*Littlefield and Jagger vs. Perry, 964.

3. An agreement to account and pay a specified royalty, contained in an instrument of assignment, forms part of the consideration of the assignment, and does not reduce the grantee to the position of a licensee.

[*Littlefield and Jagger vs. Perry, 964.

4. Neither does a clause of forfeiture for non-performance, contained in an assignment, reduce the grantee to the position of a licensee. For the non-payment or other non-performance a forfeiture may be enforced as for condition broken; but until it is enforced the title granted remains in the assignee.

[*Littlefield and Jagger vs. Perry, 964.

5. An instrument purporting to convey inventions not yet in esse is not an assignment, but only an executory contract.

[T. A. Edison, 423.

6. It would seem that where, in enforcing specific performance of a contract to assign an interest in a future invention, equity may (after the invention has been perfected and patented) carve out an undivided interest in the patent, a valid assignment to a third party will afterward take effect upon the interest remaining in the patentee.

[T. A. Edison, 423.

7. The object of the statute requiring assignments of interests in patents to be recorded within three months from their dates is for the protection of *bona fide* purchasers, without notice of previous assignments. Therefore, an assignment by the patentee of a right under the patent would be valid as between the parties thereto without being recorded.

[*Turnbull vs. The Weir Plow Co., 173.

8. Where the patentee, Littlefield, under letters patent relating to stoves, executed with Treadwell and Perry a "grant" and a "supplemental agreement" on the same day, by the former of which, for the consideration therein named and of the agreements contained in the supplemental paper, he made conveyance of an absolute interest in his patent for a specified territory, said deed being duly recorded in the Patent Office, while in the supplemental agreement it was stipulated that nothing contained in the grant should give the grantees the right to use the principle of the patent in furnaces erected in cellars, &c., which supplemental paper was never recorded: *Held*, that the "grant" was to be treated as an assignment, and that the grantees and those claiming under them could sue in the circuit court in their own names to prevent an infringement of their rights.

[*Littlefield and Jagger vs. Perry, 964.

9. An assignment of an imperfect invention, with all the improvements upon it that the inventor may make, is equivalent in equity to an assignment of the perfected results. In such cases the assignees become in equity the owners of the patent issued upon the invention when perfected, and, if the assignor takes the legal title, he holds it in trust for them, and should convey.

[*Littlefield and Jagger vs. Perry, 964.

10. Where there is a residuary interest left in the assignor under a patent within the territory mentioned, the words "all the *right, title, and interest*" of the patentee, in the conveying clause of an assignment, must be construed as only conveying such residuary interest.

[*Turnbull vs. Weir Plow Co., 173.

11. This rule would hold even though the prior deed of assign-

ment, by which the patentee had alienated a part of his original interest in the territory specified, had not been recorded when the later assignment was made.

[*Turnbull *vs.* Weir Plow Co., 173.

12. The provisions of the 36th section of the Patent Act of 1870, with regard to the recording of assignments of patents, are substantially the same as those of the 11th section of the act of 1836, as construed by the courts.

[*Turnbull *vs.* Weir Plow Co., 173.

13. In a contest between an assignor in equity and his assignee a court of equity will give the same effect to an equitable title that it would to one that was legal.

[*Littlefield and Jagger *vs.* Perry, 964.

CASES COMMENTED UPON.

1. Gardner *vs.* Goodyear Dental Vulcanite Co., 3 Pat. Off. Gas., 295. Hotchkiss *vs.* Greenwood, 11 Howard, 248. Hicks *vs.* Kelsey, 18 Wall. 670.

[*Goodyear Dental Vulcanite Co. *vs.* Geo. Willis, 41.

2. Stoddard *vs.* Perry, 6 Off. Gaz., 33.

[Case *vs.* Hastings, 557.

3. Wallace and Sons *vs.* Holmes *et al.*, 9 Blatch., 65.

[*Saxe *vs.* Hammond, 781.

CAVEAT.

Where a party has a caveat pending in the Office, if another obtains a patent for the same invention without notice to the former, he will gain no advantage by it, but must establish his case in an interference as if he were an applicant.

[Ware *vs.* Bullock, 39.

CLAIMS.

1. Descriptions and claims must be unambiguous; but the Office neither prescribes nor proscribes any particular form or phrase.

[F. W. Dahne, 1095.

2. Parts essential to the completeness of a structure, if omitted in the terms of a claim, must be understood, if the specification by which the claim is to be interpreted will justify it.

[G. Richardson, 1053.

3. The patentee having disclaimed a revolving cutter, his claim to "the cutter A, constructed substantially as shown and described, and for the purposes set forth," is a claim to the particular form, shape, and angles of the cutter, which adapted it to the purposes of a glass-cutter, and is as exact and accurate as the nature of the subject will permit.

[*Monce and Ives *vs.* Adams, 177.

4. Where the fair interpretation of the words employed to describe an invention or discovery includes matters not in the mind of the patentee at the time, he is as fully authorized to claim the unlooked-for as he is the anticipated results.

[*Welling *vs.* Rubber-Harness Trimming Co., 606.

5. Where a claim covers a process not described in the specification, there is much reason for holding that it is invalid.

[*Needham *vs.* Washburn *et al.*, 649.

(See Construction of Claims; Novelty, 2.)

COMPOSITION OF MATTER.

Where a new ingredient is added to an existing composition of matter, and the composition is thereby materially changed in form and quality, it is patentable.

[Horlick and Horlick, 898.

COMBINATIONS.

1. The question considered of collocation and co-operation of different parts or machines as distinguished from mere aggregation.

[S. M. Sherman, 1054.

2. An invention which consists of a combination of elements is not complete until all the elements are combined.

[Baker *vs.* Atwood and Moore, 697.

3. Inasmuch as defendant employs a combination of a rocker with a bed by loose journals projecting on each side the picker-staff, and the combination is effected by means of a journal-bearing arm, it is immaterial that the form of his journal-bearing arm is unlike that of complainant's, or that its mode of attachment is different, so long as it performs the same function in substantially the same way.

[*Mason *vs.* Graham and Rouse, 833.

4. The combination of old devices, which constitutes the invention set forth in the Westlake Patent, is anticipated by the English patent to Isaac Evans in 1861.

[*Dane *et al. vs.* Chicago Manufacturing Co., 924.

(See Infringements, 7, 8, 9.)

COMMISSIONER OF PATENTS.

1. Powers and duties of the Commissioner of Patents declared.

[*Hull *vs.* Commissioner of Patents, 559.

2. A favorable decision of an Examiner or of the Board of Examiners-in-Chief in the Patent Office, upon an application for a patent, is not conclusive upon the Commissioner of Patents, and it does not follow thereupon that he has only the ministerial duty to perform of countersigning and sealing the patent.

[*Hull *vs.* Commissioner of Patents, 559.

3. The statute nowhere prescribes the duties of Examiners and their assistants. They are appointed upon nomination of the Commissioner, and their duties are such as he is authorized to prescribe under the 19th section of the patent act. (Sec. 483 Revised Statutes.)

[*Hull *vs.* Commissioner of Patents, 559.

4. The result of an examination is to be reported to the Commissioner, and if it should appear to him, upon inspection of the report, that the alleged invention is neither novel nor meritorious, he would be bound in duty, under section 31, not to issue the patent. (Sec. 4:33 Revised Statutes.)

[*Hull *vs.* Commissioner of Patents, 559.

5. If to decide that a claimant is justly entitled to a patent, and that his invention is sufficiently useful and important, be the office of Examiners, then, by section 7 of the statute, it is made the duty of the Commissioner to superintend the performance of these duties by the Examiners.

[*Hull *vs.* Commissioner of Patents, 559.

6. Under the 23d section of the act (sec. 4885 Revised Statutes) it is not the duty of Examiners to pass and allow patents. It is the duty of the Commissioner alone, after the examination has been reported, to say whether the patent shall be allowed and passed.

[*Hull *vs.* Commissioner of Patents, 559.

7. The 53d section of the act contains an express recognition of power in the Commissioner to refuse patents, and an *ex parte* bill in equity is given applicants as a remedy for such refusal. This section provides for a different class of cases from those which come before the Commissioner by appeal from the Examiners under sections 47 and 48—cases in which the Commissioner may refuse patents after favorable decisions by his subordinates, by virtue of his general supervisory authority. (Secs. 4910, 4911, and 4915 Revised Statutes.)

[*Hull *vs.* Commissioner of Patents, 559.

8. The Commissioner of Patents may suspend, temporarily, proceedings in interferences, when the evidence used therein tends to show that the first inventor, who is also the applicant, had abandoned his invention before applying for a patent, and to refer the application back to the Primary Examiner to ascertain the fact of such abandonment.

[*Bigelow *vs.* Commissioner of Patents, 603.

CONSTRUCTION OF THE STATUTE.

Section 58 of the patent act of 1870 authorizes the court, in a suit thereunder, to review both patents on their merits, and to decree the cancellation of either or both; and this on the ground of lack of novelty as to either or both, or any other ground that in an action for infringement would affect the validity of either.

[*Foster *vs.* Lindsay and Kalb, 514.

CONSTRUCTION OF CLAIMS.

1. The word "independent" in the claim of the patent of R. L. Webb, December 31 1867, does not mean that the latch and its mechanism operate without any contributory aid from the main case or adjuncts thereto. All that it imports is that there is an outer case and a separate inner frame or case in which the latch mechanism is arranged and held in position.

[*Russell and Irwin Manufacturing Co. *vs.* The Corbin Manufacturing Co. and North, 363.

2. The patentee having described a wooden bung rendered impervious by the application of a coating to its end, and having pointed out the particular material which he regards as the most suitable for the purpose, his claim for "A wooden bung rendered impervious to the passage of fluids through the pores of the wood by means of the described *or other suitable substance*" will not be held void as being too broad.

[*Goires *vs.* Goetinger, 563.

3. The first claim of the reissued patent of Walter Hunt, of October 29, 1872, (original July 25, 1854,) which is for "a shirt-collar composed of paper and muslin, or its equivalent, so united that the muslin will counteract the fragile character of the paper," construed to be for "a shirt-collar composed of paper and muslin, or its equivalent, united by paste, glue, or other appropriate sizing, by means of which union the fragility of the paper is re-enforced by the fibrous strength of the muslin, and the necessary cohesiveness of the fabric thus secured."

[*Union Paper Collar Co. *vs.* White, 696, 877.

4. The claim for "a shirt-collar composed of paper and muslin, or its equivalent, so united that the muslin will counteract the fragile character of the paper," is not for the mere effect resulting from the union of paper and muslin, nor for the fabric thus produced, nor for the special mode of preparing it; but it covers the use of it for making collars, where its constituents are incorporated with each other, so that the textile strength of the one is made available to re-enforce the fragility of the other.

[*Union Paper Collar Co. *vs.* White, 696, 877.

5. The original patent of Hunt described a standing collar composed of cloth with paper on both sides; but both the invention and the claim are more comprehensive than this, and include a collar with paper on one side only, and this, too, when the collar is *turned over*, so as to expose the cloth surface only to observation.

[*Union Paper Collar Co. *vs.* White, 696, 877.

6. The fifth claim of reissued patent of David M. Weston for "Improvement in Centrifugal Machine for Draining Sugar," &c., dated January 14, 1868, (original dated April 9, 1867,)—viz: "The construction of the openings I in the bottom of the cylinder of such machines, and the valve J for the purpose of closing the same, substantially as described"—is not limited to such centrifugal machines only as are constructed in all respects like those described in the specification.

[*Weston *vs.* Nash, 1096.

7. The term "such machines" in this claim means such centrifugal machines as are so constructed as to admit of the application and operation of the claimed devices in substantially the described mode and by substantially the described means.

[*Weston *vs.* Nash, 1096.

CONSTRUCTION OF SPECIFICATIONS AND PATENTS.

1. While patents are to be construed liberally, they should not be so construed as to enable patentees to reach out and cover every improvement or invention which, after seeing the same, they conclude they might have embraced within their patent, but which was not so embraced and included.

[*Trader *vs.* Messmore, 365.

2. The general rule is that the *first* in a series of applications for a patent is the one on which the patent, when granted, depends.

[*Pelton and Taylor *vs.* Waters, 495.

3. If, between the first and a second application for a patent, the patentee has manifested an actual intention to abandon the first, his patent will have relation to the last one only. His actual intention severs the proceedings.

[*Pelton and Taylor *vs.* Waters, 495.

4. Where the defense against a reissued patent is that it is for a different invention from the original, it cannot be doubted that the latter may be the subject of reference, as to a repealed statute, to aid in the construction of the new patent issued upon the corrected specification.

[*Reedy *vs.* Scott, 463.

5. Where the invention is a very limited improvement upon an old device, a former patent covering such device will not be held to embrace the improvement unless it is distinctly described therein.

[*Arnold *vs.* Wilcox, 356.

6. The patent is not void for ambiguity because the specification merely says that the cutter is to be "hardened" without specifying what degree of hardness is to be given to it.

[*Monce and Ives *vs.* Adams, 177.

7. Where a patentee describes a martingale-ring formed by enveloping a metal ring, by means of dies, with a plastic composition known as "factitious ivory," or "any similar compound," the claim being for "the ring for martingales, &c., manufactured as set forth, with a metal ring enveloped in composition, as and for the purposes specified," *Held*, That the patent would include the application of hard rubber to a metal ring by means of dies.

[*Welling *vs.* Rubber-Harness Trimming Co., 606.

8. The fact that the rubber must necessarily undergo the additional process of vulcanization does not exempt it from the control of the patent. Though not the same substance, in its essence and constituents, as the "factitious ivory," it is a similar material as regards its capability of being adapted to the purposes for which the latter is used.

[*Welling *vs.* Rubber-Harness Trimming Co., 606.

9. The Welling patent of March 17, 1863, for an "Improvement in Rings for Martingales," construed to be for a metal ring surrounded with some plastic composition like artificial ivory, capable of being compressed, solidified, and polished by the action of dies, and which is, in fact, subjected to such action, whereby a martingale-ring is produced with an exterior surface more durable and more highly polished than had before been obtained by different processes.

[*Welling *vs.* Rubber-Harness Trimming Co., 606.

10. Where complainants had used their device for thirteen years without ascertaining that their patent covered such a device as that which formed the alleged infringement, and this latter had become the subject of a patent and possessed superior utility to that of complainants: *Held*, That the patent sued on should be interpreted strictly.

[Trader *vs.* Messmore, 365.

11. It becomes important, in interpreting the language of a patent, to know what construction the patentee himself placed upon it; and to this end recourse may be had to the files of the application, to ascertain what changes were made in the original specification and claims, and the significance of those changes as revealed by the history of the case.

[Trader *vs.* Messmore, 365.

COPYRIGHT.

1. The owner of the copyright of a book having agreed with the author of certain notes and additions to the same, embraced in two editions of the same prepared by him, that he would make no use of such notes and additions in subsequent editions of the work, but the author might use the same as he pleased; it was thereupon decreed that he should have the exclusive benefit of the copyright for the same.

[*Lawrence *vs.* Dana *et al.*, 81.

2. Where the editor of subsequent editions makes notes and additions which can be clearly separated and distinguished from the notes and additions in the previous ones, he is entitled to use them and have a monopoly of them.

[*Lawrence *vs.* Dana *et al.*, 81.

3. But if they cannot be thus separated and distinguished from the former notes, he cannot use them without violating the copyright for the former notes.

[*Lawrence *vs.* Dana *et al.*, 81.

4. The editor of a subsequent edition cannot borrow from citations introduced into the previous ones by another editor without infringing the copyright for them, though they are not accompanied by the extracts previously presented with the citations; nor can he borrow citations of authorities, although without remarks or comments, even when prefixed or appended to notes not otherwise objectionable.

[*Lawrence *vs.* Dana *et al.*, 81.

5. Where notes are partly original and partly copied, the latter may be published if they can be distinguished and separated, otherwise the publication must be restrained.

[*Lawrence *vs.* Dana *et al.*, 81.

(See Infringements, 1, 2.)

DAMAGES.

1. Where defendant had been in the habit of selling the infringing picker-staff motion both separately and attached to looms, in ascertaining his profits upon those sold with the looms, regard should be had to his profits upon those sold separately, rather than to the aggregate profits made by him upon the loom and attachment combined.

[*Mason *vs.* Graham and Rouse, 833.

2. If defendant has cheapened the cost of producing the infringing device by an improvement of his own, he is entitled to a corresponding credit in the ascertainment of the profits which complainants are entitled to recover.

[*Mason *vs.* Graham and Rouse, 833.

3. When the patent on which a recovery is based is for a combination, the complainant may recover simply for the value of the improvement or element that he has added to what was before old.

[*Ingals *vs.* Mast, 836.

4. In cases of infringement the profits actually realized, without interest, are usually the measure of unliquidated damages. Circumstances may, however, arise which would justify the addition of interest in order to give complete indemnity for losses sustained by wilful infringements.

[*Littlefield and Jagger *vs.* Perry, 964.

5. Where defendants were dealers in musical instruments, and some of the instruments bought and sold by them contained a tremolo attachment, which infringed complainants' patent, and others not, defendants were properly allowed, in the ascertainment of the profits made by them from the sales, to prove the general expenses of their business incurred in effecting the sales of all musical instruments, and deduct a ratable proportion from the gross profits made by the sale of the attachments.

[*Tremain and Tremain *vs.* Hitchcock *et al.*, 1055.

DESIGNS.

Although the applicant may have discovered how to give his design a peculiar shade when worked into the surface of articles of enameled iron ware, that does not give him any better title to a patent for a design.

[Niedringhaus and Niedringhaus, 171.

DILIGENCE.

1. Where, after making a model, the inventor took no further steps for five years, although able to apply for a patent, and another in the meantime obtained a patent, the first party must be held to have been wanting in diligence; and it is no excuse for his delay that his employers declined to adopt his improvement and put it in practice.

[Hammond *vs.* Laird, 170.

2. Where an inventor employed and paid an attorney to file his application for patent, and was deceived by false representations that it had been done, the delay thus fraudulently caused was not unreasonable delay by the inventor, such as to work forfeiture or abandonment of his invention.

[Case *vs.* Hastings, 557.

DOUBLE USE.

1. The practice of plating articles of metal with nickel in order to harden their surfaces and give them a polish is common, and to apply it to pens is a mere double use, and is not entitled to a patent.

[B. Brower, 40.

2. A sheet out of which to cut the upper part of an india-rubber shoe, such sheet and such upper part having a variety of thickness in different parts, and being formed in one piece at a single operation by the use of rollers, one of which has a surface the reverse of the form to be produced, is an analogous manufacture in all respects to the sheet out of which to cut the sole of an india-rubber shoe, as described in the patent of Hyatt and Meyer of January 17, 1854, such sheet and sole having a variety of thickness in different parts, and being formed in the manner above described.

[*Myer and Evans *vs.* Pritchard, 1012.

3. The fabric not being new, the application of it to make the upper part of the shoe is a mere double use of the same invention.

[*Myer and Evans *vs.* Pritchard, 1012.

EQUIVALENTS.

(See Double Use.)

EMPLOYER AND EMPLOYÉ.

The relations of employer and employé, in regard to the origin of inventions stated.

[*Union Paper-Collar Co. *vs.* Van Deusen *et al.*, 919.

ESTOPPEL.

1. An applicant is estopped from contradicting his deed of assignment, but an estoppel by deed arises alone upon a recital of a particular fact.

[T. A. Edison, 423.

2. A party to an interference, having conceded priority of invention to his opponent in general terms, and a patent having issued in accordance with his concession and request, is estopped from claiming a new interference with the same party on the subject-matter common to the same application.

[Harlow *vs.* Guernsey, 513.

EVIDENCE.

1. Testimony of witnesses examined in a case as to alleged prior use by parties not set up in the answer, can only be considered by the court for the purpose of showing the state of the art at the time of patentee's invention. The same rule would apply to printed publications by which it is sought to anticipate the invention.

[*Geir *vs.* Goetinger, 563.

2. Evidence of what one of the parties has done in another country toward reducing the contested invention to practice is not admissible upon an interference.

[Smith *vs.* Barter, 1.

3. Mere descriptions of an invention, and fugitive sketches which have not been preserved, will receive little consideration in determining the questions of priority between two rival applicants.

[Ware *vs.* Bullock, 39.

4. The uncontradicted testimony of an applicant, supported by that of a disinterested and credible witness, that he made drawings of his invention at a certain date held sufficient, although the drawings were not preserved, to prove the conception of the invention at that date.

[Smith *vs.* Edson, 927.

5. Alleged sketches of an invention not preserved or accounted for, and not followed up by a reduction of the invention to practice, are not sufficient to establish priority of invention.

[Hart *vs.* Little, 962.

6. The invention having been patented in England by a third person: *Held*, That, in order to support the objection resting upon the issuance of a foreign patent, proof should be given connecting the complainant with its procuration.

[*Goodyear Dental Vulcanite Co. *vs.* Geo. Willis, 41.

7. Where testimony as to the expense of working a process, as compared with that of working a certain patented process was excluded by a master: *Held*, That it should have been admitted.

[*Black *et al. vs.* Thorne *et al.*, 176.

(See Presumptions, 2.)

EXPERIMENTAL USE.

Where, for the purpose of practically testing complicated mechanism, a slight use of it was made, held that such was experimental, and not a public use that would work abandonment of the invention, if a patent was not applied for within two years.

[Baldwin *vs.* Bigelow, 1011.

FOREIGN PATENTS.

(See Evidence, 6; Use in a Foreign Country.)

IMPROVEMENTS.

The inventor of an apparatus who has reduced it to actual practice and then left it, is not entitled to claim improvements upon it which have been invented and applied by others, although he may have contemplated them and labored upon them, if he never reduced them to form, nor embodied them in any visible representation.

[Trotter *vs.* Bartlett, 3.

INFRINGEMENTS.

1. Equity suits on copyrights are usually referred to a master to examine into the charge of infringement, and upon the nature and extent of it.

[*Lawrence *vs.* Dana *et al.*, 81.

2. Even when the infringement has been established on the principal hearing, it will still be referred to a master for the same purposes.

[*Lawrence *vs.* Dana *et al.*, 81.

3. A brush-head like the plaintiff's, but having an additional feature, as used by the defendant, held to be none the less an infringement because of the additional feature.

[*Murphy *vs.* Kissling, 302.

4. The claim of the letters patent granted to Rodolphus L. Webb, December 31, 1867, for an "Improvement in Reversible Locks and Latches"—namely, "The combination of a lock and latch when the latch-bolts and its operative mechanism are arranged in a case or frame independent of the main case, and constructed so that the latch-bolt may be reversed, substantially as described, without removing the said independent case from the main case," is infringed by the combination of a lock and latch in which the latch-bolts and its operative mechanism are arranged in a skeleton frame within an outer or lock case, which operates to preserve the proper relations of the yoke and tumbler while being moved forward and backward, although it does not so operate when the latch and latch mechanism are removed from the outer or lock case.

[*Russell and Irwin Manufacturing Co. *vs.* The Corbin Manufacturing Co. and North, 363.

5. Infringement is not avoided by the fact that, when the patentee's latch-bolt is drawn forward for the purpose of reversing it, the case or frame moves forward with it in a straight line, and that the defendants' frame, when the latch-bolt is drawn forward, moves in a curved line.

[*Russell and Irwin Manufacturing Co. *vs.* The Corbin Manufacturing Co. and North, 363.

6. Nor is infringement avoided by the fact that the defendants introduce a catch and spring to hold the latch and its mechanism in position, after reversal, until the knob-spindle is inserted. This superadded device may improve the aggregate structure, but it has no effect whatever upon the functions or mode of operation of the patented devices, nor does it justify the defendants in appropriating them to their own use.

[*Russell and Irwin Manufacturing Co. *vs.* The Corbin Manufacturing Co. and North, 363.

7. A patent for a combination is infringed by the use of a similar combination, although one of the elements is omitted and another substituted for it, unless the substituted device is a new one, or performs a function essentially different, or was not known at the date of the patent as a proper substitute for the one omitted.

[*Welling *vs.* Rubber Harness-Trimming Co., 606.

8. Different parties may all infringe by respectively making or selling, each of them, one of the elements of a patented combination, provided those separate elements are made for the purpose and with the intent of their being combined by a party having no right to combine them.

[*Saxe *et al. vs.* Hammond *et al.*, 781.

9. The mere manufacture of a separate element of a patented combination, unless such manufacture be proved to have been conducted for the purpose of aiding infringement, is not, in and of itself, infringement.

[*Saxe *et al. vs.* Hammond *et al.*, 781.

10. A patent which claims the application of means to a musical instrument whereby the air may be agitated to produce a tremulous note "*by agency external to the wind-chest which shall not check the flow of the air past the reeds*," so as to give a continuous tremulous note, but not cut off the sound and make a succession of notes, is not infringed by the simple making of a fan capable of revolving, and the selling of the same to a manufacturer of musical instruments.

[*Saxe *et al. vs.* Hammond *et al.*, 781.

11. Whether such a device would infringe, would depend upon the position and arrangement of it in the organ—whether or not it be placed external to the wind-chest, and whether it be placed so as to cut off the sound and produce a succession of notes, or merely to agitate the air and vary the notes without interrupting their continuity.

[*Saxe *et al. vs.* Hammond *et al.*, 781.

12. Where complainants had licensed large numbers of manufacturers to put a patented tremolo attachment upon their instruments, and had agreed to license all reputable makers who might apply: *Held*, That one who simply made and sold the attachment could not be held as an infringer, unless it appeared that the sale was to an unlicensed manufacturer.

[*Saxe *et al. vs.* Hammond *et al.*, 781.

13. The unauthorized use of complainants' openings and valve would be an infringement if used in centrifugal machines, to which they could be usefully applied by reason of there being an unobstructed space at the bottom of the machine, into which the sugar could fall, although the cylinders were not suspended as shown in the patent.

[*Weston *vs.* Nash, 1096.

14. The patent of Hunt for shirt-collar of paper and muslin is not infringed by collars of paper with a simple cloth re-enforcement at the button-holes.

[*Union Paper Collar Co. *vs.* White, 698, 877.

15. Characteristic resemblance is the fairest test of substantial identity.

[*Union Paper Collar Co. *vs.* White, 698, 877.

INJUNCTIONS.

An injunction will be ordered when there has been a reference to a master only when the infringements are few and their nature can be conveniently ascertained.

[*Lawrence *vs.* Dana, Jr., *et al.*, 81.

(See Pleadings and Practice, 9, 12.)

INTERFERENCES.

1. Where an interference is declared in the Patent Office, the examination is to be confined to "priority of invention." (Wylie and Mac Arthur, *J. J.*)

[*Bigelow *vs.* The Commissioner of Patents, 603.

2. It is not the intention of the patent law that, on a question of interference, the Examiner in charge of interferences should consider a question of abandonment. (Wylie and Mac Arthur, *J. J.*)

[*Bigelow *vs.* The Commissioner of Patents, 603.

(See Caveat; Commissioner of Patents, 8; Estoppel, 2; Evidence, 2; Judgments and Decrees; Mandamus, 2; Practice, 5.)

INVENTION AND SKILL.

1. It being a matter of common knowledge among mechanics that iron, or iron and steel, may be successfully welded without flux, there is no invention in simply omitting, in the casting of car-wheels, the flux previously used between the steel tire and the molten iron which forms the body of the wheel.

[Needham *vs.* Washburn *et al.*, 649.

2. Although paper and muslin or linen cloth were before united and used for maps, &c., this was not analogous to the use Hunt made of these materials, nor in any wise suggestive of his invention. He produced a new device by giving a new form to an old substance, and, by suitable manipulations, making its peculiar properties available for a use to which it had not before been applied. This involved invention, and, in view of the great practical benefits resulting from it, invests the product with special patentable merit.

[*Union Paper Collar Co. *vs.* White, 698, 877.

INVENTIONS.

1. The accidental making of an improved article, in a single instance, without knowledge on the part of the producer of how to accomplish it, or to produce another like it, is not invention.

[*Pelton and Taylor *vs.* Waters, 425.

2. The Weston invention is not anticipated by the device shown in the British patent of Hardman, of 1843, in which the openings in the bottom plate of the rotary cylinders are closed by a disk or plate held up against them while the machine is in operation by a nut and spring, and simply lowered, without being removed, so as to leave a free and unobstructed space, when the sugar is to be discharged.

[*Weston *vs.* Nash, 1096.

3. Nor by the Alliott machine, described in English patent of February 3, 1851, in which the bearings of the shaft and its foundations are directly under the cylinder, so as to render impossible a free and unobstructed space below the cylinder into which the sugar may be discharged.

[*Weston *vs.* Nash, 1096.

4. Although defendants' valve is operated by turning on the shaft, and, in this respect, may be an improvement upon the valve of the patent, which moves up and down on the shaft, this is not a substantial difference. It is but another form of the same device, with the same mode of operation, so far as the operation is concerned to which the whole device relates—that of discharging through the bottom of the cylinder the purged contents of the charge.

[*Weston *vs.* Nash, 1096.

(See Combinations, 2.)

JUDGMENTS AND DECREES.

In an interference, judgment of priority is conclusive, not only on interfering matters which were claimed, but on all which might have been claimed.

[Harlow *vs.* Guernsey, 513.

JUDICIAL DECISIONS.

1. The principles upon which the several circuit courts of the United States are bound by the decisions of each other examined and discussed.

[*Goodyear Dental Vulcanite Co. *et al. vs.* Geo. Willis, 41.

2. The adherence to decisions is by no means confined to those which precede the case in question in the same tribunal. Those of co-ordinate courts are equally influential.

[*Goodyear Dental Vulcanite Co. *et al. vs.* Geo. Willis, 41.

3. The circuit courts of the United States, although divided in jurisdiction geographically, constitutes a single system, and where one court has fully considered and deliberately decided a question, every suggestion of propriety and fit public action demand it should be followed until modified by the appellate court.

[*Goodyear Dental Vulcanite Co. *et al. vs.* Geo. Willis, 41.

LICENSE.

1. While a mere licensee cannot, in his own name, sue strangers who infringe, yet he would be permitted in a court of equity to bring suit against the patentee for the infringement of the rights secured to him by his license.

[*Littlefield and Jagger *vs.* Perry, 964.

2. Where a machine was licensed for use in a particular territory: *Held*, That the use of it, by subsequent purchasers, in territory other than that for which it was licensed, was unlawful.

[*Wicke *vs.* Kleinklecht, 1096.

3. The mere fact that the agent of the patentee, after the transfer of the machine to the unlicensed territory, demanded of the purchasers the back royalties due upon it, conferred no right to use it outside the territory named in the license.
[*Wicke *vs.* Kleinklecht, 1008.

(See Assignments, 3, 4; Infringements, 12.)

MANUFACTURES.

1. Articles of manufacture may be new in the commercial sense when they are not new in the sense of the patent law.
[*Union Paper Collar Co. *vs.* Van Deusen *et al.*, 919.

2. A shoe having the material of the upper part thickened up by a patented process is not a new article of manufacture in view of the prior shoe having the material of the sole so thickened up.
[*Myer and Evans *vs.* Pritchard, 1012.

(See Patentability, 10.)

MANDAMUS.

1. In that the 53d section supplies a remedy for a refusal of a patent by the Commissioner in such cases, it is decisive against the remedy by mandamus; for this writ will not issue where the law furnishes any other adequate specific remedy.
[*Hull *vs.* Commissioner of Patents, 559.

2. An application for a patent was put in interference with a party to whom a patent had been previously issued. On the testimony in the interference case it was contended that the applicant had abandoned his invention to the public use, and the Commissioner referred the question of such abandonment back to the Primary Examiner. And it was held that mandamus would not lie to compel the Commissioner to allow the patentee to take an appeal from the decision of such Primary Examiner to the Board of Examiners-in-Chief.
[*Bigelow *vs.* Commissioner of Patents, 603.

3. A writ of mandamus will not be allowed against the Commissioner of Patents where the law submits the subject to his opinion. (Carter, *Ch. J.*)
[*Bigelow *vs.* Commissioner of Patents, 603.

NOVELTY.

1. The invention covered by letters patent to Samuel G. Monce, June 8, 1869, for an "improved tool for cutting glass," consists, so far as the revolving steel cutter is concerned, in the fact that the sides, which are parallel at the axis, are beveled toward each other, at the perimeter, at an angle of about forty-five degrees to the axis, thus meeting about midway and forming a cutting-edge, which is approximately a right angle. Such an instrument embodies the conditions that give efficiency to the glazier's diamond, and is not anticipated by revolving cutters designed and used for other purposes, (as for dressing the surface of grindstones, the cutting of gas-pipe, or the cutting of paper or of pasteboard, or of leather,) in which the distinctive feature of the invention—the double bevel forming the right-angled edge—is present, if at all, by accident, and which, although capable in exceptional cases of being used to cut glass, will not practically perform the office of a successful glass-cutter for glaziers' purposes.
[*Monce and Ives *vs.* Adams, 177.

2. The cutter of the patent, which makes a cut at right angles to the surface of the glass, is not anticipated by the Pike cutter, which bears upon the glass in a slanting direction.
[*Monce and Ives *vs.* Adams, 177.

3. Collars and cuffs made of paper being known, and paper embossed in various modes, some of which were imitations of the surface of textile fabrics, being known, there existed no patentable novelty in the application of paper embossed in imitation of linen to the making of collars and cuffs.
[*Union Paper Collar Co. *vs.* Leland, 221.

4. The invention of Francis McLaughlin, of a brush-head, provided with an angular groove and a rubber ring fitted therein, (patented January 11, 1870,) is not anticipated by a door-stop provided with a rubber fitted in an angular groove.
[*Murphy *vs* Kissling, 302.

5. The machine covered by the patent of Charles and Andrew Spring, May 10, 1859, for Lathe for Turning Irregular Forms, the claim of which is for "The combination of a griping-chuck, by which an article can be so held at one end as to present the other free to be operated upon, with a rest preceding the cutting-tool, when it is provided with a guide-cam, or its equivalent, which modifies the movement of the cutting-tool, all operating together, for the purpose set forth," is anticipated by the Pernot lathe for turning sewing-machine needles, which had the griping-chuck, the rest, and the cutting-tool, but instead of the guide-cam a pattern, it appearing that, at the date of the patent, a fixed pattern was the equivalent, in machines of this kind, for a cam pattern or guide.
[*Spring *vs.* Packard and Howard, 341.

6. The case is nowise changed by the fact that the screw of the Pernot machine operated differently from the adjusting-screw of the patented machine, the screw not being an element in the claim of the patent, and the alleged difference not being such as would constitute a defense against the patent if the Pernot machine were later in date than the patented one.
[*Spring *vs.* Packard and Howard, 341.

7. It is immaterial that Pernot did not turn needles to *a point* on his machine, as is done in the patented one. The particular form of pattern used was not of the essence of the invention, and his lathe only needed a change of pattern to make it applicable to turning the point of needles.
[*Spring *vs.* Packard and Howard, 341.

8. Where a patent had been granted for a martingale-ring formed by enveloping a metal ring, by means of dies, with a plastic composition known as "factitious ivory:" *Held*, That such an invention is not anticipated by rings made of ivory, or of compositions known as artificial, factitious, or imitation ivory, or of metal coated with varnish, lacquer, japan, enamel, porcelain, or metallic plating, such coatings being applied with a brush or the fingers, or fused on by heat.
[*Welling *vs.* Rubber-Harness Trimming Co., 606.

9. The first claim in reissued patent for feed-water heater and filter, granted to E. R. Stilwell, August 24, 1869, which is for "filtering material F, between a series of shelves and outlet, substantially as described," held valid, notwithstanding the fact that filters had been used for freeing the feed-water for boilers from the matter held in mechanical suspension therein, and the further fact that heaters composed of a series of shelves had been used for a similar purpose to remove from the water the matter held in solution and a portion of that held in suspension.
[*Stilwell and Bierce Manufacturing Co. *vs.* Cincinnati Gas Co. *et al.*, 829.

10. Although the operation of neither the shelves nor the filter is affected by the union of the two in the same machine, a new result is produced, inasmuch as the water is passed into the boiler in a condition different from that which would have been produced by either of the devices separately.
[*Stilwell and Bierce Manufacturing Co. *vs.* Cincinnati Gas Co. *et al.*, 829.

(See Infringement, 15.)

PATENTS.

1. Both the process and the product may be included in one patent; but in such case the description of the invention in the specification and claims should disclose that the inventor had both results in his mind.
[*Welling *vs.* Rubber-Harness Trimming Co., 606.

2. The patent of E. H. Graham, of October 16, 1860, reissued May 22, 1867, for "picker-staff motion in looms," has no relation to the *mere form* of a journal-bearing arm, nor does it consist in arranging a journal-bearing arm in a slot in the rocker. It embraces every combination of a rocker with a bed and loose journal-bearing arms, arranged so as to produce the result described in the specification as affected by the combination.
[*Mason *vs.* Graham and Rouse, 833.

PATENTABILITY.

1. A hollow metal coffin-handle having its ends inserted into rings in bars on the casket, and then indented into the rings, and farther attached by inserting plugs, being found an improvement both in point of economy and security, held entitled to a patent.
[J. S. Ray, 40.

2. Claims for what are called "mechanical processes" should not be allowed when they comprehend no more than the mere functions of mechanism described; in such cases it is the apparatus only that is patentable.
[Case *vs.* Hastings, 557.

3. The conditions under which the use of one material instead of another in constructing a known machine or article may be patentable considered and explained. *Hotchkiss* vs. *Greenwood*, (11 How., 248,) and *Hicks* vs. *Kelsey*, (18 Wall., 670,) cited and discussed.
[*Goodyear Dental Vulcanite Co. *et al. vs.* Geo. Willis, 41.

4. The idea that if a pencil is inserted into a cavity in a piece of rubber smaller than itself the rubber will attach itself to the pencil, and, when so attached, become convenient for use as an eraser, is not of itself patentable; but a new device by which this idea may be made practically useful is.
[*The Rubber Tip Pencil Co. *vs.* Howard *et al.*, 172.

5. As the rubber head described in the patent may be of any convenient external form, and is not limited as to either the form or the longitudinal extent of its socket, it is not new; and, as it was previously well known that if a solid substance was inserted into a cavity in a piece of rubber smaller than itself the rubber would cling to it, the size of the socket in the head, as compared with that of the pencil, does not add to the patentable character of the invention.
[*The Rubber Tip Pencil Co. *vs.* Howard *et al.*, 172.

6. The reissued patent of W. E. Lockwood, January 28, 1873, (original dated April 26, 1859,) for ladies' cuffs and collars, the claim of which is for "a collar having a paper surface imitative of the textile face and fiber of a dressed linen collar, as set forth," held, in view of the state of the art, not to cover patentable subject-matter.
[*Union Paper Collar Co. *vs.* Leland, 221.

7. Car-wheels having been made by placing a heated tire of cast-steel in a mold, and then pouring in molten cast-iron *at the center of the mold*, thus producing a weld or union between the iron and the steel, it did not require invention, and was not patentable to introduce the molten iron through openings or "sprues" *just inside the heated rim or tire*. Nor can it make any difference that a *series* of such openings or holes are used, instead of a *single* opening.
[*Needham *vs.* Washburn *et al.*, 649.

8. The Stilwell patent is not invalidated by the earlier English patent of Wagner, since it is doubtful whether the Wagner device could be practically used with success.
[*Stilwell and Bierce Manufacturing Co. *vs.* Cincinnati Gas Co. *et al.*, 829.

9. There is no force in the objection that the Stilwell patent does not specify what filtering material is to be used. The patent permits the use of any suitable filtering material, and persons skilled in the art could at once use the invention without experiment or additional invention.
[*Stilwell and Bierce Manufacturing Co. *vs.* Cincinnati Gas Co. *et al.*, 829.

10. New articles of commerce are not patentable as new manufactures unless it appears in the given case that the production of the new article involved the exercise of invention or discovery beyond what was necessary to construct the apparatus for its manufacture.
[*Union Paper Collar Co. *vs.* Van Deusen *et al.*, 919.

11. It appearing that the collars made by Evans, apart from the paper composing them, were identical in form, structure, and arrangement with collars previously made of linen, paper of different quality, and of other fabrics, and that Evans did not invent the special paper used by him, nor the process by which it was obtained: *Held*, That he was not entitled to a patent for the collars as a new manufacture.
[*Union Paper Collar Co. *vs.* Van Deusen *et al.*, 919.

12. The object in turning down a collar on a curved line instead of a straight line is precisely the same, whether the collar be all paper, paper and linen, or all linen. Hence, where it appeared that linen collars had been turned over on a curved line to prevent wrinkling, and to afford space for the cravat: *Held*, That it was not patentable to apply the same mode of turning down to collars of paper or paper and linen.
[*Union Paper Collar Co. *vs.* Van Deusen *et al.*, 919.

(See Invention and Skill, 2.)

PLEADINGS AND PRACTICE.

1. Where a suit in equity under a patent is pending at the time of the reissue, a supplemental bill setting up the reissued patent is not a proper pleading to revive such a suit, as nothing can be recovered, either as damages or profits, for the infringement of the surrendered patent.
[*Reedy *vs.* Scott, 463.

2. The infringement of the reissued patent becomes a new cause of action, for which, in the absence of any agreement or implied acquiescence of the respondent, no remedy can be had except by the commencement of a new suit.
[*Reedy *vs.* Scott, 463.

3. But where the complainant, having reissued his patent pending a suit, set up this fact in a supplemental bill, all the proofs in the case being taken thereafter, and neither the respondent nor the court below made any objection to the irregularity of the pleadings, the irregularity was also disregarded by the court on appeal.
[*Reedy *vs.* Scott, 463.

4. In a suit brought under section 58 of the act of 1870, to repeal an interfering patent, motion was made to strike out such part of defendants' answer as related to an alleged lack of novelty in the invention covered by complainant's patent, on the general ground that the object of the statute was merely to enable the complainant to determine the question of priority as between himself and his adversary prior to going before the public to test the validity of the patent on its merits: *Held*, That this allegation of the answer was admissible. The motion was overruled.
[*Foster *vs.* Lindsay and Kalb, 514.

5. If it should appear that as to prior use not set up in the answer, testimony clearly establish the invalidity of the patent, the court might grant the respondents leave to amend.
[*Geier *vs.* Goetzinger, 563.

6. Where the patented improvement formed a part only of the infringing stoves made by the defendants, the inquiry in the accounting before the master should have been confined to an account of the profits received by the defendants as the direct result of the improper use of the improvements, and could not include all the profits received from the manufacture of the stoves embracing such improvements.
[*Littlefield and Jagger *vs.* Perry, 964.

7. An amendment which changes the character of a bill ought not, generally, to be allowed after a case has been set for a hearing, and still less after it has been heard. The answer might become inapplicable if such an amendment were permitted.
[*Tremain and Tremain *vs.* Hitchcock *et al.*, 1055.

8. Where the original bill set up only the first reissue of a patent that had been twice reissued, but the proofs, both for final hearing and before the master on the accounting had reference to the second reissue, as also the proceedings upon the master's report, an order of court directing that the record be amended by inserting in the bill an averment of the second reissue was properly made, even after the final decree.
[*Tremain and Tremain *vs.* Hitchcock *et al.*, 1055.

9. An injunction having issued against the defendants because of their manufacture of rings, a motion for an attachment against them for the manufacture of *terrets, buckles, and hooks* was denied; but the master, notwithstanding, was instructed to state a separate account of such trimmings, with view to a reconsideration of the questions involved upon the hearing of the exceptions to the report.
[*Willing *vs.* Rubber Coated Harness-Trimming Co., 606.

10. Whether, in a suit brought against the respondents *as copartners* but in which the proofs fail to show a partnership, but do show that the respondents with others were organized into a corporation, with the same name as the alleged copartnership, it would be competent for the court to enter a decree against the *corporation, quære.*
[*Needham *vs.* Washburn *et al.*, 649.

11. In such case the court will not delay the hearing of the cause; since the defect, if it be one, may be cured by an amendment.
[*Needham *vs.* Washburn *et al.*, 649.

12. Where acquiescence alone is relied on as a basis for a motion for a preliminary injunction, the infringement must be palpable.
[*Burleigh Rock-Drill Co. *vs.* Lobdell *et al.*, 836.

13. The fact that a defendant is using a machine openly made and sold, under patents, and which the manufacturers have in good faith put in open competition with the machines made by complainant, honestly believing that they were not trespassing on any rights of complainant, though no defense if he is adjudged at final hearing to infringe, is a reason why the court should hesitate to interfere before the final decree in a case where there is no suggestion of any irremediable injury in the intervening time, or any want of ability to respond to any judgment which may finally be recovered.
[*Burleigh Rock-Drill Co. *vs.* Lobdell *et al.*, 836.

(See Evidence, 7.)

PRACTICE IN THE PATENT OFFICE.

1. Where the Examiner and the Board agree in their findings upon the facts in interferences, it is not necessary for the Commissioner to minutely review the testimony.
[Case *vs.* Hastings, 557.

2. An application for a design patent should not be entertained by the Examiner if the specification and claim are wholly wanting in clearness, exactness, and particularity. Such an application will not be allowed.
[Niedringhaus and Niedringhaus, 171.

3. The expressions in the statute "intend to adopt" and "intended to be applied and used," held to authorize the registration of a trade-mark which has been devised and is intended to be used.
[J. W. Rothschild, 220.

4. Where applicants file new applications, such as have been before filed by them and abandoned under the 2d proviso of the 35th section of the act of 1870, the proper action for Examiners is not to reject them on reference to the former application, but to refuse to consider them on the ground that the right to file them no longer exists.
[A. Mills, 961.

5. Where two parties have each an application pending at the same time before the Office, and one of them obtains a patent, he will derive no advantage from it if an interference is declared afterward between it and the other application; but he must establish his title by the same proof as if he was still an applicant.
[Smith *vs.* Barter, 1.

6. The decisions, rulings, and practice of the Patent Office will be made conformable to the decisions of the courts.
[Rouse and Stoddard, 169.

7. According to the organization of the Patent Office, the ques-

tion of patentability of an alleged invention is to be referred for examination first to one of the Primary Examiners. If his decision be unfavorable the applicant has the right of appeal to the Examiners-in-Chief; and then (in case of unfavorable decisions) to the Commissioner and to the Supreme Court District of Columbia.

[*Hull *vs.* Commissioner of Patents, 559.

(See Abandonment, A and B, 1, 2; Patentability, 2; Claims, 1, 4; Interferences, 2.)

PRESUMPTIONS OF LAW.

1. The presumptions of the law are in favor of the patent and the utility of the invention.

[*Geier *vs.* Goetinger, 563.

2. Patents granted by the Commissioner pursuant to the provisions of the statute relating thereto offered a *prima facie* presumption, when introduced in evidence, that the patentee is the original and first inventor of what is therein described as his invention or discovery.

[*Needham *vs.* Washburn *et al.*, 649.

(See Reissues, 3.)

PRIORITY OF INVENTION.

1. The mere making of a model of an invention held not to constitute invention, as against a patent subsequently granted to another for the same thing.

[*Stilwell and Bierce Manufacturing Co. *vs.* Cincinnati Gas Co. *et al.*, 829.

2. W. and T. having filed applications for patents showing substantially the same device, at the respective dates March 31 and April 21, 1868, were rejected. T. persisted in his claim, and upon appeal secured his patent, while W. amended his application, excluding from his claim the common device, and thus, without appeal, obtained a patent of narrow scope. Subsequently, learning of T.'s patent, he filed a second application, broad enough to include the device previously omitted, and, in the consequent interference proceedings with T., was adjudged the prior inventor, and thereupon obtained a broad patent: *Held*, in a suit brought by T. against W., that W.'s second application was the commencement of a *new proceeding*, and that alone upon which the patent granted in pursuance of it depends; and, therfore, that the presumption, as regards priority of invention, was with T.

[*Pelton and Taylor *vs.* Waters, 425.

3. The party who first reduces an invention to actual use is entitled to the patent for it, although the other may have first conceived it, if he did not exercise reasonable diligence in reducing it to practice.

[Smith *vs.* Barter, 1.

4. If the party who first conceived a machine followed up the idea diligently, and was the first to reduce it to actual practice, he is entitled to a patent for it, although his competitors had complete working drawings of it previously prepared, and had obtained a patent.

[Rees *vs.* Richards and Berry, 37.

5. Whoever first reduces an invention to practice and makes an application of it to use will usually be held the prior inventor.

[Ware *vs.* Bullock, 39.

6. In order to defeat a patent the courts require it to be shown that another not only conceived the invention in dispute before the patentee, but was also the first to perfect and adapt the same to practical use, or was using reasonable diligence for that purpose.

[Hammond *vs.* Laird, 170.

7. In accordance with this the Office uniformly requires an applicant to adduce the same evidence when he attempts to obtain a patent for an invention for which another has already obtained one in good faith.

[Hammond *vs.* Laird, 170.

8. The parties who first embodied an invention in a machine which they kept in operation afterward for actual use, besides manufacturing and selling other machines, are *prima facie* entitled to the patent.

[Crane *vs.* Whitehead and Atherton, 219.

9. In order to overcome their title their competitor must show that he had not only conceived the invention before them, but had exercised reasonable diligence in perfecting it, and had continued to do so until he had reduced the invention to practice.

[Crane *vs.* Whitehead and Atherton, 219.

10. He is the inventor, entitled to the protection of the patent law, who is first to complete the invention and publish it to the world, and not he who confines the knowledge of it to his closet.

[Arnold *vs.* Wilcox, 558.

11. Where an invention consists of a combination of elements the date when all the elements are combined is the date of the invention.

[Baker *vs.* Atwood and Moore, 697.

12. Where an applicant was first to conceive an invention, to reduce it to a working drawing and model, and to make application for a patent upon it, held that he was the first inventor, his opponent not having reduced the invention to practice.

[Smith *vs.* Edson, 827.

13. Where one is first to conceive an invention, but throws aside all evidence of the conception, makes no effort to complete or introduce the invention to the public, and delays making application for a patent for nearly four years after another has brought it into extensive use, he has no standing as an inventor.

[Hart *vs.* Little, 962.

14. An applicant first to conceive, complete, and practically test an invention in a full-sized working machine, which he preserved, held to be the first inventor, although, before he made his application for a patent, an independent inventor had procured a patent comprehending the same invention.

[Baldwin *vs.* Bigelow, 1011.

(See Evidence, 3, 5.)

PUBLIC USE.

(See Affidavits.)

REDUCTION TO PRACTICE.

1. Embodying an invention in a model is not a reduction of it to practice.

[Hammond *vs.* Laird, 170.

2. The mere filing in the Patent Office of an application for a patent describing the invention, will not be considered a reduction of it to practice.

[Crane *vs.* Whitehead and Atherton, 219.

REISSUES.

1. A reissued patent cannot be overlooked if matter be found in it the same as that claimed in a subsequent application, even though the subject-matter referred to had been improperly introduced into the patent upon reissue.

[G. Richardson, 1053.

2. Where the original patent related to *ornamented* paper collars and cuffs, but the description pointed out that the *surface* of the linen or other textile fabric would be imitated as well as the ornaments: *Held*, that the patent was lawfully reissued, so as to claim the imitated *surface* as well as the imitated *ornaments*.

[*Union Paper Collar Co. *vs.* Leland, 221.

3. Notwithstanding the fact that the patent has been reissued seven times, the law presumes that the last patent was granted to correct accidental or inadvertent mistakes in the original. The only test of the validity of the Commissioner's action is whether he has allowed a reissue for a different invention from that covered by the original patent, or for what was not therein described, claimed, or indicated.

[*Union Paper Collar Co. *vs.* White, 908, 877.

4. The purpose of a reissue is to render effectual the actual invention for which the original patent should have been granted—not to introduce new features.

[*Union Paper Collar Co. *vs.* Van Deusen *et al.*, 919.

5. Therefore, in an application for reissue, parol testimony is not admissible to enlarge the scope of the invention beyond what was described, suggested, or substantially indicated in the original specification, drawings, or Patent Office model.

[*Union Paper Collar Co. *vs.* Van Deusen *et al.*, 919.

6. Whether a reissued patent is for the same invention as the original depends upon whether the specification and drawings of the reissued patent are substantially the same as those of the original; and, if not, whether the omissions or additions are or are not greater than the law allows to cure the defect of the original.

[*Union Paper Collar Co. *vs.* Van Deusen *et al.*, 919.

7. Where the original patent for improvement in paper shirt-collars, granted to Andrew A. Evans, May 26, 1863, stated the invention to consist, first, in making the collars of parchment-paper, or paper prepared with animal-sizing; and, second, in coating one or both sides of the collar with a thin varnish of bleached shellac to give smoothness, strength, and stiffness, and to repel moisture, the claim being for "a shirt-collar made of parchment-paper, and coated with varnish of bleached shellac, substantially as described, and for the objects specified:" *Held*, that a reissue thereof which describes a paper or other than parchment-paper, or one prepared with animal-sizing, and which does not require either side of the collars to be coated with a varnish of bleached shellac for any purpose, the claim being for "a collar made of long-fiber paper, substantially such as is above described," is for a different invention from that embodied in the original patent.

[*Union Paper Collar Co. *vs.* Van Deusen, *et al.*, 919.

REJECTED APPLICATIONS.

A rejected application will no longer be considered, therefore, a bar to a new application for a patent for the same invention.

[Rouse and Stoddard, 169.

SPECIFICATIONS.

(See Construction of Specifications and Patents.)

SURRENDER OF PATENTS.

The surrender of a patent to the Commissioner is an act which, in judgment of law, extinguishes it. It is a legal cancellation of it; and hence the patent can no more be the foundation for the assertion of a right, after the surrender, than could an act of Congress which has been repealed; and it has frequently been determined that suits pending which rest upon an act of Congress fall with the repeal of it. Antecedent suits depend upon the patent existing at the time they were commenced, and unless it exists and is in force at the time of the trial and judgment, the suits fail.

[*Reedy *vs.* Scott, 463.

TO WHOM A PATENT SHALL ISSUE.

In determining to whom a patent shall issue, where assignments have been made, the Commissioner of Patents must be governed by the record. He cannot regard mere equitable claims, but must issue the patent to the person or persons having the legal title, the requirements of the Office having been complied with.

[T. A. Edison, 423.

TRADE-MARKS.

The right under the statute to adopt and register, distinguished from the common-law right acquired by use.

[J. W. Rothschild, 220.

USE IN A FOREIGN COUNTRY.

The right of an inventor in this country to a patent is not impaired by anything of the same nature as his invention which has been achieved abroad, provided it has not been patented nor described in any printed publication.

[Smith *vs.* Barter, 1.

COMMISSIONER'S DECISIONS.

BECKER *vs.* THROOP.—*Interference.*

[*Appeal from the Examiner of Interferences in the matter of the interference of Becker vs. Throop.* GRAIN-CLEANING MACHINES.—*Decided July 7, 1875.*]

Where an interference had been declared between an application for a reissue of a patent granted in 1873, and a patent of a subsequent date: *Held*, that the interference was without authority of law, and should be dissolved.

The Commissioner of Patents must be governed, in regulating the practice of the Patent Office, by the decisions of the United States courts, so far as they apply.

The decision of the Supreme Court of the District of Columbia in *ex-parte* Mayall in effect abrogates the last paragraph of Rule 51 of the Rules of Practice of the Patent Office; and hereafter Rule 51 may be regarded as amended, so that applications for reissue will, under no circumstances, be put in interference with patents granted subsequently to the date of original patents sought to be reissued.

THACHER, *Commissioner:*

This is an appeal from a decision of the Examiner of Interferences denying a motion to dissolve the interference. The motion is based upon the fact that the interference was declared between Throop's application for reissue of a patent granted February 11, 1873, and a patent granted to Becker subsequently, to wit, June 2, 1874, which proceeding, it is insisted, is without authority of law. The interference was declared under the authority of the fifty-first rule promulgated by the Commissioner of Patents, with the approval of the Secretary of the Interior; but in a recent case (*ex parte* Mayall) heard on appeal by the Supreme Court of the District of Columbia, it was decided by the court that the Commissioner of Patents has no authority of law to declare an interference between an application for reissue and a patent granted subsequently to the original patent sought to be reissued.

As I have frequently stated in decisions already published, the Commissioner of Patents must be governed in his practice by the decisions of the courts.

The decision referred to above must control the Patent Office, therefore, in the declaration of interferences hereafter, so far as it applies. Its effect is to strike out the fourth case cited under Rule 51, in which an interference will be declared.

Rule 51 may be regarded as amended by my decision in this appeal to the extent of striking out the last paragraph thereof.

Applications for reissue will not hereafter be put in interference with patents granted subsequently to the date of the original patent, under any circumstances whatever, and all interferences of this character now pending may be dissolved without further proceedings.

The decision of the Examiner of Interferences in the present case is overruled, and the interference dissolved.

[*Appeal from the Board of Examiners-in-Chief in the matter of the application of Josiah Holmes for Letters Patent for* "RAKE-TOOTH."—*Decided June 1, 1875.*]

JOSIAH HOLMES.—*Appeal.*

The change from a round to an oval cross-section at different portions of a rake-tooth, compared with a similar construction in a hay-fork tooth. The construction and purpose being the same, the different use of the tool is immaterial.

SPEAR, *Acting Commissioner:*

The objection made by the Examiner to the allowance of the claim presented by applicant appears to be twofold. In the first place he says that the "feature claimed in this case is regarded as a matter of judgment and not of invention;" further, that "the particular form of tooth claimed is not new in analogous implements," and cites the model in the patent of Matthewson. More fully stated, I understand the reason first offered by the Examiner to be that the expedient resorted to to strengthen the rake-tooth at the bent part is an expedient in common use for the same purpose—that is to

say, if it were deemed desirable to lighten a round rake-tooth without diminishing its strength—any ordinary workman ought to be aware that this could be accomplished by increasing the diameter in the line of the pressure to be resisted, while the diameter at right angles might be lessened. Certainly this expedient is a part of the common stock of information among artisans of ordinary skill, and I cannot regard it as an invention, to apply it in this particular case. I have no doubt that the expedient was resorted to for the same purpose in the hay-fork cited by the Examiner. In that case the same conditions exist. There is a necessity for increased strength in the upper part of the prongs, and like necessity for easy delivery at and near the points; accordingly, we find the points and the lower parts rounded and the upper parts flattened. It seems to me an altogether forced and unreasonable conjecture to regard this as an accidental and meaningless construction, and I do not see why, if the device were patentable, the patentee in this case might not, under the law, reissue, amending his drawings and specification by the model, and claiming the precise device claimed by the applicant in the present case, for the tooth or prongs in this respect are the same, though one be applied to a hay-fork and the other to a hay-rake; but I regard the first objection as fatal to the application. This applicant has not made an invention. He has used an old device for an old and well-known purpose. The fact that the tooth to which he applies it is inserted in a different machine and put to a slightly-different use affords him no relief.

For these reasons I must affirm the decision of the Examiners-in-Chief.

DECISIONS OF THE COURTS.

U. S. CIRCUIT COURT, SOUTHERN DISTRICT OF NEW YORK.

GILBERT & BARKER MANUFACTURING COMPANY *vs.* OAKES TIRRELL.

[*In equity.—Before* WOODRUFF, *Cir. J.—Decided June*, 1874.]

The chief feature of the improvement set forth in the patent granted to J. F. Barker and C. N. Gilbert, August 3, 1869, for an "Improved Apparatus for Carbureting Air," is the placing of the carbureter under ground in a vault separate from the building to be lighted, at any desired or convenient distance therefrom, while the power and the motor, by means of which atmospheric air is forced through pipes leading into the carbureter, are placed in an apartment in the building, or near thereto, conveniently accessible with or without a light, as occasion may require, whenever, for adjusting the motive power or the machinery thereof, it is desirable to do so.

Such isolation of the carbureter under ground prevents danger from explosion, secures an even, regular supply of the gas, unaffected by changes of temperature above ground, and effects a preliminary condensation of the gas before it enters the distributing-pipes.

This is more than a mere change in the location of an old device. By the new arrangement the patentees bring into contributory and effective co-operation, with a carbureter and the machinery for supplying air thereto, the earth and its even temperature below. This is more than merely making use of the natural state of the ground or the natural laws, which, operating below the surface, make such new location desirable, as a matter of mere judgment. It brings into conjoint operation new elements, working both actively and passively to produce the result, and to produce the ultimate and final result in a better manner—in a manner which combines safety with convenience and utility, as had never before been done.

The new arrangement of the carbureter was patentable, and the claim—viz, "The arrangement of the carbureter with a motor-wheel, said wheel being driven by a descending weight or other equivalent mechanical power, applied to force the air through the carbureter to the burners, said carbureter being placed within a vault by itself, separate from the building to be lighted, the whole arranged and connected with pipes, substantially as herein described and set forth"—is valid.

Mere differences in the mode of constructing the carbureter held not to avoid the patent, so long as the moderate temperature of the earth and the underground passage of the gas are availed of.

[*E. W. Stoughton* and *William Stanley*, for complainant.
Edmund Wetmore, for defendant.]

WOODRUFF, *Circuit J:*

The bill herein is filed to restrain the infringement of a patent granted to J. F. Barker and C. N. Gilbert on the 3d of August, 1869, for an approved apparatus for carbureting air.

By means of this apparatus it is claimed that gas is produced from petroleum and similar volatile oils employed for carbureting atmospheric air, thus rendering it combustible, light-producing, and suitable for lighting houses, manufactories, &c.

Neither the process nor the chief parts of the apparatus are claimed to be new. The claim in the patent which the defendant is charged with infringing is in these words:

> The arrangement of the carbureter with a motor-wheel, said motor-wheel being driven by a descending weight or other equivalent mechanical power applied to force the air through the carbureter to the burners, said carbureter being placed within a vault by itself, separate from the building to be lighted, the whole arranged and connected with pipes, substantially as herein—i. e., in the specification—described and set forth.

It appears by the proofs that, prior to the invention of the patentees, attempts to produce and bring into general use gas manufactured by forcing atmospheric air through or in contact with volatile oils under such pressure that it was suitably impregnated or carbureted were liable to two difficulties.

The chief of these was that, under any already-devised arrangement, the danger of explosion, as an incidental result of the escape of gas from the carbureter, was very great; and this not only *per se* hindered its use, but made it difficult or impossible to procure insurance upon buildings so lighted. Another difficulty lay in the fact that, in passing the gas from the carbureter through the distributing-pipes, whenever the temperature of the pipes was lower than that of the carbureter condensation occurred, which produced in the pipes not an obstruction merely, but a highly inflammable liquid, greatly inconvenient and dangerous.

If an attempt was made to obviate these objections by locating the apparatus in apartments separate from the building lighted, there was a necessity to provide for the changes of temperature in our ever-varying climate, which were liable to cool the carbureter to a degree which made it practically inoperative; or, if the apartment was artificially heated, the danger of explosion was not avoided.

I shall not enter very fully or minutely into a discussion of the details of the patented apparatus, since most of them are confessedly old.

The chief feature of the improvement is in the placing of the carbureter under ground, in a vault separate from the building to be lighted, at any desired or convenient distance therefrom, while the power and the motor, by means whereof the atmospheric air is forced through pipes leading into the carbureter, is placed in an apartment in the building, or near thereto, conveniently accessible with or without a light, as occasion may require, whenever for adjusting the motive power or machinery thereof it is desired to do so. Such apartment being thus wholly separated by walls or intermediate earth, or both, no gas from the carbureter pervades it, and no danger of explosion arises.

Besides this result, which may be claimed to be purely incidental, and perhaps not novel, because it would result from any mere separation of the two parts of the apparatus by placing them in different apartments, a most important result is effected in making such separation practicable, and at the same time producing an even, regular supply of the gas by the carbureter, unaffected by changes of temperature above ground, and effecting also a preliminary condensation before the gas enters the distributing pipes, which relieves the operation of the apparatus from the objection secondly above named.

Three questions are hereupon raised. Was this new arrangement patentable? Was it new, and were the patentees the first inventors? Does the defendant infringe?

1. Upon the first question it is insisted that the patentees merely changed the location of the carbureter, and that the mere change in the location of an old device is not patentable.

In *Marsh et al.* vs. *The Dodge and Stevenson Manufacturing Company*, in the Northern District, at the June term, 1873, (5 OFFICIAL GAZETTE, 398,) I had occasion to say that "mere change of location is not invention." But it was also held that "where change of location involves the employment of new devices to adapt an apparatus for use in the new position, and a beneficial result is produced, then this location, in its connection with such new devices—that is, the means by which the result is produced, and not the result itself—is patentable; and where such change of location brings into existence a new combination of devices, operating by reason of such new combination to produce a new and useful result, such new combination is patentable."

This illustrates the nature and patentable character of the arrangement described in the patent in this case. By the new arrangement the patentees bring into contributory and effective co-operation, with a carbureter and the machinery for supplying atmospheric air thereto, the earth and its even temperature below the surface, and obtain protection from the efflux of gas from the carbureter and its accumulation in the frequently visited location of the motor, and from the danger of consequent explosion, and secure, by the passage of the gas from the carbureter through a cooler medium, the preliminary condensation, which makes the use of the gas in the building and its passage through the distributing-pipes safe, convenient, and valuable.

It is no impeachment of the patent to say that this is only making use of the natural state of the ground, or the natural laws which, operating below the surface, make such new location desirable as a matter of mere judgment. It is more than that. It brings into conjoint operation and effect new elements, working actively and also operating passively to produce the result, and to produce the ultimate and final result in a better manner—in a manner which combines safety with convenience and utility as had never before been done.

The most important inventions ever made consist in subordinating natural elements or controlling natural laws to the production of useful results.

I cannot doubt that the invention of the patentees was patentable, as truly so as it is abundantly proved to be greatly useful and valuable.

2. The questions of fact—was this arrangement new, and were the patentees the first inventors—must be answered in the affirmative.

I cannot, in a brief opinion, review in detail the evidence. I must content myself with saying that, after a careful examination of the testimony and attention to the very full argument of the counsel, the conclusion seems to me clear that no prior devices or arrangements anticipated the patentees.

3. Does the defendant infringe? It was but feebly, if at all, insisted that, if the arrangement of devices by the patentees was entitled to be called invention, and was patentable, as above explained, the defendant did not employ its distinguishing features or characteristics. The details in the construction of his carbureter were not precisely like that used by the complainant, but those specific features were not claimed. The substantial operation of his carbureter and the mode of impregnating the atmospheric air are alike in both.

The difference between the apparatus of the defendant and that of the patentees chiefly relied upon is that, whereas the latter make the cavity below the ground a vault having surrounding walls, the defendant, having inserted his carbureter in the cavity, surrounds it with earth in direct contact therewith, and carries up to the surface a pipe through which to replenish the carbureter with oil, instead of having a removable opening to the vault below employed by the patentees.

The substance of the invention the defendant uses. The means of its effective useful operation are the same. The even, moderate temperature of the earth, the underground passage of the gas, and the effect thereof are alike used in both. The difference in the construction of the carbureter used by the patentees, as described in the drawings, may make a more permanent opening about its sides desirable; but I cannot regard these details as of the substance of the invention. The apparatus of the defendant does substantially operate by the same means, in the same way, and to produce the same result.

The complainant must have a decree for an injunction and account in the usual form.

DESIGNS PATENTED DURING THE WEEK.

[Each Design bearing date July 6, 1875.]

8,450.—Glass Dishes for Table Use.—JAMES S. ATTERBURY and THOMAS B. ATTERBURY, Pittsburg, Pa. Application filed June 10, 1875. Term of patent 7 years.

8,451.—Metal Case for Electro-Magnetic Machine.—WILLIAM H. BURNAP, Jersey City, N. J. Application filed May 15, 1875. Term of patent 7 years.

8,452.—Writing-Paper.—HENRY D. CONE, Stockbridge, Mass. Application filed May 31, 1875. Term of patent 14 years.

2,723.—Metal.—THE PATENT METAL COMPANY, Philadelphia, Pa. (Re-registration.) Application filed November 3, 1870.
"monogram GLS."

2,724.—Yeast-Powder.—H. K. THURBER & Co., New York, N. Y. (Re-registration.) Application filed October 1, 1870.
"a representation of a loaf of bread, on a preferably dark background, with the words 'The Best Yeast-Powder' printed upon or near the same."

2,725.—Cotton Flannels.—TREMONT AND SUFFOLK MILLS, Lowell, Mass. Application filed July 1, 1875.
"the words, letters, and numerals, 'Progress,' 'T M,' 1870.'"

2,726.—Whisky.—VIDVARD & SHEEHAN, Utica, N. Y. (Re-registration.) Application filed January 24, 1871.
"Mehan's Malt Potteen,' arranged in the form of a circle around the figure of an Irish harp."

2,727.—Whiskey.—VIDVARD & SHEEHAN, Utica, N. Y. (Re-registration.) Application filed March 28, 1871.
"a representation of a medal having stars on its face accompanied by the words 'Gold Medal Kentucky Malt Bourbon,' the words 'Gold Medal' being arranged in an arch over the medal, and the three words 'Kentucky Malt Bourbon' being arranged in as many straight lines thereunder."

2,728.—Electro-Voltaic Bands.—VOLTA BELT COMPANY, Cincinnati, Ohio. Application filed April 23, 1875.
"a symbol consisting of the words 'Electricity is life,' printed across the figure of a globe, and beneath clouds from which lightning-flashes proceed."

2,729.—Fertilizer.—WALTON, WHANN & Co., Wilmington, Del. (Re-registration.) Application filed May 15, 1871.
"words 'Virginia Tobacco Guano.'"

2,730.—Fertilizer.—WALTON, WHANN & Co., Wilmington, Del. (Re-registration.) Application filed November 3, 1870.
"words 'The Great Fertilizer—Whann's Rawbone Superphosphate.'"

2,731.—Cigars.—WESTFIELD CIGAR-MAKERS' CO-OPERATIVE ASSOCIATION, Westfield, Mass. Application filed June 21, 1875.
"the name of said association and the picture of said mountain and scenery, and the word 'Ætna.'"

2,732.—Wire Goods.—WOODS, SHERWOOD & Co., Lowell, Mass. Application filed January 8, 1875.
"word 'Lustral.'"

TO CORRESPONDENTS.

Persons ordering drawings of patents, or making inquiries in regard to patents, must always state the name of the inventor, subject-matter, and date. In making inquiries in regard to applications for patents letters must state the name of the applicant, subject-matter, and date of filing. In ordering drawings by classes, under the subject-matter index of September, 1871, (furnished gratis on application,) it will be understood that the Office cannot take upon itself to make selections of certain lines of inventions, embracing portions only of the patents in the classes as specified. The number of classes has been made as ample as the conduct of the business in this office will readily permit. An order should, therefore, embrace the entirety of a given class or classes. They cannot be subdivided unless ordered specifically by number, name, and date.

The cheapness of the copies, and the comparatively small number of patents in each of the one hundred and seventy-six classes, render an order by class by no means an onerous undertaking.

APPLICATION FOR EXTENSION.

UNITED STATES PATENT OFFICE,
Washington, D. C., May 19, 1875.

On the petition of ANN JENNETTE HATHAWAY, of Milwaukee, Wis., executrix of JOSHUA HATHAWAY, deceased, authorized by act of Congress approved February 16, 1875, praying for the extension of a patent granted to the said JOSHUA HATHAWAY, on the 3d day of April, 1860, for an Improvement in Devices for Converting Reciprocating into Rotary Motion,

It is ordered that the testimony in the case be closed on the 20th day of July next; that the time for filing arguments and the Examiner's report be limited to the 30th day of July next; and that said petition be heard on the 4th day of August next.

Any person may oppose this extension.

J. M. THACHER, *Commissioner.*

REMITTANCES.

All money sent by mail, either to or from the Patent Office, will be at the risk of the owner. In no case should money be sent inclosed with models. All payments to or by the Office must be paid in specie, Treasury notes, national bank-notes, certificates of deposit, or post-office money-orders.

INDEX OF INVENTIONS PATENTED JULY 6, 1875.

	Class No.	No. of Patent.
Advertising medium, H. Baldwin	54	165,147
Air brake, automatic, S. B. Ladd	122	165,337
Anger, earth, J. P. Simmons	51	165,376
Axle protector, C. G. Cowell	31	165,213
Bale band tightener, J. L. Sheppard	7	165,374
Barrels, bung for, Norris and Hickley	40	165,360
Barrels, machine for compressing, E. J. Granger	40	165,163
Basket and table, convertible lunch, E. B. Carver	88	165,305
Basket, stave, R. B. Wheeler	109	165,265
Battery, galvanic, Clamond and Guiffe	50	165,210
Batteries, pole for galvanic, H. P. Dechert	50	165,312
Bearings, anti-friction compound for, Lathrop and Weber	87	165,340
Bed bottom, L. Hull	62	165,166
Bedstead, W. West	62	165,284
Blind slat adjuster, J. G. White	24	165,384
Blind stop, C. E. Steller	24	165,269
Boiler, agricultural, W. A. Swarthout	59	165,362
Boiler tube cleaner, M. M. Smith	148	165,182
Boot and shoe counter stiffener, J. L. Hatch, (reissue)	16	6,534
Boot and shoe heels, machine for polishing the edges of, J. H. Ryder	16	165,260
Boot and shoe last, C. F. Hill	16	165,330
Boot tree T. Branigan	16	165,151
Brush, Albaugh and Toole	22	165,195
Brush, O. Jenness	23	165,236
Brush binder, J. Blair	22	165,202
Buckle, trace, M. T. Hayes	73	165,230
Burner, Argand gas, J. B. Fuller	64	165,221
Butter package, metallic, Roberts and Briggs	45	165,256
Butter preserving firkin, J. Wilhelm	45	165,288
Cameo, device for the manufacture of, C. C. Tracy	117	165,386
Can, oil, T. Boddick	107	165,257
Canal lock gate, J. E. Renk	82	165,178
Car brake, R. C. O'Hara	122	165,250
Car brakes, device for operating, S. B. Ladd	122	165,336
Car starter, S. Corse	122	165,309
Car ventilator, railroad, E. Ruesne	106	165,180
Cars, automatic air brake for, A. James	122	165,235
Carburetors, air blower for, W. H. Reed	27	165,254
Carbureting machine, E. Schoenberg	27	165,372
Casting bronze, G. R. Meneely	33	165,353
Casting metals, apparatus for, Grasser and Stepp	33	165,164
Casting turbine wheels, G. H. Jones	33	165,237
Cattle rack on platform scales, device for raising and lowering, P. C. Deckstader	144	165,217
Chair, barber's, W. Hoehn	62	165,232
Chair, folding rocking, A. W. Stewart	62	165,185
Charcoal manufacturing animal, O. Lugo	155	165,344
Clevis, safety, C. N. Poundstone	114	165,253
Clock work, electric winding mechanism for, J. W. Wignall	36	165,396
Coal vase and fire iron standard, G. J. Munschauer	154	165,248
Cock and anti-concussion valve, combined, I. F. Van Duzer	107	165,190
Cock, globe, J. Powell, (reissue)	148	6,527
Cooler, milk, Porter and Eaton	45	165,364
Cooler, water, G. I. Mix	58	165,357
Corn drill, pilot wheel, J. Campbell	133	165,155
Curtain fixture, J. S. Brown	62	165,209
Dams, construction of, W. Schmols	82	165,371
Dental vulcanizing apparatus, F. Heiudsmann	46	165,324
Digger, potato, J. H. Leuch	114	165,342
Draft evener, A. Whitemore	31	165,395
Drawing and spinning frames, top roll covering for, Atkinson and Edwards	142	165,197
Drier, J. F. Gent	48	165,226
Eaves trough, R. Tyhurst	126	165,388
Egg box, W. H. Holdam	116	165,233
Ellipsograph, M. Toulmin	97	165,385
Engine, condensing, J. F. Barker	150	165,148
Engine, reciprocating cylinder revolving, Palmer and Dewey	150	165,175
Engine, steam, S. F. Davenport, (reissue)	150	6,532
Engine valve, steam, G. E. Tower	150	165,187
Evaporating pan, P. E. Fox	156	165,223
Eyeglass, J. J. Bausch	157	165,199
Eyeglass, W. H. Peckham	157	165,251
Fences, barb for wire, Duffy and Schroeder	82	165,220
Fertilizer, O. Lugo	96	165,345
Fertilizer, C. H. North	96	165,172
Filtering apparatus, liquid, T. R. Sinclaire	167	165,377
Fire arm, revolving, J. Rupertus	123	165,369
Fire place, J. Adair	154	165,194
Floodway for warehouses, J. H. Morrell	30	165,247
Flower bracket, A. J. Gardner	63	165,227

	Class No.	No. of Patent.
Flower pot brackets, revolving saucer for, Freeman and Smith	63	165,224
Furnace for burning straw, J. R. King	149	165,169
Furnace for heating soldering irons, P. P. Beals	136	165,200
Furnace for manufacturing iron, process and, G. J. and S. J. Shimer	85	165,375
Gage, caliber, G. B. Weld	132	165,193
Gage, metal or paper, E. W. Dennison	132	165,158
Gage, pressure, J. W. Stiles, (reissue)	148	6,530
Game apparatus, J. D. Butler	146	165,154
Gas apparatus, E. P. Spice	27	165,268
Gas apparatus, coal, M. W. Kidder	66	165,168
Gas governors, diaphragm for, W. Frost	64	165,161
Gas machines, automatic mixing valve for, L. D. Towsley	27	165,188
Gas, manufacture of, P. W. Mackenzie	66	165,347
Gas, manufacture of, H. W. C. Tweddle	27	165,189
Gas retorts, cleaning, H. S. Wolf	66	165,398
Gate, farm, W. Waggoner	52	165,191
Generator, steam, J. and G. Firmenich	148	165,222
Grate, Warmington and Forrester	154	165,279
Grave, coffin, and monument, combined, Speers and Clark	54	165,267
Grinding wheel, J. W. and I. S. Hyatt	70	165,234
Gun, machine, D. C Farrington	105	165,318
Hame, Nunnelee and Kirksey	72	165,249
Harness saddle, H. H. Hallett	72	165,165
Harvester, J. H. Elward	74	165,316
Harvester, J. M. Rosebrook	74	165,368
Harvester, Webster, Dore, and McClenathan	74	165,220
Harvester, corn and cane, T. Merrell	75	165,171
Hat bodies, machine for stretching, G. Yule	76	165,400
Head rest, O. C. White	62	165,226
Heaters, frame for fire place, N. A. Boynton	154	165,298
Heating apparatus, hot water, E. F. Wackwitz	147	165,277
Hides from vats, machinery for raising and transferring, W. Coupe	92	165,212
Hinge, gate, G. Marsh	24	165,351
Hog ringing apparatus, S. and J. W. Sparks	144	165,266
Hook, bench, C. E. Smith	29	165,362
Hook, snap, C. E. Jackson	23	165,333
Horseshoe, J. Wanstall	60	165,278
Hose, hydraulic, L. H. Downing	81	165,159
Hose, rubber, J. Greacen, Jr	81	165,324
Hub, E. F. Friend	31	165,225
Ice cream, &c., vessel for measuring and handling, T. Burkhard	89	165,301
Insect destroying compound, E. Wilkins	63	165,228
Insect powder box, W. J. Van Patten	63	165,276
Iron and steel, flux for welding, D. Miles	85	165,246
Iron, process and furnace for manufacturing, G. J. and S. J. Shimer	85	165,375
Journal bearing, A. B. G. A. Williams	87	165,392
Knitting machine for making bullion fringe, E. P. Curtiss	89	165,311
Lamp chimney, R. Norris	90	165,361
Lantern, magic, L. J. Marey	157	165,242
Liquid filtering apparatus, T. B. Sinclaire	167	165,377
Liquids, apparatus for dispensing effervescent, L. Warker	1	165,391
Lock for safe and vault doors, J. Sargent	93	165,370
Lock, seal, L. I. Todd	93	165,384
Mail bag, Boyle and Stephens	162	165,205
Mail bag catch, Amrock and Judson	162	165,293
Mallet, A. G. Fellows	29	165,221
Match box, O. H. Hicks	90	165,329
Measuring distances, apparatus for, F. Weldon	157	165,393
Metal or paper gage, E. W. Dennison	132	165,158
Mill, metal rolling, J. I. Williams	125	165,390
Molds, blackwashing, J. B. Aston	33	165,196
Mortising machine, J. Berry	173	165,294
Muff, ear, E. Strauss	38	165,373
Music stand, J. Lyons	62	165,346
Nails, making chisel pointed, G. Stacy	103	165,360
Nut lock, D. D. Jones	14	165,167
Oil casks, sink for, F. C. Wyckoff	40	165,399
Ordnance, projectile for, H. Reilly	105	165,253
Paper bag machine, C. B. Stilwell	109	165,381
Paper bag machine, C. Van Hoesen	109	165,390
Paper damping machine, C. Kahler	117	165,238
Paper pulp, bleaching jute for, E. Conley	108	165,307
Paper pulp screen, J. S. Warren	108	165,122
Paper vessel, J. Stevens	109	165,270
Paper, &c., device for protecting the ends of rolls of, J. L. Firm, (reissue)	117	6,533
Piano forte action, T. P. Carr	112	165,304
Picture frame hanger, A. Brown	62	165,206
Pile driver, steam, T. T. Loomis	82	165,170
Piles or fagots of old railway rails, forming, J. Downing, Sr	125	165,219
Pipe cover, smoking, F. L. Suter	160	165,274
Pipe tongs, S. Stone	100	165,271
Plane, dado, Miller and Bailey	29	165,356
Plane iron, W. Young	29	165,291
Plane, tonguing and grooving, C. G Miller	29	165,355
Planing machine, J. K. Smith	173	165,264
Planter and fertiliser distributer, seed, D. F. Balentine	133	165,198
Planter, corn, W. B. Garoutte	133	165,322
Plow, G. Ringen	114	165,179
Plow, vineyard, M. Rose	114	165,258
Pocket book frame, B. M. J. Blank	146	165,303
Pocket book lock, F. Kinn	146	165,239
Potato bugs, machine for catching and destroying, Mathewson and Mills	63	165,243
Press, A. W. Harrington	7	165,327
Press, baling, H. L. Pike	7	165,256
Press, power, J. E. Coffin	7	165,306
Printers' leads, device for the manufacture of, L. W. Tracy	117	165,387
Pump, E. McDermott	118	165,244
Pump, A. M. Putnam, (reissue)	118	6,537
Pump chain adjuster, J. B. Brown	118	165,207
Pumps, bucket for chain, W. C. Barker, (reissue)	118	6,531
Purifier, middlings, J. C. and F. C. Knoebel	57	165,240
Quarts mortar, A. W. Anderson	3	165,146
Radiator, E. Russell	154	165,181
Railway rails, forming piles or fagots of old, J. Downing, Sr	125	165,219
Railway signals, circuit closer for, S. Weeks	50	165,281
Railway sprinkler, G. M. Stephens	122	165,184
Railway switch, J. C. Wilhelm	120	165,227
Railway wrench, J. R. Finley	100	165,319
Regulator, automatic feed water, J. Wertheim	148	165,283
Rein holder, Bulger and Inglis	31	165,153
Sad iron, S. Elliott	91	165,160
Sample holder, revolving, J. H. Preater	54	165,366
Sash fastener, W. Brown	24	165,300
Saw, Brown and Sedore	131	165,152
Saw, jig, S. B. Fuller	131	165,162
Saw set, A. E. Hoffman	131	165,332
Saw wheel, band, F. Gleason	130	165,323
School settee and desk, J. Peard, (reissue)	62	6,536
Screws, machine for threading wood, Prindle and Kennedy	171	165,367
Separator, grain, H. H. Seeley	159	165,373
Sewing machine, O. T. Gronner	134	165,325
Sewing machine, McKay and Mathies, (reissue)	134	6,535
Sewing machine needle, G. H. Blelock	134	165,204
Sewing machines, &c., gearing for driving, W. J. Lane	134	165,338
Sewing machines, &c., hydraulic motor for driving, W. J. Lane	134	165,339
Shafts, knuckle coupling for tumbling, O. D. Herrick	67	165,231
Shingles, machine for cutting, G. H. Degraw	174	165,313
Signal apparatus for steam vessels, electric, C. A. Stearns	50	165,183
Skate, Dexter and Tanner	143	165,216
Skins, preparing or tanning, E. Manasse	92	165,348
Skirt elevator, G. W. Denny	38	165,315
Smoking case, H. W. Dann	160	165,215
Snow plow, Reeder and Fetterhoff	122	165,177
Soda water apparatus, W. Loughridge	1	165,343
Soldering apparatus, G. H. Perkins	136	165,362
Speeder, T. Mayor	142	165,352
Spinning machines, flier for, C. K. Pevey	142	165,363
Spoke socket, B. Poulson	31	165,365
Stamp canceler, D. M. Cooper	146	165,308
Steel, compound for welding, hardening, and tempering, S. Slater	85	165,378
Stereoscope, H. J. Lewis	157	165,241
Still for the manufacture of alcoholic spirits, J. H. and J. B. Beam	47	165,201
Stove, W. Burrows	154	165,209
Stove, heating, A. Bettes	154	165,205
Stove, heating, S. H. Kreider	154	165,335
Stove, heating, C. H. J. Ratten	154	165,259
Stove, parlor cook, A. White	154	165,393
Stoves, self-closing door for, N. A. Boynton	154	165,297
Strainer for pots, P. Michele	136	165,354
Strap slide, breast, T. C. Crenshaw	72	165,214
Straw cutter, A. Vanidiech	59	167,389
Table leaf lifter and support, T. E. Smith	62	165,265
Tag stringing machine, W. L. Nye	146	165,173
Tailor's measure, W. D. C. Tilney	97	165,383
Tanning hides, A. De Meritens	92	165,314
Tanning skins, preparing or, S. Manasse	92	165,348
Teeth, process and apparatus for treating celluloid bases for artificial, J. G. Cannon	46	165,303
Telegraph, automatic, P. B. Delany	50	165,156
Telegraph, duplex, G. Smith	158	165,263
Telegraph, printing, J. E. Smith	158	165,379
Telegraph relay, P. B. Delany	50	165,157
Tire upsetting machine, M. G. Schenck	60	165,261
Tube expander, P. Fitzgibbons	100	165,320
Valve gear, G. E. Tower	152	165,166
Valve, globe, J. Powell, (reissue)	152	6,528
Valve, globe, J. Powell, (reissue)	152	6,529
Valve, steam, H. R. Marchand	152	165,349
Valve, steam, H. E. Marchand	152	165,350
Vegetable cutter, S. Hauck, Jr	59	165,229
Vehicle seat, J. R. Hill	31	165,331
Vehicle spring, Doland and Scherb	31	165,218
Vehicle wheel, W. Corrie	31	165,211
Ventilator, P. Mihan	166	165,245
Vessels, apparatus for raising sunken, J. N. Furman	82	165,226
Vessels, electric signal apparatus for steam, C. A. Stearns	50	165,183
Warehouses, floodway for, J. H. Morrell	30	165,247
Wash bench, G. Bauman	91	165,149
Wash stand, N. O. Bond	8	165,296
Washing machine, J. Myers	91	165,358

	Class No.	No. of Patent.
Washing machine, J. Myers	91	165,359
Watch chains, charm for, E. B. Ealer	86	165,317
Watches, safety pinion for, L. W. Thompson	36	165,275
Water closets, automatic shut-off attachment for, J. Cavanagh	8	165,209
Water closets, automatically cleansing, J. J. O'Donohue	8	165,174
Water mains, device for tapping, J. Curran	167	165,310
Water trap, W. A. Butler	8	165,302
Water wheel, turbine, S. R. Jenner	168	165,334
Whiffletree plate, B. S. Porter	31	165,176
Whisky, manufacturing, E. Wersigk	47	165,399
Windmill, W. H. Aldrich	118	165,292
Windmill, W. A. Guzeman	118	165,326
Windmill, D. C. Stover	118	165,272
Wire, machine for rolling, J. and S. Law	163	165,341
Wood, machine for carving, J. F. Blackman	173	165,150
Wrench, railroad, J. R. Finley	100	165,319

INDEX OF PATENTEES TO WHOM PATENTS WERE GRANTED JULY 6, 1875.

	Patent No.
Adair, J., Fire place	165,194
Albaugh, W. A., and J. Toole, Brush	165,195
Aldrich, W. H., Windmill	165,292
Allen, C. H., assignee	165,214
American Art Foundry, assignee	165,104
Amrock, E., and C. Judson, Mail bag catch	165,293
Anderson, A. W., Quartz mortar	165,146
Andrews, C. B., assignee	165,229
Anthony, E. and H. T., & Co., assignees	165,241
Aston, J. B., Blackwashing molds	165,196
Atlantic Refining Company, assignee	165,302
Atkinson, E., and E. Edwards, Top roll covering for drawing and spinning frames	165,197
Bailey and Miller	165,356
Baldwin, H., Advertising medium	165,147
Balentine, D. F., Seed planter and fertilizer distributer	165,198
Barker, J. F., Condensing engine	165,148
Barker, W. C., Bucket for chain pumps, (reissue)	6,531
Bauman, G., Wash bench	165,149
Bausch, J. J., Eyeglass	165,199
Beals, P. P., Furnace for heating soldering irons	165,200
Beam, J. H. and J. B., Still for the manufacture of alcoholic spirits	165,201
Bell, R. W., assignee	165,187
Berry, J., Mortising machine	165,294
Bettes, A., Heating stove	165,295
Blackman, J. F., Machine for carving wood	165,150
Blair, J., Brush binder	165,202
Blank, B. M. J., Pocket book frame	165,303

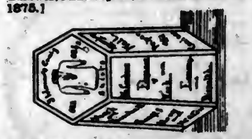
TITLES, DRAWINGS, AND CLAIMS

OF

PATENTS GRANTED JULY 6, 1875

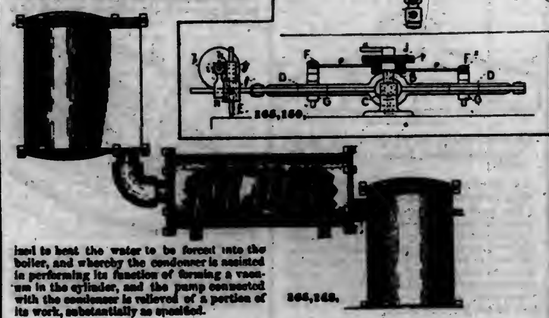


165,146. QUARTZ-MORTARS. August W. Anderson, Lyon County, Nev. (Filed Mar. 4, 1875.)

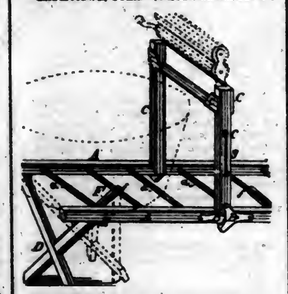
Brief.—A series of pieces of varying heights are used successively to support the screen, so as always to keep it at the same level with the die-head as the latter wears away.

In a quartz-crushing mortar, the combination of the die or dies B, screen C, and two or more interchangeable supports, A, of varying heights, substantially as described.

165,147. ADVERTISING MEDIUMS. Horace Baldwin, Philadelphia, Pa. (Filed Mar. 19, 1875.)



1. A glass vessel, A, having spaces *b* therein, in combination with advertising cards *b'* applied with their printed faces against such spaces, substantially as and for the purpose described.

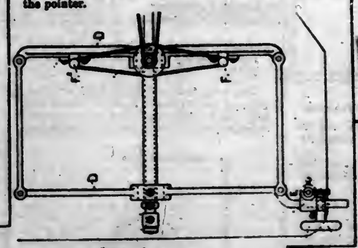


2. A glass vessel having advertising-cards held in place against its interior by filling the vessel with plaster-paris, substantially as described.

165,148. CONDENSING-ENGINES. John F. Barker, Springfield, Mass. (Filed Sept. 16, 1874.)

The steam-cylinder A, condenser E, and the heating-cylinder D, containing a heating vessel or coil, *a*, provided with an inlet and outlet, *b* and *b'*, all the said parts being combined and arranged substantially as described, whereby the heat of the exhaust steam is utilized to heat the water to be forced into the boiler, and whereby the condenser is assisted in performing its function of forming a vacuum in the cylinder, and the pump connected with the condenser is relieved of a portion of its work, substantially as specified.

165,149. WASH-BENCHES. G. Bauman, Middletown, Conn. (Filed Feb. 21, 1874.)



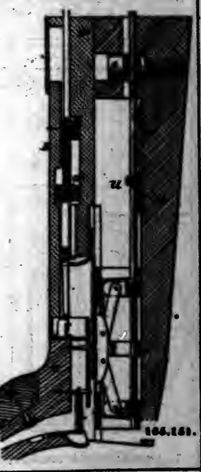
1. The combination of strips A A' with the vertical pieces C and the hinges B B', substantially as and for the purposes set forth.

2. The wash-bench herein described, consisting of strips A A', hinges B B', wringer-support C C', hinged legs D, and movable braces F, the several parts constructed and combined substantially as described.

165,150. MACHINES FOR CARVING WOOD. John P. Blackman, Brooklyn, N. Y. (Filed May 26, 1875.)

Brief.—By means of a frame centered upon a bar pivoted at one end to a standard on the table, and provided at its outer end with a foot-piece and roller, and passing through the middle of the frame, which has a rocking and horizontal motion, the main cutter is caused to follow the course of an adjustable pointer, whether the frame is in a vertical or horizontal position. A reverse or left of the pattern can be produced by securing the auxiliary cutter in a hollow standard, moving the adjustable pointer over the pattern, and moving the cutter in an opposite direction to that of the pointer.

1. The frame D, constructed and operating substantially as described, in combination with an adjustable pointer, E, and cutter F, substantially as and for the purposes set forth.

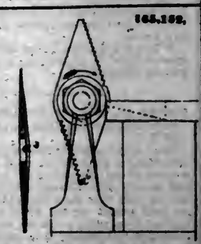


2. The combination of the frame D, constructed and operating substantially as described, the adjustable pointer E, and the cutters F and F', as and for the purposes set forth.

165,151. BOOT-TREES. Thomas Brannigan, Beloit, Wis. (Filed Nov. 19, 1874.)

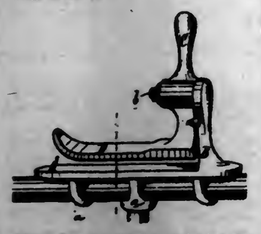
Brief.—The tree is provided with an interchangeable instep-piece, that a single form may be applied to both right and left boots.

1. In a boot-tree, the reversible right-and-left instep-shaping piece Q, substantially as and for the purpose set forth.



2. The rod E, collar U, rack V, spring-bearing *t*, in combination with parts A, B, C, and D, and intermediate mechanism, all substantially as and for the purpose described.

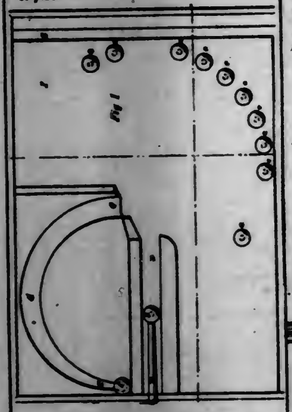
165,152. SAWS. C. A. Brown, Brooklyn, and C. B. Sedore, New York, N. Y. (Filed Jan. 9, 1875.)



Brief.—A cauiform notch can be cut in a plank or other article by means of a rhomboidal-shaped saw-blade, having teeth on two of its parallel edges, and tapering in thickness from the middle to the ends.

A rhomboidal saw-blade having teeth on two of its parallel edges, and tapering in thickness from the middle to the ends, substantially as described.

HELIOTYPE RELIEF PROCESS. JAMES R. OSGOOD & Co. BOSTON



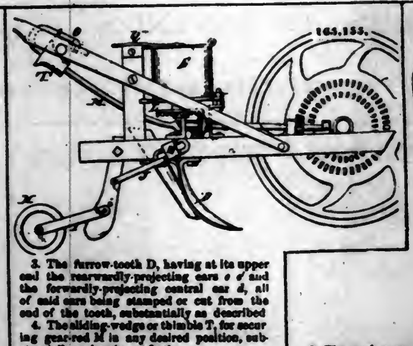
165,156. REIN-HOLDERS. Jas. Bulger and Nicholas Inglis, Muskegon, Mich. (Filed Aug 12, 1874.)

The combination of a plate, A, having clips c, and a standard, B, provided with a horizontal stud, b, and lever C, having a horizontal toe, D, and a spring, c, with the end-board or dash-board of a wagon to form a rein-holder, all substantially as set forth.

165,157. GAME APPARATUS. J. D. Butler, Lancaster, Mass. (Filed Nov. 12, 1874.)

Brief.—The principal object-ball is first set rolling; it is then struck by the cue-ball, if possible, so as to dislodge other object-balls or pins.

1. A game apparatus consisting of the table I, the two balls A and B, the inclines C, and the marbles c, or their equivalents, substantially as described.



2. The combination, in the table I, of the grooves C and D, substantially as and for the purpose described.

165,158. PLOT-WHEEL CORE-DRILLS. Jas. Campbell, Harrison, Ohio. (Filed Dec. 19, 1874.)

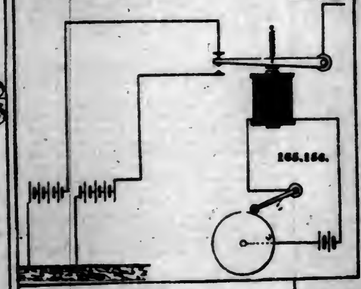
Brief.—On the longitudinal shaft is adjustably secured a small pinion, which gears with a pinion on the lower end of the vertical shaft that imparts motion to the mud-wheel. Extending back from the adjustable pinion is a rod bent around the rod for connecting the handles, upon which a thimble, for adjusting the pinion and holding it in position, is secured. To the hinged cover of the mud-box is secured an arm that extends rearwardly, and has a projection, which fits into a T-slot in the cross-bar, for holding it down.

1. The adjustable pinion I, in combination with the pinion L on the mud-box H, adapted to rise to allow a change of speed when the drill is in operation, substantially as herein set forth.

2. The combination of the pinion I, slide-rod H G, with pinion L, and pivoted grain box H, constructed and arranged substantially as herein set forth.

165,155.

165,156.



3. The furrow-tooth D, having at its upper end the rearwardly-projecting ears *c c'* and the forwardly-projecting central ear *d*, all of said ears being stamped or cut from the end of the tooth, substantially as described

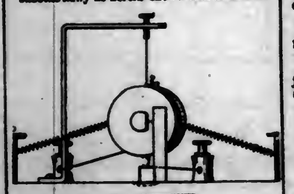
4. The sliding-wedge or thimble T, for securing gearered M in any desired position, substantially as herein set forth.

5. The fastening device shown in Fig. 3, constructed and arranged as herein set forth.

2. The mechanism consisting of the lower or base roller B, the upper roller F, and bar E, pivoted together as explained, the bent lever *d*, pivoted at one end to the bar E, and with its opposite end engaging the tubular rock-shaft *j* or a pinion affixed to the latter; and, lastly, the pointer *l* and dial-plate *m*, with its index engressed upon it, the whole being substantially as and for purposes stated.

165,159. HYDRAULIC HOSE. Lovewell H. Downing, North Andover, Mass., assignor to John A. Wiley, same place. (Filed May 22, 1875.)

165,164.

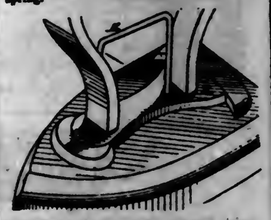


165,160. AUTOMATIC TELEGRAPH. Patrick B. Delaney, Jersey City, N. J. (Filed Oct. 21, 1874.

The combination, with an automatic transmitter, of a relay which connects the line on one movement of its armature to the signaling battery, and upon the other to the earth or to a reversing-battery, substantially as and for the purposes set forth.

165,167. TELEGRAPH-RELAYS. Patrick B. Delaney, Jersey City, N. J. (Filed Dec. 11, 1874.)

The combination, with a fixed armature, plain or electro-magnetic, of an electro-magnetic coil, movably suspended above the same, substantially as herein shown and described.



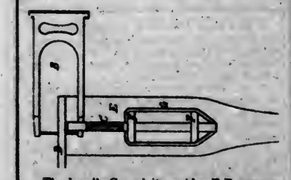
165,166. METAL OR PAPER GAGES. E. W. Donelson, Boston, Mass. (Filed Apr. 26, 1875.)

1. In an instrument for gaging paper and other materials, a stationary roller or bed on a base upon which the material to be gaged passes, in combination with a yielding or sliding roller or block, disposed over and bearing the first, and connected in a suitable manner with an index and pointer, to register the extent to which the two rollers or bearings are separated by the introduction of an object between them, the whole being substantially as and for the purposes stated.

A base, A, made of cloth, covered with vulcanized rubber or composition, and provided with a re-enforce or strip, B, as described, folded back upon itself, and applied to opposite sides of a lap, a, and extended beyond its edge, and cemented together in the extension, and to the parts of the base in contact with such re-enforce, all substantially as shown and explained.

165,168. SAD-IRONS. Stephen Elliott, Indianapolis, Ind. (Filed Dec. 26, 1874.)

Brief.—A detachable handle fitting in projecting grooves in the end-iron, and held by a spring.

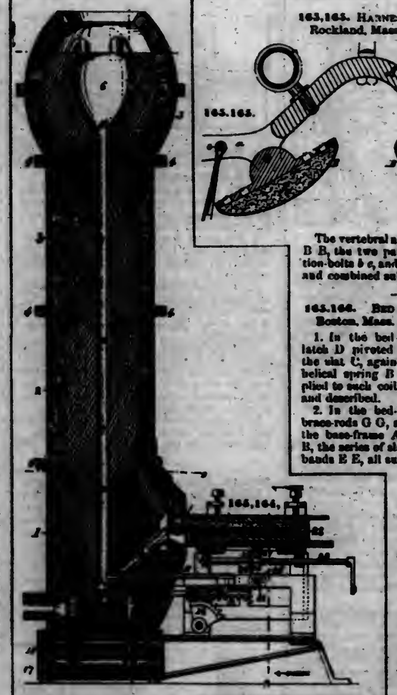


The combination, with a sad-iron, of the dovetail circular projections C D, the plates G H, and the bolt E rigidly attached to the standard of the handle F, substantially as and for the purpose described and shown.

165,161. DIAPHRAGMS FOR GAS-GOVERNORS. Walter Frost, Newark, N. J. (Filed Mar. 25, 1875.)

A process for treating leather for diaphragms for gas-regulators with a composition of about equal parts of glycerine and castor-oil, as and for the purpose specified.

165,162. JIG-SAWS. Sylvester B. Fuller, Lynn, Mass. (Filed June 1, 1875.)

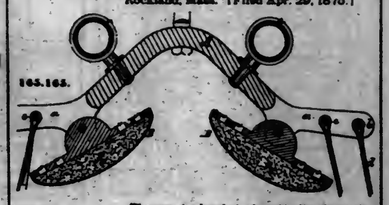


The handle C, and its guides F F, and operative spring G, arranged and combined with the saw-carrier B, and the supporting-frame D E, all substantially in manner and to operate as shown and described.

165,163. MACHINES FOR COMPRESSING HARRELS. Elihu J. Granger, Brooklyn, N. Y. (Filed June 2, 1875.)

Brief.—The two compressing and hooping machines are operated alternately by means of continuously-revolving cams.

1. The combination of two stationary barrel-compressing dies with two movable barrel-compressing dies, and a cam or cams for simultaneously imparting a reciprocating rectilinear motion to the said movable dies, the one movable die acting in conjunction with its opposed stationary die, to compress and hoop a barrel, while the other movable die is being withdrawn from its opposed stationary die, for the purpose of permitting another barrel-cylinder to be placed in position to be operated upon, the whole constructed substantially as described.



165,164.

165,162.

2. In combination with barrel-compressing dies, substantially such as described, the pusher T, for facilitating the dislodgment of the barrel from the dies at the conclusion of the compressing and forming operation, substantially as set forth.

165,165. HARNESS-SADDLES. H. H. Hallett, Rockland, Mass. (Filed Apr. 29, 1875.)

The vertebral arch A, the self-adjusting pads B B, the two pairs of arms a a, the connection-bolts b c, and the four straps d d, arranged and combined substantially as specified.

165,166. BED-BOTTOMS. Livorus Hull, Boston, Mass. (Filed Jan. 30, 1875.)

1. In the bed-bottom, the rotary duplex latch D pivoted at its middle to the side of the slat C, against which the end coil of the helical spring B is to rest or bear, and applied to such coil, all substantially as shown and described.

2. In the bed-bottom, the two pairs of brace-rods G G, arranged and combined with the base-frame A, the sets of spiral springs B, the series of slats C, and their connection-bands E E, all substantially as specified.

165,166.

165,167.

2. The combination of a valve, 12, with a stand-pipe, 7, and ascending duct 13, operating substantially as set forth.

3. In an apparatus for casting refractory metals, the valve 12, constructed of porcelain and working, within a suitable sleeve or casing, in contact with the molten metal, the whole surrounded by a protecting body of crucible stuff or other non-conducting material to prevent the too rapid heating of the porcelain, substantially as set forth.

4. The porcelain coupling-tubes 10, employed substantially as set forth, in combination with the sectional stand-pipe 7, and a surrounding body of crucible stuff, or other non-conducting material to protect the porcelain in an apparatus for casting refractory metal.

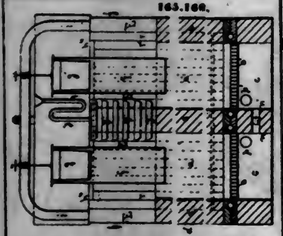
5. The porcelain mouth-pieces 14, constructed and applied as herein set forth, surrounded by a protecting body of crucible stuff or other non-conducting material within the furnace-walls.

6. The flanges 8 and 9, employed to center and support the crucible 6 and pipes 7, respectively, substantially as set forth.

7. The combination of the crucible 6, stand-pipe 7, valve 12, duct 13, and mouth-piece 14 within a suitable furnace, constituting a self-acting fountain for the delivery of molten metal for casting purposes.

8. The adjustable table 33, operated by racks and pinions 34, 36, 37, 38, substantially as described, for the purpose set forth.

165,167. NUT-LOCKS. David D. Jones, Pittsburg, Pa. (Filed Apr. 6, 1875.)



Brief.—The locking-washer is provided with legs that bear upon the flange of the rail, to retain it in position. The legs are bent upward, and when the nut is removed the washer turns with it.

The improved nut-locking washer, consisting of the spring plate C, having the elastic oblique tongues c sprung outwardly, as described, and having their inner edges perpendicular to the radius of the central opening, said plate being formed with the legs d, all as shown and specified.

165,168. COAL-GAS APPARATUS. Moses W. Kidder, Boston, Mass., assignor of one-half his right to F. Noyes, same place. (Filed Sept. 1, 1874.)

Brief.—The gas-generating and combustion chambers are connected at the top by a trunk. The anthracite coal and charcoal being ignited in both chambers, the steam and air pipes to one are opened and the gas pipe closed, while the steam and air pipes to the other are closed and its gas-pipe opened. The gas produced in one passes down through the other. They are then operated alternately, one as a generator and the other as a purifier

165,168.

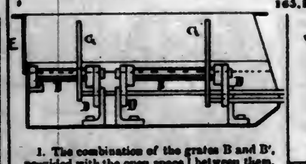
1. The combination, in a gas making furnace, of a trunk, E, connecting the top of one combustion-chamber with another, and serving the double purpose of a conductor for gases, and as a receptacle for hydrocarbon-trays, substantially as described.

2. In combination with a gas-generating apparatus, constructed with two or more compartments or combustion-chambers, a a', connected at their tops by a trunk, E, as described, a pipe, m, with branches n n', and a cock or valve, o, for the admission of air into either ash-pit, for the purpose of reversing the current of air from one ash-pit to the other, substantially as described.

3. The steam-conduits n n, formed by the apposition of the two plates v and v', having inner grooves u and steam-outlets or fissures 8, for the purpose of delivering steam horizontally upon, and about on a level with, the tops of the grates, substantially in the manner and for the purpose described.

4. The coal-feeding hoppers, constructed as described, with fixed extensions f f' depending to or near a level with the tops of the combustion-chambers, in combination with and passing through the connecting-trunk E, and provided with gates k k', having external operating mechanisms, and with covers g g', substantially as described.

5. In combination with a gas-generating apparatus constructed with two or more compartments or combustion-chambers, having free and open communication one with the other by a trunk, E, as described, one or more evaporating plates, p', within the trunk E, and a pipe, p, leading to the space above the upper plate, for the purpose and substantially as described.



6. In combination with a gas-generating apparatus constructed with two or more combustion-chambers, connected by a trunk, E, as described, a steam-generator composed of a series of pipes, r, and a connected steam-receptacle, S, with pipes t t' t'' and valves T T', communicating with the steam-conduits n n', and an air-pipe, m, with branches n n' leading to each ash-pit, substantially as described.

7. The gas-outlet pipes p p' p'', provided with suitable valve or valves, in combination with a gas-generating furnace having two or more combustion-chambers, a a', and a trunk, E, and ash-pits c c', for the purpose of conveying gas from either ash-pit, substantially as described.

8. The combination, in a coal-gas apparatus, of the following instrumentalities, viz: First, a coal combustion-chamber, a, wherein to produce gas from coal in a state of combustion, as set forth; second, a gas-purifying chamber, a', containing incandescent coal, operating to screen and purify the gas, as specified; and, third, a connecting-trunk, E, operating to convey the gas from the combustion-chamber a to the gas-purifier a', all constructed and operating substantially as described.

9. The smoke-pipe X, with its valve X', in combination with the trunk E and the two connected combustion-chambers a a', for the purpose of conveying smoke and arresting the gases from the chambers a a' through the trunk E, substantially as described.

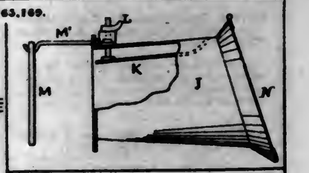
165,169.

1. The combination of the grates B and B', provided with the open space l between them, substantially as set forth and specified.

2. The combination of the grates B and B', having the open space l, with the ash-pan made adjustable by means of the extension-legs D D, substantially as set forth and specified.

3. The grates B and B' when provided with the open space l, in combination with the rakes G G', arranged to operate substantially as described.

4. The hood or bonnet feeding device, with its compressing-plate K, in combination with means for enlarging the entrance, consisting of the screws L L, substantially as set forth and specified.



5. In combination with the hood J on the furnace and its adjustable flap K, constructed as set forth, the swinging plate M, suspended from the arms M' M' within the furnace, for the purpose of controlling and regulating the supply of straw, as described and specified.

6. The perforated screens O O, in combination with the extension ash-pan A, substantially as and for the purpose specified.

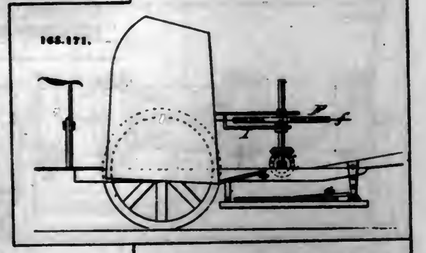
165,170. STEAM PILE-DRIVERS. Thomas T. Loomis, Chicago, Ill. (Filed Mar. 15, 1875.)

Brief.—Small auxiliary cylinders and pistons connected to the slide-valve stem move the valve by steam admitted from the main cylinder. A small primary valve on the lower auxiliary cylinder is operated by tappets on the valve-stem and a lug on the concussion-block. The hammer-frame consists of two side and two end bars, secured to lugs on the steam-cylinder above, and to a plate below. A spring concussion-block in the side of the hammer takes up the shock.

165,169.

1. In a steam pile-driver, the combination of the cut-off valve and stem E with the primary cylinders D D and piston-head F F', arranged to open and close the cut-off valve by the impact of steam, as specified.

2. In a steam pile-driver, the primary valve K, arranged to alternately open and close the ports d s of the primary cylinder D' by the ascending or descending movement of the hammer.



3. The spring concussion-block M, having the lug n, in combination with valve-stem l, having the arms g for operating the primary cut-off valve, as specified.

4. The hammer-frame, consisting of the bars A A and B B', the bars A A and B extending to the upper end of the cylinder and bolted to the sides of the same, as specified.

165,171. CORN AND CANE HARVESTERS. T. Merrell, Dixon, Ill. (Filed Mar. 26, 1875.)

Brief.—Improvement on Nos. 124,757 and 133,327. The fingers of the rotating disks force the stalks against the cutters, and throw the cut stalks upon the droppers. In addition to the lower guards used in the machines of which this is an improvement, the upper guards are used in corn-harvesting, to prevent the ears from interfering with the gatherer.

The combination and arrangement of the revolving disks or wheels F with their fingers f, the cutters C, and the guards I K, as described and set forth.

165,171.

165,172. FERTILIZERS. Charles H. North, Somerville, Mass. (Filed Apr. 24, 1875.)

Brief.—Evaporates nearly all the water contained in the "soap" by moderate heat; then subjects the mass to a temperature of about 300° Fahrenheit for four hours, thus converting the soap into a hard brittle mass, which is easily pulverized, and mixed, if desired, with commercial fertilizers.

1. As an improvement in the art of manufacturing fertilizers, the process of treating the soap obtained upon rendering offal, consisting in heating it, when the water is nearly all evaporated, to about 300° Fahrenheit for about four hours, substantially as described.

2. The fertilizer produced by heating the soap obtained upon rendering offal to about 300° Fahrenheit after the water is mostly evaporated from it, as above described.

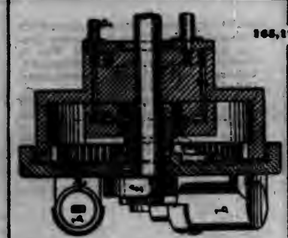
165,170.

165,172.

165,166. FURNACES FOR BURNING STRAW. James R. King, Modesto, Cal. (Filed Nov. 20, 1874.)

Brief.—A space is provided between the two grates to receive the cinders, ashes, &c., from the tubes into a vertically adjustable ash-pit. The admission of straw into the furnace through the hood is controlled by an adjustable flap. The tube sheet is protected from the sticky cinder raised by the draft by means of a perforated sliding deflector on the inner grate. Hanging screens prevent the loose straw outside the furnace from igniting.

165,173. MACHINES FOR STRINGING TAGS. Wm. L. Nye, Boston, Mass. (Filed Apr. 20, 1875.)



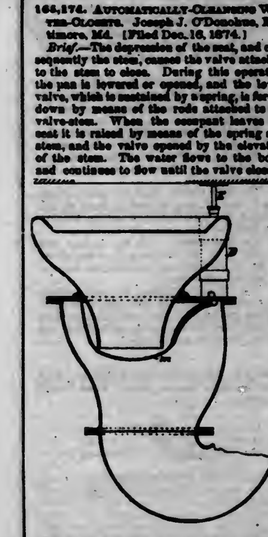
Brief.—An inclined trough with adjustable bottom has a hollow needle parallel with the bottom. The tags are strung upon the needle, and drawn off singly. A portion of the twine passing through the tag is secured by a bit of metal folded around its ends.

1. In machinery for stringing tags, the combination, with a tubular tag-carrying and cord-conducting sheath or rod, of a plate arranged beneath said sheath, upon which the tags in passing along the sheath may rest, substantially as described.

2. The combination of the tubular tag-carrying and cord-conducting sheath and the tag guide or trough, provided with a bottom adjustable toward and from said sheath, substantially as set forth.

3. A machine for stringing tags, comprising the following elements in combination, namely: a tag-carrying and string-conducting tube, a tag supporting or guiding plate or trough, a clamp-holding mechanism, and a knife intermediate between said mechanism and the said sheath, substantially as described.

165,175.



1. Revolving cylinders b, with fixed bearings, together with pistons e, when arranged to operate tangentially to the line of revolution of the crank-wheels f, in combination with gearing i, pinions j, crank-wheels f, crank-pins s, and slotted cross-heads d, substantially as set forth.

2. Segments c, as described, with tubes v, when arranged to operate in combination with the parts p and e, substantially as set forth.

165,174. AUTOMATICALLY-CLEANSING WATER-CLOSETS. Joseph J. O'Donohoe, Baltimore, Md. (Filed Dec. 16, 1874.)

Brief.—The depression of the seat, and consequently the stem, causes the valve attached to the stem to close. During this operation the pan is lowered or opened, and the lower valve, which is sustained by a spring, is forced down by means of the rods attached to the valve-stem. When the occupant leaves the seat it is raised by means of the spring and stem, and the valve opened by the elevation of the stem. The water flows to the bowl, and continues to flow until the valve closes.

165,174.

165,176.

1. In a water-closet, the movable seat C, in combination with the valve-stem E, upper valve g, and valve-plate b', substantially as shown.

2. The valve-case D, in which is secured the valve-plate b', connected, by the tube d, to the partition c, in combination with the valve e, spiral spring f, and valve g, provided with the rods n, substantially as set forth.

3. The stem E with collar l thereupon, in combination with the spiral spring k and valve-case D, substantially as specified.

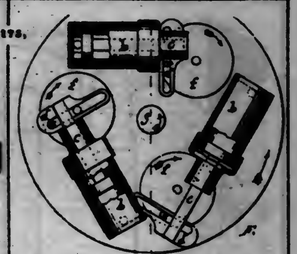
4. The combination of the pan m and rod i with the vertically-moving valve-stem E, substantially as described.

5. The valve-case D, divided into separate compartments or chambers, as shown, in combination with the inlet and outlet pipes a and b, and provided with the combination of valves connected and operated as described, substantially as and for the purpose set forth.

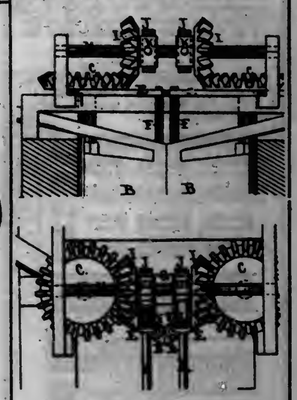
165,175. SNOW-BOOMS AND SNOW-PLOWS. Thomas Reeder and Albert Fetterhoff, Oskaloosa, Iowa. (Filed Nov. 19, 1874.)

Brief.—Light snow carried to dividing-plow, and by it thrown aside. If too heavy therefor, the plow is removed, and snow carried over into box with divided bottom.

1. The combination of the gathering-plow K, gathering-reel L b b, endless carrier C, and double plow O, substantially as and for the purposes set forth.



2. The combination of the gathering-plow K, gathering-reel L b b, endless carrier C, and divided box P R, having hinged bottoms S, substantially as and for the purposes set forth.

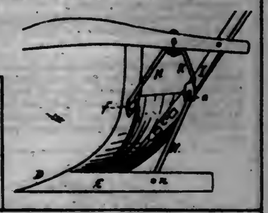


165,176. WHIFFLETREE-PLATES. R. S. Porter, Ottawa, Ill. (Filed Mar. 30, 1875.)

The combination of the plate A, provided with hollow central hub a, for the reception of a bolt, f, and circumferential rim b, having interior flanges d d, with the plate B, provided with central aperture c, and annular projection h, with exterior flanges i i, substantially as and for the purposes herein set forth.

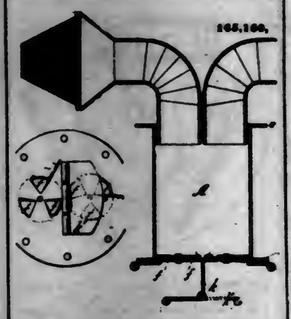
165,178. CANAL-LOCK GATES. J. B. Beak, Albany, N. Y. (Filed Apr. 14, 1875.)

Brief.—The gates of the lock are operated simultaneously through bevel-gears on the quoin-posts, and on a transverse shaft, which is actuated by pawl-levers acting on ratchet-wheels on the shaft.



The gates B, in combination with the wheels C, pinions I, shaft H, ratchet-wheels J, levers K, and pawls L, when arranged to operate in the manner and for the purpose herein specified.

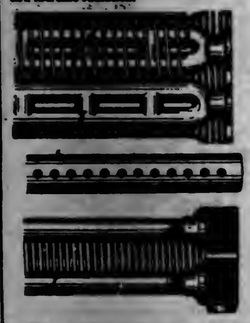
165,179. PLOWS. Gerhard Ringen, Smith City, Mo. (Filed June 28, 1874.)



In a plow, a continuous brace, consisting of the rounded portions H, K, and N, and of the flattened points f, s, r, and u, the part N being the prolongation of the left-hand handle L, and the whole adapted to the brace, standard, beam, handle, and land-side by a single brace, substantially as herein described.

165,180. RAILROAD-CAR VENTILATORS. B. Benson, Rutland, Vt. (Filed May 28, 1875.)

Brief.—The air-chamber has a director, by which the air may be directed to the front or rear of the car, as desired. The draft is regulated by circular openings and plates.



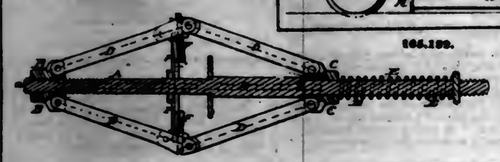
165,180.

In a ventilator for railroad-cars, a single air-director, *b'*, by which alone the air may be directed either to the front or rear of the car, in combination with the air-chamber A and openings *f*, and circular plates *f'*, for regulating the draft of air from said chamber, substantially as described.

165,181. RADIATORS. Edmund Bussell, Brooklyn, N. Y. (Filed May 27, 1875.)

Brief.—The coils allow circulation of air and increase radiation.

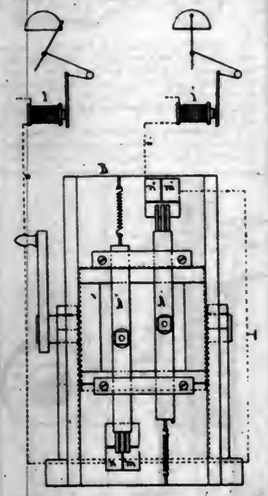
1. In combination with a group of loop-pipe radiators, arranged in relation to each other substantially as shown and described, coils of metallic wire introduced between the loop-pipes, as and for the purpose specified.



2. In combination with a group of loop-pipe radiators, a coiled sheet of perforated metal, substantially as shown and described.

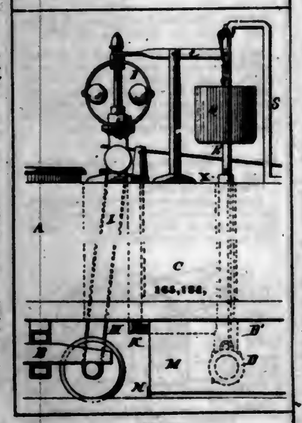
3. In combination with a loop-pipe radiator, a coil of metallic wire wound around the loop-pipe, as and for the purpose specified.

165,182. BOILER-TUBE CLEANERS. Minard M. Smith, New York, N. Y., assignor of one-half his right to Lewis C. Tufts, same place. (Filed May 17, 1875.)



Brief.—The scrapers are mounted on toggle-arms, and made adjustable by sliding caps and springs.

The combination of the spindle A, adjusting screw-nut B, working on the screw-threaded extremity a of the spindle, collar C, toggle-joints D, provided with scrapers F, and helical spring E, constructed and operating substantially in the manner described and specified.



165,183. ELECTRIC SIGNAL APPARATUS FOR STEAM-VESSELS. Chas. A. Stearns, Boston, Mass., assignor to himself, Wm. H. Torbert, Philadelphia, Pa., and Edmund B. Vanneter and O. H. Dolbear, Boston, Mass. (Filed Nov. 27, 1874.)

Brief.—The shaft or other moving part of the machinery has a stud affixed to it, which operates upon a circuit-closing apparatus, so arranged that one circuit is closed when the shaft moves in one direction, and the other circuit when in the other. An indicator is placed at any distance to show the direction, which will also show the rapidity of the revolutions.

The combination of the shaft E, projection F, bent levers D D', sliding bars A A', plates *n n' n n'*, battery M B, circuits *w w'*, and indicators I I', substantially as and for the purpose set forth.

165,184.

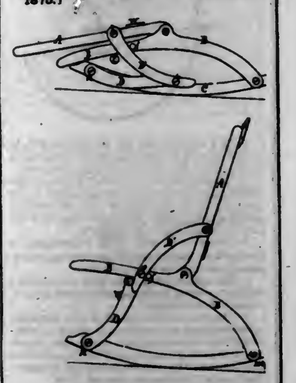
1. A railroad-sprinkler, consisting of the tank A, mounted upon car-trucks B, and provided with a sprinkler, D, and valve for governing the flow of water into the sprinkler, and the governor for regulating the operation of the valve to conform to the speed of the car, substantially as and for the purpose described.

2. In combination with a railroad-sprinkler, the box or case M, surrounding the said sprinkler, substantially as and for the purpose described.

3. In a railroad-sprinkler, the combination, with the box M, of the canvas, or its equivalent N, substantially as and for the purposes described.

4. The combination, with the tank of a sprinkler, pivoted at its middle point, and provided with a suitable mechanism, Q R T, whereby it may be maintained in a level position, substantially as and for the purposes described.

5. The combination, with the pivoted sprinkler, of the weight Q, pivoted bar R, standard S, and rods T, substantially as and for the purposes described.



6. The combination, with the valve, of a float, U, lever V, and suitable mechanism Z F *s*, whereby the float is made to vary the valve-opening, substantially as and for the purpose described.

7. The combination, with the valve, of the float U, lever V, toggle-joint Z, band H, and governor F, substantially as and for the purpose described.

8. The combination, with the tank A and sprinkler D, of the vent-pipe K, rising above the top of the tank, substantially as and for the purposes described.

9. In a railroad-sprinkler, the combination, with the car-axle and the valve-rod, of an intermediate governor, F, for regulating the flow of water into the sprinkler, substantially as and for the purposes described.

165,185. FOLDING ROCKING-CHAIRS. Alex. W. Stewart, Boston, Mass. (Filed May 10, 1875.)

1. The front legs D and braces D', in combination with the rockers, seat, and back of a rocking-chair, when said legs D are pivoted to the rockers C and to braces D', and the braces D' are connected to the back, substantially as described.

2. The bar E and pins *f*, when said bar and pins are arranged to guide the movements of pieces D and D', and to hold them in position, substantially as described.

165,186. VALVE-GEARS. George B. Tower, Annapolis, Md., assignor of one-eighth his right to Eli P. Wetherwax, West Sandlake, N. Y. (Filed Apr. 27, 1875.)

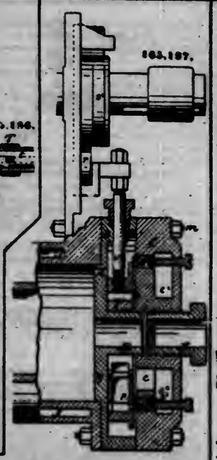
Brief.—A spiral rod in the hollow shaft is moved longitudinally by the governor, which causes a small cam to protrude more or less from the face of the main cam, to cut off steam.

1. The combination, with the hollow rotary cam-shaft S, of the collar T and its pin *t*, and a spiral rod within said shaft, and rotated by it by means of said collar and pin, said rod being bounded longitudinally by helicoidal faces, and neither helically grooved or threaded, nor longitudinally toothed, whereby rotary motion is transmitted by said rod to the cut-off cam of the engine, in the manner substantially as described and set forth.

2. The combination of a spiral rod, *s'*, contained within the hollow rotary cam-shaft S, with the cut-off cam *s*, sliding collar T, and pin *t*, and any suitable adjusting device for said collar, whereby said cam is adjusted to cut off the steam in proportion to the work to be performed, in the manner substantially as described and set forth.

3. The combination of the three-sided spiral rod *s'*, gib or step *g*, and adjusting-screw *s* with the hub of an eccentric, wheel, or cam, whereby the rod is allowed a longitudinal spiral motion through said hub, and provision is made for tightening the hub on the rod, in the manner substantially as described and set forth.

4. The combination of the three sided spiral rod *s'* and cut-off cam *s*, provided with the adjusting device *s g*, whereby provision is made for the wear of the cam and the rod, in the manner substantially as described and set forth.



5. The combination of the differential rollers *r r'*, mounted in a suitable rocker or carriage, with the cams *s s'*, whereby motion is transmitted from both cams by the longer roller, and from the full-stroke cam only, by the shorter roller, in the manner and for the purpose substantially as described and set forth.

6. The combination of a full-stroke cam, having a portion of one side of its rear face cut away, a cut-off cam contained within it, and the rollers *r r'*, of different depths, mounted in a suitable rocker or carriage, whereby allowance is made for the contact and clearance of said cams and rollers, in the manner and for the purpose substantially as described and set forth.

7. The combination, with the cross-bar H and rocker R, of the vibrating auxiliary arm L, connected to said rocker by any suitable device, whereby the parallelism of the cross-bar is preserved, in the manner substantially as described and set forth.

8. The combination, with a cut-off valve, of the cross-bar H, the cut-off cam *s'*, and the elliptic spring P interposed between said bar and the steam-chest, whereby the valve is reopened, if required, after cutting off the steam before the end of the stroke, and lost motion in the joints of the valve-gear taken up, in the manner substantially as described and set forth.

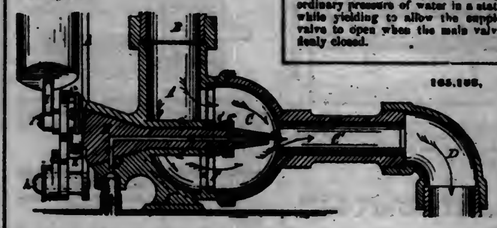
165,187. VALVES FOR STEAM-ENGINES. George B. Tower, Annapolis, Md., assignor of one-eighth his right to R. W. Bell, Seboodook Landing, N.Y. (Filed Nov. 20, 1874.)

1. Plate or disk valves, having a rectilinear reciprocating motion, in combination with the two cylinder-heads of a steam-engine, whereby the steam is suitably controlled in its entrance to and exit from the cylinder in actuating the piston thereof.

2. A box-valve V, provided with peripheral steam-ports *v*, and axial exhaust-ports *v'*, whereby the valve is rendered capable of receiving either rectilinear or angular motion, in the manner substantially as described, for the purposes set forth.

3. The combination, with the cylinder-head of a steam-engine, of a box-valve, V, centrally slotted for the passage through it of the piston-rod and the allowance of its own rectilinear motion, in the manner substantially as described, for the purposes set forth.

4. A combined cylinder-head and steam-chest, B, provided with respective steam and exhaust passages *b b'* and ports *a*, in the manner substantially as described, for the purposes set forth.



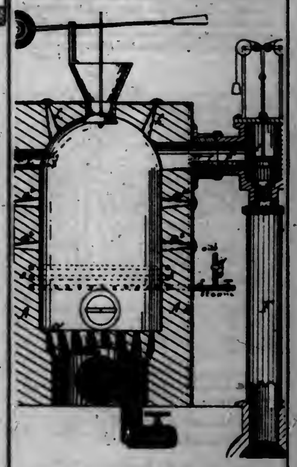
5. A steam-chest cover, C, provided with inner exhaust-ports *c*, annular exhaust-chamber and parking-space *c'*, and outer exhaust-passage *c''*, in the manner substantially as described, for the purposes set forth.

6. The combination of the cylinder-head B and steam-chest cover C, each constructed substantially as described, whereby a suitable valve-chamber is provided for the valve V, and a stuffing-box provided for the piston-rod, all in the manner substantially as described, for the purposes set forth.

165,188. AUTOMATIC MIXING-VALVES FOR GAS-MACHINES. Lovias D. Townley, Cincinnati, Ohio. (Filed May 4, 1875.)

Brief.—The air-valve is secured by rectangular bearings, and by a helical spring and nut, to the oil-vapor valve-plug, and turns with it, and the air and vapor are thus shut off simultaneously.

1. The cylinder C, having diaphragm *a* and valve F, in combination with pipes *a* C', and oil-vapor supply mechanism, substantially as and for the purpose hereinbefore described and set forth.



2. The cylinder C, having diaphragm *a* and valve F, and air-supply pipe *a*, in combination with the valve-plug E, and the mechanism herein described for regulating the supply of gas, substantially as and for the purpose described and set forth.

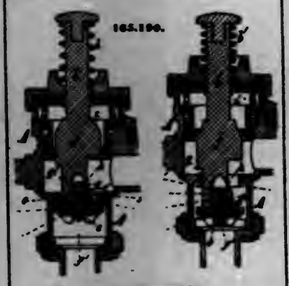
3. The oil-vapor valve-plug E, having the bore *c' c''*, and contracted nozzle *c*, in combination with oil-vapor supply pipe, C, substantially as hereinbefore described and set forth.

4. The mechanism for operating and regulating the valve, composed of lever I connected with the gas-holder, the arm H having projections *h' h''* engaging the pin *e*, the connecting-rod *l* and the spring J, substantially as hereinbefore described and set forth.

5. The combination of the adjustable connecting-rod *l* with the arm H, spring J, and piston L, substantially as hereinbefore described and set forth.

165,189. MANUFACTURE OF GAS. Herbert W. C. Tweddle, Pittsburg, Pa. (Filed Mar. 6, 1875.)

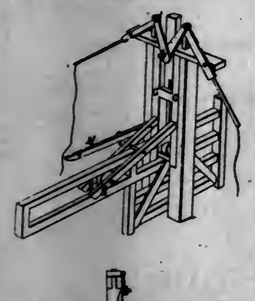
As an improvement in the manufacture of illuminating-gas, the process herein described, viz., superheating an admixture of hydro-carbon vapor and steam, and then passing the same through an incandescent mass of mixed carbonaceous and decomposing material contained within a closed chamber, substantially as specified.



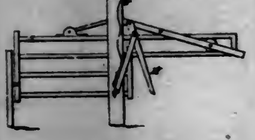
165,190. COMBINED COCKS AND ANTI-CONCUSSION VALVES. I. F. Van Duzer, Middletown, assignor to Charles Harrison, New York, N. Y. (Filed June 19, 1875.)

Brief.—The cock is closed by the pressure of the water. Any tendency to produce a jar by the valve closing suddenly is relieved by the small supplementary valve.

In a cock for fluids, the combination of the main valve with a supplementary valve and a spring so graduated in strength as to hold the supplementary valve upon its seat against the ordinary pressure of water in a state of rest, while yielding to allow the supplementary valve to open when the main valve is suddenly closed.



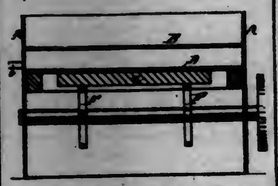
165,190.



165,190.

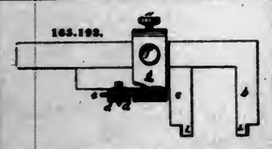
165,191. FARM-GATES. Wm. Waggoner, Creston, Iowa. [Filed May 1, 1875.]

Brief.—The gate can be vertically adjusted for passage of small stock by the lever without affecting the operative mechanism by which it is glided across the road.



In combination with a farm-gate, constructed as described, the frame G G, provided with the arms *g g*, and the lever H for raising the gate, substantially as and for the purpose set forth.

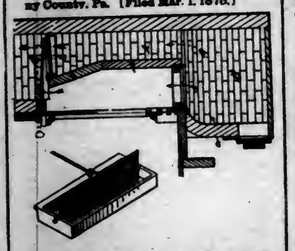
165,192. PAPER-PULP SCREENS. John S. Warren, Wilmington, Del. [Filed Apr. 20, 1875.]



Brief.—An elastic diaphragm under the screen is jogged by an irregular cam underneath.

The diaphragm D, with bottom piece *c*, and the axle F, with disks F F, in combination with the screen B and frame A, substantially as described, and for the purpose set forth.

165,193. CALENDER-GAGES. Geo. B. Weld, Providence, R. I. [Filed Feb. 3, 1875.]

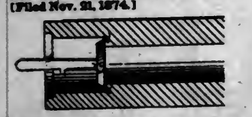


165,193.

1. The combination of the stirrup *g*, having the clamp-screws F and A, the screw *e*, fixed to the stirrup, and carrying the adjusting-nut screwed between the abutments *d d* of the arm *c*, when used for final adjustment of a gage, substantially as and for the purpose herein set forth.

2. A caliber-gage consisting of the fixed arm *a b*, the sliding arm *c*, provided with the abutments *d d*, the stirrup *g*, having the thumb-screws *f* and *h* for securing the stirrup to the arm *c*, and the screw *e*, secured to the stirrup and carrying the adjusting-nut, when operating together substantially as and for the purpose herein described.

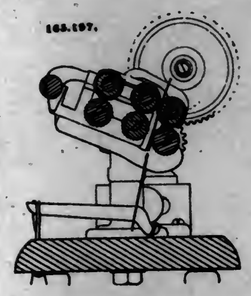
165,194. FIRE-PLACES. James Adair, Killbuck Township, (Pittsburg P. O.,) Allegheny County, Pa. [Filed Mar. 1, 1875.]



In combination with an air-supplying ash-pit, a fire-chamber, an interposed low-down grate, and an independent flue leading from such ash-pit past the fire-chamber into the chimney, and provided with a damper, all arranged substantially as set forth, whereby, when the damper is open, the main line of draft shall be up such independent flue, but when closed shall be through the fire.

165,195. BRUSHES. Wm. A. Albaugh and John Toole, Baltimore, Md. [Filed Apr. 3, 1875.]

A whitewash-brush constructed with abrupt edged ca[illegible] or ledges *a a* raised above the general surface of the sides of the brush-block A, substantially as and for the purposes herein specified.

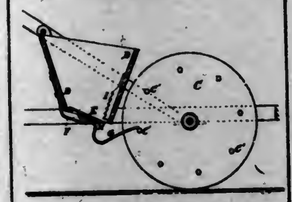


165,196. MODES OF BLACKWASHING MOLDS. John B. Aston, Pittsburg, Pa. [Filed Nov. 21, 1874.]

The mode herein described of blackwashing bowl-pipe molds by means of the disk or valve O, constructed to seat on the shoulder *a*, as shown.

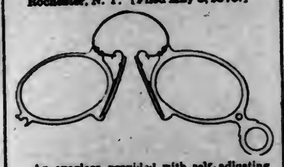
165,197. TOP-ROLL COVERINGS FOR DRAWING AND SPINNING FRAMES. Edwd. Atkinson, Brookline, and Ernest Edwards, Boston, Mass. [Filed Jan. 22, 1875.]

165,197.



1. As an article of manufacture, a roll for spinning and other textile machinery, having a covering formed from a gelatinous compound, prepared substantially as described.

2. In machinery for treating cotton and other fibers, the combination of the fluted roll with the top roll, prepared substantially as described.



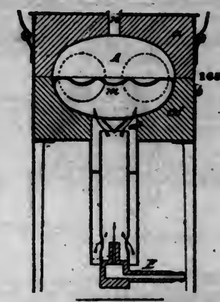
165,198. SEED-PLANTERS AND FERTILIZER-DISTRIBUTERS. David F. Belentine, Mount Gallagher, S. C. [Filed May 15, 1875.]

Brief.—Hopper-bottom hinged, with a graduated opening, and vibrated by an arm struck by pins on the bearing-wheel. Within the hopper is a vertical serrated plate for preventing the seed from rising with the vibrating bottom.

The combination of the hinged bottom E, the toothed plate I, the spring F, and the arm G, with the hopper D, and pins *d'* on the wheel C of the machine, substantially as herein shown and described.

165,199. EYEGLASSES. John J. Bausch, Rochester, N. Y. [Filed May 8, 1875.]

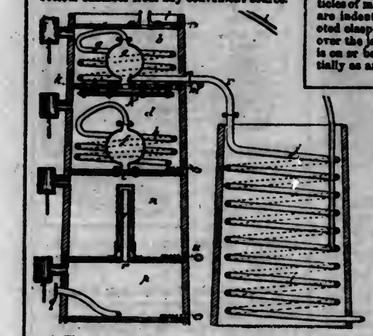
An eyeglass provided with self-adjusting nose-pieces closed at both ends, as and for the purpose described.



165,200. FURNACES FOR HEATING SOLDERING-IRONS. Pascal P. Beals, Buffalo, N. Y. [Filed May 21, 1875.]

Brief.—The bridge on which the points of the irons rest prevent their overheating.

1. The combination, with the gas-burner E, of the metallic case *b* and heating-chamber A, constructed of fire-bricks *a a'*, and provided with flame and escape apertures *d' e*, substantially as and for the purpose hereinbefore set forth.



2. The combination, with the heating-chamber A and gas-burner E, of the bridge *w*, for supporting and protecting the points of the soldering-irons, substantially as herein before set forth.

165,200.

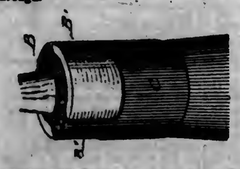
165,201. STILLS FOR THE MANUFACTURE OF ALCOHOLIC SPIRITS. John H. Beam and Joseph B. Beam, Bardstown, Ky. [Filed Feb. 3, 1875.]

Brief.—The mash is admitted cold into the upper chamber, and treated by the vapors of distillation contained in the receiving-vessel and connected coil while on their way to the condenser through the singlings-worm. A worm also conveys the vapors from this vessel to the condenser. The mash is let down into the next chamber, being further treated therein by the vapors of distillation and the free steam generated by the operation. A perforated partition separates to the two chambers, to which is attached a false head to prevent "spewing." A pipe and hood in the third chamber pass the vapors and steam into the mash. Automatic valves prevent collapsing when the contents of the chambers are charged down. Steam is admitted into the bottom chamber from any convenient source.

1. The combination of a centrally-located head and vapor receiving vessel, *c*, and the coil *g*, leading from and surrounding it, with the charging-chamber A, said vessels communicating with the chambers below and the singlings-worm *j*, whereby the spirits and steam are caused to pass upward and out through said vessel, and the cold incoming beer brought to a boil by the central heating-surface and the coils near the walls of said chamber, substantially as herein set forth.

2. The centrally-located vessel *f* and coil *h* leading from and surrounding it within the chamber *d*, and opening therein, whereby the vapors are discharged from the chamber *a* directly into the beer in the chamber *d* to partially distill it, substantially as herein set forth.

3. The combination, with the chambers *b d*, of the central heating-vessels *c f* and their surrounding coils *g h*, the coil *h* opening into the bottom of the chamber *d*, to let out the hot vapors therein, and the coil *g* terminating in the singlings-worm *j*, for the discharge of the spirits therein, as set forth.



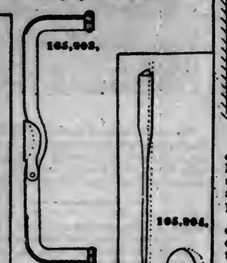
4. The combination, with the closed chambers *b* and *d* and the vapor-receiving vessel *c*, of the closed head *k* and false head *k'*, whereby the beer is prevented from being thrown up into the singlings-worm, and carried out with the singlings, by too great agitation in the charging-chamber, substantially as herein set forth.

5. The combination, with the charging-chamber *b* and the centrally-located heat and vapor receiving vessel *c* therein, of the singlings-pipe *i* and the condensing-coil *j*, whereby the vapors generated by the hot vessel *c* and its coil *g* in the charging-chamber pass off during the preliminary heating and boiling of the beer, substantially as herein set forth.

6. The combination of the centrally-located vessel *f* and its coil *h* with the centrally-located vessel *c* and its coil *g* by means of the wall of the still and the perforated head *k* and false bottom *k'*, substantially as herein set forth.

165,202. BRUSH-HOLDERS. John Blair, Boston, Mass. [Filed May 1, 1875.]

Brief.—The device is composed of one piece of rubber, and is cut away upon the sides, and has a central yoke that the handle passes through.

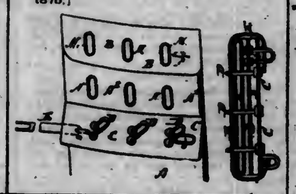


The brush-holder herein described, comprising the cylindrical tube C, and centrally-perforated yoke B B', made of one piece of india-rubber, as and for the purpose set forth.

165,203. POCKET-BOOK FRAMES. Bart M. J. Bleek, Jersey City Heights, N. J., assignor to Morris Rubens, New York city. [Filed Mar. 20, 1875.]

A frame for pocket-books and similar articles of manufacture in which the hinged jaws are indented to about the length of the pivoted clasp at the point where the same binds over the jaws, so that the clasp, when locked, is on or below the level of the jaws, substantially as and for the purpose set forth.

165,203.



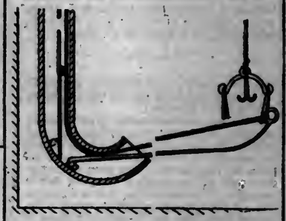
165,204.

165,204. SEWING-MACHINE NEEDLES. Geo. H. Bialoch, Springfield, Mass. [Filed Jan. 8, 1875.]

The sewing-machine needle, as described, with a portion of its shank removed at the shuttle or looper side of the needle, and rounded to the same arc of a circle, or nearly so, as the other portions of the shank, for the purposes set forth.

165,205. MAIL BAGS. John Boyle and E. Stephens, Brooklyn, N. Y.; said Stephens assignor to said Boyle. [Filed June 16, 1875.]

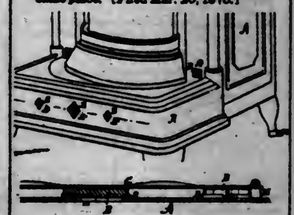
The combination of the flap B, formed by an extension of the side A', and having the staples F and slots M, the upper portion of the front of the body of the bag A', having the slots N, and the back, having the slots N', the flap C, having staples D D D and *e*, and the closing-strap E, all constructed substantially as and for the purpose specified.



165,206. PICTURE-FRAME HANGERS. A. Brown, Rochester, N. Y. [Filed Mar. 6, 1875.]

As a new article of manufacture, the picture-hanger A, formed from a single piece of metal, with the tongue *b* and teeth *a a* struck out on the two opposite sides, and the said teeth forming hooks, which stand angular to the plate to strike into and hold in the wall, and made broadest at their points to prevent crumbling of the plaster, as herein shown and described.

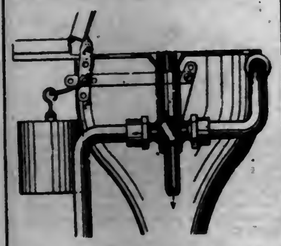
165,207. PUMP-CHAIN ADJUSTERS. James B. Brown, Hannibal, Mo. [Filed May 22, 1875.]



Brief.—A device consisting of a chain or rod having grappling-hook at one end, and spear-shaped head at the other. A flexible wire, as shown, is used in connection with it. By this device any difficulty arising from a broken chain, or from the knotting, wedging, or twisting of the same in the tube, is overcome.

1. The adjusting device for chain-pumps, composed of an adjusting chain or rod, with hook and spear ends, a flexible conductor, and a grappling-cord attached thereto, to be operated substantially in the manner and for the purpose set forth.

2. The spear-shaped end of the adjusting chain or rod, in combination with the socket-eye of the conductor, for forcing the same through the chain-tube and bottom shoe, as specified.



165,208. STOVES. William Burrows, New York, N. Y., assignor to Jordan L. Mott, same place. [Filed Mar. 30, 1875.]

As an improvement in ornamenting stoves, a stove composed of cast plates A, provided with openings A', and having the flanges D and legs F cast thereon, in combination with the ornamenting tile B and slotted bar C, whereby the tile are removably secured in place, all as and for the purpose herein set forth.

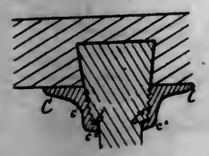
165,909. AUTOMATIC SHUT-OFF ATTACHMENTS FOR WATER-CLOSETS. James Cavanagh, New York, N. Y. [Filed June 12, 1875.]

Brief.—When the seat is depressed the adjustable weighted lever turns the cock, and admits a supply of water. When the pressure is removed the return movement of the lever shuts off the water. The valve may be easily removed, and has the means of lubrication shown.

1. An automatic shut-off attachment for water-closets, consisting of a water-supply pipe, with regulating stop-cock, connected by adjustable lever mechanism with the hinged and weighted cover that operates thereby the stop cock, substantially in the manner and for the purpose set forth.

2. The combination of the stop-cock by a supporting-tube and fastening-nut with the flange of the bowl, to be readily detached for repairs, substantially as specified.

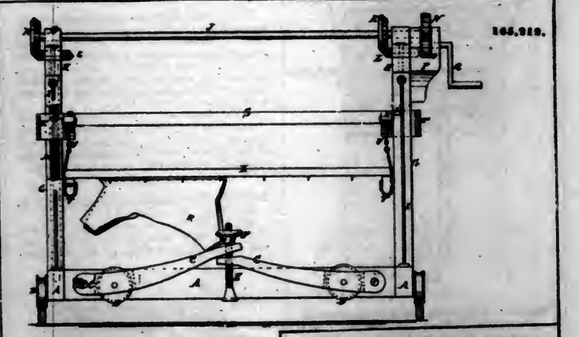
3. The supporting-tube of the stop-cock, forming a lubricating-chamber, and having bottom aperture to supply oil to stop-cock, substantially in the manner set forth.



165,910. GALVANIC BATTERIES. Joseph C. Clamond and L. A. Guibe, Paris, France. [Filed Nov. 6, 1874.]

Brief.—An artificial carbon is produced by calcining a mixture of graphite, tar, and sugar. The carbon thus prepared is immersed in a solution of perchloride of iron, or of acetates and incorporated in the pores of the carbon other salt of sesquioxide of iron, and then in ammonia. The sesquioxide of iron is precipitated. By this means the porous vessel is dispensed with, and the depolarizing agent is chemically produced in the pores of the carbon itself.

1. The improved sesquioxide-of-iron battery, containing sesquioxide of iron, in combination with zinc and an ammoniacal salt, as specified.

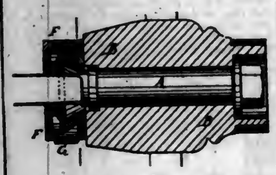


2. The method herein described of preparing a sesquioxide-of-iron battery by mixing sesquioxide of iron with coke, or fixing it in the pores of carbon, substantially as specified.

165,911. WHEELS FOR VEHICLES. William Currie, Rochester, N. Y. [Filed Apr. 21, 1874.]

The enlarged inclined angular end *b* of the spoken, having the shoulders *b' b'*, in combination with the flanges C C, having the inclined angular inner surfaces *c' c'* and shoulders *c' c'*, overlapping the shoulders on the spoken, and all constructed substantially as shown and described.

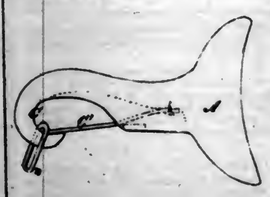
165,912. MACHINERY FOR RAISING AND TRANSFERRING BRICK FROM VATS. Wm. Coupe, South Attleborough, Mass. [Filed June 6, 1873.]



165,912.

1. The combination, with the frame A G H, provided with wheels E, and bars for suspending the hides, of the pivoted levers C, carrying-wheels D, the screw-rod R, and nut F, as shown and described.

2. The combination of the gearing J K L, N O Q, and the swiveled screws M with the frame-work A G H, for raising and lowering the hides, substantially as herein shown and described.

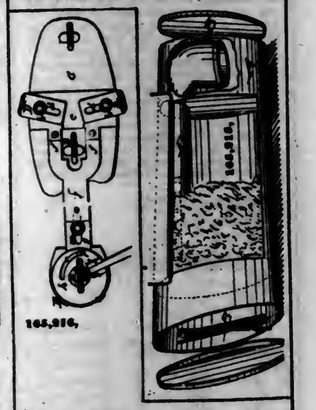


3. The combination of the cross-heads R, connecting-bars S, nuts T, and the chains and hooks U V with the swiveled screws M, for connecting the hides with the operating gearing, substantially as herein shown and described.

165,913. AXLE-PROTECTORS. C. G. Cowell, Plainfield, Ill. [Filed May 22, 1875.]

The combination of the flaring sand-band D, the flaring wheel E, the cap F, having an opening in the lower part, and the scraper G, with each other, and with the hub B and axle A, substantially as herein shown and described.

165,914. BREAST-STRAP SLIDES. Thos. C. Crenshaw, Lexington, assignor of one-half his right to Cotton H. Allen, St. Louis, Mo. [Filed Dec. 26, 1874.]

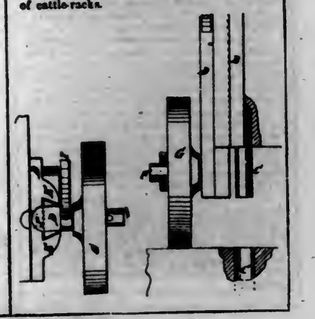


The breast-strap slide A, snap-hook C and O, and the martingale-bar E, constructed and combined substantially as described, and for the purpose set forth.

165,915. SMOKING-CASES. H. W. Dana, West Troy, N. Y. [Filed May 22, 1875.]

Brief.—The case has a central space for the tobacco, with a side cover leading thereto, and at each end is a receptacle for matches and the pipe, the latter having a tube that extends into the main case for the stem of the pipe.

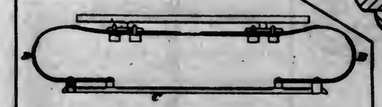
A new article of manufacture, consisting of case B, divided into three compartments, having a separate cover at each end, as well as in the middle, and provided with pipe-tube D, as shown and described.



165,916.

165,916. SKATES. John C. Dexter and E. V. Tanner, Florence, Mass. [Filed May 31, 187

The combination of the foot-plate C, having the slots *a*, clamps D, carrier-plate *e*, connecting-rod *f*, slotted plate *g*, adjustable clamp E, pin *p*, and plate *h*, having the circular slot *r*, substantially as shown and described.

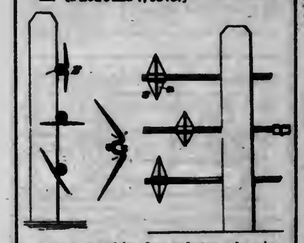


165,917. DEVICES FOR RAISING AND LOWERING CATTLE-RACKS ON PLATFORM-SCALES. Preston C. Dockstader, Lyndon, Ill. [Filed May 10, 1875.]

Brief.—A device for the easy manipulation of cattle-racks.

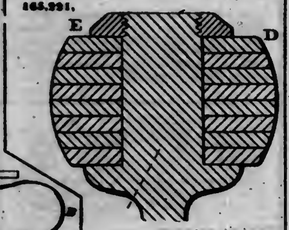
The combination, with cattle-rack A, of plate B, having pin C and button I, the slide D having rib H and stop J, and the axle F having wheel G, all constructed and arranged as and for the purpose specified.

165,918. VEHICLE-SPRINGS. Fran: F. Doland and Francis Scherb, Sacramento, Cal. [Filed Apr. 15, 1875.]

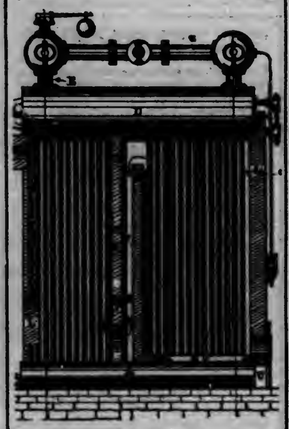


In combination with the reaches C, the C-springs D D, extended at their top so as to unite, substantially as and for the purpose set forth

165,919. METHODS OF FORMING PILES OR FAGOTS OF OLD RAILWAY-RAILS. Joseph Downing, Sr., Allentown, Pa. [Filed May 15, 1875.]



A pile of old railroad-rails, constructed of one whole rail and two part-rails, divided by cutting longitudinally along the middle of web, the web portion of said parts being placed in the pile, so as to abut against the web of the whole rail, and the interstices being filled with extra pieces of metal, one or more, substantially as and for the purpose described.



165,920. RAKES FOR WIRE FENCES. James F. Duffy and Nicholas Schroeder, Chicago, Ill. [Filed June 7, 1875.]

As a new article of manufacture, the wire-fence barb B, made of sheet metal, pointed at the ends and stiffened by means of the longitudinal groove or furrow *a*, and having the central loop or arch *a'* therein for receiving the wires of the fence, substantially as shown and described.

165,921. STEAM-GENERATORS. Jos. Firmenich and George Firmenich, Buffalo, N. Y., assignees of one-third their right to Frank Firmenich, same place. [Filed Apr. 15, 1875.]

1. The arrangement, with the steam and water receptacle D, of the circulating end tubes C, inclosed by the brick wall or walls L, and a mud-drum, A, situated below the fire-line of the steam-generator, substantially as described, and for the use and purpose set forth.

2. The combination, in a steam-generator, as described, of the front, commingling, and rear chambers having the partitions M and N, arranged as shown, and provided with the air-ducts P, and outlets Q, substantially as described, and for the use and purpose set forth.

3. The combination, with the series of mud-drums A and steam and water drums D, of the series of heating-tubes C, and the fire-grate S, when the said fire-grate is arranged between the said series of heating-tubes C and above the mud-drums A, substantially as described, and for the use and purpose set forth.

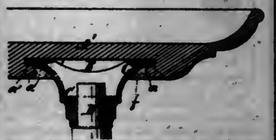
4. The combination, with the mud-drums A, having the flue-sheet B, of the series of heating-tubes C, steam and water drums D, with the connections E, steam-domes F, with the connections G, and the setting of the steam-generator, consisting of the front and rear walls L and partition M, the whole when arranged substantially as described, and for the use and purpose set forth.

165,922. MALLETS. Albt. G. Fellows, Philadelphia, Pa. [Filed May 14, 1875.]

Brief.—The mallet consists of a metallic handle formed with a collar and screw-threaded shank, and a series of disks of prepared paper or other suitable material fitted in the shank, and clamped between the collar and a nut working in the end of the shank.

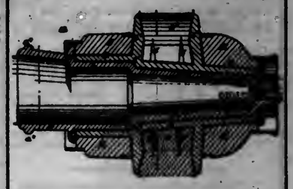
The handle A with shank C and collar B intermediate thereof, all formed in one piece of metal, in combination with the series of disks D and the clamping-nut E at the outer end of the shank, all constructed to operate substantially as and for the purpose set forth.

165,923. EVAPORATING-PANS. P. B. Fox, Marlow, N. H. [Filed May 24, 1875.]



Brief.—Pans of graduated sizes are united into a connected series by means of tubular bolts, lap-edges, and connecting-rods. When done using, the connection is broken, and the pans are stored in a small compass for future use.

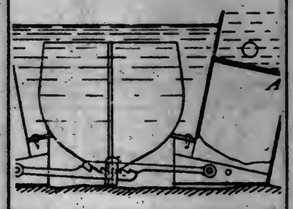
An evaporating-pan composed of a series of narrow pans connected together by means of the rods *b b*, tubular connections *c d*, and lap *e*, substantially as and for the purpose described.



165,924. REVOLVING SAUCERS FOR FLOWER-POT BRACKETS. Stephen Freeman and Geo. H. Smith, Racine, Wis. [Filed June 21, 1875.]

Brief.—The saucer is made with a recessed bottom, with projecting lips at regular intervals, and into this is fitted a socket with projections, which pass beneath the lips and into the recess, in which position it can be secured by plaster or otherwise. The socket, being of hard material, rests upon a round tenon, and thus turns freely with wear of the softer material of the saucer.

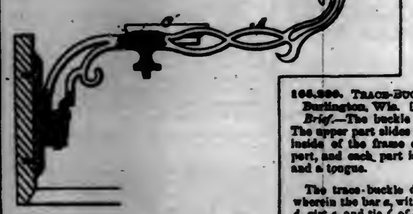
The revolving saucer made of wood, earthy, vitreous, or other light analogous materials, and with a socket, E, notches *b*, and ledges *e'*, in combination with a metallic flanged thimble, C C', united to it by means of the flanges on the thimble, the lips on the saucer, and cement or other retaining agent, substantially as and for the purpose described.



165,925. HUBS. Edward F. Friend, Marianna, Ark. [Filed Apr. 2, 1875.]

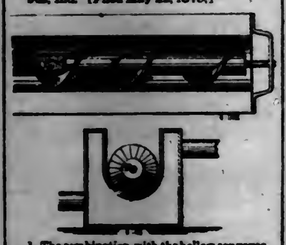
1. The axle-skein A, having shoulders a^2 a^2 and ring-flanges a^3 a^3, substantially as and for the purpose set forth.

2. The axle-box B, having shoulders b^1 and ring-flanges b^2, flaring upon the outer part and dovetailed upon the inner part of their inner surfaces, and connected by wedge-shaped partitions b^3, substantially as set forth.



165,926. APPARATUS FOR RAISING SUNKEN VESSELS. J. Nelson Furman, Patchogue, N. Y. [Filed Apr. 17, 1875.]

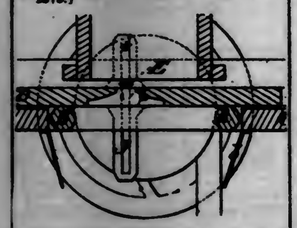
The combination of a pair of tanks, A, and contrivances for locking them together, the tanks being constructed with inclined bottoms to haul over, and when rising gripe the sides of the vessel to be raised.



165,927. FLOWER-BRACKETS. A. J. Gardner, Lee, Mass. [Filed Feb. 20, 1875.]

Brief.—The main arm of the bracket is pivoted to a wall-piece in the usual manner, so as to swing around to the right or left, as desired. A dovetail notch is formed at about the middle portion of the main arm upon the upper side. A pin rising from the center of the depression forms an additional security for the supplemental arms, which are rigidly attached to each other, and fitted to the dovetailed depression, their arms extending forward, so as to bring the center of gravity of the flower-pot cup forward of the point of attachment.

The combination, with the main pivoted arm A, having the attachment-notch D, with central pin *p* and rear dovetail wall *d'*, of the transverse cross bracket-bar C *c*, constructed entire, with its center of gravity in front of the attachment-notch, and provided with a corresponding perforated dovetail brace, substantially as specified.



165,928. DRYER. Joseph F. Gent, Columbus, Ind. [Filed May 22, 1875.]

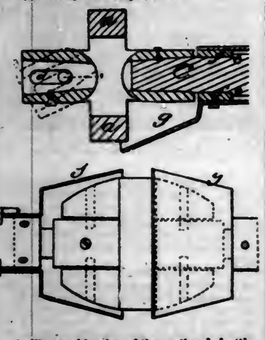
1. The combination, with the hollow conveyer-trough for reception of steam for drying the grain, of the spiral flanged shaft and brushes G, substantially as shown and described.

2. The brushes G, (one or more,) in combination with a conveyer, for the purposes described.

165,929. VEGETABLE-CUTTERS. Samuel Hauck, Jr., Lebanon, Pa., assignor of two-thirds his right to A. B. Hauck and Chas. B. Andrews, same place. [Filed May 15, 1875.]

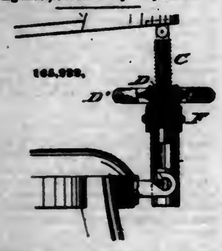
In a vegetable cutting machine, the combination, with the topper F, of the horizontally-reciprocating platform D, provided with an adjustable cutter, E, and rollers B, mounted upon an extensible frame, substantially as and for the purpose set forth.

165,930.



165,930. TRACE-BUCKLES. Miles T. Hayes, Burlington, Wis. [Filed Jan. 26, 1874.]

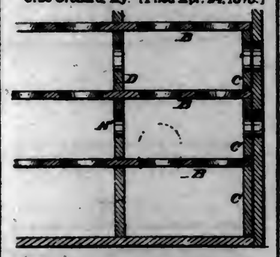
Brief.—The buckle is made in two parts. The upper part slides underneath lugs on the inside of the frame of the lower or under part, and each part is provided with a loop and a tongue.



The trace-buckle described, in two parts, wherein the bar *a*, with the tongue *b*, the sides *d*, girt *e*, and tie *f*, of one part, and the bed *h*, tongue *i*, and girt *k*, of the other part, are constructed and arranged substantially as described.

165,931. KNUCKLE-COUPLINGS FOR TUMBLING-SHAFTS. Oscar D. Herrick, Ottumwa, Iowa. [Filed May 1, 1875.]

1. The combination of the sectional sheathing K with a sectional and folding tumbling-shaft, substantially as specified.

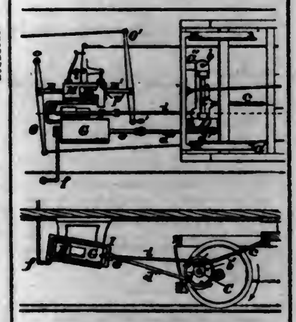


2. The sectional metallic sheathing E, having bearing-rings *f* and swells or enlargements *g* in the form of half a conical frustum, adapted for use in connection with a folding sectional tumbling-shaft, substantially as specified.

165,932. BARBERS' CHAIRS. Wm. Hoehn, New York, N. Y., assignor to A. Schwaab, same place. [Filed Apr. 24, 1875.]

The combination in a barber's chair of pivoted screw C, nut D, hand-wheel D', and sleeve F, with a tube, E, trunnioned in bearings *b*, as and for the purpose specified.

165,933. BOO-BOXES. Wm. H. Holdam, Crab Orchard, Ky. [Filed Apr. 24, 1875.]



The box A, having detachable egg-holders B, provided with adjacent spacing and supporting end pieces C C, as shown and described, so that each may be conveniently placed on a floor or table, and filled with eggs before being inserted in box.

165,934. GRINDING-WHEELS. John W. Hyatt and Isaiah S. Hyatt, Newark, N. J., assignors to the Celluloid Manufacturing Company, New York, N. Y. [Filed Dec. 1, 1874.]

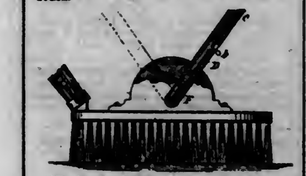
The grinding-wheel made of emery or similar particles united together by celluloid or pyroxyline, or their compounds, as set forth.

165,935. AUTOMATIC AIR-BRAKES FOR CARS. Alex. James, Seymour, Ind. [Filed May 31, 1875.]

Brief.—The air-pump is actuated by a friction crank-wheel, which is automatically thrown in and out of contact with the axle of the car-wheel, according as the pressure in the receiver is increased or diminished. The air-pump is supplied with air through a pipe leading to the roof of the car.

1. The combination of swinging frame B *b b'*, shaft C, spring *c*, driving-wheel D, pump *d'* E *e*, receiver G *g*, cylinder H H', plunger *h h'*, yoke I *i*, regulating-valve K L, cylinder M, and oppositely-acting pistons N N', for operating the levers O O of the brake apparatus, substantially as herein explained.

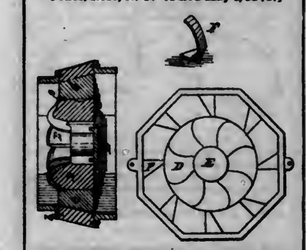
2. In combination with the cylinder H H' and retracting devices *k* l, the adjustable perforated nut J *j*, valve K *k*, cock L, and the inlet-pipe P, which communicates with the receiver G, substantially as described.



3. In combination with the cylinder M and its oppositely-acting pistons N N', the port *m*, channel *m'*, inlet-valve P, outlet-valve P', exhaust-port *p'*, and the pipe *p*, leading to the receiver G, substantially as and for the purpose set forth.

4. The described combination of pivoted levers T *t* T' *t'*, rods U U', and connection S, for operating the bell-crank Q from either end of the car, for the purpose stated.

5. The suction-pipe *f* of pump E, when carried up within the car, so as to draw off the vitiated air from the same, substantially as set forth.



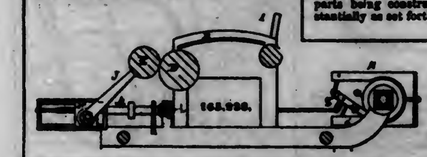
165,936. BRUSHES. Orlando Jenness, Alton, N. H. [Filed May 12, 1875.]

Brief.—The handle is bifurcated and pivoted to the back of the brush, and carries a sliding pin, which engages various holes, to set the handle at different inclinations to the brush.

The handle G, bifurcated at one end for attachment to the angle segmental piece F, and carrying the spring-catch D in a central longitudinal opening, having a slot at one side thereof for the operating-knob *b* to work in, all combined and arranged substantially as shown and set forth.

165,937. CASTING TURBINE WHEELS. G. H. Jones, Ross, N. Y. [Filed May 1, 1875.]

1. The water-wheel pattern, consisting of the sections D, provided with grooves *d*, the hub E, and ring *g*, substantially as and for the purpose specified.



2. The partition-plates F, constructed and applied substantially as and for the purpose set forth.

165,938. PAPER-DAMPING MACHINES. C. Kahler, Chicago, Ill., assignor to himself, M. C. Barnes, Wm. L. Ogden, W. Severin, and Philipp Ruraith, same place. [Filed Apr. 17, 1875.]

Brief.—Makes the shaft carrying the roll upon which the paper is wound adjustable.

1. The combination of the roller E, journaled on the swinging arms J, with the adjustable shaft K and the driving shaft or roller D, substantially as specified.

2. The combination of the shaft L, screw shafts M, and sliding blocks N with the shaft K, arms J, roller E, and beveled wheels *a b*, substantially as set forth.

---

3. The combination of the brake B, wheel Q, and spool-shaft F with the sliding board E, driving shaft or roller D, and swinging and adjustable roller E, arms J, and adjusting shaft K, for regulating the tension of the paper and controlling the speed, substantially as specified.

165,939. LOCKS FOR POCKET-BOOKS. P. Elias, New York, N. Y., assignor to Wm. Boyd, same place. [Filed June 2, 1875.]

Brief.—The metallic tongue of the closing flap is constructed with ears or projections, and seated in a recessed base-piece connected to the body of the book, having notches to receive its ears, and is held therein by a pivoted lever-clamp impinging upon its ears

In a lock for pocket book, &c., the combination of the metal tongue *a* having one or more outwardly-projecting shoulders, *c*, with the mortised or recessed plate *b* having one or more inwardly-projecting shoulders *d*, and with the cam lever *f*, the rigid tongue *e* fitting into the recess or mortise of the plate *b*, all substantially as herein shown and described.

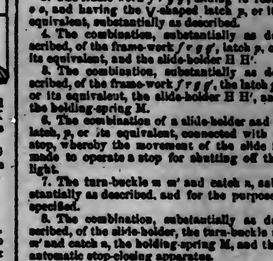
165,940. MIDDLINGS-PURIFIERS. Jacob C. Encobel and Fred C. Encobel, Belleville, Ill. [Filed Apr. 10, 1875.]

Brief.—As the material is directed by the cant-boards to the neighborhood of the air-inlet openings, the slopes prevent its passage out through said openings. An exhaust-fan communicates with the outer diving-flue, to produce the necessary currents

1. The combination of the cant-boards E and slope F in a case having air-inlet passages K and outlet-passages I, with regulating-valves J, substantially as specified.

2. The combination of the diving passage G H and passage L with the case having the cant-boards E and outlet-passages I, substantially as specified.

165,941. STEREOSCOPES. Henry J. Lewis, Green Point, Brooklyn, N. Y., assignor to H. and E. T. Anthony & Co., New York city. [Filed June 7, 1875.]



1. The base for the graphoscope made of the two portions *a* and *b*, that are hinged together and form the inclosing-box, substantially as set forth.

2. The rods *e'* for the picture-holder *d*, hinged at their lower ends to the cross-bar *e*, sliding within the base *b*, in combination with the friction-spring 3 and eyes 2, that guide the holder when in use, substantially as set forth.

3. The stereoscope-lens frame *g'*, hinged to the front edge of the base *a*, in combination with the hinged leg *r* at the back of such lens frame *g'*, substantially as set forth.

4. The base *a b* of the graphoscope, hinged to the stand by a folding strut, substantially as set forth.

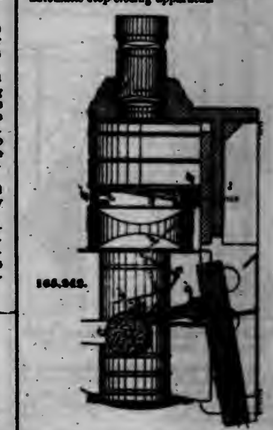
5. The picture-holder *d*, hinged to the sliding cross-piece *e*, and the sliding stereoscope-holder *m*, in combination with the folding lens-holders and box *a b*, forming the base, the parts being constructed and arranged substantially as set forth.

165,942. MAGIC LANTERNS. L. J. Mercy, Philadelphia, Pa. [Filed June 16, 1875.]

1. The stop *a*, or its equivalent, when placed immediately in front of the source of illumination.

2. The combination of the stop *a*, or its equivalent, in the position specified, with the long lever *d*, substantially as described.

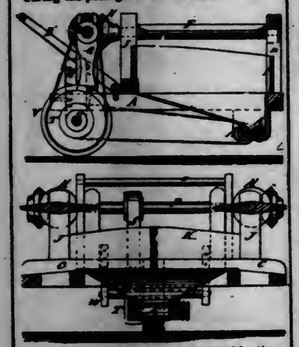
3. The frame-work *f r g g'*, sliding in rests *o o*, and having the V-shaped latch *p*, or its equivalent, substantially as described.



4. The combination, substantially as described, of the frame-work *f r g g'*, latch *p*, or its equivalent, and the slide-holder H H'.

5. The combination, substantially as described, of the frame-work *f r g g'*, the latch *p*, or its equivalent, the slide-holder H H', and the holding-spring M.

6. The combination of a slide-holder and a latch, *p*, or its equivalent, connected with a stop, whereby the movement of the slide is made to operate a stop for shutting off the light.

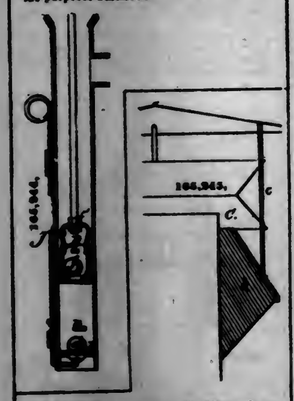


7. The turn-buckle *m m'* and catch *n*, substantially as described, and for the purposes specified.

8. The combination, substantially as described, of the slide-holder, the turn-buckle *m m'* and catch *n*, the holding-spring M, and the automatic stop-closing apparatus.

165,942. MACHINES FOR CATCHING AND DESTROYING POTATO-BUGS. C. B. Mathewson and Harvey T. Mills, Franklin Corners, Pa. [Filed May 1, 1875.]

Brief.—The machine is supported on two wheels, one in rear of the other. The body is hopper-shaped, with a pair of crushing-rollers in the bottom. On each side are revolving vanes, which sweep the insects into the hopper, and, in addition to these, there are two gathering-fingers, which support the vines during the passage of the machine.



1. In an insect-destroyer, the combination of the inclined side bars A and the guards or fingers E with the frame-work B O D G H J of the machine, substantially as herein shown and described.

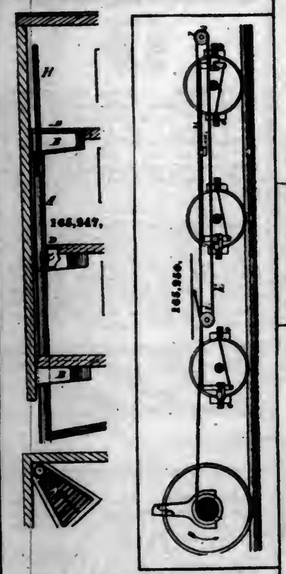
2. In an insect-destroyer, the combination of the vines F with the guards or fingers E, the side bars A, and the frame-work B O D G H J of the machine, substantially as herein shown and described.

165,944. PUMPS. Edward McDermott, Minneapolis, Minn. [Filed May 8, 1875.]

Brief.—A bar or pin projecting across the cylinder just above the lower valve prevents undue displacement of the lower ball, and raises the other when the piston is depressed to its lowest point. A bent rod operated outside the cylinder then lifts the lower ball, and the pump clears by gravity of its contents.

In combination with the rod J, and the two valves *d j*, the rod a, substantially as and for the purposes described.

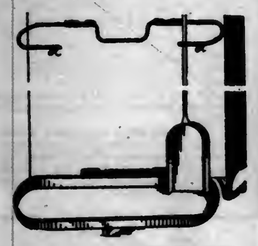
165,945. VENTILATORS. P. Milan, Cambridgeport, Mass. [Filed Mar. 11, 1875.]



The combination, with the main pipe A, of the coats frustums E F, the storm-guard or frustums G G', and dome D, the whole being constructed and arranged substantially as shown and described.

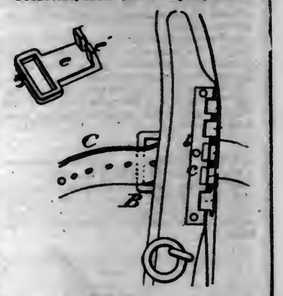
165,946. FLUXES FOR WELDING IRON AND STEEL. David Miles, Kingston, Pa., assignor to himself and William H. Squarey, same place. [Filed Mar. 26, 1874.]

A flux for welding and working iron and steel, made of slag, substantially as described.



165,947. FLOODWATE FOR WAREHOUSES. John H. Merrell, New York, N. Y. [Filed May 26, 1875.]

Brief.—A means of protecting fire-proof warehouses from damage by water, consisting of vertical pipes connecting the eaves and floors, and provided with openings and sinks in the corners, covered by gratings. Said pipes connect with the sewer-pipe below.

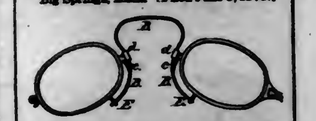


The pipes A, extending up through the building and having the openings C, in combination with the sinks B, covered by gratings D, upon each floor, the said pipes A communicating with the eaves-pipe above, the sewer-pipe below, and with all of the sinks through the openings C, substantially as described, and for the purpose set forth.

165,948. COAL-VASES AND FIRE-IRON STANDARDS. George J. Munschenser, Buffalo, N. Y. [Filed May 13, 1875.]

The combination, with a coal-scuttle, of the curved pivoted arms *a a* near the top of the scuttle, and the dish or plate *b* hinged near the base of the scuttle, all substantially as and for the object specified.

165,949. HAMES. James D. L. Nunnaley, Centreville, Tenn., and W. E. Kirkney, Booneville, Miss. [Filed May 24, 1875.]



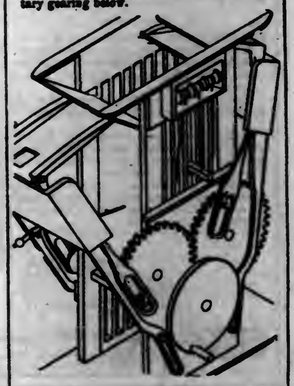
In a hame, the adjustable loop B, constructed with a shank, *c*, and lugs *c' c'*, in combination with the notched plate *c* and strap C, substantially as described.

165,950. CAR-BRAKES. Richard C. O'Hara, Houston, Tex. [Filed Feb. 13, 1875.]

Brief.—Applies brakes to rear car first.

The combination of chain-drums *i*, chains *v*, brake-levers *m*, chain-wheels *i*, and chain *l*, leading from the rear car to the winding drum *f*, all substantially as and for the purpose set forth.

165,951. EYEGLASSES. Wm. H. Peckham, Big Springs, Kans. [Filed June 9, 1875.]

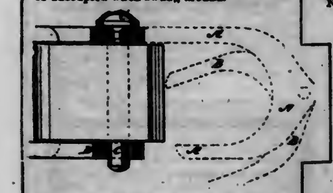


1. The small spring *c*, in combination with the nose-spring B, substantially as described, and for the purposes specified.

2. The nose-spring B, having the small spring *c*, in combination with slotted post *d* and lug E, substantially as shown and described, and for the purpose specified.

165,952. BALING-PRESSES. Harvey L. Pike, Seattle, Wash. [Filed May 21, 1875.]

Brief.—The material, thrown in continuously at the top of a vertical frame, is passed over and drawn down by a pressure-plate on each side, attached at right angles to downward-extending levers, operated alternately by rotary gearing below.

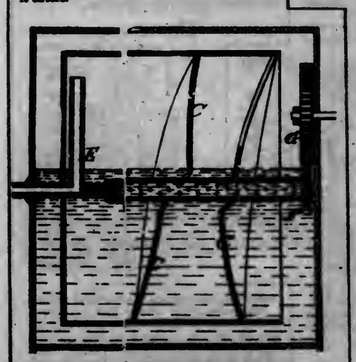


1. The pressing-plate C, with their connecting-arms E, guide-rods G, and cranks F, for the purpose of giving the plates a downward motion, and withdrawing them from the press alternately, substantially as and for the purpose herein described.

2. The connecting-rods E, extending from the plates C to the crank F, and the guide-rod G, together with the connecting-latch *m*, and the stationary pin P, for the purpose of alternately uniting and releasing the rods as they move, substantially as herein described.

3. The feeding-tables B, hinged at their outer ends, and having their inner ends alternately depressed and elevated by the movement of the presser C, so that the material can be fed beneath each presser alternately, substantially as herein described.

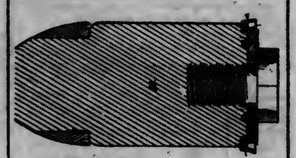
165,953. SAFETY-CLEVISES. Charles N. Poundstone, Grand Ridge, Ill. [Filed May 6, 1875.]



Brief.—Each rear arm of the clevis is made whole, but becomes a half-section at the center or front, where the two arms are pivoted together. From the pivot each half tapers around the curve, and runs out a little short of the other rear end. The bolt-hole is near the rear of the crescent, allowing the clevis to be uncoupled when swung around.

The clevis formed of the two hook-shaped parts A B, pivoted to each other at their heads, and the pin C, swiveled to the long arm of one of the parts A B, and working loosely in the long arm of the other part, substantially as herein shown and described.

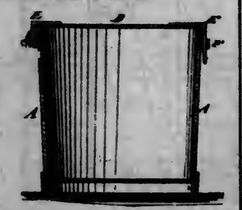
165,954. AIR-BLOWERS FOR CARBURETORS. William H. Reed, Chicago, Ill., assignor to himself, W. A. Wells, H. G. Hoyt, Dan. J. Small, Henry Jones, and L. P. Converse, same place. [Filed June 4, 1875.]



Brief.—The perforated hollow shaft within the blower-drum allows the water to return, as the air is carried by the helical flange to the exit-pipe at the opposite end from which it enters.

1. In an apparatus for supplying air regularly to gas-carburetors, the helical flange C, provided with web *a*, and cone B, combined with the case A, having an induction-passage, *g*, and an educion-pipe, E, and rotated substantially as described.

2. The helix C, having web *a*, in combination with the perforated shaft D, and cone B, open at one end, substantially as and for the purpose set forth.



165,955. PROJECTILES FOR ORDNANCE. H. Reilly, Brooklyn, N. Y. [Filed Feb. 19, 1875.]

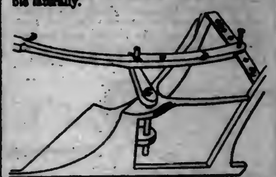
1. A sabot, with a thin expansible edge attached to the projectile by a removable plate, being prevented from turning upon the projectile by fitting around a projection from the base of the projectile, as described.

2. A sabot, provided with perforations to allow the escape of gas, substantially as herein before set forth.

165,956. METALLIC BUSHES-PACKAGES. M. C. Roberts and K. D. Briggs, Great Bend, N. Y. [Filed Apr. 24, 1875.]

The combination of strips E and loops or keepers F with cover D and body A of the package, as shown and described, for the purpose specified.

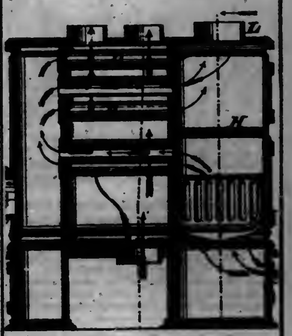
165,957. OIL-CANS. Thos. Boddick, Stranraer, Scotland. [Filed Apr. 24, 1873.]



Brief.—The annular disk secured within the oil-can forms an air-chamber. The can is provided with air-tubes opposite each other—one in the collar of the neck of the can, the other in line therewith below—so that a wire can be inserted through them in case they should get clogged up with impurities.

The combination and arrangement of the can *a*, annular disk *c*, annular air-chamber *b*, neck *a*, with its collar *f* and air-tube A, located directly above the air-tube *d* leading from the chamber *b* to the oil-receptacle *a*, substantially as and for the purpose set forth.

165,958. VINEYARD-PLOWS. Milton Rose, San Jose, Cal. [Filed Feb. 18, 1875.]

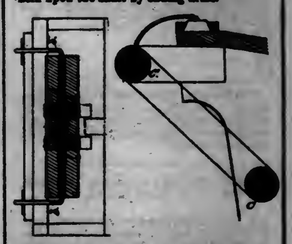


Brief.—The beam mounted upon a standard having a crank, and its rear end also adjustable laterally.

A plow, having the rear end of its beam D adjustable between the handles, in combination with the crank G for shifting its middle and forward end, substantially as and for the purpose above described.

165,959. HEATING-STOVES. H. J. Sutton, Cobourg, Canada. [Filed Dec. 14, 1874.]

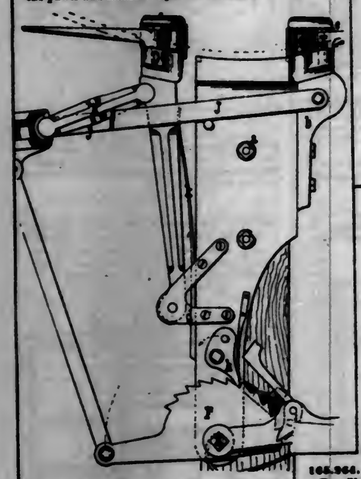
Brief.—The draft may be direct through the front trunk, or direct through the rear trunk, or indirect through both rear and front.



1. The combination of the collar J, for direct-draft attachment, with the rear trunk B, and the tubes O D, constructed and operating as described.

2. The combination of the removable plate H in the stove, constructed herein described, with two trunks, A B, connecting-tubes O D, and two collars, J L, for either direct or reversed draft.

165,960. MACHINES FOR POLISHING THE BEARS OF BOOT AND SHOE HEELS. Joshua H. Ryder, Brockton, Mass. [Filed Jan. 6, 1875.]

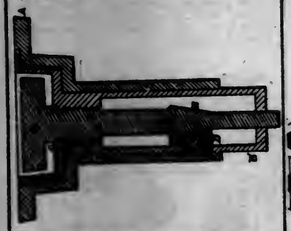


Brief.—The removable polishing-rolls are held upon the shaft by sliding arms.

In a heel-edge scouring-machine, the combination of the shaft D, rolls E E, pulley C, and sliding arms *b b*, the whole being constructed and arranged substantially as and for the purpose set forth.

165,961. TIRE-UPSETTING MACHINES. M. G. Schenck, Marlborough, N. J. [Filed May 19, 1875.]

Brief.—A movable jaw operated toward the anvil by means of a reverse lever. A foot-lever connected to the lever by suitable ratchet-and-pawl devices shortens the length of each throw by repeating the throws, said ratchet-and-pawl mechanism having trips to hold back the pawls and loosen the jaw when desired.



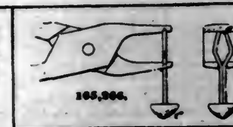
1. In combination with the clamps of a tire-upsetting machine, the levers K and J, and foot-lever G, substantially as described.

2. In combination with the levers K and J, the ratchet-lever F with pawls *h* and *i*, and foot-lever G, substantially as described.

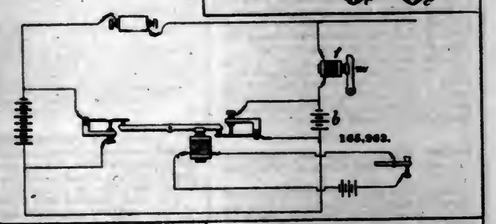
3. The combination of the ratchet-lever F and foot-lever G with pawls *h* and *i*, having trip-pins and stops, substantially as described.

165,962. BENCH-HOOKS. Chas. B. Smith, Lowell, Mass. [Filed Jan. 16, 1875.]

Brief.—The dog is retained at any desired elevation above the bench by means of a holding-block, seated upon by a conical screw-wedge, which forces it into the corrugations of the case.



The bed-plate A, provided with the extension A', in combination with the hook B B', thumb-screw C, with its conical wedge E, and wedge-block D, substantially as and for the purpose specified.



165,963. DUPLEX TELEGRAPHS. O. Smith, Astoria, N. Y. [Filed Dec. 29, 1874.]

1. The two batteries *a* and *b* of unequal power, connected with the same poles to the line, in combination with the adjustable rheostat between the larger battery and the line, the receiving instrument between the smaller battery and the line, and the key for simultaneously opening and closing the circuits from both batteries, substantially as specified.

2. In a duplex telegraph the arrangement of the batteries *a* and *b*, receiving instrument *f*, and rheostat, substantially as specified, so that the batteries shall neutralize each other at the receiving instrument, and act together on the line substantially as set forth.

165,964.

165,965.

165,966. PLANING-MACHINES. J. K. Smith, Burrillville, R. I. [Filed May 1, 1875.]

Brief.—The rotating cutters are carried upon the end of a vibrating arm, and controlled in their movements by a weight and guide.

The combination of the table A, having an arc-shaped slot, *a*, pivoted and weighted horizontal arm B, revolving cutter C, and pivoted side guide-strip E, as and for the purpose set forth.

165,967. COMBINED GRAVE, COFFIN, AND MONUMENT. L. M. Speere and A. Clark, Newberry, S. C. [Filed May 26, 1875.]

A combined grave, coffin, and monument, formed of the recessed lower part A, the grooved cover B, made thicker at its head end, and having an opening formed through it, in which is cemented a single, double, or triple glass plate, C, and the cover D, all constructed substantially as herein above and described.

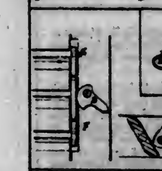
165,968. GAS APPARATUS. Robert Paulson Spice, Westminster, Great Britain. [Filed Mar. 6, 1875.]

The combination of the superheater W with the fire-box C and arch P, extending down the sides of the fire-box, as shown.

165,969. TABLE-LEAF LIFTERS AND SUPPORTERS. Tilton B. Smith, Attica, Mich., assignor to himself and Charles J. Locker, same place. [Filed May 22, 1875.]

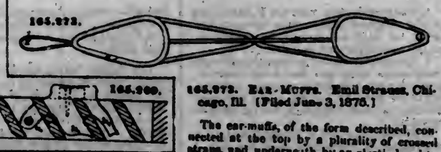
Brief.—A movable bar is connected with two sliding lifters by means of hook-rods and a center-pin.

A device for lifting and supporting table-leaves, consisting of the bar C, lifters F F, hooks G G, and center-pin B, in combination with a frame, A, all arranged to operate as described.



165,970. HOG-RINGING APPARATUS. Silas Sparks and John W. Sparks, Bowensville, Ohio. [Filed May 15, 1875.]

An apparatus consisting of a pliers, the jaws of which are grooved and slotted, as described, and a doubled wire having an inverted cone, C, (or other-shaped piece of metal,) at one end, and an opening, D, at the other, substantially as described, for ringing hogs, as set forth.



165,971. BLIND-STOPS. Charles H. Steller, Milwaukee, Wis. [Filed May 15, 1875.]

Brief.—As an improvement on former patent, No. 159,830. A thin metal plate, suitably notched, is arranged between the inner edge of one of the stiles of the blind and the ends of one or more of the blind-slats, so as to slightly oscillate, and combined with this vibrating plate is a cam-button, secured to the stile in such manner that by turning the button against the plate the slats will be held by friction in any desired position.

The combination, with cam-button D, of the notched plate C, having arms F extended between slats and beyond the slat-pivot, as and for the purpose specified.

165,972.

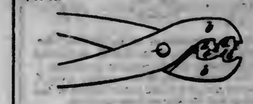
165,969.

165,973. EAR-MUFFS. Emil Strauss, Chicago, Ill. [Filed June 3, 1875.]

The ear-muffs, of the form described, connected at the top by a plurality of crossed straps, and underneath by an elastic band to pass below the chin, so that when said muffs are secured over the ears by the tension of the said crossed straps they will assume a concave form, thereby entirely inclosing the ears, substantially as described.

165,974. SMOKING-PIPE COVERS. Fredk. L. Suter, Brooklyn, N. Y. [Filed June 12, 1875.]

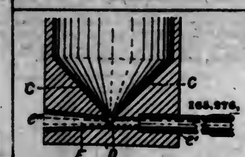
A pipe cover and guard consisting of a wire screen, with handle and downward-extending spring legs or guides, all bent of one piece, substantially as specified.



165,975. SAFETY-PINIONS FOR WATCHES. Lyman W. Thompson, Cherry Valley, N. Y. [Filed Apr. 26, 1874.]

Brief.—A safety-wheel in which the recoil, when the mainspring breaks, acts upon a flat curved spring, causing a stud attached thereto to rise from the inclined notch in the third wheel, thus releasing said wheel from connection with the train.

The safety-pinion herein described, consisting of the shaft *a*, the pinion B, the flanged and threaded hub J, and screw-cap C, all rigidly connected, the flat curved spring S carrying the latch-pin *c*, and the loose wheel A seated on said hub, and having the chamfered notch *n*, all constructed and arranged as specified.



165,975.

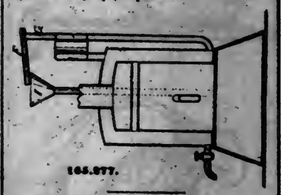
1. The frame-cap A, having a groove in the upper portion, furnishing an entire support for the balls, in combination with the recessed revolving head B, having a depending flange, *a*, whereby the balls are supported free from the shaft and protected, substantially as and for the purpose herein specified.

2. The weights H and I, arranged so that the weight H moves independently a certain distance before the weight I is raised, then both raised by the same power, in combination with a vane and mechanism for raising the weights, substantially as herein specified.

165,976.

165,976. INSECT-POWDER BOXES. William J. Van Patten, Burlington, Vt., assignor to Wells, Richardson & Co., same place. [Filed Mar. 17, 1875.]

Brief.—A box or package for holding insect-powders is so constructed that each individual box is ready for use by removing the corks from the apertures, and inserting a blow-pipe or mouth-piece into one of the apertures.



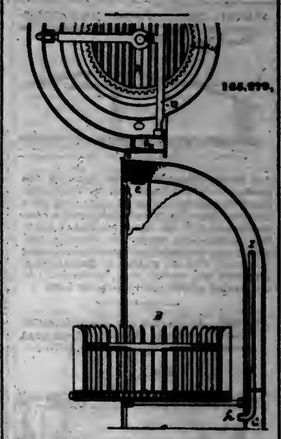
1. A powder-box constructed in one piece, and having a cone-shaped bottom, C, a vertical aperture, D, connecting with a horizontal aperture; E, the latter being formed with shoulder *c'* at one end, and a funnel-shaped outlet, *c''*, at the other end.

2. A powder-box constructed as above described, and in combination with a mouth-piece or tube to force the contents through and out of the horizontal aperture E, as specified.

165,977. HOT-WATER HEATING APPARATUS. Ernest P. Weckwitz, New York, N. Y. [Filed Apr. 24, 1875.]

Brief.—Steam escapes from the upper end of the cross-pipe, and water is returned to the boiler through the lower end.

The combination, with heater, of overflow-pipe G, open-ended cross-pipe F, and funnel I, as for the purpose specified.



165,977.

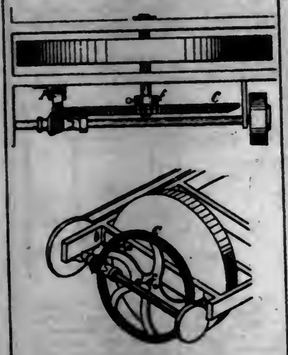
165,978. HOUSEMOUSE. John Wanstall, Washington, D. C. [Filed June 17, 1875.]

Brief.—A tapering groove for the securing-pin is arranged across the upper surface of the shoe, with its greatest depth on the inner edge, where the least wear occurs.

In combination with a horseshoe provided with vertical slots and tapering grooves, the calks with slotted shanks, and the securing-nail, substantially as and for the purposes described.

165,979.

165,979. GRATES. James Warmington and John Forrester, Chicago, Ill. [Filed June 11, 1875.]



Brief.—The grate is turned in one direction, and the fire-pot in the opposite. The fires provide for an indirect draft.

1. The combination, in a grate, of the vertical section B and horizontal section D with the spurs or teeth *f f'* and wheel *e*, substantially as and for the purposes specified.

2. The fires E F G and openings *a b*, in combination with the dampers *c d* and grate, substantially as and for the purpose herein described.

3. The fires E F G and heating-space H, in combination with the grate and the air-heating pipe I, all constructed and arranged as and for the purpose herein specified.

165,880. HARVESTERS. J. B. Webster and Wm. A. Dorr, Stockton, and M. McClenathan, Merced, Cal. [Filed Nov. 6, 1874.]

1. The bevel gear-wheel C, having the partial keyway c, in combination with the pin or rib e, on the end of the shaft d, and the sliding ring or collar f, with its set-screw O, substantially as and for the purpose above described.

2. The gear-wheel C, in combination with the adjustable pressing-roller p, substantially as and for the purpose above described.

3. The lever S, with its wear-plate W and projecting circular rim R, in combination with the beam U, with its wear-plate t, and the bolt or pin X, substantially as described, for the purpose specified.

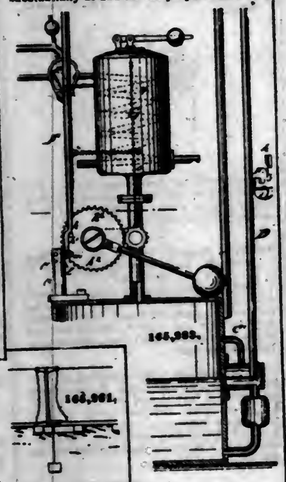
165,881. CIRCUIT-CLOSERS FOR RAILWAY-SIGNALS. Saml. Weeks, New Orleans, La. [Filed June 6, 1876.]

A circuit-closing device for signaling the passage of railway-trains over the track, composed of a spring-supported connecting-plate insulated from the ground, and placed in communication with the line-wires, and of a central contact-plate supported below the contact-plate and connected to the earth for closing the circuit with the station by the contact of connector and central plate, substantially in the manner and for the purpose set forth.

165,882. APPARATUS FOR MEASURING DISTANCES. Francis Waldon, Moninabad, Deccan, India. [Filed Mar. 20, 1875.]

The bar A B H, having sights B and H, and a graduated scale thereon, the limb C D K, having also sights at its extremities, and the indicator D F I, all combined and arranged, as shown and described, to form an apparatus for measuring distances.

165,883. AUTOMATIC FEED-WATER REGULATORS. Joseph Wertheim, Frankfort-on-the-Main, Germany. [Filed June 6, 1875.]



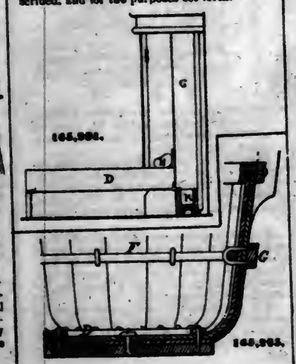
Brief.—The valves are operated by the contraction and expansion of a pipe alternately filled with water and steam. A steam-pipe passes through the tank to heat the water.

1. The combination, with rod F, having leg m, of the recessed spring-catch l, having spring-arm l', the pin P, and the wheel having pin h', as and for the purpose specified.

2. The combination of governing-rod F with waste-steam valve and feed water reservoir, producing the alternating warming and cooling of the same, for heating up the water and creating the suction-vacuum, for the purpose specified.

3. The governing-rod F, having shoulder h, in combination with projecting-pin h', of weighted cog wheel h', and stop-cock pinion for opening and closing the stop-cock on expansion of tube D at low-water level, substantially as set forth.

4. The combination of spring-acted governing-rod F, having projecting-leg m at lower most end, with recessed and spring-acted elbow-catch l, and the weighted stop-cock gear to respond to small variations of the main tube, substantially as and for the purpose set forth.

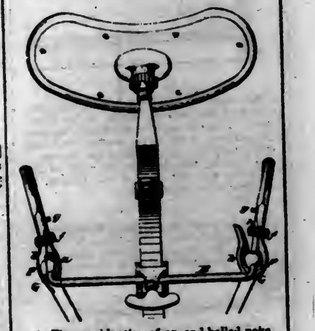


165,883.

165,884. BEDSTEADS. Wm. West, Toronto, Canada, assignor of one-half his right to G. West, same place. [Filed Feb. 3, 1875.]

Brief.—The front portion of the case is designed for permanent use as a wardrobe or book-case, and the bed is drawn out at the side from a recess in the rear portion of the case.

The main case, having the front portion thereof constructed and arranged as described, and having the recess G in its rear portion, in combination with the sliding frame F, drawer K, and folding bed D, substantially as described, and for the purposed set forth.

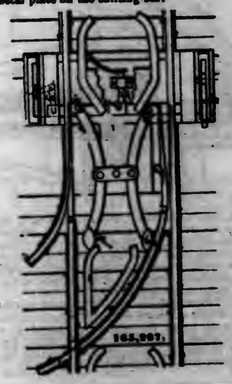


165,884.

165,885. STAVE BASKETS. R. B. Wheeler, Niles, Mich., assignor of one-half his right to Henry Lardner, same place. [Filed Jan. 23, 1874.]

The basket herein described, having the bottom board B, extending from the center of the bottom to the head of the staves, the double series of tapering staves, united by the outer hoop G, the inner wire hoop F, and staples E, and meeting point to point, and lying flat on the bottom board within their bends, the inside hoop D, and the center nail C, having a large head covering all the stave-points, and securing the same in their relation to each other and to the bottom board, as shown and described.

165,886. HEAD-RESTS. Otis C. White, Hopkinton, Mass. [Filed May 22, 1875.]



1. The combination of an end-bolted yoke, E, crooked at G G, with rods D D, having socket F, as and for the purpose described.

2. The combination, with a sliding ring, f, of grooved pieces a b, the latter hinged to the former, as and for the purpose set forth.

3. The slide-ring f, notched at h, in combination with rods D, having stud g, as and for the purpose specified.

165,887. RAILWAY-SWITCHES. John C. Wilhelm, Petersburg, Pa. [Filed June 18, 1874.]

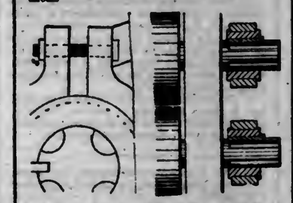
Brief.—A railroad-switch which is operated through vertical jointed striking-levers, the lower ends of which are connected to the movable switch-bar by a bell-crank lever; said bar also being connected to horizontal curved striking-levers, which lie alongside the rails, and are operated by the passing wheels in case the switch is misplaced. The switch is secured in position by a spring-bolt having a wedge-shaped projection, which takes into correspondingly-shaped notches in a metal plate on the shifting-bar.

165,887.

1. In a railroad-switch, a bar, E, with the doubly-sloped bearing e, and the bolt L, with the spring b, substantially as specified.

2. The switch levers M, springs m^1, bell-crank levers G H, and coupling bar E, in combination with the levers P Q, having thrust-blocks p' q', connecting-piece R, and switch-tongues C D, all operating in the manner substantially as described.

165,888. BUTTER-PRESERVING FIRKINS. J. Wilhelm, Orville, Ohio. [Filed Apr. 24, 1875.]



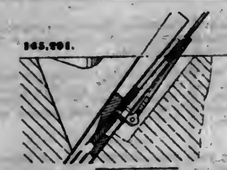
The combination of the heads B E, having cross-bars or cleats b' e' attached to their outer sides, and the hoops C D, one, two, or more, having cleats c' d' attached to their outer sides, with an ordinary butter-firkin, A, substantially as herein shown and described.

165,889. INSECT-DESTROYING COMPOUNDS. Edward Wilkins, Chestertown, Md. [Filed Jan. 21, 1875.]

The compound of chloride of sodium and hyposulphite of soda for use as an insecticide, substantially as set forth.

165,890. METAL-ROLLING MILLS. John I. Williams, Millvale Borough, (Bennett P. O.,) Pa. [Filed Feb. 18, 1875.]

Brief.—The purpose of the brake is to prevent reboun[illegible] or accelerated velocity of the rolls on the sudden cessation of resistance that happens at the moment the bloom or bar leaves them.

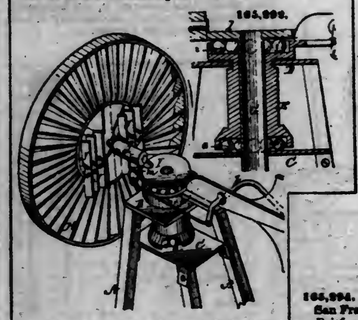


In combination with the rolls of a rolling-mill and their driving mechanism, a brake or brakes arranged in the line of the driving power, at or outside of the driving-pinions, upon the axis or an extension thereof of one or more of the rolls, substantially as and for the purpose specified.

165,891. PLANE-IRONS. William Young, Mahon, Nova Scotia. [Filed May 18, 1875.]

Brief.—The plane-iron is provided with guide-slots, and has an adjustable cap-piece, which is locked in place by an eccentric lever pivoted to a post sliding in the central slot of the iron, and secured by a countersunk base-plate to the cap-piece, for the purpose of quickly adjusting and locking the cap-piece, and give the plane more iron.

The combination of a plane-iron, having guide-slots, with the cap-piece, adjusted and secured by an eccentric lever pivoted to post of the same, substantially as and for the purpose set forth

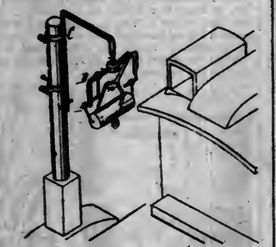


165,891.

165,892. WINDMILLS. William H. Aldrich, Beloit, Wis. [Filed May 3, 1875.]

Brief.—A stationary regulating-vane is placed immediately in rear of the wind-wheel, to throw the wheel wholly or partially out of the wind, according to the force thereof. As the force decreases, a counter-balance throws the wheel into the wind again.

165,892.



1. In combination with a wind-wheel, a stationary regulating-vane, located directly behind and opposite the central opening of the wheel, for throwing the same more or less out of the wind, for the purposes herein set forth.

2. The combination with a wind-wheel, of a stationary regulating-vane, located immediately in rear of the wheel, and a counter-balance connected with the wheel, substantially as and for the purposes herein set forth.

3. The combination of the vane-pivot E, having a central opening, made cup-shaped at the top and bottom, and inclosing balls f and a, the plates B and C, the wheel pivot G, with plate I, all constructed substantially as and for the purposes herein set forth.

165,893. MAIL-BAG CATCHERS. Edward Amrock and Chester Judson, West Newton, Mass. [Filed May 11, 1875.]

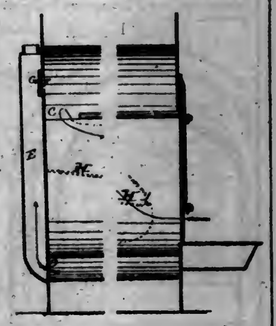
Brief.—When open end of box on car strikes the bag it is carried off the horizontal arms into the receptacle, through the hinged bottom of which it falls into the body of the mail-car. The ratchet is turned away from the pawl at the same time, and thus the bifurcated guide is thrown out of contact.

1. The yoke or holder D for supporting a mail-bag, provided with the two arms 10 and hooks f and 11, in combination with the pivoted bifurcated guide p and a crane, C, erected near the railroad-track, all constructed to operate substantially in the manner and for the purpose set forth.

2. The adjustable sliding arm i, in combination with the holder D and crane C, substantially as described, for the purpose specified.

3. The bifurcated guide p, with its ratchet p and pawl q, in combination with the holder D operating as and for the purpose set forth.

165,894. MORTISING-MACHINES. J. Berry, San Francisco, Cal. [Filed Jan. 4, 1876.]

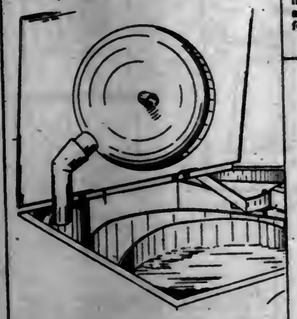


Brief.—The mortise is cut by an endless chain-saw, which is put in motion by a sprocket-wheel, and retained in the proper position for operation by a vertical guide-bar, provided with a guiding-roll at its lower end.

1. The endless chain-saw, consisting of the single and double teeth d e so united that a groove, f, and slots f are formed along its inner edge, to receive the guide-plates or ways b b and teeth a a upon the plate J, and the periphery or edge of the disk L, as set forth and specified.

2. The loosely-fitted grading-disk L, in combination with the plate K and endless chain-saw, all the parts being constructed and operating substantially as herein set forth and specified.

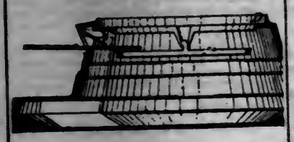
3. The combination of the endless chain-saw, having double and single teeth d e, slot f, and groove f, with the actuating-disk J and guiding disk or plate L, when constructed substantially in the manner as herein set forth and specified.



165,895. HEATING-STOVES. Alex. Botten, Warrensburg, Mo. [Filed Jan. 7, 1875.]

In a heating-stove, the combination of the oval or nearly cylindrical exterior case, the lining or inner wall B, arranged parallel thereto, and provided with openings at the top, near the rear end of the combustion-chamber, the diaphragm H, cut away at *h*, the flap E, joined to and forming an integral part of the case, and the openings D and F, the latter provided with a valve, G, all as shown and described.

165,296. WASH-STANDS. Nathan C. Bond, Fairfax Court-House, Va. [Filed June 2, 1875.]

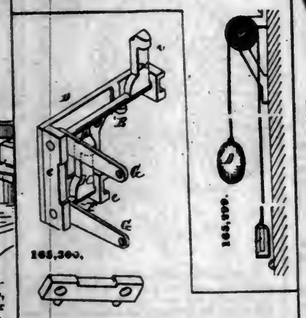


Brief.—The stand has suitable bowl and semicircular reservoir. The waste-bucket is raised up under the bowl by a parallel action, so that when the former receptacle is full, notice is given by the foul water appearing in the bowl.

1. In a portable wash-stand, the combination of a reservoir, operated by a pump, with a waste-bucket, which is lifted up under the bowl and held in that position, substantially as and for the purposes specified.

2. The draw F, when constructed to feed a tank or reservoir from the side thereof, substantially as specified.

165,297. SELF-CLOSING DOORS FOR STOVES. Nathaniel A. Boynton, New York. N. Y. [Filed Apr. 16, 1875.]



In combination with a stove body or base, having an aperture in its wall opposite the annular space between the grate and fire-pot, a self-closing door applied to said opening, substantially in the manner and for the purposes set forth.

165,298. FRAMES FOR FIRE-PLACE HEATERS. Nathaniel A. Boynton, New York, N. Y. [Filed Apr. 16, 1875.]

The deflector or shield B, having an aperture, C, in the upper part, provided with a cover, and combined with the stove-frame, substantially as and for the purposes set forth.

165,299. CURTAIN-FIXTURES. J. S. Brown, Washington, D. C. [Filed June 21, 1875.]

The combination of a coiling, self-balancing, flat band, C, and counter-weight D, with a weighted shade, A, and its roller B, the said band winding upon itself, and thus varying its acting distance from the center of revolution in proportion to the variations in the active weight of the shade, the said distance decreasing as the shade is wound up and increasing as the shade is lowered, substantially as and for the purpose herein specified.

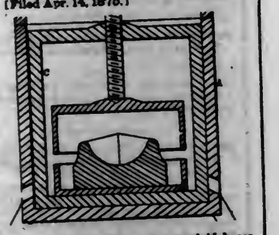
165,300. SASH-FASTENERS. Wm. Brown, Duncannon, Pa. [Filed Apr. 6, 1875.]

Brief.—Improvement on Patent No. 82,797. The metal frame and its lugs are cast in a single piece, and a separate end piece, having projecting pins, is attached thereto, in such manner that the operating-shaft is readily secured in place, and the construction of the entire device simplified and strengthened.

The plate D, cast with its lugs *c c*, and having perforations *x x*, combined with the bar *c'*, having pins *y y*, which pass through the holes *x x*, and are rivoted thereto, all substantially as and for the purposes set forth.

165,301. VESSELS FOR MEASURING AND HANDLING ICE-CREAM, &c. T. Burkhard, New York, N. Y. [Filed May 17, 1875.]

As an article of manufacture, a vessel for molding, measuring, and handling ice-cream, &c., in which is combined an outer vessel, B, provided with a bottom, C, constructed with an opening, as described, and an inner vessel, A, suspended within the outer vessel for holding the frozen cream, all substantially as and for the purpose described.

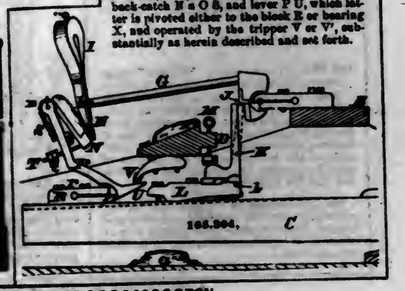


165,302. WATER-TRAPS. Wm. A. Butler, New York, N. Y. [Filed June 11, 1875.]

Brief.—The trap is made in halves, and has the seam or rib in the form and position shown.

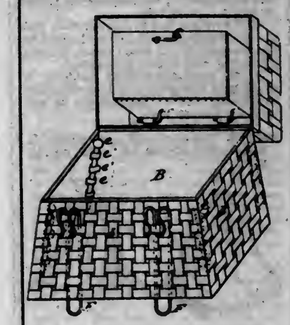
A metal trap composed of two similar portions or halves, united by a seam which extends directly along the trap and from front to back in a plane centrally intersecting the trap, substantially as herein described.

165,303. PROCESSES AND APPARATUS FOR TREATING CELLULOID BASES FOR ARTIFICIAL TEETH. John G. Cannon, York, Pa. [Filed Apr. 14, 1875.]



1. The process of rendering celluloid bases plastic to admit of their attachment to artificial teeth, and by causing the bases to conform to the contour of the mouth casts, by subjecting the plastic bases to a current of heated air through the medium of a ventilated chamber surrounding the said bases, substantially as herein set forth.

2. The combination of the ventilating-chamber A, clamp O sliding in grooves, screw *o*, and perforated hinged lids *c*, all substantially as and for the purposes herein specified.



165,304. PIANO-FORTE ACTIONS. Theddeus P. Carr, Yellow Springs, Ohio. [Filed May 6, 1875.]

Brief.—Greater elasticity and range is given to the back catch.

In combination with a piano-key, C, hammer G H I J, and jack K *k*, the pivoted adjustable back-catch E *a* O S, and lever P U, which latter is pivoted either to the block R or bearing X, and operated by the tripper V or V', substantially as herein described and set forth.

165,305. CONVERTIBLE LUNCH BASKETS AND TABLES. Emma B. Carver, Philadelphia, Pa. [Filed Apr. 23, 1875.]

1. The lunch-basket body B, constructed of the sections *a b*, hinged together and provided with devices to lock it in position, either when folded as a lunch basket or box or extended as a table top, substantially as specified.

2. The tray A, having the loops *d'*, in combination with the box D, having the sliding pins *d'*, substantially as shown and described.

3. The detachable case D, in combination with the tray A, substantially as and for the purpose specified.

4. The combination of the mat *a*, sections *b*, loops *d'*, and pins *c*, forming the basket B, as shown.

5. The sliding loops F and buttons *f*, in combination with the mat *a* and sections *b*, constituting a table top, substantially as described.

6. The pins *e* and loops d^2 d^2, in combination with the mat *a* and sections *b*, constituting a table top, and provided with means for the attachment of legs, substantially as described and shown.

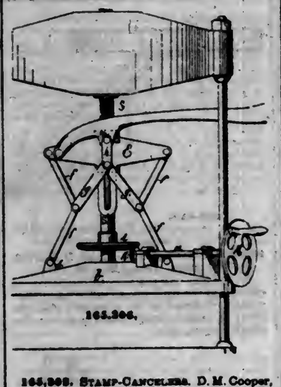
7. The folding legs G, in combination with the folding table top, consisting of the mat *a* and hinged sections *b b*, substantially as specified.

165,306. POWER-PRESSES. John R. Coffin, Mystic River, Conn. [Filed June 17, 1875.]

Brief.—The platen is lowered, and ordinary pressure given to it by a pinion and shaft in bearings thereon, gearing with a wheel rotating a vertical screw. The added pressure is given by a supplemental head-block loose between collars on the screw, and a lever pivoted thereto, to operate toggle-levers by intermediate links.

1. The combination with a screw-press, substantially as described, of an auxiliary lever-press, whereby an extended movement can be given to the platen to effect a compress, substantially as specified.

2. The combination, with the head-block F and platen *b*, of the compound toggle-jointed levers *f f g g* and operating-lever L, substantially as described.



3. The combination, in a power-press, of the adjustable platen *b*, the screw S, the supplemental head-block E, and the toggle-jointed links *f f*, operated by suitable mechanical means, substantially as described.

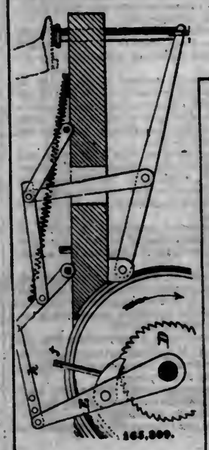
4. The combination of the platen *b*, the driving-pinion *h*, supported by the platen, the gear-wheel *i*, and the screw S, substantially as described.

165,307. PROCESSES OF BLEACHING JUTE FOR PAPER-PULP. Edward Conley, Cincinnati, Ohio. [Filed Feb. 10, 1874.]

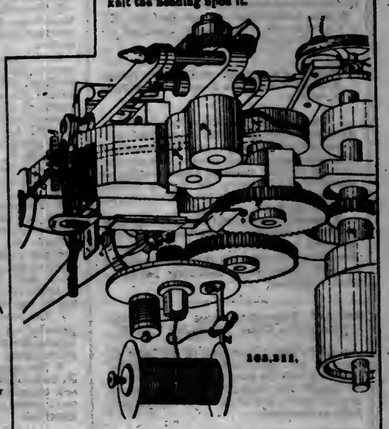
Brief.—Boils jute in caustic alkali of 70 to 80° Baumé, under pressure of eighty pounds, for ten hours.

The process of producing white pulp for paper, from jute, said process consisting in boiling the specified quantity of stock in a close vessel, of the degree of pressure and in caustic alkali of the strength and quantity indicated, and subsequently washing the same in warm water, as described.

165,308. STAMP-CANCELERS. D. M. Cooper, Georgetown, D. C. [Filed June 22, 1875.]

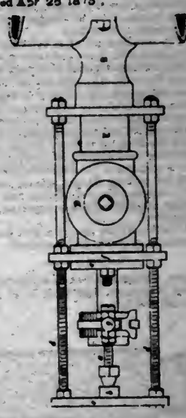


The yielding non-rotating impression-ring *r*, the rotating abrading-disk A, and the adjustable spring *s*, combined with the rotating spring-stem *a* made in one piece, and the slotted tubular handle *b*, substantially as described, for the purpose specified.



165,309. CAR-STARTERS. Samuel Corse, New York, N. Y. [Filed June 11, 1875.]

Brief.—By pressing treadle spring is stretched. Its contraction operates lever bearing pawl, which turns ratchet fast on wheel, and thereby starts car.



1. The combination, with the pawl G and ratchet D, of the levers E H, connecting-link *h*, toggle-levers I J, connecting-link *i*, levers M N, and foot-bar P, arranged and operating as shown and described, for the purpose specified.

2. The combination of the ratchet D, pawl G, levers E H, and their connecting-link, and the spring R, as shown and described, for the purpose specified.

165,310. DEVICES FOR TAPPING WATER-MAINS. James Curran, Baltimore, Md. [Filed Apr. 26, 1875.]

1. The boring-bar F, having a cylindrical cup end to receive the piece cut from the main, and provided upon its annular edge with cutters or serrations, as described, combined with the ratchet and feed mechanism herein described, as and for the purposes specified.

2. The branch B, pipe and valve E D, flange *f*, cross-bar *c*, and screw-bolts *d*, with their nuts, combined substantially as and for the purposes set forth.

3. The combination of the branch B, pipe and valve E D, gland *e*, flange *f*, screw-rods *d*, cross-bar *c*, boring-bar F, and the ratchet and feed mechanism, all substantially as and for the purposes herein set forth.

165,311. KNITTING-MACHINES FOR MAKING BULLION-FRINGE. Edwd. P. Curtiss, Norwalk, Ohio. [Filed June 7, 1875.]

Brief.—The roving to form the skirt of a fringe passes from a spool through the hollow axis of the rotating twister and between drawing-rolls, whereby a twist is imparted to it. It passes thence through a take-up, and through an eye in a reciprocating carrier, whereby it is folded around a hook, which reciprocates vertically to alternately hold and release it, and is laid in front of the needles, which, operating upon additional threads, knit the bending upon it.

1. The combination of a carrier, O, take-up F, and adjustable hook *n*, with the needles and thread-guides of a warp-knitting machine for the manufacture of fringes and gimps, substantially as described.

2. The combination of a twisting device, carrier, adjustable hook, and take-up with the needles and thread-guides of a warp-knitting machine for the manufacture of balloon-fringes and gimps, substantially as described.

3. The combination of the twister, carrier, take-up, adjustable hook, and drawing-rolls E, with the needles and thread-guides of a warp-knitting machine, for making fringes, gimps, and the like, substantially as described.

4. In a machine of the character herein described, for making fringes, gimps, and the like, the combination of a twisting and covering device, constructed and arranged as shown and described.

5. A balloon-fringe, having a knit heading, substantially as shown and described.

165,812. POLES FOR GALVANIC BATTERIES. Hewel. P. Deshert. New York. N. Y. [Filed June 26. 1874.]

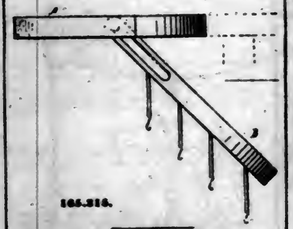
A battery-pole consisting of a conducting skeleton or perforated frame or jacket, containing broken carbon or a carbon-plate, substantially as and for the purpose described.

165,813. MACHINES FOR CUTTING SHINGLES. Geo. M. Dogeway, Brooklyn, N. Y., assignor to himself and Reuben G. Grover, same place. [Filed May 17, 1875.]

Brief.—The cutters are placed in a horizontally-revolving disk, and the material fed to them through openings in the cover of the machine.

1. The combination, with the revolving table C, knives G, and adjustable plates H, of the adjustable screws J, substantially as and for the purpose herein described.

2. The combination, with the feed-port K, of the adjustable throat-plate L, arranged as shown and described.

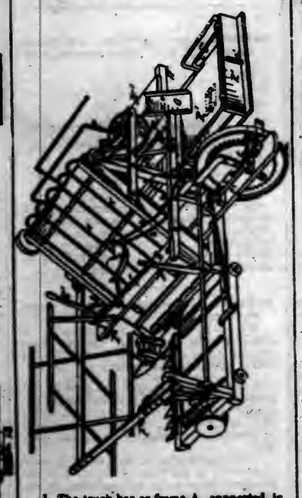


165,814. PROCESSES OF TANNING HIDES. A. de Mortimer, Paris, France. [Filed June 11, 1875.]

1. The described method of tanning hides, which consists in arranging the wet bark and hides in alternate layers between positive and negative anodes, which connect with an electric pile or other source of electric action, as described, and passing the electric current through the charge, all in the manner substantially as set forth.

2. As an improvement in the art of tanning, the arrangement of the hides and wet bark in alternate horizontal layers, the one resting on the other, between zinc or its equivalent on top, and carbon or its equivalent below, as herein described.

165,815. SHIRT-ELEVATORS. G. W. Denny, New Haven, Conn. [Filed Jan. 7, 1875.]



A shirt-elevator composed of the band A, provided with pockets *a* on opposite sides, combined with the hasp B, the ends of which are slotted and jointed to the band A, so as to pass into or out of said pockets, substantially as described.

165,816.

165,816. HARVESTERS. John H. Hward, St. Paul, Minn. [Filed Mar. 26, 1875.]

Brief.—The cut grain is delivered by an elevator to the receiver, and, after being compressed, is bound by the attendant, when the sheaf is automatically discharged into the sheaf-dumping tray.

1. The truck-bar or frame A, supported in front and rear of the main frame C, in combination with the said main frame pivoted centrally to and vibrating upon said truck-frame, substantially as described.

2. The main frame C C', connected with the truck-frame A by means of the link *d* and *d*, arranged and operating substantially as described.

3. The upright endless apron G, or its equivalent, arranged at the inner end of the platform, and operating substantially as described for moving the butts of the grain backward to clear the forward guard of the elevator, as set forth.

4. The combination, with the elevator and the compressing rods or wires *n*, of the dodder-apron W, overhanging the grain-receiver and the upper end of the elevator, and operating substantially as and for the purpose set forth.

5. The concave grain-receiving arms or hooks adjustably secured to the inclined delivery board or chute H, substantially as described.

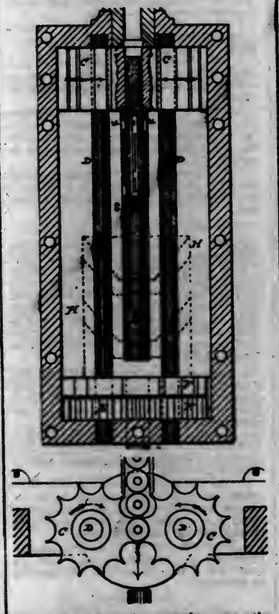
6. The receiving arm or hook H' extended outward and upward, and connected with the rod or shaft J, in combination with the arm J', arranged and operating substantially as and for the purpose set forth.

7. The receiving and compressing arm H', provided with the jointed extension I, for releasing the bundle, arranged and operating substantially as described.

8. The compressing and discharging arms J', made adjustable upon the rotating shaft J, and operating in combination with the receiving-arm and fulcrum H', substantially as described.

9. The combination, with the jointed arm H', of the locking-spring I' and the spur *i*, and tripping-slide *p*, operated by a cam or projection on the shaft J, for releasing the jointed extension I, as set forth.

10. The rods or bars P, in combination with the discharging-arm J', for giving direction to the movement of the bound bundle in being discharged, substantially as described.



11. The adjustable inclined chute O, in combination with the adjustable receiving and compressing arm H', substantially as and for the purpose set forth.

165,817. CHARMS FOR WATCH-CHAINS. B. B. Baker, Philadelphia, Pa. [Filed Apr. 15, 1875.]

The charm for watch-chains, consisting of the bell A, the swiveled cannon E, and the clapper-bolt H, said clapper-bolt formed with a hook at its end above the cannon, constructed as herein described, for the purpose specified.

165,818. MACHINE-GUNS. De Witt C. Farrington, Lowell, Mass. [Filed July 2, 1875.]

1. In an automatic or machine gun, the intermittently-rotating fluted carrier-rolls, adapted to take one cartridge at a time and place it in line between the plunger and the barrel, and hold it there until the same is forced into the barrel for discharge, and then, upon the empty shell being extracted, the rolls permit the shell to drop, in combination with the plungers and other mechanical means, as above described, by which each cartridge is presented singly to, and forced into, the chamber and discharged, and the empty shell withdrawn, substantially as set forth.

2. The combination of one or more barrels, fluted carrier-rolls for cartridges and cartridge-shells, an operating-cam, and plunger, to operate substantially as and for the purpose described.

3. The pawl or stop, in combination with the driving-knob and other means above described for imparting movement to the carrier-rolls, whereby an intermittent rotary movement is given to said rolls, so as to successively bring cartridges singly into position in front of the plunger, as set forth, and for the purpose described.

4. In an automatic or machine gun having a rotative operating-cam hung loosely upon the driving-shaft, a cocking-plate rigidly secured to said shaft, in combination with the loose driving-cam, said cam being constructed to permit a relative movement between the cocking-plate and the cam, whereby the hammer-stud will be switched and the gun cocked and fired when operated in one direction, but when reversed the hammer-stud may be permitted to move freely, substantially as set forth.

5. In a machine-gun, a series of barrels hung in a frame, as described, and adapted to be successively brought into position at the will of the operator, after a plurality of shots have been fired from one of the barrels, substantially as and for the purpose set forth.

165,819. RAILROAD-WHEELS. James B. Finley, Delphi, assignor to himself, M. Simpson, and J. H. Cobbs, La Fayette, Ind. [Filed Mar. 24, 1875.]

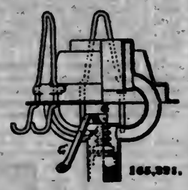
Brief.—The instrument is held in place by a foot-lever and eccentric clamps, and operated by a ratchet-lever.

The combination of clamp-frame B C D, revolving cheek E, and short cheek G with the eccentrics I I and foot-piece H, all constructed and arranged to operate substantially as and for the purposes set forth.

165,820. TUBE-EXPANDERS. Patrick Fitzgibbons, Oswego, N. Y. [Filed Mar. 16, 1875.]

Brief.—The device is held in place by the laterally-expanding toothed jaws, while the head carrying the beading-rollers is operated.

165,820.



1. In combination with the hollow mandrel A A', provided with the radial openings *e'' e''*, &c., the toothed jaws B B, &c., placed within said openings, and the mandrel C, fitted into the axial opening *e'* within said mandrel A, provided with the nut D, and having its tapered portion *c* bearing against the inner faces of said jaws, substantially as and for the purpose specified.

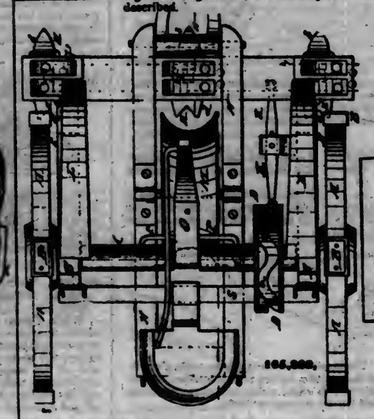
2. The mandrel A, A', *a*, *a'*, and *a''*, the jaws B B, &c., the mandrel C *c c'*, the head E, carrying the grooved rollers F F, &c., the nuts D and H, and the washer I, all constructed and combined to operate in the manner and for the purpose substantially as set forth.

165,821. ARGAND GAS-BURNERS. Jim Bill-Hagan Fuller, Brooklyn, N. Y. [Filed June 10, 1875.]

1. In an Argand gas-burner, constructed as described, the upper annular ring, provided with holes for the escape of the gas, drilled through the metal thereof previous to the removal of said form, thereby preventing the formation of burr around the inner edge of said holes, as set forth.

2. The valve P of the eccentric G, and the lever G', combined and arranged substantially as above described, so that a vertical motion of said lever opens and closes the valve, while, by a horizontal motion of the lever, it can, without opening or closing the valve, be adjusted in any required position for convenient operation.

165,821.



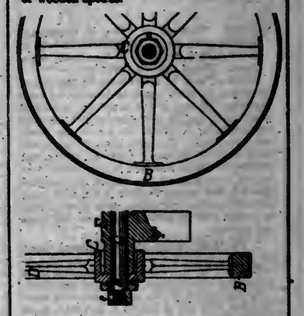
165,822. CORN-PLANTERS. W. R. Gorsuch, Springfield, Mo. [Filed May 1, 1875.]

Brief.—Bearing-wheels provided with bosses for passing the earth about the seed. A concave central roller serves to carry the machine while turning, and also to cover the seed of a central row when desired.

1. The wheels A A, provided upon their periphery with the pressing-bosses B B, said bosses arranged at regular intervals, to operate as and for the purpose set forth.

2. The wheel D, with zigzag grooves *d*, combined with axle C and wheels A A, having bosses B B, all arranged to deliver the grain, substantially in the manner set forth.

3. The plow H, constructed to form opener *b* and coverer *d d*, and arranged to have a tilting or rocking motion, substantially as herein described.

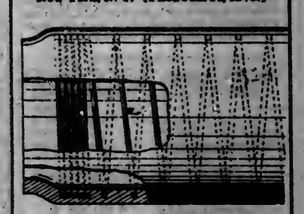


165,822.

---

4. In a corn-dropper, the wheels A A, having boxes B B, axle C, wheel D, with its zigzag groove *a*, center wheel M, lever O, and ball P, all constructed and arranged as herein set forth.

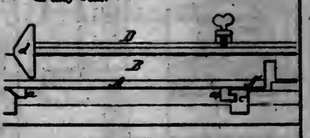
165,823. BAND-SAW WHEELS. F. Gleason, Philadelphia, Pa. [Filed Mar. 16, 1875.]



Brief.—To obviate the expansion and contraction, and the consequent warping and twisting of the rim of a band-saw wheel, the rim is constructed of compressed paper-pulp. The wheel is provided with a hollow hub, which is connected to the rim by solid metal or wooden spokes.

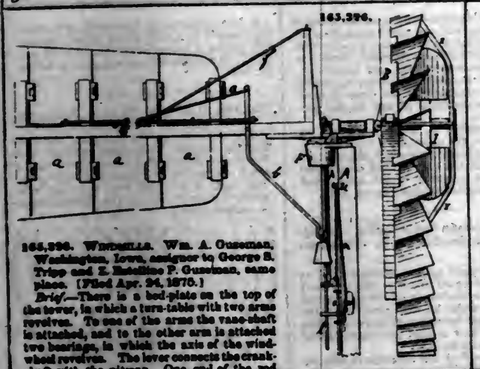
1. In a band-saw wheel, the rim B of compressed paper-pulp, substantially as described.

2. In a band-saw wheel, the combination of the rim, solid arms, and a hollow hub, as shown and described.



165,824. BURNER HOOD. John Grauson, Jr., New York, N. Y. [Filed Jan. 14, 1875.]

A suction-hood, constructed with tempered steel wire, the ends of the wire being waterproofed, and wrapped around the ends of the hood in a succession of rings lying closely together and at right angles to the axis of the hood, whereby the ends of the hood are reinforced, substantially as and for the purpose described.



165,825. SAWING-MACHINES. Otto T. Grauer, Baltimore, Md. [Filed Mar. 12, 1875.]

Brief.—The slides of the saw-table are so constructed as to prevent lateral movement as they wear.

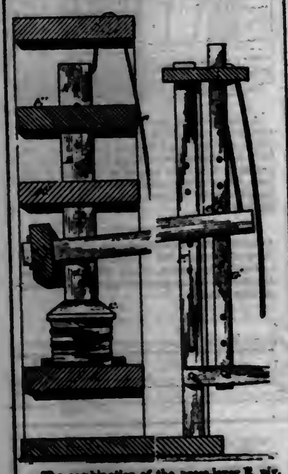
1. A sliding table provided with beveled way *a* and L-shaped way *a'*, in combination with correspondingly constructed way *c c'*, as and for the purpose described.

2. The gage D, having end step *d*, and tongues upon each side, in combination with grooved guide B, as and for the purpose specified.

165,226. WINDMILL. Wm. A. Gunsman, Washington, Iowa, assignor to George S. Tripp and S. Bataline P. Gunsman, same place. [Filed Apr. 24, 1875.]

Brief.—There is a bed-plate on the top of the tower, in which a turn-table with two arms revolves. To one of the arms the vane-shaft is attached, and to the other arm is attached two bearings, in which the axis of the wind-wheel revolves. The lever connects the crank-shaft with the pitman. One end of the rod moving in loops fastened to the tower is so looped as to slide on the pitman and support the rod, also looped to slide in a similar manner. There are two ropes, each passing over a pulley, and by pulling on them the vanes are opened.

1. The combination of the sectional vanes on the vane-shaft, arranged with relation to each other as described, and operated by a weight, as hereinbefore shown and described.



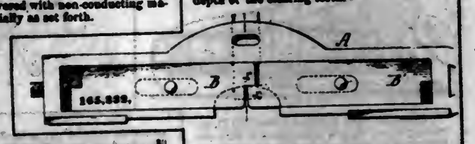
2. The rope *n*, pulley *o*, and rod *o*, in combination with rod *p*, pulley *r*, and cord *m*, as herein specified and set forth.

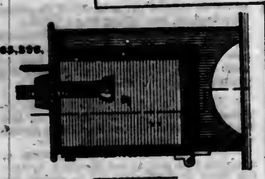
3. In a windmill, the additional vane I, in combination with the wind-wheel B, vane C, and tower A.

4. The turn-table K, provided with one arm for supporting the vane-shaft, and another arm for supporting the bearings of the wind-wheel, each on opposite sides of the tower and in vertical parallel planes to each other.

5. The tower A, wind-wheel B, additional vane I, braces *s s*, shaft *k*, slotted lever *r*, bed-plate P, vane-shaft C, provided with sectional vanes *a a*, rods *b c d e*, and weight D, and rods *o p* and their connections for closing and opening the vane-sections, as before shown.

165,227. PRESSES. Anthy. W. Harrington, Berkeyville, Ky. [Filed Apr. 2, 1875.]





The combination of the press-lever B, pivoted or fulcrumed in the head-block C, with the adjustable plunger-shaft D, plunger G, guide-bar F, adjustable connecting-bar G', and operating-lever I, substantially as and for the purpose hereinbefore described and set forth.

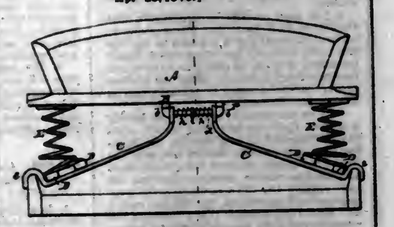
165,228. DENTAL VULCANIZING APPARATUS. Ferdinand Heindsmann, New York, N. Y., assignor to Samuel S. White, Philadelphia, Pa. [Filed June 26, 1875.]

Brief.—The article to be heated is placed in the oven, and clamped by the screw. The door is then closed and heat applied by inserting a lamp or burner under the bottom of the oven. The plaster prevents the bottom from heating too rapidly.

The dental heater hereinbefore described, consisting of the combination of the open-bottom perforated casing, and the oven, having its door covered with non-conducting material, substantially as set forth.

165,229. MATCH-BOXES. Oliver H. Hicks, Baltimore, Md. [Filed June 5, 1875.]

A match-box, provided with the tray C, having the legs *c c* and capable of being inverted for the purpose of emptying its contents, substantially as set forth.



165,230. LASTS FOR BOOTS AND SHOES. Chas. F. Hill, Baltimore, Md. [Filed May 21, 1875.]

Brief.—The sharpened edge of the points is intended to facilitate the withdrawal of the last by slightly gashing the sole when the last is pulled.

The combination, with the metallic plate B, of the points *a*, having their rear sides reduced to a knife edge, substantially as described, and for the purpose set forth.

165,231. VEHICLE-SEATS. John R. Hill, Republic, assignor of one-half his right to Joseph M. Dorke, Fostoria, Ohio. [Filed Apr 23, 1875.]

In combination with the seat A, spiral springs F, and slats D, the arms C, rods *d*, with center collars *i*, springs A, and cross-bars E, with legs *b*, all constructed as described, and for the purpose set forth.

165,232. SAW-SETS. Adolph B. Hoffman, Philadelphia, Pa. [Filed Apr. 16, 1875.]

Brief.—The dies are alike at both ends, with the exception that their corners are cut away to a greater or less extent, in virtue of which the amount of set imparted may be varied. A plate arranged in a vertical opening in the frame always bears against the teeth adjoining that being operated upon, and insures the proper position of the dies upon the teeth which they embrace. Projections on the frame can be used as a gage for determining the depth of the clearing-teeth.

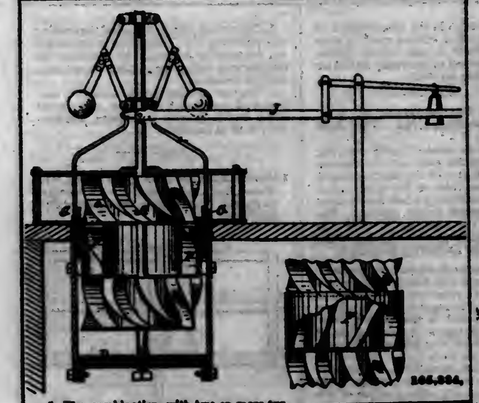
1. The frame A, constructed with a suitable handle at one end, having a set-screw at the other, and a recess for the reception and guidance of dies, all substantially as set forth.

2. The combination of the frame and its recess with the sliding dies confined by set-screws B B, which pass through elongated openings in the said frame, all substantially as specified.

3. The combination of the frame and dies with the adjustable plate F.

4. The dies having projecting ends *s*, that of one die for overlapping the other, as and for the purpose set forth.

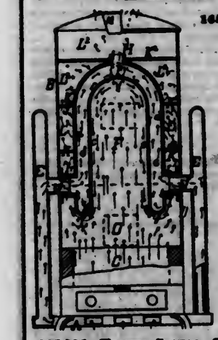
5. The combination of the flanges *s s* on the frame with the dies B B', and the space formed by the discontinuation of the flange *s'*, all substantially as and for the purpose set forth.



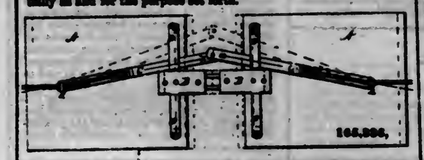
165,233. SNAP-HOOKS. Chas. E. Jackson, Middletown, Conn. [Filed Mar. 19, 1875.]

The combination of the buckle-frame C, cross-bars *c*, *d*, and *e*, and the body of the snap-hook A, all cast in one and the same piece, and the tongue E, substantially as and for the purpose described.

165,234. TURBINE WATER-WHEELS. S. R. Jenner, Milltown, Ind. [Filed Mar. 26, 1875.]



Brief.—Two or more turbine water-wheels attached to the same shaft, in combination with alternating stationary water-ways, which deliver the water transversely to the inclination of the buckets. If also consists in the combination, with the stationary water-ways and the turbine wheels, of a cylindrical cut-off and a counter-balance.



1. The combination, with two or more turbine water-wheels attached to one and the same shaft, of alternating stationary water-ways, which deliver their water transversely to the inclination of the turbine-buckets, substantially as and for the purpose described.

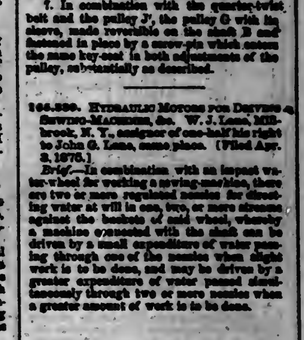
2. The combination, with the turbine-wheels and the alternating stationary water-ways, of the cylindrical cut-off O, the lever J, and the weight K, substantially as and for the purpose described.

165,236. AUTOMATIC AIR-BRAKES. Story B. Ladd, Washington, D. C. [Filed Feb. 22, 1875.]

Brief.—A friction crank-wheel, operating an air-pump, is attached to an axle having vertically-moving bearings. The friction-wheel is forced against a wheel secured to the car-wheel axle by a spiral spring. When the desired pressure of air is stored in the receiver, the friction-wheel is raised by means of a lever actuated by the piston-rod of an auxiliary cylinder, in which the pressure is equal to that of the receiver.

1. The wheels A and B, the latter sliding in the vertical bearings *b b*, in combination with the pump E, provided with the pipes F and G, and the cylinder H, all constructed to operate substantially as and for the purpose set forth.

2. The wheels A and B, constructed as described, and pump E, provided with the pipes F and G, in combination with the cylinder H and lever D, substantially as and for the purpose set forth.



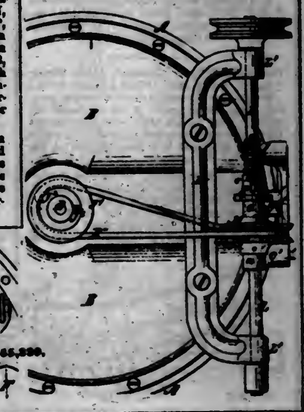
165,235. HEATING-STOVES. S. H. Kridler Philadelphia, Pa. [Filed July 31, 1874.]

1. The combination of the base A, shell B, air-pipes E, heater F, division-plate E', and the chamber L', having an annular register, F, as shown and described.

2. The combination of the base A, shell B, air-pipes E, heater F, and the division-plates K K' K'', substantially as and for the purpose shown and described.

165,236. DEVICES FOR OPERATING CAR-BRAKES. Story B. Ladd, Washington, D. C. [Filed June 14, 1875.]

The arms O O, pivoted in the rear of the buffers, and having a lateral motion, and provided with the guide-rings *d d* and *d'*, in combination with the cord H and supports D D, so as to allow the arms to be changed from one side of the buffer to the other, substantially as and for the purpose set forth.



1. The combination of a motor-shaft, B, a loose pulley, J', a clutch, K, a counter-shaft, H, a shifter, N, a pitman, Q, and a treadle, P, whereby the counter-shaft is suspended from the water-wheel or power-shaft and its motion arrested without stopping the power-shaft B, and the said shafts again geared with each other, by the simple application and withdrawal of the pressure of the foot of the operator from the treadle, substantially as and for the purpose described.

2. The rocking-shifter N, in combination with the friction-clutch K with its slotted sleeve, loose pulley J', and shaft H with its pin *n* and spring L, whereby the shaft H is stopped as soon as it is suspended from the power-shaft, substantially as and for the purpose described.

165,238. HYDRAULIC MOTORS FOR DRIVING SEWING-MACHINES, &c. W. J. Lane, Millbrook, N. Y., assignor of one-half his right to John B. Lane, same place. [Filed Apr. 2, 1875.]

Brief.—In combination with an impact water-wheel for working a sewing-machine, there are two or more regulated nozzles for directing water at will in one, two, or more streams against the buckets of said wheel, whereby a machine connected with the latter can be driven by a small expenditure of water passing through one of the nozzles when slight work is to be done, and may be driven by a greater expenditure of water passed simultaneously through two or more nozzles when a greater amount of work is to be done.

165,239. MOTOR FOR DRIVING SEWING AND OTHER LIGHT MACHINERY. W. J. Lane, Millbrook, N. Y., assignor to Lane Brothers, same place. [Filed May 26, 1875.]

Brief.—Belting on the pulley of a vertical shaft of a water-wheel gives rotation to a pulley loose on a horizontal shaft lying on the casing of such wheel. A spring holds a clutch in contact with the pulley, a treadle and connecting-rod releasing them, and permitting the water-wheel to rotate while the sewing is stopped.

1. The combination of a motor-shaft, B, a loose pulley, J', a clutch, K, a counter-shaft, H, a shifter, N, a pitman, Q, and a treadle, P, whereby the counter-shaft is suspended from the water-wheel or power-shaft and its motion arrested without stopping the power-shaft B, and the said shafts again geared with each other, by the simple application and withdrawal of the pressure of the foot of the operator from the treadle, substantially as and for the purpose described.

2. The rocking-shifter N, in combination with the friction-clutch K with its slotted sleeve, loose pulley J', and shaft H with its pin *n* and spring L, whereby the shaft H is stopped as soon as it is suspended from the power-shaft, substantially as and for the purpose described.

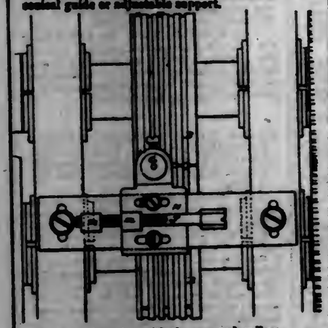
1. The nozzles I F, through which the water is allowed to pass in regulated quantities, as described, in combination with an impact water-wheel, substantially as described.

2. The nozzles I F, made with different diameters, and through which water is allowed to pass, as described, in combination with an impact water-wheel, substantially as described.

3. The nozzle or nozzles, and their regulating-cock proper, constructed entirely within the case A B, and operated by a stem, E, from the outside of the case, substantially as described.

4. The case constructed with the rib J, in combination with the water-wheel, substantially as described.

5. The combination of the swinging arm F', stationary stem F' of the foot-piece B F, and the stud F of the water-wheel case, substantially as described.



165,840. APPLE-FRUITOID COMPOUNDS FOR BEVERAGES. Lebbeus W. Lathrop and T. A. Weber, New York, N. Y. [Filed May 17, 1875.]

Brief.—Heats sugar to about 400°, and while stirring adds graphite, and incorporates thoroughly, and presses in a die to the required shape.

The compound, consisting of carbonized sugar and graphite, as described, for purposes specified.

165,841. MACHINES FOR ROLLING WIRE. James Law and Saml. Law, Cheshunt, England. [Filed May 31, 1875.]

Brief.—Rollers laterally adjustable to enable the grooves thereon to register, and a central guide or adjustable support.

1. In combination with the grooved rollers B B, the adjusting-cams B F, for the purpose of adjusting the grooves of the two rolls relatively to each other laterally, substantially as specified.

2. The combination, with the grooved rollers B B, of the central guide G, adjustable support H, and adjusting-screw J, substantially as and for the purpose specified.

165,842. POTATO-DIGGER. John Henry Leach, Beach, Ind. [Filed Apr. 26, 1875.]

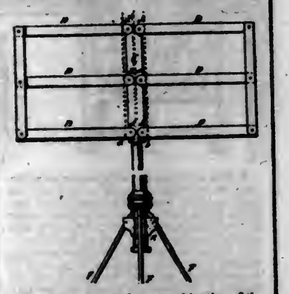
Brief.—An adjustable share raises the potatoes from the ground. A set of curved revolving arms carries them over and delivers them upon an endless-belt conveyor, by which they are deposited in a receiving-box at the rear end of the machine.

1. In a potato-digger, the endless carrier consisting of a series of bars, a a, provided at their ends with downwardly-projecting crank-plates a a, pivoted together, and every alternate bar provided with projecting teeth or arms p p, substantially as and for the purposes herein set forth.

165,843.

2. The combination in the potato-digger of the adjustable plow d, curved rotating arms b b, slotted platform G, and endless carrier a a p, all constructed substantially as and for the purposes herein set forth.

165,844. SODA-WATER APPARATUS. Wm. Loughridge, Baltimore, Md. [Filed June 12, 1875.]



Brief.—When the aerated liquid is passing to the bottle from the reservoir, the pressure becomes less on the top of the diaphragm, and it rises, lifting the valve on the upper end of the spindle, and admitting a new supply, thus making the pressure nearly constant. The valve may be regulated by the screw, as shown. The diaphragm has a spring on the under side to allow its moving as desired.

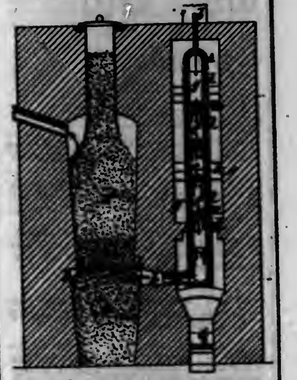
1. In a soda-water apparatus, the combination of the generator A, fountain B, and cut-off or regulator C, substantially as described.

2. In the cut-off or regulator C, the valve e, adapted to be opened in the upward movement of the diaphragm f, and spring f' through the medium of the rod e and stem d, substantially as set forth.

3. The cap h and connections, made adjustable in height to regulate the position of the valve e, independently of any action of the gas, by means of the threaded pipe h', substantially as specified.

165,845. MUSIC-STANDS. John Lyons, New Haven, Conn., assignor of one-half his right to Pedro S. Crofut, same place. [Filed Feb. 18, 1875.]

1. In a music-stand, the combination of the center-bar C, hinged to the upright, and the bars D to the said bar C, so that the said bars D will fold toward and in same plane as the bar C, and down upon the upright, substantially as described.



2. In a music-stand, the combination of the legs F, hinged to the socket E, loose upon the upright, so as to allow the upright when free to pass down through the socket, and the upper end of the legs extending up to grasp the upright above the hinged point, substantially as described.

165,846. PROCESSES OF MANUFACTURING ANIMAL CHARCOAL. Oregio Lago, Jersey City, N. J. [Filed June 29, 1875.]

Brief.—Treats the bones, &c., with bisulphide of carbon or benzine, to remove oils, fats, &c.; then cleans the bones. The solution of fats in benzine may be subsequently evaporated, in order to separate the benzine therefrom.

The process herein described for producing bone-black or animal charcoal, consisting in removing the oxide and fats from the bones by means of solvents such as described, and then charring, all substantially as set forth.

165,847. MANUFACTURE OF GAS. Philip W. Mackenzie, Mountville, N. Y. [Filed May 8, 1875.]

The process of generating hydrogen and carbonic-oxide gases, which consists in burning coke, anthracite coal, or like carbonaceous material until it is at a white heat, then secluding the incandescent material from the outer air, and then passing into the material, solely so heated, and continuously so secluded, and from time to time fed with additional material, the gases derived from steam heated to its decomposing temperature, while those gases are at such temperature, whereby the high heat of the carbonaceous material, the application of the hot gases, and the production of the final gases are continuously maintained, as set forth.

165,848. PERFUMERIES. Orazio Lago, Jersey City, N. J., assignor to J. R. McPherson, same place. [Filed June 26, 1875.]

Brief.—Congeines blood by heat and agitation, separates the serum, and treats the albumen with any metallic salt, such as sulphate of tin, and dries in a centrifugal machine.

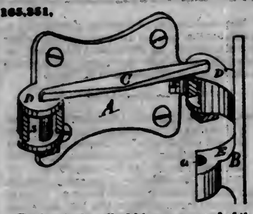
165,849. PROCESSES OF PREPARING OR TANNING SKINS. Emanuel Manasse, Napa, Cal. [Filed May 3, 1875.]

Brief.—Solution No. 1: Salt, white-rock potash, water. Solution No. 2: Hard-soap, neat's-foot oil, water.

1. The tanning solution, No. 1 and No. 2, composed of the ingredients named, in about the proportions stated.

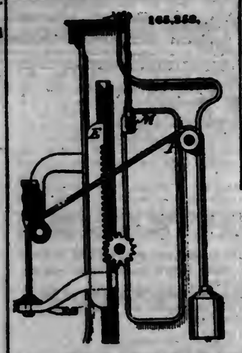
2. As an improvement in the art of tanning, the application of the solutions named to animal skins, substantially in the manner and order stated.

165,850. STEAM-VALVES. H. B. Marchand, Pittsburg, Pa. [Filed Apr. 26, 1875.]



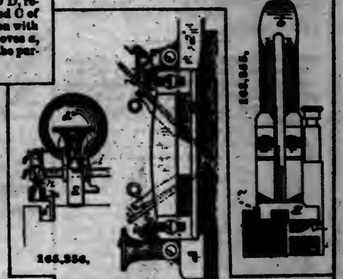
1. A reciprocating valve constructed with two exhaust-ports, one passing partly around the same to exhaust the steam from the back of the piston in the main cylinder, and the other port passing directly through the center of the valve for exhausting the steam from the rear of the valve, as described, and both of said exhausts being adapted to communicate with the main exhaust in the valve-box, substantially as shown and described.

2. The valve D, constructed with the central port D' and ports D' D', branching laterally therefrom, the recesses F extending across one side of said valve, and the port E extending directly through the center of the valve, as described, in combination with the ports H H leading from each end of the valve-box to the center thereof, and opening into the recess I in the valve D, as and for the object specified.



3. The valve-box having the ports H H and G G and the valve D, constructed with the port E extending through the same, the central port D and the branching ports D' D' and recess I, in combination with the hollow oscillating cut-off K, having its open end resting in the recess I in the valve D, and constructed with the slot n opening into said hollow cut-off, and adapted to communicate with the exhaust-port of the valve-box, as and for the object specified.

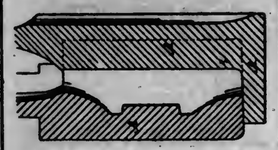
165,851.



The herein-described hinge composed of the plates A B, provided with the heads D D, recessed at c c, and connected by the rod C of one piece with the plates, in combination with the legs E, having flanges c c and grooves c, arranged and operating as shown, for the purpose set forth.

165,852.

165,856.



165,855.

165,852. STANCHIONS. Thomas Mayer, Providence, R. I. [Filed July 16, 1874.]

The combination, with the shifting-rod G, the weighted lever I, and the arm M, of the lever K, connected by a chain or its equivalent with the arm M, so that by moving the lever K in the proper direction the arm M is raised and the spreader stopped, substantially as and for the purpose specified.

165,853. CASTING BROOMS. G. B. Mossely, West Troy, N. Y. [Filed Feb. 15, 1875.]

The process of casting "crome journal-box bearings in copper molds, for the purpose of producing greater density in the broom metal than can be obtained by casting in sand, substantially as described.

165,854. STRAINERS FOR POTS. P. Michels, Brooklyn, N. Y. [Filed May 12, 1875.]

Brief.—The spring is readily inserted in the plate, and the whole is adapted to spouts of different sizes.

The combination, with a tea or coffee pot, of the arc-shaped spring b and strainer C, having the openings c c as or about its center to receive and seat the spring, as and for the purpose specified.

165,855. TONGUING AND GROOVING PLANES. Charles G. Miller, New Britain, Conn., assignor to the Stanley Rule and Level Company, same place. [Filed Apr. 6, 1875.]

Brief.—By means of a shifting guide, eccentrically attached to a vertical shaft, hung and rotating in a socket secured to the side of the stock, which can be adjusted so as to cover or uncover the planing-bits, the tool can be used for tonguing or grooving the edges of boards.

In combination with the body or stock a and the chisels b' b', the guide f, having adjustments to cover and uncover one of the chisels, substantially as shown and described.

165,856. DADO-PLANES. Charles G. Miller and Leonard Bailey, New Britain, Conn.; said Miller assignor to said Bailey. [Filed Feb. 24, 1875.]

Brief.—The "dado" is provided with a gravitating side guide, which is laterally and vertically adjustable, and a detachable and reversible depth-gage, which can be used in the right or left side of the body of the tool, as may be desired.

1. The combination of the stock a, rods f f, bar g, sockets f' f', rods n n, having free play, within limits, in sockets f', and the guide m, all substantially as described.

2. The combination of the body a with the depth-gage d and side guide m, which can be used upon either side of the body a, substantially as shown and described.

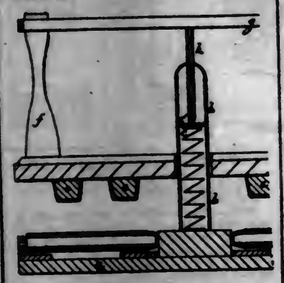
165,857. WATER-COOLERS. Gaety I. Miz, Yalesville, Conn. [Filed Apr. 20, 1875.]

Brief.—Exposes the outside of the iron vessel, to prevent its corrosion by the packing of calcined plaster.

1. In a water-cooler, the combination of an iron vessel, covered internally and externally with porcelain, with a solid inclosing covering of calcined plaster, substantially as and for the purpose specified.

2. In a water-cooler, the combination of an iron vessel, covered interiorly and exteriorly with porcelain, a sheet-metal inclosing casing and a solid filling of calcined plaster between said vessel and casing, substantially as and for the purpose shown.

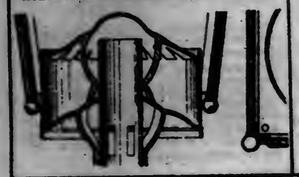
165,859. WASHING-MACHINE. J. Myers, Prospect, Ill. [Filed May 17, 1875.]



Brief.—The wooden base of the lower rubber has openings for water, and is covered with a perforated metallic plate of radial ribs of different lengths.

The combination of the metallic cover A, and the wood bottom B, when the former is provided with the raised radial ribs B, and perforated with the openings *c c*, and the latter is cut away under such openings, substantially as specified.

165,860. WASHING-MACHINE. J. Myers, Cedar Falls, Iowa. [Filed Jan. 12, 1875.]



Brief.—A lower disk with radial rollers, and a vertical hollow column, in which is a spring, an upper disk with knobs, a pivot-rod, and standards.

The combination of the base *a*, composed of radial rollers, as specified, the hollow column *b*, containing the spring *c*, the follower-disk *d*, provided upon its under surface with the knobs *e e*, standards *f f*, cross-bar *g*, and pivot-rod *h*, resting upon said spring, substantially as specified.

165,861. LAMP-CHIMNEYS. Robert Norris Anna, Ill., assignor of one-half his right to C. Kirkpatrick and W. Kirkpatrick, same place. [Filed Mar. 16, 1876.]

Brief.—The glasses can readily be replaced from the outside without change in the frame.

165,862. BUNGS FOR BARRELS. Charles F. Norris and Peter J. Hickey, New York, N. Y. [Filed June 8, 1875.]

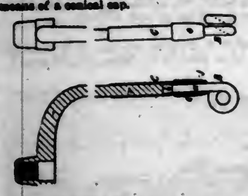
Brief.—The bush has the flaring opening and projections shown, while the bung is provided with slots and inclined threads. When the projections of the bush pass over the inclines of the bung, a water-tight joint is formed.

The casing A, provided with a flaring mouth and lugs *c c*, in combination with the bung D, having recessed head, barrel G, slots *e e*, and partial threads *i i*, all constructed substantially as and for the purposes herein set forth.

The combination of tapering glasses with a frame having tapered grooves opening on the outside thereof, as shown and described, to allow the glasses to be entered or removed without separating the parts of frame.

165,863. SOLDERING APPARATUS. George H. Perkins, Philadelphia, Pa., assignor to himself and Joseph Le Comte, New York city, and Atlantic Refining Company, Philadelphia, Pa. [Filed Mar. 24, 1875.]

Brief.—A pivoted bar is provided with an arm that serves as a counter-balance. Spring-fingers are arranged upon the bar, and press upon the cups to be soldered.



1. The combination of the pivoted and weighted box or frame with the elastic fingers *x*.

2. The pivoted and weighted box or frame and its elastic fingers, in combination with the weighted arm E.

3. The combination of the pivoted box or frame and its fingers, and arm E, with the stops *d* and *a*.

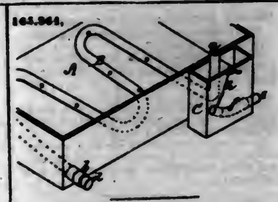
165,864. FLIERS FOR SPINNING-MACHINES. Chas. K. Fuvey, Worcester, Mass. [Filed June 10, 1875.]

Brief.—The hook of the flier is of glass, and is secured by being inserted in the split end of a tube attached to the flier-arm, the tube being compressed against the shank of the hook, or a rubber tube surrounding it, by means of a conical cap.

1. The combination of the flier A, the separate anti-friction hook B, and the coupling C *c*, substantially as described.

2. The elastic sleeve *f*, combined with the anti-friction hook B, and the jawed coupling C *c*, as specified.

3. The anti-friction hook B, provided with the tapering head *b*, in combination with the flier A, and the coupling C *c*, as set forth.



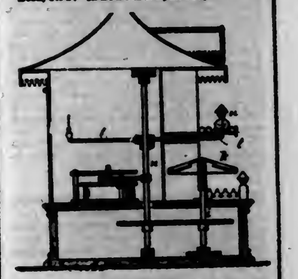
4. The combination of an anti-friction hook B, and a coupling, C *c*, substantially as described.

165,865. MILK-COOLERS. Edward N. Fuller and Melville B. Eaton, Morrisville, Vt. [Filed Jan. 28, 1875.]

1. An adjustable flexible pipe attached to the inner end of the outlet-pipe of a milk-cooler, for regulating the height of the water in the cooler, as herein set forth.

2. The combination, with the milk-cooler A, tortuous perforated pipe B, having short tube *b*, and upward-bent pipe *c*, of the pocket C, outlet-pipe *e*, flexible pipe *f*, and chain or cord *h*, all constructed substantially as set forth.

165,866.

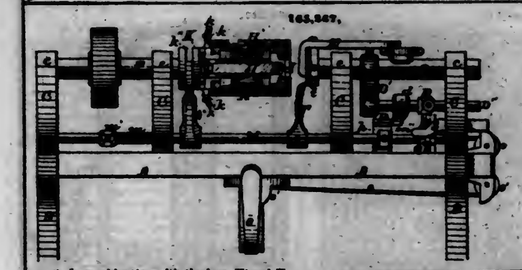


The spoke and felly connection consisting of the support C, provided with the ears *a a* and socket D, in combination with the spoke A, felly B, and rivet *b*, substantially as and for the purposes set forth.

165,866. SPOKE-SOCKETS. Britton Poulson, Fort Wayne, Ind. [Filed Apr. 16, 1875.]

Brief.—The felly is not entered by the spoke.

165,867. REVOLVING SAMPLE-HOLDERS. James H. Procter, Brooklyn, N. Y., assignor to Wright Gillies and Gilbert B. Scott, New York city, and Jos. M. Gillies, Plainfield, N. J. [Filed June 5, 1875.]



The revolving sample-holder A, sustained upon a vertical shaft, 4, and placed in a recess in the structure representing a pagoda, in combination with the shaft a, provided with arms *t*, having figures *u* attached thereto, which are operated as set forth.

165,868. MACHINES FOR THREADING WOOD-SCREWS. Franklin B. Priddy, Southington, and John T. Kennedy, Mount Carmel, Conn. [Filed May 1, 1875.]

Brief.—The machine contains two sets, three each, of threading-cutters, on levers pivoted in radial slots in the cutter-head—one set for threading the body of the blank, and the other, a little in the rear of the first, for threading the point only. The two sets of levers are actuated by two sliding cones, the one fitted in slots in the other. The actuating mechanism is so constructed as to first cut the body-dies on the blank, and when the blank drawn in by them commences to enter the printing-dies, these latter gradually open in proportion as the entering portion becomes larger, and, after they have passed over and threaded the point, cease operation by being still further separated.

1. In combination with the revolving head G, the pivoted bars H and H' and the radially-moving threading and point-threading cutters I' and I, respectively, substantially as and for the purposes specified.

165,867.

2. In combination with the bars H' and H, pivoted within the head G and carrying upon their forward ends the threading-cutters I' and I', the cone K', fitted into and sliding longitudinally within a recess in the forward end of the cone K, having its forward motion limited by the headed studs *l*, *l*, and caused to maintain such position by means of the springs *p* and *p'*, substantially as and for the purpose set forth.

3. In combination with the cones K and K', the bar M, vertical arm N, collar *n''*, spring-pawl *p' p''*, bar D'', arm *d d'*, arm Q, spring-pawl *q q'*, collar E, and inclined bar S, substantially as and for the purpose shown and described.

4. In combination with the holder U and with the head H'', provided with the recess *h'''*, the block W, fitted within said recess, held in place by the screw *u* and nut *w'*, and caused to bear against said holder by means of the set-screw *w''*, substantially as and for the purpose specified.

5. In combination with the bar H and with the cutter-holder U, the head H'', pivoted upon the forward end of said bar, and rendered circumferentially adjustable by means of the set-screws *h'''* and *h'''*, substantially as and for the purpose shown.

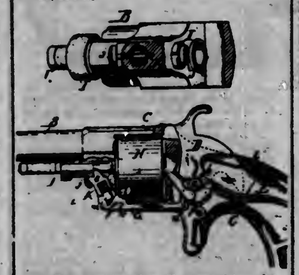
6. In combination with the holder U, fitted into the recess *h'''* of the head H'', and held in place by means of the radially-adjustable block W, the radial wedge-shaped bar X, fitted between the rear side of said recess and the inclined back face of said holder, and made longitudinally adjustable, substantially as and for the purpose set forth.

165,868. HARVESTERS. J. M. Rosebrook, Hoosick Falls, N. Y., assignor to Walter A. Wood Mowing and Reaping Machine Company, same place. [Filed Nov. 20, 1874.]

1. The driving-wheel mounted on an axle connected with the vibrating sector plate or arm, in combination with the windlass, arranged on said axle for adjusting the height of the main frame, and operating substantially as described.

2. The seat and lever plate or arm E mounted on the drive-wheel axle, and combined with the main and pole frames by means of the sector-rods, and the links A E', and lever H, substantially as and for the purpose described.

3. The removable lever D, provided with the socket *d*, whereby it is adapted to rotate the windlass for elevating the frame, as described.

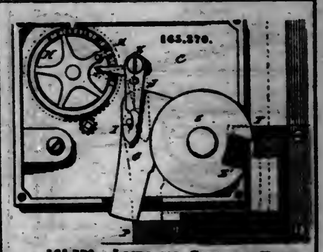


4. The heel plate I, to which the finger-bar is bolted, hinged to the rigid shoe A', in combination with the through-bolt *s*, whereby the cutting apparatus can be either rigidly connected with the shoe, or folded up on its hinge connection therewith for transportation, as described.

5. The eccentric cam plate O, with its inverted cam-rim and pivoted gate *p* applied to the upper end of the rake-pivot, in combination with the upwardly-projecting heel-extension of the rake and reel arms, substantially as described.

6. The latch Q, arranged over the cam-plate O, in combination with the hollow or grooved axle or rake-shaft, and the tripping cord or wire passing through said shaft, substantially as described.

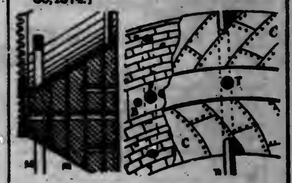
7. The rake arm or elbow E, provided with the socket for the reception of the rake-staff, and the slot, and through-bolt, permitting the adjustment of the same, and with the removable pivot-plate *p* applied thereto and operating, as described.



165,869. REVOLVING FIRE-ARMS. Jacob Reparton, Philadelphia, Pa. [Filed Sept. 16, 1874.]

1. The retaining-plate K, adapted to a slot in the frame, and to the tubular breech-pin I, and combined with the spring-pin *n* and lever G, all substantially as set forth.

2. The combination described of the hammer, the lever G, and projection *s* of the trigger.

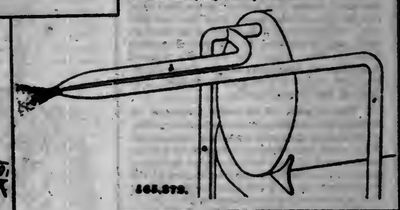


165,870. LOCKS FOR SAFE AND VAULT DOORS. James Sargent, Rochester, N. Y. [Filed June 5, 1875.]

1. The combination, substantially as hereinbefore set forth, of a time-lock and a combination-lock, both constructed to be applied upon a safe, vault, or other door, to have their bolts in contact with or rest against the bolt-work of the door, and arranged in such respect to each other that the locking of the combination-lock will lock the time-lock.

2. The combination, substantially as hereinbefore set forth, of a time-lock and a combination-lock, both constructed to be applied upon a safe, vault, or other door, to have their bolts operate upon or rest against the bolt-work thereof, and combined therewith so that the locking of the combination-lock will lock the time-lock, and cause its bolt to connect with the time-movement, and prevent the bolt-work of the door being operated until both locks are unlocked.

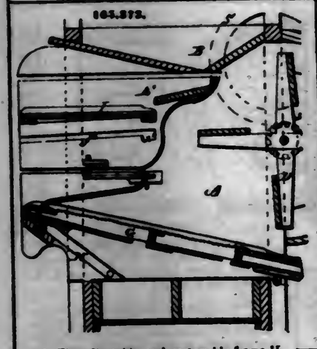
165,871. CONSTRUCTION OF DAMS. Wm. Schmoln, San Francisco, Cal. [Filed Nov. 30, 1874.]



A dam adapted for use in rapid rivers or streams, wherein a body composed of masonry tied together by iron rods and filled with rubble, earth, or other suitable material, and having an exterior sloping backward and curved up stream, is wholly covered by iron plates, substantially as described and shown.

165,872. CARBURETING-MACHINES. Emanl. Schoenberg, Baltimore, Md. [Filed June 17, 1875.]

Brief.—For use in heating soldering-instruments, &c.

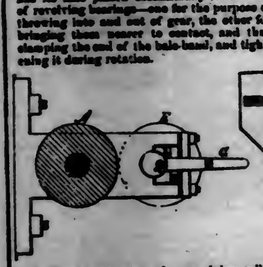


In combination with the air-forcing and carbureting chambers of a gas-machine, the extra air and gas pipes *b* and *c*, running together, as and for the purposes specified.

165,873. GRAIN-SEPARATORS. Herbert H. Staley, Fenwick, Mich., assignee of one-half his right to Alex. Ferguson. [Filed Mar. 26, 1875.]

Brief.—Novelty in construction of lower shoe, and in means for adjusting its inclination.

165,272.



1. The adjustable and removable frame H, provided with pins f and tenons h, in combination with the sides of the frame A, having grooves f, with notches x, and the lower screw G and rod K, all substantially as and for the purposes herein set forth.

2. The lower shoe O, provided with the trap-doors b b and springs d d, substantially as and for the purposes herein set forth.

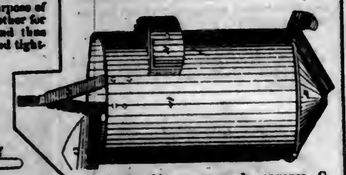
165,274. BALE-BAND TIGHTENERS. John L. Sheppard, Charleston, S. C. [Filed June 12, 1875.]

Brief.—One of each of two pairs of rollers has its axis placed eccentrically to the axis of revolving bearings—one for the purpose of throwing into and out of gear, the other for bringing them nearer to contact, and thus clamping the end of the bale-band, and tightening it during rotation.

1. The combination of a revolving roller, pivoted concentrically, with the other smaller roller, journaled eccentrically in movable bearings, substantially as and for the purpose described.

2. The combination of the roller A, the smaller rollers E, the spring S, and the lever G, substantially as and for the purpose described.

165,275. PROCESSES AND FURNACES FOR MANUFACTURING IRON. George J. Skinner and Samuel J. Skinner, Milton, Pa. [Filed Mar. 10, 1875.]



Brief.—The ore is fed into the lower part of the stack, where it is melted by the heat from the burning of the gases from the coal-and fire. When melted it flows down the inclined shelf, and is reduced by the reducing-gases from the fire. From the shelf the reduced melted metal drops into the revolving chamber, from which it is tapped, as desired. The front of the furnace opens.

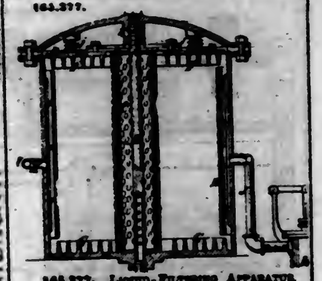
1. The process of reducing iron ore to wrought-iron in one operation, consisting, first, in subjecting the ore in a liquid or molten condition to the combining influence of a blast containing hydrogen or carbureted hydrogen gases, and, secondly, in making the ore by the subsequent action of the same blast admixed with atmospheric air, as described.

2. In a metallurgic furnace, the combination of the heating-furnace A, the forming-chamber J, inclined passage H, and smelting-chamber A, the latter having a floor cavity or depression from which the melted ore overflows and passes down the contiguous incline to chamber J, being thus subjected to the action of the blast in the desired manner, all as shown and described, to produce the result specified.

165,276. EARTH-AUGERS. J. P. Simmons, Tiffin, Ohio. [Filed May 24, 1875.]

Brief.—The strip is pivoted in a slot in the lower edge of the door, and consists of a piece of rubber confined between the jaws of a bent strip of metal, so hung as to overbalance the rubber. When the rubber comes in contact with the boss c by the closing of the door, the strip assumes a vertical position, closing the weather-opening.

1. A movable reamer and conveyer, C, hinged to the bucket at one end, and adjusted by blocks I and bolts, substantially as herein set forth and described.



2. Any number of movable blocks H attached to the sides of the cylinder, substantially as described.

3. The hinged bit B secured by hook D and eye P to the bucket A, constructed substantially as herein described.

4. The small self-adjustable bit F and valve K, substantially as herein described.

5. The combination of the cylinder A, bit B, movable reamer and conveyer G, movable blocks H, small self-adjustable bit F, and valve K, substantially as and for the purposes herein set forth and described.

165,277.

165,277. LIQUID-FILTERING APPARATUS. Thos. R. Sinclaire, Brooklyn, N. Y. [Filed May 31, 1875.]

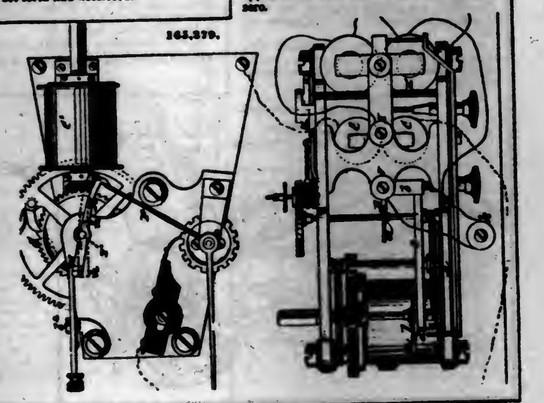
Brief.—The water is supplied to the filtering-vessel by a circular and branch pipes, and the entering currents are met by spreading-plates, which dispose the water externally about the body of filtering material, whence it is forced inward to the receiver at the center of the mass.

1. The combination, with a filtering-vessel, A, of liquid-spreading plates or deflectors, substantially as and for the purpose herein specified.

2. The combination of the filtering-vessel, the liquid-spreading plates or deflectors, and the receiver, substantially as herein specified.

3. The combination of the following elements: The filtering-vessel, the liquid-spreading plates or deflectors, the receiver, and the top and bottom rings or ledges, any or all, substantially as herein specified.

4. The combination of the following elements: The filtering-vessel, the receiver, the liquid-spreading plates or deflectors, and the forcing apparatus, with its connecting feed-pipes, substantially as and for the purpose specified.



165,278. COMPOUNDS FOR WELDING, HARDENING, AND TEMPERING STEEL. Sarah Slater, Philadelphia, Pa., assignor to herself, Henry W. Gray, and Moses Smiley, same place. [Filed Apr. 28, 1875.]

A compound for welding, hardening, and tempering steel and iron, consisting of a mixture of wrought-iron filings, borax, muriate of ammonia, cyanide of potassium, prussiate of potash, corrosive sublimate, and alcohol, in the proportions as set forth.

165,279. PRINTING-TELEGRAPHS. John R. Smith, New York, N. Y. [Filed May 31, 1875.]

Brief.—Type-wheel revolved both on make and break of circuit. One coil of printing-magnets in a local closed by escapement-lever on prolonged closure of main circuit, other in a local ditto on prolonged breaking. Unison applied to stop-transmitter automatically at zero.

165,279.

1. In a printing-telegraph, the arrangement of one-half or portion of the wire of the printing-magnets in one local circuit or branch of a local circuit, and the other half or portion of the wire of said magnets in another local circuit or branch of a local circuit, in combination with a circuit-breaker that acts, during the rotation of the type-wheel, to open and close the circuit or circuits alternately through the two parts of the printing-magnet, substantially as set forth.

2. In a printing-telegraph, a printing-magnet in a local circuit or circuits, a type-wheel magnet in a main circuit, and an escapement-wheel that allows the type-wheel to advance a whole character at a single movement of the escapement-pallet, in combination with a lever that serves the double purpose of liberating the type-wheel and closing the local printing-circuit, to effect an impression by either a prolonged opening or closing of the main circuit.

3. In a printing-telegraph, the ratchet-wheel *l* and the pawl *m*, in combination with the lever *f*, substantially as described.

4. The springs *c* and *e*, in combination with an electro-magnet and a train of wheels for letting into an electric circuit a resistance either measurable or infinite.

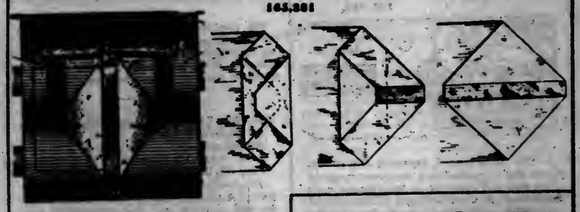
5. The magnet C, pallet B, springs *c* and *e*, resistance *k*, lever *f*, ratchet-wheel *l*, and pawl *m*, in combination with a train of wheels, substantially as set forth.

6. In the transmitter of a printing-telegraph, the combination, with a train of wheels, of the arm F and the loosely-fitted lever E, substantially as and for the purposes set forth.

7. The lever U, in combination with the lever E, substantially as set forth.

8. In printing-telegraph apparatus, a self-locking transmitter, in combination with a self-locking printer.

165,280. ART OF MAKING CHISEL-POINTED NAILS. George Stacey, Montreal, Canada, assignor of two-thirds his right to Henry Mulholland and Harley D. Cowles, same place. [Filed Oct. 10, 1873.]



The described improvement in the art of manufacturing chisel-pointed nails, which consists in operating, in the manner described, with a pair of cutting-dies of the structure and configuration herein specified, upon a square-edged nail-plate that is turned over after each cut, to be again operated on by the same dies, as and for the purposes set forth.

165,281. PAPER-BAG MACHINES. Charles B. Stilwell, Worcester, Mass. [Filed Feb. 26, 1875.]

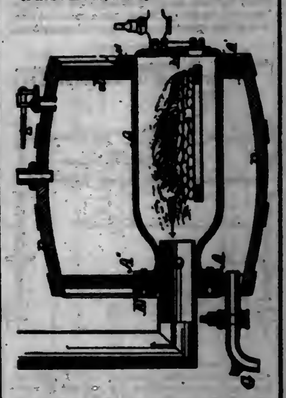
Brief.—A paper tube has its forward end opened by means which carry the plies in opposite directions on the peripheries of two rollers. This stretches the mouth and doubles the sides of the tube, so as to form the side angular folds of the bottom. One lip is then detached, while the tube is fed upward by the other to and between rolls which press and paste the bottom. The final triangular folds are then creased and folded the one by a folder traveling in the same direction, but at greater speed than the tube, and the other by passing the finishing-rolls

165,281

1. As an improvement in the art of forming satchel-bottomed paper bags by machinery, the method, hereinbefore set forth, of opening the end of a tubular blank, and forming the first fold thereof, by means of the conjoint action of two adjacent diverging surfaces, substantially as described, between which the blank is continuously fed, and to which surfaces the contiguous sides of the blank are caused temporarily to conform, (as they move over said surfaces,) by means substantially such as described, whereby the fold is formed while the blank is in motion, simply by the strain upon the paper itself.

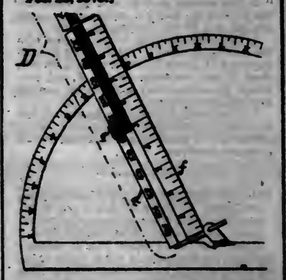
2. As an improvement in the art of forming satchel-bottomed paper bags by machinery, the method, hereinbefore set forth, of determining the form of the bottom of the bag by means of the conjoint operation of a series of knives, operating successively upon the blank, substantially in the manner described, and of two diverging surfaces, between which the blank is continuously fed, and to which surfaces the contiguous sides of the blank are automatically caused temporarily to conform as they move over said surfaces, by means substantially such as described.

3. As an improvement in the art of forming satchel-bottomed paper bags by machinery, the method, hereinbefore set forth, of pressing down the first fold of the tubular blank by means of the conjoint operation of two adjacent diverging surfaces, between which the blank is continuously fed, to which surfaces the contiguous sides of the blank are caused temporarily to conform as they move over said surfaces, by means substantially such as described, and upon which surfaces the fold is formed, while the blank is in motion, by the strain upon the paper itself, and a compressor, substantially such as described, whereby the fold is pressed flat upon the blank immediately after being formed.



4. As an improvement in the art of forming satchel-bottomed paper bags by machinery, the method, hereinbefore set forth, of forming the first of the final folds of the blank by means of the conjoint operation of knives, substantially such as described, which hold the edges of the blank outside of the portions to be folded, while passing continuously through the machine, and a following folder, substantially such as described, which travels continuously faster than the blank on an independent carrier, and in the same direction therewith while forming the fold.

5. As an improvement in the art of forming satchel-bottomed paper bags by machinery, the method, hereinbefore set forth, of forming the finishing fold of the blank by means of the conjoint operation of bands, substantially such as described, which hold the edges of the blank outside of the portions to be folded, while passing continuously through the machine, and finishing-rolls or compressing-surfaces, substantially such as described, between which the blank is guide by the bands, at an angle with the line of motion of the blank, and compressed while being held thereby.

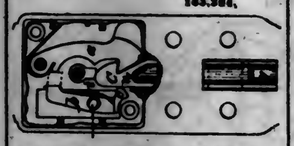


165,281.

165,282. AGRICULTURAL BOILERS. Wm. A. Swarthout, Aurora, Ill., assignor to himself and Roswell W. Gates, same place. [Filed June 18, 1875.]

In combination with the barrel D, provided with the gage-cock F, blow-off cock G, safety-valve H, and steam-tube I, the furnace A, provided with the flanges A' and A'', the door B, and the grate L, said parts being constructed in the manner and for the purpose substantially as specified.

165,283. TAILORS' MEASURES. William De Gant Tilney, Crawfordsville, Ind. [Filed Feb. 20, 1875.]

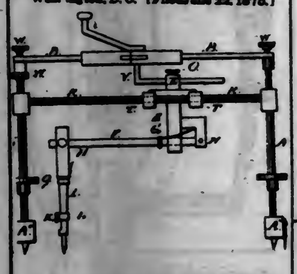


1. An instrument for marking out clothing or patterns for the same, consisting of the graduated dial A, and the expanding-measure D, constructed and operating all substantially as and for the purpose herein set forth.

2. The within-described expanding-measure, in which are combined the sliding strip *a*, graduated and perforated strip *d*, and elastic hasp *f*, all substantially as set forth.

165,284. SEAL-LOCKS. Lyman I. Todd, Chicago, Ill. [Filed Mar. 20, 1875.]

Brief.—An elbow-lever provided with an inclined arm, and having one end projecting through a hole in a seal-chamber, to lock the seal in place; said lever being operated by a sliding bolt.



165,886.

1. The elbow-lever *h*, provided with the inclined arm *a*, pivoted in a chamber alongside of the seal and chamber, in combination with the sliding bolt U and spring *i*, all constructed to operate substantially as shown and described.

2. The plate *J*, provided with the rib *h*, in combination with the spring *i*, said plate being pivoted so as to swing over the keyhole and be shoved back into a recess in the face of the lock-case, as shown and described.

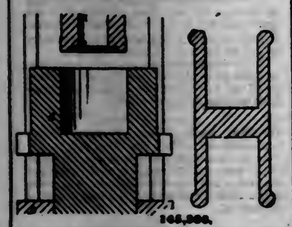
165,886. ELLIPTOGRAPHER. M. Toulman, Washington, D. C. [Filed June 22, 1875.]

1. The end pieces A A' A'', in combination with the slide-rods B B, carriage T, sliding thereon and supporting the pen-bar F, substantially as described, and for the purpose set forth.

2. The pointers S, as described, and for the purposes set forth.

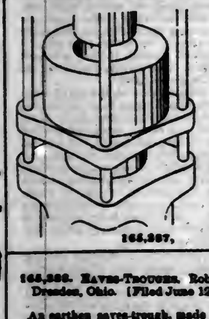
3. The arms B B, middle plate C, and cranks V and U, pivoted together, and at the points D D combined with adjustable shaft E, arm F, and pen-holder H, substantially as described, and for the purposes set forth.

4. The slide T, having an annular opening in its center, substantially as described, and for the purposes set forth.



5. The vertical shaft E, with its horizontal bar F, with the spring G, substantially as described, and for the purposes set forth.

6. The slide-rods B B, in combination with the carriage T, cranks V and U, bars B, binding-screw D, pivots D, center plate C, vertical shaft E, and horizontal pen-bar F, and pen-holder H, substantially as described, and for the purposes set forth.



7. The arms B B, pivoted to the plate C, and to A'' at D, adjustable shaft E, having arm F, crank V, slide T, and bars B B, as and for the purposes described

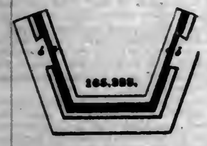
165,887. DEVICES FOR THE MANUFACTURE OF CAMES. C. G. Treay, New York, N. Y., assignor to the Shaw & Rogers Lead Company, same place. [Filed May 20, 1875.]

Brief.—The device differs from an ordinary lead-pipe machine only in the omission of the die and mandrel, and the substitution of a die of the shape of a came.

165,887.

The combination, for the manufacture of cames in the manner set forth, of the die having the structure and configuration specified, with the metal-containing cylinder and the piston or plunger, substantially as described.

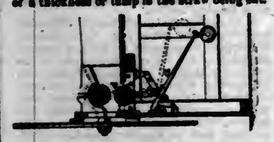
165,887. DEVICES FOR THE MANUFACTURE OF PRINTERS' LEADS. Lewis W. Tracy, Brooklyn, assignor to the Shaw & Rogers Lead Company, New York, N. Y. [Filed May 20, 1875.]



Brief.—The device differs from an ordinary lead-pipe machine only in the omission of the die and mandrel, and the substitution of a die corresponding to that of a printer's lead.

The combination, with the metal-containing cylinder and the piston or plunger, of the die having the structure and configuration specified, when used in the manufacture of printers' leads, in the manner set forth.

165,888.

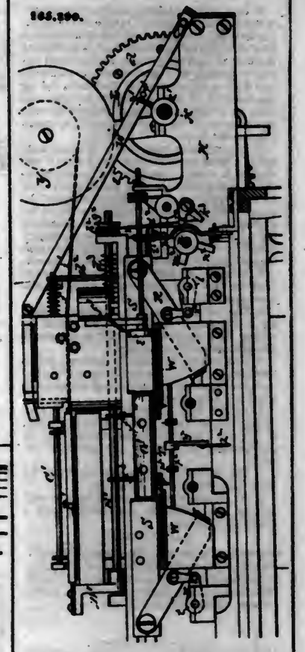


165,888. HAVEN-TROUGHS. Robt. Tyhurst, Dresden, Ohio. [Filed June 12, 1875.]

An earthen eaves-trough, made of sections having grooves *a a'*, and coupling U having tongues *b*, as shown and described.

165,889. STRAW-CUTTERS. A. Vahldieck, Johannesville, Wis. [Filed Apr. 15, 1875.]

Brief.—By a peculiar arrangement of bars, through which the action of the weight is transmitted to the rollers, the machine is protected from jarring when the roller passes off of a thickness or lump in the straw being cut.



The combination of the rollers *a d*, slotted lever *a*, rods *e e*, and weighted lever G, whereby the straw and hay being cut is held more firmly and the frame prevented from being jarred and shaken by the falling of the weight after having been raised, substantially as set forth.

165,890. PAPER-BAG MACHINES. Casper Van Mecom, New York, N. Y. [Filed Mar. 31, 1874.]

Brief.—Makes a bag provided with a wire at one end to serve as a fastening. The machine consists of two distinct sets of mechanisms, operated by adjustable segments on the main driving-wheel. One set feeds the paper into and the completed bag out of the machine, and the other set pastes, folds, cuts, and wires the bag, the one being at rest while the other is in operation.

165,890.

1. In combination with the paper cutting, folding, and pasting mechanism, operating together as set forth, and the paper-feeding mechanism, which operates alternately with the former, each being at rest during the operation of the other, the wiring mechanism, substantially as and for the purpose set forth.

2. The combination of the rack O and pinion *n* with the crank *f* and pitman *h* and suitable driving-shaft, whereby the punting, folding, and cutting mechanisms are brought into action during the advance of the rack and returned to their normal positions by the retreat thereof prior to the operation of the feeding-mechanism, substantially as and for the purpose set forth.

3. The combination of the driving-wheel L, toothed segment *d* with cam *h*, spring M with pin *g*, and crank *f*, substantially as and for the purposes herein set forth.

4. The combination of the spring M and spring-catch N, for locking and holding at rest the crank *f*, as herein set forth.

5. The folding-wings W W on each side of the folding-plate T, and operated by means of the crank-arms *g g*, adjustable arms *s s*, and rollers *a' a'*, substantially as and for the purposes herein set forth.

6. The spiral spring *S*, in combination with the folding-wings W W, for the purposes herein set forth.

7. The combination of the wire-cutter *S*, angle-bar *c'*, rod *w'*, pins *o' p'*, collar *s'*, and spring *S'*, all constructed substantially as and for the purposes herein set forth.

8. The combination of the wire-carrier A' and L-shaped strip B', for the purposes herein set forth.

9. The combination of the wire and paste carrier A' with the forming-plate T and folding-wing G', substantially as and for the purposes set forth.

10. The curved hooks *a' a'*, in combination with the forming-plate T, wire-carrier A', and folding-wing G', for the purposes herein set forth.

11. The toothed segment *e*, made in sections and attached to the main driving-wheel L, substantially as and for the purposes herein set forth.

12. The combination of the segment *e*, cam *f'*, spring *k'*, and cog-wheel *w'*, having pins on its side, all substantially as and for the purposes herein set forth.

13. The combination of the forming-plate T, plate X, belt *s'*, belt-wheels V' W', and the intermittent reciprocating shaft *s'*, substantially as and for the purposes herein set forth.

14. The combination of the continuous rollers O' and F' with the sectional roller E', adapted to bite through the notched bottom end of the forming-plate, whereby the paper of the bottom of the formed bag is grasped to feed it out of the machine and pull forward the last formed bag and the web, to which it is still attached, substantially as and for the purposes set forth.

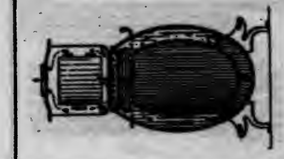
15. The combination of a paper cutting, folding, pasting, and wiring mechanism with a paper-feeding mechanism, when the same operate alternately, substantially as herein set forth.

165,891. APPARATUS FOR DISPENSING EFFERVESCENT LIQUIDS. Thomas Warner, New York, N. Y. [Filed Dec. 24, 1874.]

Brief.—When the receiving-vessel, which is provided with inclined hooks, is placed over the stem of the discharge-valve, the hooks are caused to engage with the inclines of a disk attached to the upper end of a valve-chamber, and thereby the discharge-valve is forced from its seat, and the liquid from the fountain is free to pass into the receiving-vessel.

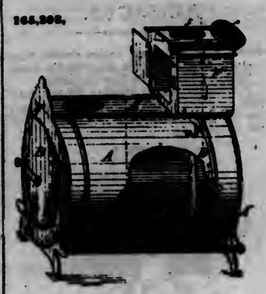
The disk C and hooks *b b*, in combination with the receiving-vessel D, valve-chamber A, and valve B, all constructed and operating substantially in the manner and for the purpose herein shown and described.

165,892. PROCESSES OF MANUFACTURING WHISKY. Edward Wernight, Monee, Ill. [Filed Apr. 8, 1875.]



Brief.—Treats the mash with any solution of tannin, (such as extract of Aleppo galls,) muriatic acid, and bitartrate of potash.

1. As an improvement in the manufacture of distilled spirits, the process of increasing the production of finest oils, and improving the flavor of the liquor by the employment of tannin in the preparation of the mash, substantially as described.



2. The process of improving the flavor and quality of liquor distilled from grain by the employment of tannin, muriatic acid, and bitartrate of potassa, in the preparation of the mash thereof, substantially in the proportions and manner set forth.

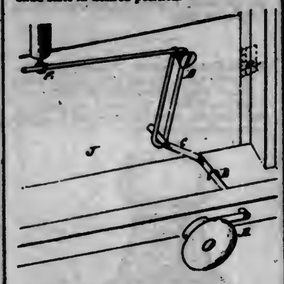
165,893. PARLOR COOK-STOVES. Alexander White, Rural Hill, Ill., assignor of one-half his right to Alex. H. Hammond, same place. [Filed May 12, 1875.]

Brief.—A "Todd" stove having a sheet-iron body and cast-iron top. The flue-strip, with its damper, provides for a direct and an indirect draft.

165,893.

1. The rear vertical flue-strip D, in combination with the lining C, and body and casing of the stove, substantially as described.

2. In the horizontal parlor cook-stove, substantially as herein described, the end plates A'', sheet-iron body A, and cast-iron plate-top A', with suitable holes for culinary vessels combined, substantially as and for the purposes set forth.



3. The combination of the stove proper A A' A'', lining C, and flue-strip D, having a suitable damper, with the detachable oven F, substantially as and for the purposes set forth.

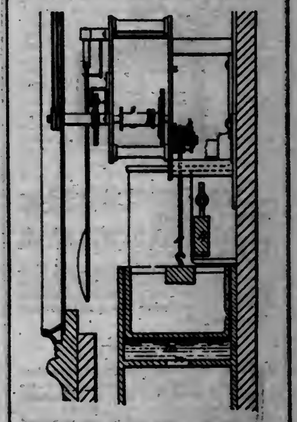
4. The combination of the flat cast-iron top plate, having inclined flanges on its sides, with the sheet-iron horizontal body, substantially as described.

5. The combination of the vertical end plates A'' A'', body A, and top A', with lining C and flue-strip D, having damper E, the several parts arranged and operating substantially as described.

165,894. BLIND-SLAT ADJUSTERS. John G. White, Charlotte, Mich. [Filed Feb. 16, 1875.]

Brief.—The slat-bar is arranged at one side, and operated by an elbow-lever pad, slotted arm, with which a crank-shaft and crank-knob from inside the room connect, and engage in such manner as to readily adjust the blind-slats in desired position.

The combination with a blind-frame, J, pivoted slats L L, and slat-bar F, attached to the slats outside of the center and provided with the eye-screw *d*, of the elbow-lever, having long arm E, and slotted arm D, and the shaft B having crank-knob A and crank C, all substantially as and for the purposes herein set forth.



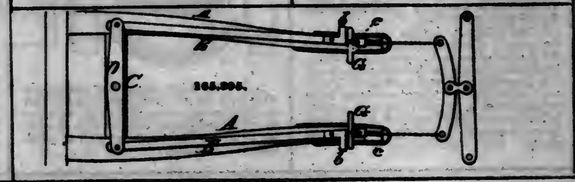
165,895. DRAFT-EVENERS. Amos Whitemore, Cambridgeport, Mass. [Filed Dec. 26, 1874.]

1. The draft-rods E E, above and below the thills, pivoted to whiffletrees D D, and connected together at their front ends, in combination with bearings *b* and pins *c*, substantially as and for the purposes described.

2. The draft portions *g* below the thills, in combination with the containing-rod *g'*, substantially as described.

165,896. ELECTRIC WINDING MECHANISMS FOR CLOCK-WORK. John Wm. Wignall, Manchester, Great Britain. [Filed Dec. 7, 1874.]

Brief.—Running down of motor allows battery-plates to lower into liquid, sending current around magnets, operating, when charged, to wind up the motor and withdraw plates.



The combination in a clock operated by a weight, of an armature, *k*, of an electro-magnet, connected to the shaft of the winding-drum, with mechanism substantially as described for putting the battery into and out of action, as for the purpose set forth.

165,897. BEARINGS FOR JOURNALS. Aaron B. G. A. Williams, Goshen, Ind., assignee of one-half his right to Reed M. Johnson, same place. [Filed May 7, 1875.]

The combination of the journal-box A, the sleeve D rigidly connected to the shaft B, and the removable head or bands C, applied to the journal-box, and each provided with packing-recesses F, for preventing wear of the sleeve and the escape of oil, substantially as described.

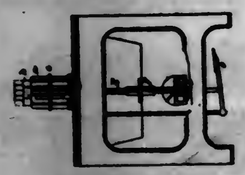
165,898.

163,999. PROCESSES FOR CLEANING GAS-RETORTS. Horace S. Wolf, South Bend, Ind. (Filed Mar. 9, 1876.)

The within-described process of cleansing gas-retorts by the use of potatoes, substantially in the manner and for the purpose set forth.

163,999. STAND FOR OIL-CASKS. Frank C. Wyckoff, New York, N. Y. (Filed Mar. 28, 1876.)

Brief.—The oil-barrel is mounted upon a skid frame-work, which holds a drip-tray, with well at the end, to convey the leakage by means of pump back to the delivery tray, thence into the barrel.



1. The pan C, provided with a well, D, combined with the skids B for an oil-barrel, substantially as set forth.

2. The pan or sled B, provided with a single funnel-neck, *e*, and legs *f f*, combined with the pump F, as set forth.

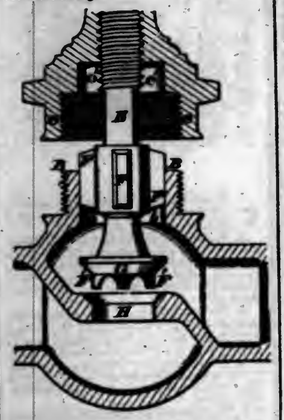
3. An oil-cabinet composed of a pan, C, secured to the skids B, and provided with the well D, combined with the sled E, constructed with legs *f f* and funnel-neck *e*, and provided with a pump, F.

163,999. MACHINES FOR STRETCHING HAT-BODIES. George Tate, Newark, N. J., assignor of one-half his right to C. Crossley, same place. (Filed Oct. 21, 1874.)

Brief.—The stretcher-arms are composed of two sets, the one arranged concentrically with the other. The inner set is hinged to the upper section of the tank-frame, and surrounded by the outer set, which is hinged to a loose sleeve upon the vertically-reciprocating shaft, which is provided with a central head for operating both sets of arms. Their relation to each other is maintained by a spring surrounding them.

1. The combination of the expansive hinged stretcher-arms a and sliding hinged stretchers or formers b, with the vertical-acting shaft E, provided with a head, *d*, substantially as set forth.

2. The combination of the expansive stretchers and formers a and b, and the vertical shaft E, provided with an enlargement or head, and the adjusting device, consisting of a right and left thread and nut, substantially as and for the purposes set forth.



3. The treadle c and its connections, in combination with the stretching-formers b, for the purpose of vertically operating the latter, substantially as and for the purposes set forth.

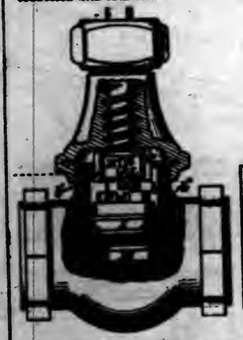
4. In combination with the hinged stretchers a and sliding and hinged stretchers b, the centered shaft E, provided with right and left left threads and adjusting-nut F, driving-shaft D, and a suitable device for connecting the shafts.

REISSUES.

6,587. GLOBE-COCKS. James Powell, Cincinnati, Ohio. Patent No. 47,555, dated May 2, 1865. (Filed May 14, 1875.)

Brief.—To facilitate grinding the valve and seat, wings are formed solid on the valve-stem, the same adapted to snugly fit the neck of the valve-casing.

1. The combined valve and valve-stem E G, constructed as set forth and guided in the smooth neck B of the body, substantially in the manner designated.



2. The valve-stem of a globe-cock, provided with wings (or collar) F, combined with the neck of the globe or body, in the manner substantially as set forth, and for the purpose designated.

3. The valve of a globe-cock, provided with downward projections F', in combination with the passage-way H and a valve-stem guided at its upper end.

4. The described combination of a guided valve, G, passage H, stem E, neck B, and permanent handle I, substantially as and for the purpose set forth.

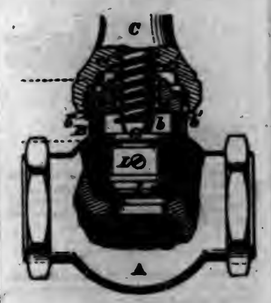
6,588. GLOBE-VALVE. James Powell, Cincinnati, Ohio. Patent No. 47,702, dated Feb. 6, 1865. (Filed May 20, 1875.)

Brief.—When it is desired to grind the valve-seat, the valve and stem may be rigidly connected with each other.

1. In combination with a screw-stem adapted to maintain an axial position in the neck of a globe-cock, a loose disk-valve constructed substantially as set forth, so as to be capable of being locked for the purpose of grinding.

2. In the described combination with a valve-stem adapted to maintain an axial position independently of its screw, and provided with a self-adjusting valve, the locking-piece K, or its equivalent, adapted to operate as set forth.

3. In the described combination, the following elements, to wit: a valve-stem having guides for preserving its axial position when released from the screw-cap; a self-adjusting valve, and the tongued and adjustable piece K, adapted to enter the cavity J in the valve, and to be secured either in or out of lock, substantially as and for the purpose set forth.



4. In combination with a screw-stem, adapted to maintain an axial position in the neck of a globe-cock, a loose disk-valve so constructed as to be guided at its lower end, substantially as and for the purpose designated.

5. The described downward prolongation *b'* of the interior wall of the neck B, in combination with a screw-stem adapted to be guided within the same, as and for the purpose explained.

6. The spring-collar G, in combination with screw-stem E, valve I, and plug H, for the purpose described.

7. The combination, in a globe-cock, of a lockable loose valve, I, valve-seat M, screw-stem E, and handle N, for the purpose set forth.

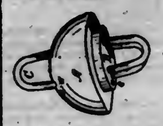
6,589. GLOBE-VALVES. James Powell, Cincinnati, Ohio. Patent No. 77,912, dated May 12, 1868. (Filed May 21, 1875.)

1. The loose collar or guiding rim F, fitting and being supported by the counterbored interior *b b'* of the globe-valve neck, substantially in the manner described.

2. The packing-collar G in combination with the loose disk-valve and the hub C, as described and set forth.

3. The described loose disk-valve I, lock-pin L, stem E, fast collar G, and loose collar F, combined and arranged as set forth.

4. The valve I, loose guide-collar F, counterbored neck *b b'*, screw-stem E, and handle J, combined and arranged substantially as described.

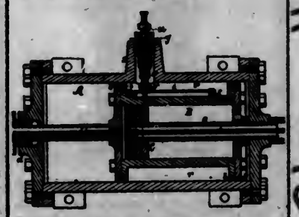


6,590. PRESSURE-GAGES. John W. Stiles, New York, N. Y. Patent No. 127,261, dated May 1, 1872. (Filed May 22, 1875.)

A pressure-gage, having the steam-piston B in combination with a float, E, moving in a chamber containing a weighing-fluid, by the rise and fall of which the amount of pressure is indicated, all operating substantially in the manner and for the purpose shown and described.

6,581. BUCKETS FOR CHAIN-PUMPS. W. C. Barker, Millport, N. Y. Patent No. 116,139, dated June 20, 1871; reissue No. 6,978, dated May 19, 1874. (Filed Feb. 17, 1875.)

Brief.—A solid elastic bucket for chain-pumps having an elastic edge and an upper portion contracted from said edge. This form allows the bucket to be easily drawn up the pump-tube, but prevents its being drawn or thrust downward. To prevent the water remaining in the tube, the bucket is provided with a leak-hole.



1. An elastic bucket for chain-pumps, adapted to fit and work in the bore of a pump-tube to raise the water by suction, provided with a suitable orifice or outlet through which the water remaining in the pump-tube above the bucket is allowed to escape down to the source of supply, substantially as and for the purpose set forth.

2. A solid elastic bucket, having an elastic bearing-edge, and its upper portion convex or contracted from said edge, whereby the bucket will readily yield to any irregularities in the pump-tube, and admit of its being easily drawn up, while at the same time it will resist moving downward, substantially as and for the purpose specified.

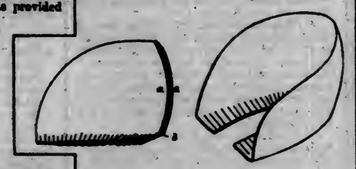
3. In combination with an elastic bucket and suitable button or washer, a link of the form substantially as described, whereby the ends, after insertion through the bucket and button, are capable of being turned up to form a rest for the button, which in turn forms a rest or support for the bucket, as set forth.

6,582. STEAM-ENGINES. S. F. Davenport, Hallowell, Me. Patent No. 60,851, dated Jan. 1, 1867. (Filed June 15, 1875.)

Brief.—The piston is moved in either direction by live and expanded steam.

1. The compound engine, substantially as described, consisting of the cylinder A, the internal movable piston-cylinder B, and the stationary piston C, all arranged as represented, and provided with valves and steam-passages, to operate to cause the cylinder B to be moved within the cylinder A and on the piston C by the steam, essentially as explained.

2. The piston C, provided with the passages *e f g*, and the valve *b'* arranged in it, as described, in combination with the piston-cylinder B, provided with the valves *l m* and the steam-passages *k n* for each of said valves, all as set forth.



6,583. DEVICES FOR PROTECTING THE ENDS OF ROLLS OF PAPER, &c. Joseph L. Firth, New York, N. Y. Patent No. 160,176, dated Feb. 23, 1875. (Filed June 6, 1876.)

6,583.

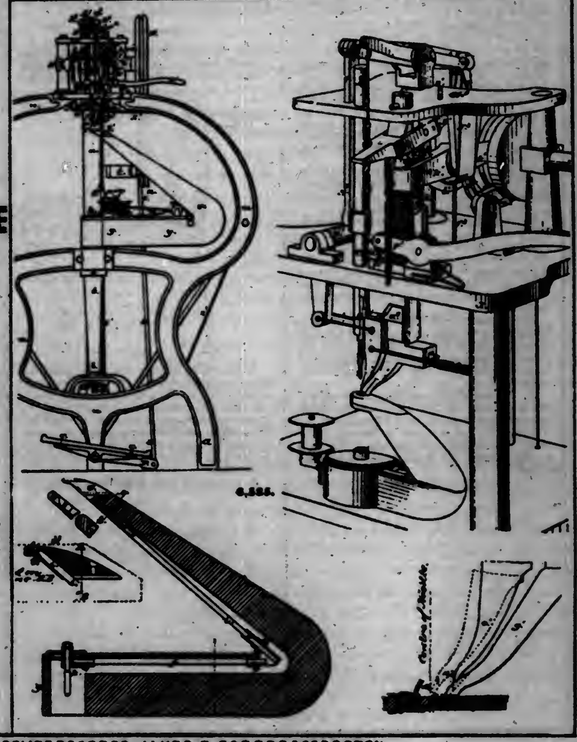
A roll-protector, composed of two caps and a connecting rod combined, substantially as and for the object specified.

6,584. COUNTER-STIFFENERS FOR BOOTS AND SHOES. James L. Hatch, Rochester, N. Y. Patent No. 146,252, dated Jan. 6, 1874. (Filed Apr. 7, 1875.)

1. As a new article of manufacture a waterproof stiffening for boots and shoes, composed of leather and leather-board, and an interior or rubber rim, substantially as described.

2. A stiffener composed of a layer of leather-board, skived about its edges, and combined with a layer of leather cemented or secured to the skived face of the leather-board by an india-rubber cement or rim, substantially as described.

3. The process of forming heel-stiffeners of leather and leather-board, consisting in first skiving the edges of the leather-board, then coating the leather and the skived face of the leather-board with an india-rubber cement, which by penetrating the leather and leather-board, renders them elastic and pliable, then uniting the leather and leather-board, and then forming the stiffener by bending the same into shape, substantially as described.



6,585. SEWING-MACHINES. Gordon McKay, Cambridge, and Robt. H. Mathieu, Boston, Mass., assignors, by mesne assignments, to Gordon McKay, trustee of the McKay Sewing-Machine Association. Patent No. 30,163, dated Aug. 12, 1862. (Filed June 26, 1875.)

Brief.—This machine is adapted to connect the soles and uppers of boots and shoes by means of a chain-stitch. The thread to form the stitch is supplied from a spool carried by a rotating horn. A rotating whirl lays the thread in the eye of the hooked needle, and the loop of thread is drawn from the whirl up through the material, the chain being formed in a channel made in the sole. The horn is capable of being rotated about an axis coincident with the axis of the needle, which inserts the stitch that fastens the sole and upper, and by moving the horn about the axis, and also the shoe on the horn, all parts of the shoe may be readily presented to the action of the needle. The length of thread drawn off from the spool is made to correspond with the thickness of the material being joined, and the throw of the needle and its carrier, together with the movements of the feed, presser, and cast-off or closing slide, is automatically varied to adapt them to material of different thicknesses.

1. In a machine for uniting soles to uppers, a rotating horn provided with a supporting-surface substantially in line with the axis of the horn, and adapted to enter and support a shoe with its sole substantially at right angles to the axis about which the horn rotates, substantially as described.

2. The combination, with a rotating horn adapted to enter and support a shoe while the upper is being united to the sole, of a feed adapted to engage and move the sole over the rotating horn, substantially as described.

3. The combination of a rotating horn adapted to enter and sustain a boot or shoe, as described, with a presser to hold the sole down on the horn, substantially as described.

6,585.

4. The combination of a presser and a feeder with a rotating horn, substantially as described.

5. The combination, with a sewing mechanism, of a rotating projecting horn and a whirl or looper carried in the end of the horn, and adapted to lay its thread into the hook of the needle, substantially as described.

6. The combination, with a rotating projecting horn and a whirl or looper, of a thread spool or bobbin, adapted to move with the horn, substantially as described.

7. The combination, with a rotating horn, of a tension device adapted to produce tension on the thread carried by the horn, substantially as described.

8. A rotary whirl or looper, combined with a rotating horn and with mechanism adapted to operate the whirl, whereby, while the whirl has an intermittent rotary movement with relation to the needle, the horn can be rotated without changing the relation of the whirl and needle to each other—or, in other words, so that rotation of the horn shall not rotate the whirl, though supported by and held in the horn, and so that rotation of the horn shall not effect the intermittent rotary movement of the whirl.

9. The combination of the needle-carrier and its operating lever with a movable fulcrum for the lever, adapted to move for the purpose of changing the throw of the carrier, substantially as set forth.

10. The means described for varying the stroke of the needle to conform to change in the length of the stitch, the same consisting of a stop made adjustable on the fulcrum bar to vary the distance between said stop and the fulcrum.

11. The combination, with a presser-foot, of a needle and needle-carrier automatically adjustable as to its stroke, substantially as described, to regulate the amount of the thread drawn from the spool by the needle, whereby the amount of thread so drawn is made to conform to varying thicknesses of stock at or near the point where the needle and presser operate, substantially as set forth.

12. The combination of a horn adapted to support a shoe or boot with an instrument acting on the upper surface of the shoe, calipering the thickness of the stock between such instrument and the surface of the horn, and adapted to regulate automatically the length of the material used for uniting the upper and sole, and the length of the stroke of the carrier, that while one terminus of it is at a fixed point in relation to the horn the other terminus shall automatically change in accordance with the variations in the thickness of the material to be united, substantially as described.

13. The combination, with the presser-foot, of a mechanism adapted to lift it a fixed amount from the surface of the stock, no matter what its thickness, substantially as described.

14. The presser-foot, combined with the needle and connected mechanism, whereby the resistance offered to the upward movement of the needle resists upon the presser to prevent it from being forced upward by the upward strain upon the stock, the presser being prevented from downward motion, substantially as described.

15. The presser and its operating lever, combined with a movable and adjustable fulcrum, whereby more or less lift can be given the presser by the positive movement imparted by a cam or other equivalent motor, substantially as set forth.

16. The combination of the closing slide of the needle with the needle and with the mechanism, shown and described, for operating the closing slide, and adapted to increase or diminish automatically the stroke of the slide as the stroke of the needle is increased or diminished.

17. The closing slide of the needle, combined with the needle, substantially by the means described or by their equivalents, adapted to operate the slide to cover the eye or hook of the needle while emerging from the stock, and to move with the needle, keeping its eye or hook covered until at or near the termination of the upward stroke of the needle, when the slide moves relatively to the needle, uncovering its eye, and then by moving downward with the needle keeps its eye uncovered until the needle punctures the stock.

18. The combination and arrangement of the separate instruments, the needle, the presser, and feeder in line, substantially as described, and in the plane of the feeding vibrations of the feeder and above the stock to be sewed, whereby they are adapted to operate on the upper surface thereof, said plane passing through the axial line of the needle, as and for the purpose described.

19. The combination, with the presser and feeder, of an inclined surface, variable in height with the presser, substantially as described.

20. The combination of the feeder, the horizontally-adjustable presser-foot and its bar, links *e'*, provided with projections *e''*, and an inclined surface variable in position with the presser-bar, and adapted to operate substantially as set forth.

21. The combination and arrangement of the spring *f* with the parts connected with the needle-lever, whereby the weight of said parts are counterbalanced to retain the needle at its upstroke until the check *f'* operates on the plate *d*.

22. The combination of the presser-foot and feeder, adapted to operate in the channel of the sole to guide the line of stitching in conformity with the channel, substantially as described.

23. In a machine for uniting soles to uppers, a rotating horn constructed, substantially as shown and described, and positioned with reference to and combined with the operating head of the machine, substantially as shown, whereby the horn always presents its supporting surface at the point where the sole and upper are being united.

6,826. SCHOOL SETTEES AND DESKS. John Peard, Brooklyn, N.Y. Patent No. 66,824, dated July 2, 1867. [Filed Apr. 23, 1875.]

1. The combination, with a school-settee and a swinging desk, of bearings on the side pieces of the settee, said bearings serving to support the desk when the same is in position for use at points intermediate between its back and front edges, substantially as described, whereby, when the front or outer edge of said desk is raised, its top face is turned toward the back of the settee.

2. The sliding desk E, provided with guiding cams *d d*, projecting from its ends and catching in guide-grooves in the side pieces A A of a settee, substantially as set forth.

3. The pivoted seat F, provided with slotted bars or stripes *f* at its ends, in combination with the pivoted supports G G, having pins *h*, to work in the slots of the bars or stripes *f*, substantially as shown and described.

4. The arrangement of book and slate racks C D between the side pieces A A of a school-settee, substantially as and for the purpose set forth.

6,827. PUMPS. Albert M. Putnam, Antrim, assignor, by mesne assignments, to himself and Charles H. Carter, same place, and C. P. Fox, Peterborough, N. H. Patent No. 94,336, dated Aug. 31, 1869. [Filed Jan. 22, 1876.]

Brief.—The pump-barrel is extended above the discharge-nozzle, and provided with an adjustable packed cover. A transverse rocking shaft is mounted in a packed journal-bearing communicating with the interior of the air-chamber; the shaft being connected to the piston-rod and the operating-brake, whereby the pump may be converted at pleasure into a lifting or force pump.

1. The combination, with a pump-barrel, having a close air-chamber above the delivery-nozzle, formed by a vertically upward extension of the barrel, of a transverse rocking-shaft, *b*, mounted in a packed journal-bearing, formed on the side of said communicating with the interior of the air-chamber, the said rocking-shaft being connected within the barrel to the piston-rod, and on the outside thereof to the operating-brake, substantially as described.

2. The combination, in a pump, of a barrel, which has an upward extension, and a transverse rocking-shaft for operating the pump-piston, mounted in a packed journal-box, as described, with an adjustable cap or cover, *d*, whereby a close air-chamber can be formed, and the pump be converted at pleasure from a simple lifting-pump to a force-pump, substantially as specified.

COMMISSIONER'S DECISIONS.

JOHN HASELTINE.—*Extension.*

[*In the matter of the application of John Haseltine, for extension of patent granted March* 25, 1856, *No.* 14,535, *for new and useful* WATER-WHEEL.—*Decided June* 15, 1875.]

The wheel of applicant having fallen into the hands of another person, who added improvements of his own, the "statement" of the value of the invention should have distinguished how much of the value was due to the portions patented by applicant.

A general statement that *the* wheel "added one-twelfth to the power of former wheels" is not sufficiently definite when the merits due to the devices of the applicant, and those of the subsequent patentee, are not definitely ascertained.

Examination of the specific points of each, and the apparent disuse of some of the applicant's devices, considered as bearing upon the questions of novelty and of value to the public.

SPEAR, *Acting Commissioner:*

This application is made under authority of an act of Congress, approved February 18, 1875, permitting the applicant, John Haseltine, "to make application to the Commissioner of Patents for the extension of his patent for a new and useful water-wheel."

In respect to the novelty of the invention covered by the claim in the patent under consideration, the report of the examiner may be considered favorable, and, indeed, the novelty of the precise invention claimed is not seriously questioned by the remonstrants. Nor am I disposed to call in question the insufficiency of the remuneration; nor to inquire very strictly into the causes of the failure to receive adequate remuneration, farther than the inactivity of applicant may bear upon the question of the value and importance of the invention, as it existed at the time when it was relinquished by this inventor, and passed into the hands of his assignee, Whitney.

This application was assailed most seriously upon two points: First, that the applicant had not furnished a written statement, under oath, of the ascertained value of the invention or discovery, as the law requires; and, second, that the invention, as originally made by Haseltine, and as described and claimed in his patent, is not valuable or important to the public. In his statement of the ascertained value of his invention he puts the number of wheels, containing his invention, manufactured and sold in this country as being, on an average, thirty each year since 1856. Now, it appears from the testimony of Whitney himself that most of these wheels were not made in the precise form shown and claimed in the patent under consideration. They were made, with few exceptions, in accordance with the patent granted to Whitney himself, to whom the patent of Haseltine was assigned about the date of its issue, and who took upon himself the whole business of manufacturing. Now, this patent of Whitney shows marked changes in the wheel as compared with that patented to Haseltine, changes which appear to be of considerable importance, and the nature of which I shall have occasion more particularly to consider hereafter.

Referring to these wheels, there is no statement or calculation to indicate how much an improvement this Whitney wheel was upon the old form existing prior to Haseltine's wheel, and nothing to indicate what part of the improvement is due to Haseltine, and what part is due to Whitney. There is nothing, beyond what appears to be a rough guess, that applicant added one-twelfth to the power of wheels which preceded his. This estimate might serve the purpose, and be taken as based upon applicant's former experiments, if the wheel used, and the number of which enters as an element into the computation, were the same wheel as that upon which Haseltine formerly experimented, in order to ascertain the amount of power gained. But the change in the form of the wheel from that patented to Haseltine to that patented to Whitney vitiates the whole calculation, and I cannot base any conclusion upon it.

The second point is very closely connected with the first, and many of the same class of facts bear alike on

both. As before remarked, the Whitney wheel, as shown in his patent, appears to differ in essential points from that of Haseltine: First, Whitney in the place of the flat cover, which Haseltine placed over the floats, substituted a crown in the shape of the segment of a cone made hollow and inverted, so as to turn the water gradually downward upon the lower outwardly-bent part of the float. In the second place, Whitney distends the band, and locates it about the outer limits of the wheel around the end of the floats, so as to give an amount of discharge commensurate with the diameter of the wheel. The third change, of greater importance, and one about which there is some dispute, consists in the total or partial omission of the radial portion of the floats. These are a marked characteristic in the patent of Haseltine, and constitute one of the leading elements of his claim. In the model of Whitney's patent, and in the cuts which Whitney caused to be made to represent his patent, this radial portion does not appear, or not to any extent worthy of note. In his patent, and as appears from his testimony, in most of the wheels made by him, the water was conducted to the wheels through chutes arranged entirely around the wheel, and at such an angle to the floats that no radial portion appears to be necessary, as it was in a construction shown in the patent of Haseltine. It would appear from Whitney's patent, and from the cuts referred to, that practically the radial portion was omitted, and the testimony on this point does not satisfy me that the contrary is true. But as this was the wheel upon which applicant expends his efforts to make a showing of value and importance, no weight can be given to that evidence, unless it appear that the wheel of Whitney has all the elements which were the invention of Haseltine, and which Haseltine might claim upon reissue. Now, the only remaining features in common with the Whitney and the Haseltine wheel are the tangential floats and the downward and outwardly turned edges of those floats. It is insisted, and it is undoubtedly true, that the outwardly-turned or lower portion of the floats in the Haseltine wheel are of such position, in relation to the center of the wheel, that the water is turned partially away from the center. Now this is the same, both in the Haseltine and in the Whitney wheels; but the question arises as to whether Haseltine could claim this upon reissue. Certainly he made no pretensions to such a claim in his original application, nor did Commissioner Mason, in allowing the patent, give any intimation that Haseltine was, in the judgment of the office at that time, the inventor of these two elements last specified. I have carefully examined the model and drawing and specification of the Dripp's wheel, referred to by the remonstrants in this case, and I am satisfied that it contains these two elements. Indeed, it is singularly like the Whitney wheel. That it has the tangential floats there can be no question, and this I do not understand applicant to deny. There was some question as to whether the lower portion of the floats turned outward from the center, as is the case in the Haseltine wheel. If the lower edges of the floats were parallel with the upper, the lower and bent portions of the floats would still give an amount of outward inclination proportioned to the amount of inclination of the tangential line to a radial line. But it is expressely stated in Dripp's specification that the lower edge of the floats is not parallel with the upper, but is at a greater angle, or in lines tangential to a larger circle than the upper circle, to which the upper lines are tangent, thus making what may be called a twist outward in the float. This, and an inspection of the model, convince me that the lower portion of the float has a positive outward turn, and to this extent it anticipates the invention of Haseltine, who is, therefore, not entitled, under any circumstances, to claim the two elements which remain after the omission of the radial portion. All the testimony of the expert, Waters, in regard to the arrangement of the chutes for pitching water upon the wheels does not appear to me to bear upon the merits of the case, for the reason that it constitutes no part of the invention under consideration. It is the wheel, and the wheel alone, which Haseltine claims to have improved, and with which I have compared the wheel of Dripp, disregarding altogether the other portion of Dripp's invention, as having no relevancy to this case. It appears clear to me, therefore, that all that Haseltine was originally entitled to claim, and all that he did claim, was not of value. In harmony with this view is his early and not very reluctant abandonment of the enterprise, and in like accordance are the marked improvements of Whitney, patented as they were without reference to the Haseltine wheel.

With these views of the case I deem it unnecessary to discuss other points raised at the hearing.

The applicant has not, in my judgment, furnished sufficient foundation for the grant of an extension of his Letters Patent, and his petition is accordingly denied.

DECISIONS OF THE COURTS.

SUPREME COURT, DISTRICT OF COLUMBIA.

[*In general term.—April*, 1875.]

STEPHEN HULL *vs.* THE COMMISSIONER OF PATENTS.

[*Mandamus.*]

On a rehearing, the doctrine is again affirmed that this court will not compel the Commissioner of Patents to issue a patent even in a case where the Examiners-in-Chief have rendered a decision in favor of the applicant.

STATEMENT OF THE CASE.

This case was heard and decided at the last term of the court; but one of the judges having intimated a desire to have the case reargued, it was again heard before a full bench. The facts of the case, as set forth on the original hearing, are as follows:

A motion is made in this matter for a mandamus commanding the Commissioner of Patents to issue a patent to the relator, Stephen Holl. The facts upon which the application is based are stated in the petition and the return of the Commissioner to be that Stephen Hull, of Ponghkeepsie, in the State of New York, on or about the 1st day of March, 1869, filed in the United States Patent Office an application for a patent for an improvement in harvesters, of which he believed himself the original and first inventor; that said application

having been twice rejected by the Primary Examiner, an appeal was taken to the Board of Examiners-in-Chief, as provided by law. That on or about the 28th of August following, notice having been received that the decision of the Primary Examiner had been overruled and the patent allowed, he paid into the Patent Office the final fee of $20, which he considered was all that was necessary on his part to entitle him to the possession of the said patent; but the Commissioner of Patents directed the said patent to be withheld, and the case sent back to the Board of Examiners-in-Chief for reconsideration, in view of certain decisions which had then been recently made by himself; that said board did proceed to reconsider their said decision accordingly, but reaffirmed the same, and held that the patent should be allowed. Nevertheless, the said Commissioner still refused to allow the said patent to issue, and on the 14th of April, 1870, made the following order: "Further action in this case is suspended until the further order of the Commissioner;" and no notice of the order was ever given to said Hull or his attorneys, nor was its existence known to either himself or them until within the past three months; and that the "further order" here contemplated has never been made. He again applied to the present Commissioner of Patents, (Leggett,) requesting him to direct the patent to issue in accordance with the decision of the Board of Examiners-in-Chief above referred to. But the said Commissioner, after having fully considered said application, denied the request therein presented, mainly, as he (Hull) believes, on account of the length of time that had elapsed since the aforesaid order of April 14, 1870, was made, and also on account of the rule that one Commissioner will not review and reverse the rulings of his predecessor, (Fisher,) the former incumbent.

Believing that the facts above stated leave no discretion with the Commissioner of Patents; that under the circumstances of this case the law definitely prescribes this duty, which is the performance of a mere ministerial act, petitioner asks that a writ of mandamus may issue under the seal and authority of this honorable court, commanding the said Commissioner of Patents to issue said patent, or to show cause why he declines to do the same, or to do such other acts and things as his official duty shall require, and such as shall be in accordance with the general principles of jurisprudence that are applicable to such cases.

The return of the Commissioner gives a history of the application of the petitioner from September 25, 1856, when he filed his first application, down to April 14, 1870, when the Commissioner (Fisher) placed the written order on file suspending further proceedings until his further order, but of which no notice was sent to Hull, although it is stated he had actual knowledge of such order. On February 11, 1874, relator moved Commissioner Leggett to issue the patent, which he declined to do, for the following reasons:

First, my predecessor had evidently deliberately decided that a patent could not be granted, and under the practice in all the departments, which, if not statutory, has the force of law, I am not at liberty to review his decision; and, second, the delay of nearly four years between the last action of my predecessor and the filing of the present request for reconsideration, works abandonment under existing statutes.

Upon an examination of the merits of the case, I am inclined to the belief that there are no equities in the case that should lead to any forced construction of the statute in favor of the applicant.

The Commissioner, in his return, resists the application for the writ of mandamus upon the following grounds:

The respondent denies that upon the facts of the case his predecessor was left nothing but a mere ministerial act to perform—viz., to deliver the patent; or that he, as successor, is left in that position; and he says that, inasmuch as a patent never was executed, there remains still a judicial discretion to be exercised by him, in determining whether or not all the conditions prescribed by law were complied with in every respect, so as to authorize him to lawfully execute and deliver the patent.

He denies that the decision of the Board of Examiners-in-Chief, upon the single point appealed to them from the Primary Examiner, concluded him upon that point, or upon other points which the law makes conditions precedent to the grant of patents, and charges him with the duty of determining.

He denies that the writ of mandamus should issue from the honorable court, as petitioned for, to compel him to execute and deliver the patent sought by the relator previous to a regular appeal to the court, and an adjudication in his favor, as provided for in the forty-eighth and fiftieth sections of the patent act, and says that such a remedy, if ever available before the complete execution of a patent, is now barred in this case by the delay of the relator in invoking it.

The principal question to be determined upon this state of facts is, whether the court will require the Commissioner of Patents to issue a patent where the Board of Examiners-in-Chief have twice decided in favor of the applicant.

[*Charles Mason*, for the relator.
Marcus S. Hopkins, for the Commissioner.]

HUMPHREYS, J.:

This case has been reheard, and the majority of the court find no reason to alter the judgment of the last term.

The petitioner filed his application for the writ of mandamus requiring the Commissioner to issue a patent for "an improvement in harvesters." The Patent Office is attached to the Department of the Interior, and the Commissioner of Patents, under the direction of the Secretary of the Interior, is required to superintend or perform all duties respecting the granting and issuing of patents directed by law. (Sections 475, 481, Revised Statutes.) The Commissioner of Patents and three Examiners-in Chief are nominated and appointed by the President and Senate. (Sec. 476.)

The language of section 482 is as follows:

The Examiners-in-Chief shall be persons of competent legal knowledge and scientific ability, whose duty it shall be, on the written petition of the appellant, to revise and determine upon the validity of the adverse decisions of examiners upon applications for patents, and for reissues of patents, and in interference cases; and, when required by the Commissioner, they shall hear and report upon claims for extensions, and perform such other like duties as he may assign them.

Section 4904 authorizes an appeal to the Board of Examiners-in-Chief and the Commissioner in interference cases.

Section 4909 provides for an appeal to the Board of Examiners-in-Chief, in three classes of cases, the application originally, the application for a reissue, and in interference. Section 4910 provides for an appeal from the decision of the Examiners in-Chief to the Commissioner in person. These are the only sections making any provision for the action of the Board of Examiners-in-Chief.

In the case before us the relator, Hull, states that his application was twice rejected by the Primary Examiner, whereupon he appealed to the Board of Examiners-in-Chief, and they determined that he was entitled to a patent; that in August, 1869, he paid into the Office twenty dollars, the fee required by law; that notwithstanding this the Commissioner of Patents re-

fused to grant the patent, and sent the matter back to the Examiners-in-Chief, who reaffirmed their opinion, or decision, that the patent should be allowed; that on April 14, 1870, the Commissioner issued the following: "Further action in this case is suspended until the further order of the Commissioner."

The relator further states, that he has applied to the Commissioner to issue the patent, who, "after having fully considered the application, denied the request," &c. It is contended by the relator that the Commissioner is bound to issue the patent, because the Board of chief examiners has pronounced that it should be done; that his duty is a mere ministerial one, and he, having declined to perform that duty, this court must order him to sign the patent; that he is without remedy except this order.

Section 4911 provides that if any applicant for a patent is dissatisfied with the decision of the Commissioner he may appeal to this court.

Section 4914 provides for the hearing the appeal and determining the same. No appeal having been taken in this matter, it is not necessary to decide whether it is a proper case for an appeal; for, apart from that consideration, the question is presented whether a mandamus can be issued. On an appeal we are instructed by the statute what to try.

The relator asks this court to order the Commissioner to issue a patent before placing before us in a regular judicial mode the evidence that one ought to issue. He contends that because the chief examiners have determined that a patent ought to issue, therefore the Commissioner must perform the clerical ministerial act of doing so.

Section 481 is in the following language:

> The Commissioner of Patents, under the direction of the Secretary of the Interior, shall superintend or perform all duties respecting the granting and issuing of patents directed by law; and he shall have charge of all books, records, papers, models, machines, and other things belonging to the Patent Office.

The law is explicit and mandatory that if certain things exist a patent for certain objects shall be granted. The law is alike explicit who is to determine if these facts exist. The law designates the judge who is to superintend, and he may even perform all the work. Certain officers have been assigned—paid out of the Treasury — to whom he can intrust examinations. Even all this the Commissioner does under the direction of the Secretary of the Interior.

In the very inception of a matter for a patent the Commissioner controls the application, by express enactment, and he is the officer to cause an examination to be made, and could even do it himself. Section 4893—

> The Commissioner of Patents, subject to the approval of the Secretary of the Interior, may, from time to time, establish regulations, not inconsistent with law, for the conduct of proceedings in the Patent Office.

Section 483, we are not appealed to to determine upon the facts and evidences in the application whether the relator is entitled to a patent for an invention or discovery of a new and useful improvement of harvesters, for we have not that case before us. The position of the relator is that as the Board of Examiners-in Chief has decided that he is entitled to a patent, therefore this court must order the Commissioner to issue the patent. If the whole case was before us, we might find that the Primary Examiner and the Commissioner were right and the board wrong, or *vice versa*. The final judgment is the action of the Commissioner. That is not appealed from, nor are its merits presented to us. We are asked to decide that he is not entitled to any judgment, but that his duties are merely clerical and ministerial. This would be an unfair interpretation of the powers, attitude, and design of a very important officer of a highly important office of a prominent department for the orderly regulation of the interests of the country. As an appellate tribunal, we certainly have jurisdiction over the judgments of the Commissioner; but we must have his judgments before us, and the party seeking to reverse must appeal to us in the proper manner.

Section 4915 may apply to cases of applicants residing in any of the States whose claims have been rejected both by the Commissioner and this court; also to cases rejected by the Commissioner in interference applications.

When this case was heard at the last term of this court the members thereof were divided in opinion; a bare majority were of the opinion that we could not grant the writ. I thought that this was ground sufficient to raise a doubt. And under the rules of the organization of a tribunal for the proper adjustment of controversies, this fact being made to appear, we had the right and organic power to call upon counsel, learned and experienced in the law, to come before us the second time and present arguments why the judgment should be reconsidered. We have reconsidered our former determination.

Counsel have been heard at length a second time after full opportunity for preparation.

This case presented facts, somewhat novel of the first impression, for the application of well-known principles.

The majority of the court is of the opinion that this is not a case proper for a mandamus to issue, and so far as I am concerned I am much better satisfied of the correctness of this conclusion than on former hearings. Each case must depend upon the facts thereof, and we cannot undertake to require other departments to do that which in their judgment they ought not to do, unless we are in the full possession of all the facts and merits of any application. An appeal ordinarily brings before a court the entire merits of a cause, and action may be had understandingly.

Mandamus refused.

Ch. J. CARTTER and MAC ARTHUR, J., dissenting.

DESIGNS PATENTED DURING THE WEEK.

[Each Design bearing date July 13, 1875.]

8,467 to 8,480, inclusive.—Carpets.—JOHN T. WEBSTER, Philadelphia, Pa., assignor to JOHN and JAMES DOBSON, same place. Applications filed July 1, 1875. Term of patents 3½ years each.

8,481.—Lamp-Pedestals.—NATHANIEL L. BRADLEY, West Meriden, Conn., assignor to THE BRADLEY & HUBBARD MANUFACTURING COMPANY, same place. Application filed July 6, 1875. Term of patent 14 years.

8,482.—Paper-Weight.—HOMER LEE, New York, N. Y. Application filed June 26, 1875. Term of patent 7 years.

8,483.—Heating-Stove.—ROBERT SCORER and ROBERT HAM, Troy, N. Y., assignors to SCORER, HAM & WILKINSON, same place. Application filed June 4, 1875. Term of patent 3½ years.

8,484.—Stove-Cover Lifter.—HENRY C. BROWN, New York, N. Y. Application filed November 5, 1874. Term of patent 3½ years.

8,485.—Printing-Type.—ANDREW LITTLE, New York, N. Y. Application filed June 29, 1875. Term of patent 7 years.

8,486.—Rubber Eraser.—CHRISTOPHER ROBERTS, Newark, N. J. Application filed June 11, 1875. Term of patent 14 years.

8,487.—Neck of Broom-Heads.—CHRISTOPHER VAN SLYCK and HENRY S. DE FOREST, Schenectady, N. Y. Application filed June 26, 1875. Term of patent 7 years.

TRADE-MARKS REGISTERED DURING THE WEEK.

"three bent mailed legs radiating from a central rosette."

2,740.—Rupture Cure.—HENRY T. MITCHELL, Brooklyn, N. Y. Application filed July 1, 1875.
"the representation of an ancient knee-buckle, in connection with the words 'Mitchell's Goldeu Rupture Cure,' with the words trade-mark inside of buckle."

2,741.—Medicine.—CARRIE L. REX, Newark, N. J. Application filed June 24, 1875.
"monogram 'Rex' and the words 'Malarial Specific.'"

2,742.—Soap.—ROBINSON BROS. & Co., Boston, Mass.—Case B. Application filed July 6, 1875.
"compound word 'RICE-FLOUR.'"

2,743.—Lye and Potash.—I. N. STERN, Keokuk, Iowa. Application filed May 15, 1875.
"figure Vishnu, a goddess of ancient mythology, represented as a preserver, said figure being inclosed in a circle."

LABELS REGISTERED DURING THE WEEK.

[Each certificate bearing date July 13, 1875.]

268.—Title: **"Carter's Aromatic Scotch Bitters."**—L. F. CARTER, Georgetown, Mass. Application filed July 6, 1875.

269.—Title: **"Fisk, Clark & Flagg, City Made."**—FISK, CLARK & FLAGG, New York, N. Y. Application filed June 3, 1875.

270.—Title: **"Dr. C. C. Frost's Indian Vegetable Cough and Humor Cure."**—C. C. FROST & Co., Manchester, N. H. Application filed June 14, 1875.

271.—Title: **"Holyoke Sarsaparilla Cream."**—CARL D. S. FAUH, Philadelphia, Pa. Application filed June 29, 1875.

272.—Title: **"Gill's Bilious and Liver Pills."**—EBENEZER GILL, Great Bend, Pa. Application filed July 1, 1875.

273.—Title: **"The Leader Shirt."**—WILLIAM HARRISON, Lawrence, Mass. Application filed February 11, 1875.

274.—Title: **"Dublin Laundry Blue."**—SAMUEL LOAG, Philadelphia, Pa. Application filed June 16, 1875.

275.—Title: **"Morgan's Polish Reviver."**—A. MORGAN, Cambridge, Mass. Application filed May 31, 1875.

276.—Title: **"The Adjustable Shirt Front with Fitting Neckband for Shirt."**—MORRIS POPPER, New York, N. Y. Application filed July 3, 1875.

277.—Title: **"Waite's Patent White Felt Wicking."**—JAMES M. STEWART, Franklin, Mass. Application filed July 8, 1875.

278.—Title: **"Dr. Scott's Compound Sugar Coated May-Apple Pills."**—JANE SCOTT, New York, N. Y. Application filed February 23, 1875.

279.—Title: **"Chinese Catarrh Remedy."**—ADELINE W. WILDES, Boston, Mass. Application filed June 26, 1875.

280.—Title: **"The Celebrated Cooke's Favorite Tomato."**—JONES YERKES, Morristown, N. J. Application filed June 2, 1875.

APPLICATION FOR EXTENSION.

UNITED STATES PATENT OFFICE,
Washington, D. C., May 19, 1875.

On the petition of ANN JENNETTE HATHAWAY, of Milwaukee, Wis., executrix of JOSHUA HATHAWAY, deceased, authorized by act of Congress approved February 18, 1875, praying for the extension of a patent granted to the said JOSHUA HATHAWAY, on the 3d day of April, 1860, for an Improvement in Devices for Converting Reciprocating into Rotary Motion,

It is ordered that the testimony in the case be closed on the 20th day of July next; that the time for filing arguments and the Examiner's report be limited to the 30th day of July next; and that said petition be heard on the 4th day of August next.

Any person may oppose this extension.

J. M. THACHER, *Commissioner.*

INDEX OF INVENTIONS PATENTED JULY 13, 1875.

	Class No.	No. of Patent.
Acids, carrier for, F. H. Kalbfleisch	35	165,500
Acids, apparatus for concentrating sulphuric, G. A. Hagemann	35	165,567
Alarms, circuit for electric, G. C. Maynard	50	165,602
Aquarium, J. Wenmackers	54	165,639
Auger handle, F. Wertz	29	165,522
Bag holder, J. James	57	165,596
Bale tie, P. R. Dawson	7	165,407
Barrels or casks of fermented liquors, apparatus for tapping, J. Barrett	19	165,467
Basin faucet, J. F. Sheridan	167	165 621
Basket, grain, H. C. Jones	169	165,417
Basket, stave, H. C. Jones	169	165,416
Basket, stave, H. C. Jones	169	165,418
Basket, stave, H. C. Jones	169	165,419
Battery, galvanic, G. L. Leclanché	50	165 452
Bearing, conical roller thrust, M. C. Bullock	87	165,538
Bed lounge, T. Q Hall	62	165,571
Bedstead, folding, H. Krieie	62	165,492
Bee hive, H. Penoyer	9	165,501
Billiard cue tip fastener, C. Gravelius	143	165,502

	Class No.	No. of Patent.
Boilers, feeding apparatus for steam, N. Yagn	148	165,435
Bolt trimmer, A. Graham	100	165,445
Bolts, die for heading and squaring, J. B. Clark	14	165,542
Book support, W. Pattoo	146	165,500
Boot and shoe crimping machine, J. P. Mitchell	16	165,605
Boot and shoe peg cutter, G. L. Ellis	16	165,411
Boot and shoe stretcher, O F. Garvey	16	165,556
Boot fronts, cutting, J. T. Harper	16	165,579
Boot jack, A. N. De Baun	16	165,482
Boots and shoes, machine for pegging, T. T. Prosser	16	165,613
Boring and mortising machine, H. Neumann	173	165,495
Bracket stand, A. B. Denison	62	165,549
Brick, air dried, J. Wurzner	20	165,649
Broom, corn, A. Maurer	22	165,601
Broom corn sizing machine, A. Walrath	22	165,458
Brushes, device for attaching handles to, Hood and Joseph	22	165,582
Bucket, elevator, J. B. Cline	79	165,543
Buckle, W. Leser	23	165,422
Buckle, trace, A. G. Dodds	23	165,551
Bureau and washstand, knock-down, W. S. Moses	62	165,494
Burner, vapor, J. Benson	90	165,468
Button fastening, P. Snee	23	165,518
Buttons, manufacture of, R. H. Isbell	23	165,448
Car brake, J. E. Worthman	122	165,648
Car coupling, W. E. Bell	122	165 529
Car coupling, J. Dinsmore	122	165,484
Car coupling, E. M. Law	122	165,450
Car coupling, Outland and Thomas, (reissue)	122	6,539
Car spring, J. E. Wootten	122	165,647
Car ventilators, device for regulating, G. W. Birmingham	166	165,469
Cars, door for grain, F. J. Kimball	121	165,490
Carbureter, air, Gray and Lueby	27	165,564
Cellars, constructing, ventilating and cooling, J. K. Frick	51	165,486
Chain cable, C. A. Chamberlin	60	165,541
Chair, barber's, J. Ott	62	165,498
Chairs, detachable seat for, W. W. St. John	62	165,516
Churn, reciprocating, Goodnough and Drennen	45	165,560
Clock, calendar, A. A. Cowles	36	165,548
Clock, calendar, W. A. Terry	36	165,432
Cloth cutting machine, A. Warth	37	165,636
Cloth steaming, smoothing, and drying, W. Hebdon	37	165,576
Coal chute, W. M. Thompson	79	165,632
Coal scuttle, R. M. Steele	154	165,515
Cooler, lard, F. E. Rockstroh	26	165,617
Cooler, liquid, B. F. Shaw	58	165,430
Corn stalks, machine for cutting, T. O'Bryan	73	165,496
Corset, M. K. Bortree	80	165,534
Cracker machine, G. W. Baker	6	165,527
Culinary vessel, J. Demoss	154	165,483
Cultivator, Dunnavant and Hampson	43	165,552
Digger, potato, G. W. Haag	114	165,566
Door check, J. Naughten	94	165,607
Door spring, J. B. Starkweather	94	165,626
Dredging machine, R. R. Osgood	51	165,608
Drilling machine, rock, M. C. Bullock	124	165,539
Drilling machine, E. S. Winchester	124	165,646
Duster, feather, H. L. Harrison	22	165,574
Egg beater, T. Earle, (reissue)	88	6,542
Egg beater, J. Howes	88	165,585
Elevator, H. W. Brinckerhoff	79	165,472
Engine houses, gong attachment for, R. Bragg	50	165,438
Engine, hydraulic hoisting, G. M. Gerrish	79	165,558
Engine, rotary, S. Gibson	150	165,559
Envelope machine, J. Ball, (reissue)	109	6,540
Eraser holder, W. H. Bennett	146	165,531
Exhaust mechanism, G. Benker	148	165,437
Eyeglass, I. Kahn	157	165,580
Fabrics, manufacture of imitation, C. H. Kneller	92	165,420
Fare box, G. J. Hill	42	165,579
Fence, portable, M. Burtless	52	165,439
Fence post, E. Geer	52	165,557
Fence wire stretcher, Brown and Cramer	52	165,536
Filter, R. F. Scherr	167	165,512
Fire lighter, automatic, M. Curran	154	165,409
Fire place, M. Fitzpatrick	154	165,440
Fire place, J. McHenry	154	165,604
Floor clamp, E. Hickman	29	165,446
Flower stand, S. Vanstone	63	165,456
Furnace, metallurgic, W. Swindell	99	165,630
Furnace, smelting, H. C. Creal	85	165,477
Furnaces, nozzle for hydrocarbon, H. Stacey	149	165,431
Furnaces, steam or gas and air blast pipe for, G. H. Goodsell	85	165 561
Game board, C. R. Edwards	143	165,410
Gate, automatic, O. P. Clinton	52	165,475
Gate, automatic, K. G. Knuteson	52	165,449
Gong attachment for engine houses, R. Bragg	50	165,438
Goods, &c., apparatus for transmission of, D. Brown	79	165,473
Grave cover, R. H. Sipes	54	165,622
Gun stocks, machine for checking, J. A. Blake	172	165,404
Handle attaching device, adjustable, Hood and Joseph	22	165,583
Harrow, A. W. Davis	73	165,480
Harvester, C. Wheeler, Jr	74	165,460
Harvester dropper, T. McDonough	74	165,454
Harvester safety seat, W. E. Mattison	74	165,424
Hatchway, self-closing, J. Fensom	30	165,554
Heel polishing machine, W. Westcott	16	165,640
Hinge, F. L. Sanderson	24	165,619
Holdback, W. H. Harvey	31	165,575
Hoops, machine for cutting, H. Fowler	40	165,555
Hose coupling, W. M. Henderson	81	165,415
Hose, manufacture of india-rubber, T. J. Mayall, (reissue)	81	6,545
Hubs to axles, attaching, W. E. Pratt	31	165,504
Hydrocarbons, automatic vapor test for, J. Ponton	47	165,612
Ice cream freezer, J. M. Condon	58	165,545
Ice cream freezer, W. Redheffer	58	165,427
Ice plow, R. W. Sanborn	79	165,485
Jack, lifting, Fayette and Meeker	30	165,525
Ladder, firemen's extension, A. Ames	30	165,618
Ladder, firemen's extension, J. D. Rowland	30	165,618
Lamp and gas machine, combined street, G. T. Parry	27	165,499
Lamp, nursery, Gorham and Cubley	90	165 444
Lamp reflector, street, C. Robinson	90	165,509
Lathe, metal turning, H. M. Quackenbush	100	165,425
Lemon squeezer, A. C. Weeks	88	165,638
Life preserver, J. F. Peck	138	165,610
Liquids, apparatus for drawing effervescent, C. Greiner	1	165,565
Liquids, method and apparatus for evaporating, G. A. Hagemann	155	165,568
Lock, W. H. Taylor	93	165,631
Locomotive head light attachment, Ray and Ham	94	165,426
Lock shells to bolt cases, fastening, H. Winn	93	165 644
Loom for weaving pile fabrics, S. Sanford	95	165,428
Loom picking mechanism, D. M. Collins	95	165,408
Measuring apparatus, liquid, J. M. Hopkins	132	165,447
Measuring distances and altitudes, instrument for, E. C. Roberts	157	165,616
Meat cutter, H. P. Goddard	25	165,442
Meat cutter, A. B. Good	25	165,443
Metal punching machine, D. W. Baer	119	165,466
Miner's tool, Holmes and Quirin	153	165,580
Molding instrument, D. Walther	31	165,633
Mop, Johnson and Barnes	22	165,588
Mowing machine, D. Lockhead	74	165,453
Mowing machine, C. Wheeler, Jr	74	165,461
Muff, E. Winkler	38	165,645
Nail for shoemaking, L. R. Blake	16	165,470
Nail rolling machines, conductor for, R. E. Cady	103	165,474
Neck tie, A. Hellenberg	38	165,577
Neck tie, A. Landes	38	165,593
Neck tie, S. Solomon	38	165,625
Neck tie fastener, J. H. Harrington	38	165,488
Needle sharpener, T. D. Cashin	70	165,544
Needles, machine for polishing the eyes of machine, J. Berry	104	165,532
Newspaper file, F. B. Alderson	146	165,401
Ore concentrator, G. W. White	3	165,462
Ore separator, H. P. Minot, (reissue)	3	6,538
Paper clip, C. E. Ramue	146	165,614
Paper weight, F. E. Whitney	146	165,465
Pavement, H. R. Bellamy	110	165,530
Pegging machine, T. T. Prosser	16	165,650
Piano fortes, damper mechanism for, E. Porter	112	165,503
Pick, T. R. Pinks	49	165,502
Pipe for furnaces, steam or gas and air blast, G. H. Goodsell	85	165,561
Pipes, device for thawing frozen water, R. E. Dietz	167	165,550
Planing machine, miter, J. Mannebach	29	165,600
Planter and cultivator, corn, P. S. Starnes	133	165,513
Plow, W. S. Lawrence	114	165,451
Plow, gang, H. Opp	114	165,497
Plow mold boards, making, J. Holmes	114	165 561
Pneumatic machine, G. A. Hagemann	155	165,569
Press, J. P. Kefauver	7	165 491
Printing press, M. A. Pendleton	117	165,611
Protractor, A. Swasey	97	165,519
Pump, S. B. Strong	118	165,629
Pump, bilge, J. F. Smethells	118	165,623
Pump, rotary, H. A. Barber	118	165,528
Pumps, link for connecting the handles and pitmen of, L. W. and C. Olds, (reissue)	118	6,543
Reaewing machine, E. Benjamin	130	165,436
Saccharine solutions, apparatus for filtering, Watson and Robertson	155	165,637
Safe door, N. Macneale	128	165,599
Saw guide, band, Young and Ferguson	130	165,523
Sawing machine, band, B. D. Whitney	130	165,463
Saw mill, W. T. Wayne	130	165,521
Saw set, J. E. Whiting	131	165,464
Scales, trileaf, Crane and Miner	132	165,476
Seed drill, W. A. McClintock	133	165,603
Seed sower, J. Burke	133	165,406
Separator, grain, W. S. Clymans	159	165,544
Sewing machine shuttle, C. E. Billings	134	165,405
Sewing turned shoes, machine for, E. P. Richardson	134	165,506
Shaft coupling, A. B. Cook	87	165 546
Sheet metal spouts, making, M. S. Leidy	136	165,506
Ship's galley, Lusby and Smith	154	165 423
Shoemaking, nail for, L. R. Blake	16	165,470
Shoe sole machine, J. W. Lefforts	16	165,595
Signals, circuit for electric, Hall and Snow	50	165,570
Skiving and welt splitting machine, J. W. Fifield	16	165,412
Sleighs, lance for propelling, A. Corbett	31	165,547
Sleighs, runner for, H. Smith	31	165,624
Snow plow, E. G. Graves	122	165,563

	Class No.	No. of Patent.
Soap, S. Strunz	26	165,627
Soap, transparent advertising, S. Strunz	26	165,628
Spindle, lubricating, A. M. Wade	142	165,433
Spoke socket, J. B. Blatt	31	165,403
Stamps and sealing letters, machine for attaching, E. F. Thomas	146	165,520
Stone and cement, composition for, A. Boag	153	165,533
Stone and marble, machine for dressing, O. Abell	153	165,524
Stool, G. C. Winchester	62	165,434
Stove, J. L. Roberts	154	165,508
Stove and heat radiator, combined, N. H. Lenharr	154	165,597
Stove, heating, H. G. Giles	154	165,414
Stove pipe drum, B. F. Stockford	154	165,517
Straw cutter, C. F. and M. Stewart	59	165,514
Table, folding, J. Walton	62	165,457
Table, ironing, C. Rumens	91	165,511
Table slide, extension, L. N. Willard	62	165,642
Tables, slider for extension, A. Weaver	62	165,459
Teeth protector, A. Hopfen	156	165,584
Telegraph, automatic electric, W. E. Sawyer	158	165,620
Telegraph lines, underground, D. Brooks	158	165,535
Telegraph, non-interfering fire alarm, J. W. Kates	50	165,591
Telegraph relay, pocket, Hill and Schneider	158	165,578
Thermostat, electric, E. J. Frost	50	165,413
Thermometer, registering, J. V. Raymond, (reissue)	101	6,544
Ticket case, W. H. Crowther	146	165,478
Ticket case, Crowther and Collins	146	165,479
Tobacco pouches, mouth piece for, B. Morahan	160	165,606
Trap, animal, H. H. C. Arnold	143	165,526
Trap, animal, J. M. Wilkinson	143	165,643
Tree box, E. Russell	63	165,455
Valve, globe, H. P. Buffon	152	165,537
Valve, stop, J. O. Morse	167	165,493
Vehicle spring, S. E. Foster	31	165,441
Vehicle spring, W. F. Whitney	31	165,641
Vehicle wheel, S. L. Bond	31	165,471
Vehicle wheel, C. Jeantand	31	165,587
Velocipede, ice, C. M. Day	31	165,481
Wagon brake, Garth and Rosser	31	165,487
Wagon brake, W. Lackman	31	165,592
Wagon or sleigh, dumping, J. Pattison	31	165,609
Washing machine, J. H. Harris	91	165,573
Washing machine, J. D. Lawlor	91	165,421
Washing machine, S. P. Loomis	91	165,598
Washing machine, E. H. F. Schneider	91	165,429
Watch key combination tool, O. D. Warfield	36	165,635
Water closet seat, F. Fahj	8	165,553
Water closets, water supply apparatus for, I. Riley	8	165,507
Weather strip, Hoffman and Shoemate	30	165,489
Wick trimmer, D. T. Bates	90	165,402
Windmill, W. Walker	118	165,634
Windmill and watering apparatus, Richardson and Harkness	118	165,505
Window frame, E. Roth	30	165,510
Window scaffold, A. T. Large	30	165,594
Wood, machine for splitting, J. A. Conover, (reissue)	174	6,541

INDEX OF PATENTEES TO WHOM PATENTS WERE GRANTED JULY 13, 1875.

	Patent No.
Abell, O., Machine for dressing stone and marble	165,524
Alderson, F. B., Newspaper file	165,401
Ames, A., Firemen's extension ladder	165,525
Arnold, H. H. C., Animal trap	165,526
Baer, D. W., Metal punching machine	165,466
Baer, J. H., assignee	165,595
Baird and Riley, assignees	165,507
Baker, G. W., Cracker machine	165,527
Ball, J., Envelope machine, (reissue)	6,540
Barber, H. A., Rotary pump	165 528
Barnes and Johnson	165,588
Barrett, J., Apparatus for tapping barrels or casks of fermented liquors	165,467
Bartlett, G. D., assignee	165,635
Bates, D. T., Wick trimmer	165,402
Bayer, A., assignee, (reissue)	6,544
Belfry, H., assignee	165,450
Bell, W. E., Car coupling	165,529
Bellamy, H. R., Pavement	165,530
Benjamin, E., Reaewing machine	165,436
Bennett, W. H., Eraser holder	165,531
Benson, J., Vapor burner	165,468
Berry, J., Machine for polishing machine needle eyes	165,532
Best, E. T., assignee	165,551
Bierce, C. A., assignee	165 626
Billings, C. E., Sewing machine shuttle	165,405
Birmingham, G. W., Device for regulating car ventilators	165,469
Blake, J. A., Machine for checking gun stocks	165,404
Blake, L. R., Nail for shoemaking	165,470
Blatt, J. B., Spoke socket	165,403
Boag, A., Composition for stone and cement	165,533
Bond, S. L., Vehicle wheel	165,471
Bonker, G., Exhaust mechanism	165,437
Bortree, M. K., Corset	165,534
Bowen, F. A., assignee, (reissue)	6,538
Bragg, R., Gong attachment for engine houses	165,438
Brinckeroff, H. W., Elevator	165,472
Bronson, E. D., & Co., assignees	165,458
Brooks, D., Underground telegraph line	165,535
Brown, D., Apparatus for transmission of goods, packages, &c.	165,473
Brown, W. A., assignee	165,605
Brown, W. L., and J. B. Cramer, Fence wire stretcher	165,536
Buffon, H. P., Globe valve	165,537
Bullock, M. C., Conical roller thrust bearing	165,538
Bullock, M. C., Rock drilling machine	165,539
Burke, J., Seed sower	165,406
Burtless, M., Portable fence	165,439
Bushnell, W., assignee	165,613, 165,650
Cady, R. E., Conductor for nail rolling machines	165,474
Calkins, A. C., assignee	165,613, 165,650
Cashin, T. D., Needle sharpener	165,540
Cassidy, W., assignee	165,440
Chamberlin, C. A., Chain cable	165,541
Chapin, L. C., assignee	165,451
Chick, W. H. and J. S., assignees	165,615
Churchill, P., assignee	165,566

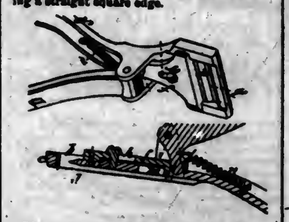
TITLES, DRAWINGS, AND CLAIMS

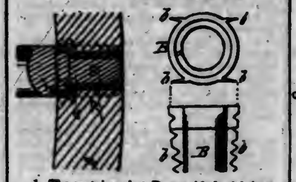
OF

PATENTS GRANTED JULY 13, 1875.



165,401. NEWSPAPER-FILES. Franklin B. Alderson, San Jose, Cal. [Filed Jan. 23, 1875.]

The rule-jointed stop *c* and arms *a*, in combination with the bars *A B* of a temporary binder, said bars being recessed to receive said stops or standards, as described.

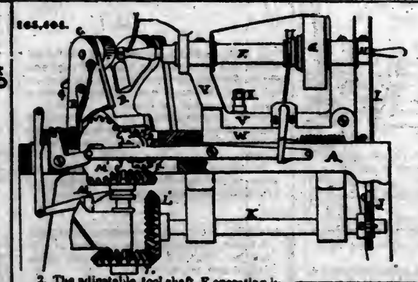


165,402. WICK-TRIMMER. D. T. Bates, Hollister, Mass. [Filed Jan. 2, 1875.]

Brief.—A stationary handle, having a knife-bed at the front of an opening therein, is provided with a sliding knife or cutter, which moves at right angles to the line of movement of the handle, and is operated by a suitable lever and spring; the construction permitting a flat lamp-wick to be introduced between the knife and its bed, where it is trimmed, leaving a straight square edge.

The combination of the stock or handle A, with its opening *b*, the pivoted lever B, acting directly on the slide *f*, the cutter *d*, which moves in a line at right angles to the line of movement of the handles, and the spring *e*, all constructed and arranged to operate substantially in the manner and for the purpose set forth.

165,403. SPOKE-SOCKETS. John L. Blair, Reading, Pa. [Filed Dec. 16, 1874.]



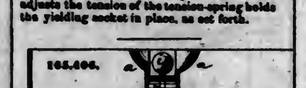
1. The metal socket B, provided with interior shoulder *a* and exterior toothed or corrugated ribs *b b*, substantially as and for the purposes set forth.

2. The combination, of the felly A, metal socket B, with ribs *b*, and the spoke C, with tenon D, all constructed substantially as and for the purposes set forth.

165,404. MACHINES FOR CHECKING GUN-STOCKS. Josiah A. Blake, Providence, R. I. [Filed June 9, 1875.]

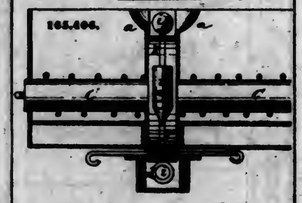
Brief.—The machine is especially designed for checking that portion of the stock upon which the thumb of the right hand rests in firing. The stock is carried in a reversing swing, and acted upon by a rotating cutter.

1. The tera-plate B, having perpendicular posts C and C', supporting a swing, D, the whole arranged and operating substantially as described, for the purpose of holding and presenting the receiver to the action of the cutting-tool.



2. The adjustable tool-shaft F operating in combination with the tera-plate B and swing D, the whole constructed and arranged in the manner substantially as described.

3. The feeding mechanism, consisting of the crank H, reciprocating lever I, ratchet J, shaft K, miter-wheels M M' and L L', pinion N, or its equivalent, in combination with the rack O, and swing D, and shaft F, the whole constructed and operating in the manner substantially as described, for the purposes specified.



165,405. SHUTTLES FOR SEWING-MACHINES. Chas. E. Billings, Hartford, Conn. [Filed May 17, 1875.]

Brief.—A sewing-machine shuttle having an adjustable screw in its forward end, which, respectively, serves to regulate the tension of the sliding socket for bobbin and of the tension-spring.

The combination of the screw F, the socket D, and the tension-spring C, the several parts being constructed and relatively arranged as shown and described, whereby the screw which adjusts the tension of the tension-spring holds the yielding socket in place, as set forth.

165,406.

165,406. SAND-SCREWS. John Burke, Sycamore, Ill. [Filed Apr. 19, 1875.]

by Letters Patent, is as follows:

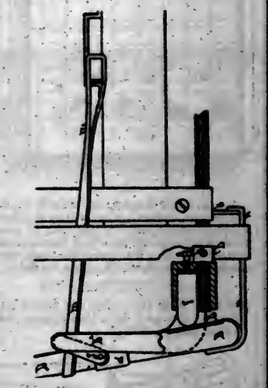
1. In a seed-planter, the partition-wings D, with the corners turned at a ew as to form an opening to give access to the seed-cups, substantially as specified.

2. The springing or elastic shell *i* of the seed-cup, substantially as and for the purpose described.

3. The combination of the springing shell *i*, having stops at its rear end, with the cover *h* and stop *j*, substantially as and for the purposes set forth.

4. In a seed-planter, the partition-wings D, with turbed corners to form an opening for the cups, in combination with the flanged feed-wheel F *h* and stops *i*, substantially as and for the purpose set forth.

165,407.



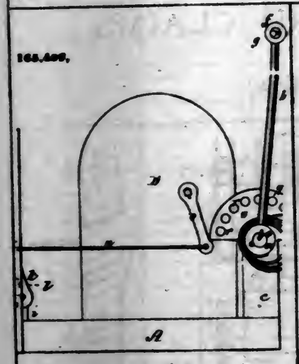
165,407. BALE-TIES. Paul R. Dawson, Brenham, Tex. [Filed Apr. 16, 1875.]

A cotton-bale tie, consisting of the loop A, provided at one end thereof with the elongated apertures B, and at the other end thereof with the transverse aperture C, the lug K on the inner side of the loop, and the lug D, one side of which is inclined or cut away to allow the end of the loop to freely pass, combined together, as and for the purposes described.

In testimony that I claim the foregoing, I have hereunto set my hand.

165,408. LOOM PICKING MECHANISMS. D. M. Collins, Lowell, Mass. [Filed May 1, 1875.]

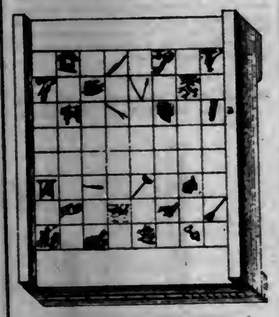
1. The forked stand B, constructed as described, with divisions B' B'', in combination with the arms *g g* and picker-staff D, provided with the picker *b*, whereby the said picker is caused to travel in a line parallel with the shuttle-race, as described.



2. The forked stand B, constructed as described, with divisions B' B'', and a notch for the fulcrum *f*, in combination with the rocker-shaft A, picker-staff D, and arms *g g*, substantially as described.

3. The adjustable fulcrum *f* and its set-screw *e*, in combination with the forked stand B, picker-staff D, and arms *g g*, as described.

4. The clasp *d*, constructed as described, with opposite studs *c*, in combination with the picker-staff D, the arms *g g*, and the forked stand A, as described.



165,409. AUTOMATIC FIRE-LIGHTERS. M. Curran, Manhua, N. H. [Filed June 22, 1875.]

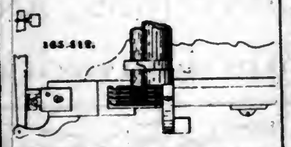
165,409.

The combination of the adjustable stop q, the arm D, with its match-holder f and spring d, the lever E, operated by clock-work, and the friction-plate E, substantially as and for the purpose set forth.

165,410. GAME-BOARDS. C. B. Edwards, Buffalo, N. Y. [Filed Feb. 20, 1875.]

A game-board divided into squares, the alternate squares being provided with enigmatical pictures suggestive of proverbs, in combination with checker-men, each having a picture corresponding with one on the board, substantially as and for the purposes set forth.

165,411. PEG-CUTTERS FOR BOOTS AND SHOES. George L. Ellis, New Albany, Ind. [Filed May 14, 1875.]

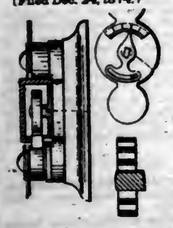


In an apparatus for cutting pegs from boots and shoes, the frame A, having a serrated under surface and an end guard, B, in combination with the adjustable corrugated cutter C, provided with the slot D and set-screw E, substantially as shown and described.

165,412. SEWING AND WELT-SPLITTING MACHINES. John W. Field, North Brookfield, Mass. [Filed Apr. 28, 1875.]

1. The combination, with the main and auxiliary feed-wheels, of the sectional presser-foot, substantially as described.

2. The removed sectional presser-foot combined with the auxiliary feed-wheels, and arranged with relation to each other substantially as described.



3. The combination, with the sectional presser-foot and auxiliary feed-wheels, of a series of levers, adapted to bear upon the sections of the foot with like or with varying degrees of force, substantially as described.

4. The combination of the removable knife-bearing table with the main and auxiliary feed-wheels and presser-foot, substantially as described.

In testimony whereof I have signed my name to this specification in the presence of two subscribing witnesses.

165,413. ELECTRIC THERMOSTATS. Edwd. J. Frost, Philadelphia, Pa., assignor of one-half his right to J. Hoehnlen, same place. [Filed Dec. 24, 1874.]

1. The thermostat consisting of a compound strip formed into a flat spiral, a central adjusting-screw, and the casing or covering, substantially as set forth.

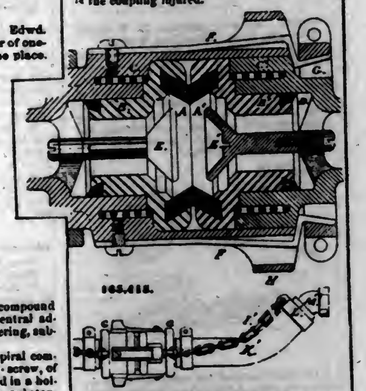
2. The combination, with the spiral compound strip and central adjusting-screw, of the index plate and index concealed in a hollow in the base of the thermostat, substantially as set forth.

165,414. HEATING-STOVES. Henry C. Giles, Troy, N. Y. [Filed Apr. 7, 1873.]

Brief.—The draft passes over the magazine and under the oven. The magazine is fed through the oven. Hot air is carried in pipes to the oven from heating-flues surrounding the base of the magazine.

165,414.

1. The oven A, flue or flues B, and aperture E, in combination with a feeding-magazine, M.



2. The oven space C, aperture E, and flue G, in combination with a feeding-magazine, M.

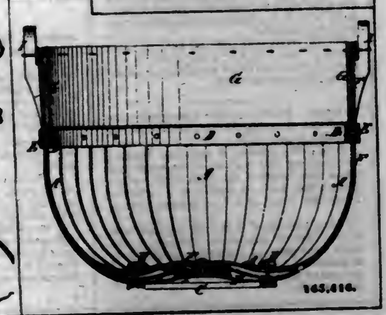
3. The oven-space C, flue or flues B, aperture E, and exit-flue F, in combination with a feeding-magazine, M.

4. The top K, flue or flues B, and lid L, in combination with a feeding-magazine, M.

165,415. HOSE-COUPLINGS. Wm. M. Henderson, Philadelphia, Pa. [Filed June 5, 1875.]

Brief.—The cone-shaped elastic rings form the facial joints, and fit into grooves turned in the faces of the movable seats, which fit the cylindrical shells. The shells have packing-rings at their extreme ends, to prevent leakage, as shown. The coupling has suitable clutch-springs and clamp-rings, so that when separated by accident no leakage occurs, nor is the coupling injured.

165,415.



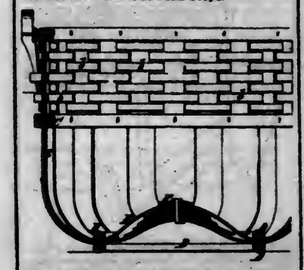
1. The fixed plugs or stoppers E E', in combination with the shells C C' and movable seats B B', whereby the vent or passage through the coupling is made at or near the mouth of each half of the coupling by the direct agency of contact of the facial joint, all as herein set forth, for the purpose specified.

2. In a hose coupling, as described, the internally-beveled slotted clamp-rings G G' and flared clutch-springs F F', combined and acting with and upon each other, as and for the purposes specified.

3. The internally-beveled slotted clamp-rings G G' and flared clutch-springs F F', combined with the coupling C, flexible hose K K', forked check-chains I I', and hose-clamps L L', all connected and acting with and upon each other, as and for the purposes herein set forth.

4. In a hose coupling, as described, the combination of the springs F with the horn-plates N, with or without the guards H, substantially in the manner and for the purpose specified.

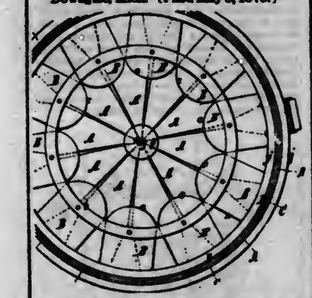
165,416.



165,416.

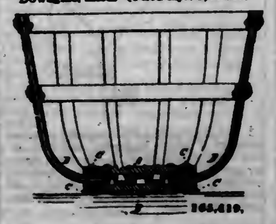
165,416. STAVE BASKETS. Horace C. Jones, Dowagiac, Mich. [Filed Feb. 26, 1875.]

The stave basket, having long outside staves F, short interior staves A, extending from the bottom of the basket to the inner and outer hoops D E, which embrace the center of the basket, and secured between said hoops by rivets, and the broad interior skirting-board O, extending from the top of the basket to about the top of the outer hoop, fastened at its upper edge to the basket, but left free at its lower edge, whereby the shrinkage or warping of the skirting-board will not affect the staves of the basket, substantially as set forth.



165,417. GRAIN-BASKETS. Horace C. Jones, Dowagiac, Mich. [Filed Apr. 8, 1875.]

Brief.—The inner and outer staves are both reduced to splints above the middle hoops, and are interwoven with horizontal splints between the middle and rim hoops.

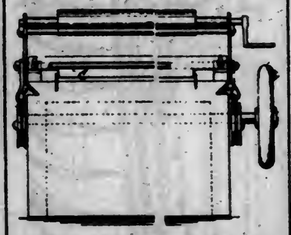


A stave-basket, as herein set forth, made up of horizontal splints and inner and outer staves, the upper ends of both the inner and outer staves being reduced to splints between the middle and the rim hoops, all combined substantially as and for the purpose described.

165,418. STAVE BASKETS. Horace C. Jones, Dowagiac, Mich. [Filed May 8, 1875.]

A basket formed of short intermediate tapered staves A, inner staves B, and outer staves C, arranged and united together substantially as described.

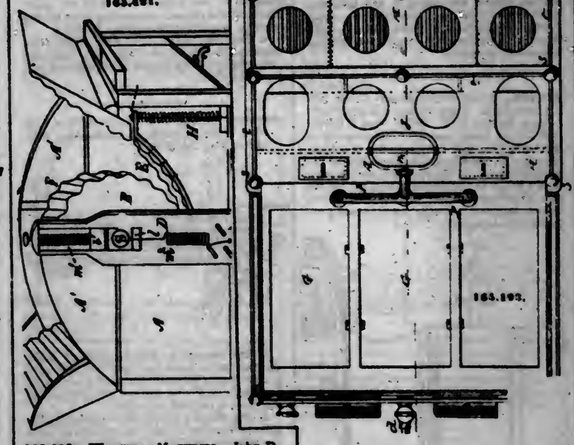
165,419. STAVE BASKETS. Horace C. Jones, Dowagiac, Mich. [Filed Apr. 8, 1875.]



165,419.

A stave-basket, consisting of the staves D, passing between hoops C C, one on the inner, the other on the outer side, and disks A B, surrounded by said hoops, both hoops and disks being bolted together by rivets passing through the staves, and being also united by nails driven laterally into each disk through its surrounding hoop, substantially as described.

165,420. MANUFACTURE OF IMITATION FABRICS. Charles H. Knelles, New York, N. Y., assignor to New York Manufacturing Leather Company, same place. [Filed Dec. 4, 1874.]



Brief.—Spreads composition on molding-table, then draws cloth screen table, enwinding it from a roll, and pressing it into the compound by a blade.

1. The process of producing a fabric from a mold in the manner described, so that the compound and the backing shall be applied to the face of the mold at the same time, substantially as set forth.

2. The combination of a blade suspended in a frame above a table a distance of the thickness of a mold and the compound and backing composing the fabric, in combination with a roller for carrying the backing, and with the said table each frame being capable of motion across the table, substantially as described.

165,421. WASHING-MACHINES. John D. Lawlor, Montreal, Canada. [Filed June 2, 1875.]

In a washing-machine, constructed as herein before described, the combination of the rectangular box A, adjustable sides A', inclined wash-boards C' and C², concave wash-board E, cylinder B, spring-rod m², having a regulating-spring, m³, and spring-rod H, the several parts being constructed, combined, and arranged to operate substantially in the manner and for the purpose set forth.

165,422. BUCKLES. William Lesser, Cincinnati, Ohio. [Filed July 29, 1874.]

A buckle, the frame of which consists of one piece of metal, slotted at the front, and provided with tongues, and having at the rear an elliptical opening, beneath which the cam-lever H is journaled in depending ears, substantially as shown and specified.

165,423. SIEVE GALLEYS. James A. Lusby and John V. Smith, Washington, D. C., assignors of one-half their right to Walton Brothers, New York city. [Filed June 10, 1875.]

Brief.—The products of combustion can be sent from either fire place to both sides or to either side of the elevated oven.

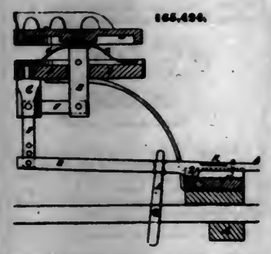
1. The fire-boxes B B' and warming-oven I, in combination with the partition e, oven H, perforated partition f, dampers h h', oven H, and partition m, extending into the stove-pipe collar J, all as and for the purpose set forth.

2. The flues E and E', in combination with the flues P and P', damper i, partition f, boilers G, and oven H, all constructed and operating as and for the purpose specified.

3. The combination, in a ship's galley, of the front and rear fire-boxes B B', ovens I H, partitions e, f, and m, flues P P' and E E', and the dampers h i, all arranged substantially as and for the purposes herein set forth.

4. The railing S on the galley, provided with hinged end pieces t, substantially as and for the purposes herein set forth.

In testimony that we claim the foregoing as our own we affix our signatures in presence of two witnesses.



165,424. SAFETY-SEATS FOR HARVESTERS. William R. Mattison, New Brunswick, N. J., assignor to William R. Mattison and Edwin Gulick, same place. [Filed Oct. 24, 1874.]

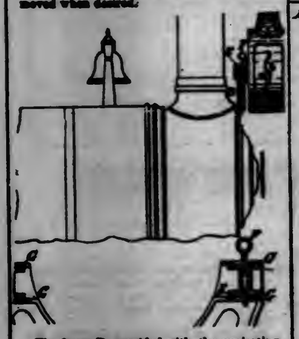
Brief.—In addition to the weight of the driver in his seat, the clutch is held engaged by a foot-lock, which is released when the driver leaves the machine.

165,421.

165,424.

165,426.

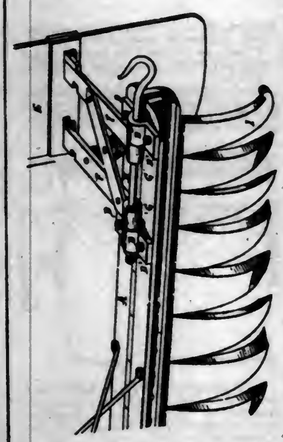
The bar H, formed with the shoulder h', and carrying the foot-rest K, in combination with the elbow-lever F, the bar E, the seat D, the spring C, the plunger B, and the lever I, substantially as herein shown and described.



165,427. METAL-TURNING LATHE. Henry M. Quackenbush, Herkimer, N. Y. [Filed May 20, 1875.]

The construction of parts, substantially as herein shown—that is, constructing the main bearing of a bab or sleeve, c, mounted adjustably upon the arbor D, or secured to or making part of the pulley E, and both susceptible of end-wise adjustment upon the arbor D, whereby the tapering plug d of the nut is fitted to its seat, and advantages are obtained essentially as stated.

165,428. LOCOMOTIVE HEAD-LIGHT ATTACHMENT. Thos. S. Ray and Charles T. Hess, Buffalo, N. Y. [Filed June 7, 1875.]

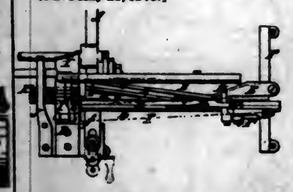


Brief.—A frame connected permanently to the locomotive and two projecting pieces on the lamp, so arranged that either side of the attachment may be disconnected, and thereby form a hinge on the opposite side, so that the face of the lamp may be turned to either side of the road, and the lamp itself be easily removed when desired.

The frame E, provided with the projecting pieces G, in combination with the parts E, removable pins F, and lamp D, substantially as and for the purposes specified.

165,429. ICE-PLOWS. Rodman W. Sanborn, Rochester, N. Y. [Filed Dec. 3, 1874.]

Brief.—An adjustable and detachable gage may be turned to either side of the plow-beam. Diagonally-faced teeth plow the outside of the groove in the ice, while a diamond-pointed tooth plows the center of the ice-groove.



1. The combination, with an ice-plow, of a gage or guide plate, hinged or pivoted to the plow-beam, and capable of being turned on its axis, for bringing it to either side of the plow, substantially as described, for the purpose specified.

2. The combination of the pivoted support-ing-arms F and horizontally-adjustable gage-board E, as and for the purpose specified.

3. The combination, in an ice-plow, of the thimble D and draft-rod H, with the gage-board E and pivoted supporting-arms having eyes G, as and for the purpose specified.

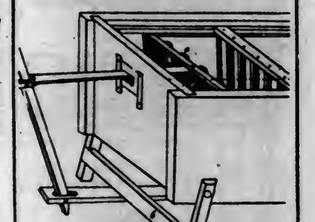
4. The combination, in an ice-plow, of a diamond-pointed tooth or teeth, with right and left cutting chisels or teeth, as and for the purpose described.

165,430. LOOMS FOR WEAVING PILE FABRICS. Stephen Sanford, Amsterdam, N. Y. [Filed May 20, 1875.]

1. The stationary wire-supporting table, elevated at its outer end, and provided with a wire motion, in combination with a shuttle-box made rigid with the lay, substantially as and for the purpose described.

2. The yielding wire-table, for relieving the shuttle-box when the shuttle is caught between the table and the box, substantially as and for the purpose described.

3. The adjusting cam or lever f, in combination with the yielding wire-supporting table, substantially as and for the purpose described.

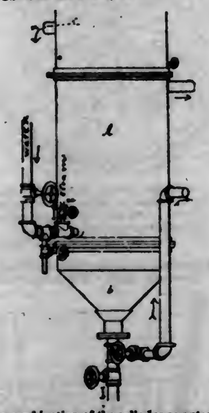


4. The combination of a wire-severing latch and an inserting-pusher, and a stationary wire-supporting table, having a groove in line with the point of withdrawal, and a groove leading to the point of insertion, and a spring-switch so arranged as to bear upon the wire head, and place the wire in position for insertion in the shed, as and for the purpose described.

5. The combination of the wire guide or guides I and J with a stationary wire-supporting table, which is elevated at its outer end, and is provided with a wire motion, and constructed to permit a shuttle-box, which is rigid with the lay to be used, substantially as and for the purpose described.

6. The spring-guards m and n, in combination with the stationary grooved wire-supporting table, substantially as and for the purpose described.

165,431. WASHING-MACHINES. Ernest H. F. Schneider, Lawrence, Kans. [Filed Jan. 14, 1876.]



Brief.—Within a wash-box, having a central slatted partition and beveled cleats at each end, is a reciprocating box with a slatted bottom and ribbed ends.

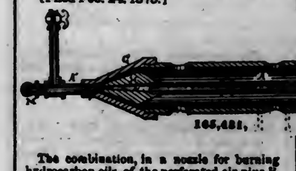
In combination with the reciprocating box B, having open slat bottom e, and at its ends vertical bars c and elongated opening g g of the tub A, provided with the stationary partition composed of vertical bars b, and having at its ends bevel-cleats f f, substantially as described.

165,432. LIQUID-COOLERS. Benj. F. Shaw, Cambridge, Mass., assignor to himself, E. Kendall, and Geo. B. Roberts, same place. [Filed Apr. 14, 1875.]

Brief.—The cooling-tubes have removable cores suspended from cross-bars, which enter eyes or open rims at their upper ends. Liquid to be cooled passes through the strainer and the annular passage between tubes and their cores. Has an overflow just below the strainer. May be delivered, overflow or original flow, to strainer by pump, and an automatic float may regulate quantity to be delivered. Annulenses, when clogged, are cleared by steam.

1. The combination of the cylinder or outer vessel of a cooling apparatus and strainer, with tubes, and cores within the tubes, forming annular passages of small capacity to operate in connection with the liquid to be cooled, and with the cooling medium, substantially as described.

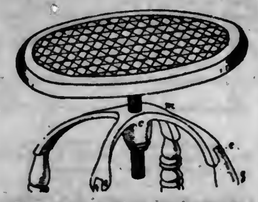
2. The combination of the strainer, the cylinder or outer vessel A, vertical cylindrical tubes and removable cores, with a liquid-receiving chamber or portion, c, and a chamber, b, for the reception of the cooled liquid, substantially as described.



3. The combination of the strainer, and cylinder or outer vessel A, and tubes and cores for conducting the melted liquid, with a pipe and adjustable inlet or valve to regulate the flow of the cooling liquid, and an adjustable outlet or valve, and pipe to regulate the flow of the liquid to be cooled, substantially as described.

4. The combination of a cylinder containing the cooling medium, and internal tubes for the passage of the liquid to be cooled, with a chamber for the reception of the liquid to be cooled, and provided with an outlet for the overflow of the liquid to be cooled, substantially as described.

5. The combination, with the strainer and the cylinder to contain the cooling medium, of internal tubes for the passage of the melted liquid to be cooled, pipe and valve to control the flow of the cooling medium, and a pipe and valve to control the admission of steam into the cylinder, substantially as and for the purpose described.



In testimony whereof I have signed my name to this specification in the presence of two subscribing witnesses.

165,433. NOZZLES FOR HYDROCARBON-FURNACES. Henry Stacey, Indianapolis, Ind. [Filed Feb. 24, 1875.]

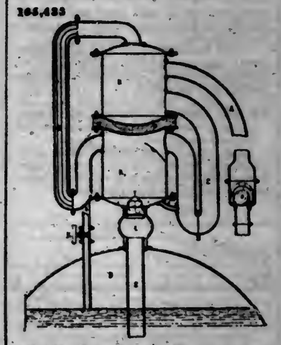
The combination, in a nozzle for burning hydrocarbon-oils, of the perforated air-pipe E, steam-pipe A, conical nozzles H and G, whereby the quantity of air is controlled, with the oil-supply pipe N, in front of the combined air and steam-pipes, by which means the oil is introduced into the furnace in the form of spray, substantially as specified.

165,434. STOOLS. George C. Winchester, Ashburnham, Mass. [Filed Jan. 2, 1875.]

The arched supporting-cross m, having dovetailed sockets s, combined with the legs p, having dovetailed upper ends f, all as and for the purpose set forth.

165,435. FEEDING APPARATUS FOR STEAM-BOILERS. Nicolas Yagn, Syzran, Russia. [Filed Aug. 11, 1874.]

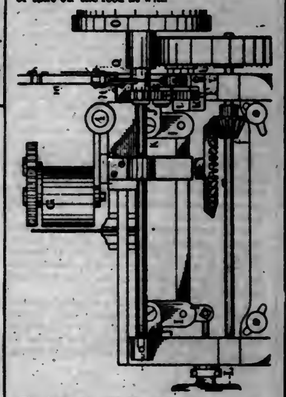
Brief.—Steam from the boiler forces water out of the lower reservoir into said boiler. When the water in the pipe which communicates with the upper part of both reservoirs falls below the lower bend therein, steam ascends. Said steam and the water in the pipe are divided into small columns by the partitions in said pipe. The water in the upper is then forced into the lower reservoir, where a vacuum is produced, which holds the valve in the pipe leading to the boiler to its seat. The upper reservoir then refills, and the operation is continued automatically.



1. A self-acting feeding apparatus having two reservoirs, E E', placed one above the other, and communicating with each by means of pipes B C, with the boiler by pipes f E, and with a well or cistern by means of a pipe, A, substantially as herein described.

2. The combination, with the chambers E E', of the pipe B, provided with partitions c c, as and for the purpose described.

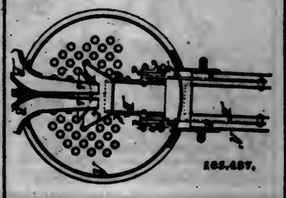
3. The combination, with a pair of reservoirs, R R', supported one above the other, with an intervening cushion, O, as described, of the pipes A B C d E f, when constructed and operating substantially as described.



4. In feed-water apparatus for steam-boilers a feed or supply pipe or conduit, B, provided with radial partitions c c, substantially as and for the purpose described.

165,436.

165,436. RESAWING-MACHINES. E. Benjaman, Chicago, Ill. [Filed Dec. 19, 1874.]



Brief.—The lumber for resawing can be run back rapidly from the saw, when desired, by means of a friction back-gear, in connection with an intermittent gear and suitable feed-gear. A lever attachment is used to reverse or take off the feed at will.

The lever m, with its weighted arm l, in combination with the friction-rollers a b, wheel c, pulley O, slotted plate R, and gear T g W f, as and for the purpose set forth.

165,437. EXHAUST MECHANISMS. George Bonker, Port Jervis, N. Y. [Filed June 12, 1875.]

Brief.—An adjustable pipe is arranged within the petticoat-pipe of a locomotive, and is constructed to be raised or lowered to produce the desired draft.

165,437.

165,438. CALENDAR-CLOCKS. W. A. Terry, Bristol, Conn. [Filed May 14, 1875.]

Brief.—A perpetual calendar in which the varying changes of the months and years are regulated by the contact of a compound lever with certain stop devices.

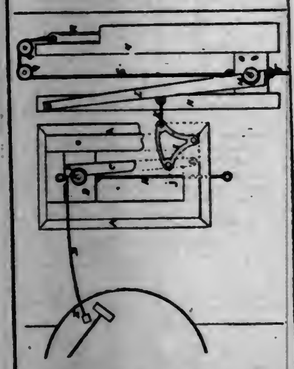
1. A pawl or lever, which operates the month-wheel, arranged to move a distance varying to correspond with the length of the months, in combination with a pin or other particular point of engagement with or upon the month-wheel, substantially as set forth.

2. The wheel A, provided with the pin for regulating the number of days in the month, in combination with the wheel B, cam C, lever E (and F and d, all operating together substantially as described.

3. The spring-pin g, in combination with the wheels A E, and lantern b of the frame D, all operating together substantially as described.

4. The combination of the wheels A B, cam C, lever E F, wheel G, and points 2, all operating together substantially as described.

5. The wheels G H, revolving together with a differential motion, in combination with the adjustable leap-year point, substantially as and for the purpose described.



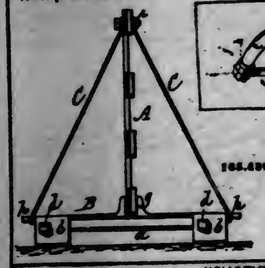
1. The tapering-formed shell B', arranged as shown, relatively to the blast-nozzles *b* and movable pipe D, and receiving the lower edge of the latter on its swelled surface, and compelling it to rest concentrically thereon, for the purposes specified.

2. The movable sections D' D², and means for elevating and depressing them, in combination with the petticoat-pipe C, blast-nozzles *b*, and a stop-disk or shell, all arranged to operate relatively to each other and to the inclosing-chimney A, as and for the purposes herein specified.

3. The flaring mouth C' and the petticoat-pipe C, arranged, as shown, relatively to the lower section D² and to the nozzles *b* and stop-surface B', as specified.

165,439. GONG ATTACHMENTS FOR ENGINE-HOUSES. Robt. Bragg, San Francisco, Cal. [Filed June 16, 1873.]

Brief.—When alarm of fire is struck on engine-house bell, first blow releases a trigger, letting fall a weight, which withdraws halter-bolts, releasing the engine-horses.



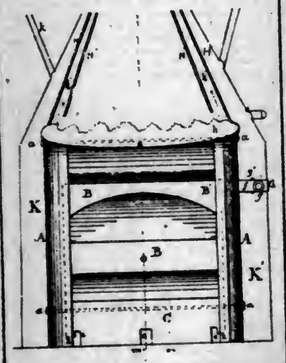
1. The rod, with its knob E and the oscillating lever C, for the purpose of releasing a suspended weight by the direct action of a gong-hammer, substantially as and for the purpose herein described.

2. In combination with the rod D and the recessed oscillating lever C, pivoted as described, the weight B and its roller G, for the purpose of relieving friction and removing the rod D from the action of the gong-hammer, substantially as herein described.

3. In combination with the weight B, caused to fall, as shown, the bell-crank lever I, cord K, and lever L, for releasing the slide O and weight R, and thus releasing the horses by means of the cord T, substantially as herein described.

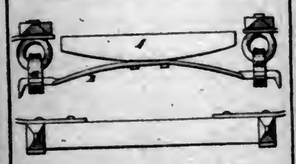
165,440. PORTABLE FENCES. M. Burliess, Seneca Falls, N. Y. [Filed May 24, 1875.]

Brief.—Two triangular hollow iron bases, provided with sockets, through which iron pins are driven to hold them firmly to the ground, are connected by an iron beam, on the upper side of which is a socket to support the lower part of the fence.



165,439.

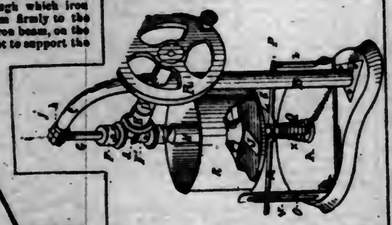
The cast-iron base B, consisting of the bar *a*, and hollow angular feet *b b*, constructed with the sockets *c c* for receiving the angular stakes *d d*, and with the socket *g* for holding the panels of fence, as herein shown and described.



165,440. FIRE-PLACES. Michl. Fitzpatrick, St. Louis, Mo., assignor to Wm. Cassidy, same place. [Filed Dec. 22, 1874.]

Brief.—By means of the double smoke-flue the hotter central current of smoke is separated from the external current, and can be carried higher before imparting its heat.

The double smoke-flue in the sheet-iron hood, in combination with a fire-place or grate, substantially as and for the purpose described.

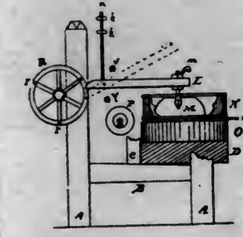


165,441. VEHICLE-SPRINGS. S. E. Foster, Minneapolis, Minn. [Filed May 21, 1875.]

In combination with the rubber spring *c*, the semi-elliptical spring-hooks B, substantially as and for the purpose set forth.

165,442. MEAT-CUTTERS. H. P. Goddard, Orange, Mass. [Filed June 2, 1875.]

Brief.—The meat to be chopped is put in a receptacle which is vertically adjustable. In this receptacle are two rotating knives—one moving to the right, the other to the left—which chop the meat.

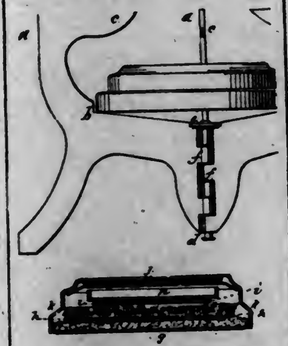


1. In a chopping mechanism, substantially such as described, the shaft G, provided with the knife J and gear F, and the sleeve H, provided with the gear F', and knife I, in combination with the tub K, gear E, standard B, and step Q, constructed and arranged to operate substantially as and for the purpose set forth.

2. In a chopping mechanism, substantially such as described, the tub K, arranged to slide vertically in relation to the knives I J, substantially as set forth and specified.

3. In a chopping mechanism, substantially such as described, the lever M, spring *x*, and serrated standard N, combined and arranged to operate substantially as and for the purpose set forth and specified.

165,443. MEAT-CUTTERS. A. B. Good, Conestoga, Pa. [Filed June 24, 1875.]

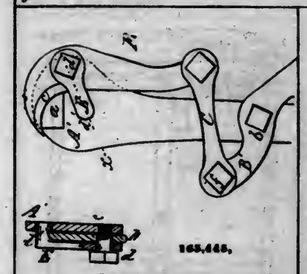


Brief.—The levers carrying the knives strike against a bar situated under the rear ends of the levers, and the descent of the knives is accelerated by the reaction of the bar.

The combination of the knife-carrying levers I, and the arresting-bar Y, arranged and operated substantially as and for the purpose specified.

165,444. NURSERY-LAMPS. Clark I. Gorham and E. J. Cubley, Chicago, Ill.; said Cubley assignor to said Gorham. [Filed June 4, 1875.]

Brief.—The leaves are held in relative position by means of the slits in the pintle-head.

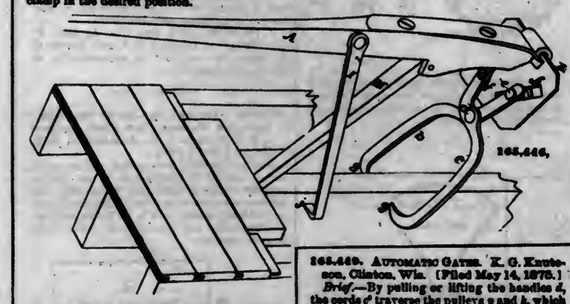


1. The pintle *d*, having a head, *e*, provided with slits *c*, in combination with the leaves *a*, substantially as and for the purposes specified.

2. In combination with a nursery-lamp, the plate *h*, located between the cotton and asbestos, and the disk *i* above the layer of asbestos, all substantially as and for the purpose set forth.

165,445. BOLT-TRIMMERS. Alex. Graham, Mumford, N. Y. [Filed Apr. 21, 1874.]

Brief.—The yoke E is constructed with a tenon passing loosely through the main bar, and is adjusted by a clamp-screw passing through the holding and cutting levers.



The combination of the lever A, provided with the recess *a* for holding the nut, with the cutting-blade D and adjustable yoke E, constructed and arranged to operate as set forth.

165,445.

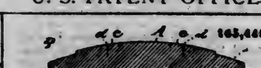
165,446. FLOOR-CLAMPS. Elijah Hickman, Red Bluff, Cal. [Filed Apr. 15, 1875.]

Brief.—The clamp consists of a handle or lever, to one end of which is secured a hinged plate provided with two inclined slots, and to which are attached, by rivets working in said slots, two pivoted gripping-jaws, which clamp the sides of the joist, a pivoted brace-bar for pressing the boards together, and a retaining-bar pivoted to the lever, and provided at its lower end with a hook, for holding the clamp in the desired position.

165,446.

The handle or lever A, having the loosely-attached plate E, provided with the converging slots *f*, in combination with the shear-like gripping-jaws *b c*, headed slides or rivets *e*, brace-bar H, and retaining-bar I, constructed to operate substantially as and for the purpose above described.

165,447. LIQUID-MEASURING APPARATUS. James M. Hopkins, Louisville, Ky. [Filed June 28, 1875.]

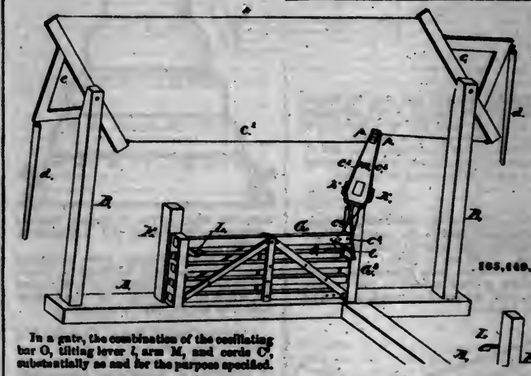


1. A cock that is provided with an opening to permit an inflow of liquid into the tank *a*, and an air-hole to permit the air to escape from the tank, and an air-hole to permit the air to escape from the gage-tube, substantially as shown.

2. In a measuring apparatus, a cock, provided with an air-hole for admitting air into the tank as the liquor is drawn off, and an air-hole for admitting air to the gage-tube, substantially as described.

165,448. MANUFACTURE OF BUTTONS. E. H. Libell, New Milford, Conn. [Filed Feb. 9, 1875.]

165,448.



1. As a new article of manufacture, a button made of one piece, on the surface of which is produced variously-formed and variously-colored figures, the figures being separated from the surrounding surface by divisions extending into the substance of the material, substantially as described.

2. The process for making colored and figured buttons, as described, consisting in dyeing the solid uncolored buttons, subjecting them to a softening operation, if the button be of a rigid material, depressing certain portions of the surface of the button by the instrumentality of engraved dies or stamps, removing the color from that portion of the surface of the previously-dyed button to which it is desired to give a different color or shade, and again dyeing, so as to affect directly the surfaces from which the color has been removed by the previous operation, which second dyeing may or may not affect the previously-dyed portions, which still contain a contrasting color.

165,449. AUTOMATIC GATES. K. G. Knutesen, Clinton, Wis. [Filed May 14, 1875.]

Brief.—By pulling or lifting the handles *d*, the cords *c'* traverse the pulleys *p* and *h*, which first causes the latch-bar O to oscillate and become unlatched from the latch-posts; then, by continued pulling upon the cords, the gate is swung open in one way or shut.

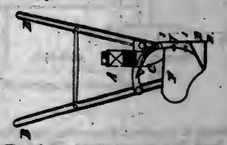
165,449.

In a gate, the combination of the oscillating bar O, tilting lever *l*, arm M, and cords C', substantially as and for the purpose specified.

165,450. CAR-COUPLINGS. Edwd. Marsden Law, Bell Ewart, Canada, assignor of one-half his right to Holland Bo'ger, same place. [Filed Feb. 12, 1875.]

165,450.

---



1. The angular compression-bar H, in combination with a hooked draw-bar, A, and the spring C, as set forth.

2. The angular compression-bar H, in combination with the buffer-bar F and spring G, substantially as set forth.

3. The cross-bar O, in combination with the sliding plate *p*, buffer-bar F, angular bar H, and spring G, substantially as set forth.

165,451. PLOWS. Wm. S. Lawrence, Kalamazoo, Mich., assignor of one-half his right to Lebeus C. Chapin, same place. [Filed Sept. 27, 1874.]

Brief.—A plate triangular in cross-section forms the colter of the plow, or front extension of both mold-board and land-side. A long upward extension curves over the furrow to clear the plow.

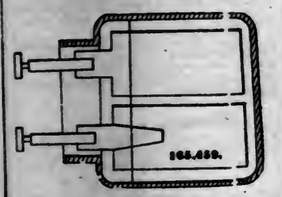
1. The plow-colter I, forming the forward extension of the mold-board and land-side, and having its top extended up and curved over the mold-board beyond the plow-standard, forming a clearer to carry the straw, &c., under the furrow, as specified.

2. The plow-standard C, extending up straight to form an attachment and support for the colter, and having an offset carrying the top of the standard back under the plow-beam, in combination with the plate K of the colter, as specified and shown.

165,452. GALVANIC BATTERIES. George L. Leclanche, Paris, France, assignor to H. L. Roosevelt. [Filed Dec. 16, 1874.]

Brief.—Incorporates the depolarizing substance with the negative element in the manner specified in claims, thus dispensing with the use of a porous cup.

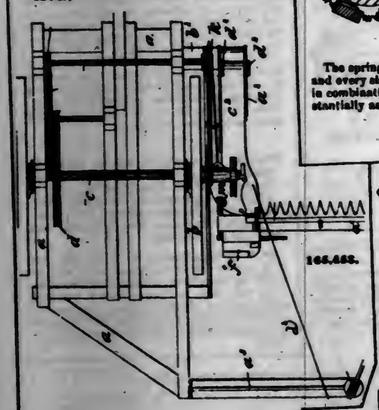
1. A galvanic battery in which the use of a porous cup is dispensed with, and in which an insoluble or slightly soluble depolarizing substance, as above defined, rendered solid, (with or without cement, by pressure,) is combined with a conductor and negative pole, substantially as and for the purposes set forth.



165,449.

2. A depolarizing body for connection with the negative pole of a galvanic battery, consisting, in whole or in part, of an insoluble or slightly soluble depolarizing substance, rendered solid, with or without cement, by pressure in a mold, substantially as and for the purposes set forth.

3. A galvanic battery in which the use of a porous cup or diaphragm, or its equivalent, is dispensed with, and in which the negative element consists of a mixture of an insoluble

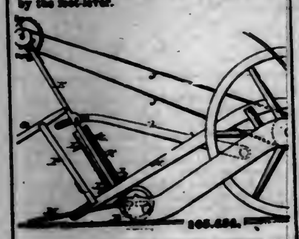


or slightly soluble depolarizing substance, as hereinbefore defined, and a conductor, with or without cement, rendered solid by pressure, substantially as and for the purposes set forth.

4. A negative element for a galvanic battery, consisting, in whole or in part, of a mixture of insoluble or slightly soluble depolarizing substance, as above defined, and a conductor, with or without cement, rendered solid by pressure in a mold, substantially as and for the purposes set forth.

165,453.

165,453. MOWING-MACHINES. David Lochhead, Hochelaga, Canada. [Filed Mar. 14, 1874.]



165,454.

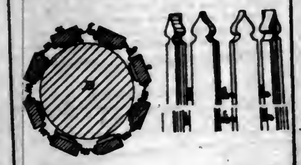
1. The link-frame c^1, and chair c^2, hinged together on one side by a ball-and-socket joint, b^1, on the other side by a cam-shaped plate, f^1 a^2, all operating as specified.

2. The finger-bar a^1, and supporting-arm c^2, in combination with the converging gathering-bars c^3 and d^3, substantially as specified.

165,454. HARVESTER-DROPPER. Thomas McDonough, Ottawa, Ill., assignor of one-fourth his right to B. K. Walbridge, same place. [Filed Apr. 6, 1870.]

Brief.—The cut grain is conducted by the adjustable inclined carrier to the dropper, which, with the guard or cut-off, is operated by the foot-lever.

165,454.



1. The inclined adjustable frame E, with brace G, rollers F and G, and apron K, as an attachment to a reaper, substantially as and for the purpose described.

2. The inclined adjustable frame E, in combination with the dropper M and lever N, substantially as and for the purpose described.

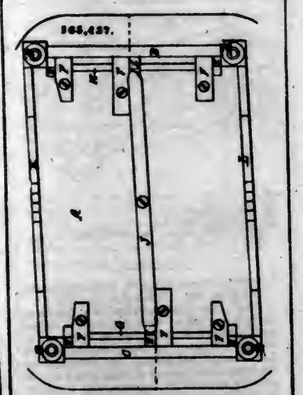
3. The inclined adjustable frame E and dropper M, in combination with the guard O and rod P, substantially as and for the purpose described

165,455. TREE-BOXES. Edward Russell, Davenport, Iowa. [Filed May 4, 1875.]

Brief.—Each slat is provided with a pad at each end, which form contact with the body of the tree, leaving a space between the slat and tree. The slats are secured together, both at top and bottom, by coiled springs, hooks, and eyes, so that any one or more slats can be removed at pleasure.

The spring or elastic band e between each and every slat, or strip, or section of tree-box, in combination with the slats and pads, substantially as described

165,456.



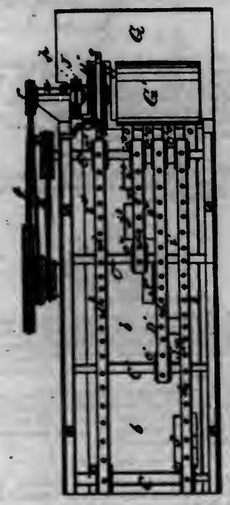
165,456. STANDS FOR FLOWERS. Samuel Vanstone, Providence, R. I. [Filed Sept. 9, 1874.]

Brief.—A conical-shaped vase, consisting of a series of chambers for containing water, and each having a perforated cover to receive the stems of cut flowers, the whole, when filled with flowers, forming a pyramid.

A standard for cut flowers, consisting of a series of water-vessels with perforated covers for receiving the stems of the flowers arranged in pyramidal or similar form, substantially as described.

165,457. FOLDING TABLES. Jos. Walton, Boston, assignor of one-half his right to Henry F. Rich, Haverhill, Mass. [Filed Dec. 28, 1874.]

Brief.—The same strip of wood that braces the legs when the table is set up serves to hold the legs against the under side of the table when it is folded. The legs are attached to the table by means of brackets and dovels.



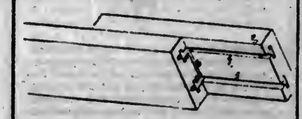
165,457.

1. A folding table composed of the top A, legs B, stretchers C D, and stretcher J, substantially as shown and described.

2. In combination, the top A, legs B, stretchers C D, brackets E F, and dowels G H, with the stretcher J, substantially as shown and described.

165,458. BROOM-CORN-SEEING MACHINES. Alphonso Walrath, Fort Plain, assignor to E. D. Bronson & Co., Amsterdam, N. Y. [Filed Apr. 17, 1875.]

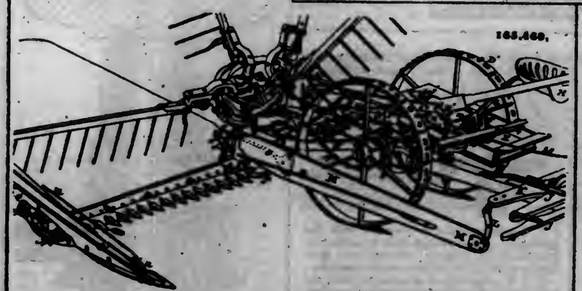
Brief.—The belts are sparred, and are of different lengths, to correspond to the various lengths of the broom-corn, which they distribute into the various bins. The corn is supported horizontally as it is fed to the machine automatically, and the stalks are cut off while in such position.



165,458.

1. The sparred and distributing belts D D^1 D^2 D^3, of different lengths, except the outer belts D D^3, which are of the same length, and the guide-strips f f^1 f^2 f^3, in combination with the bin, divided into several compartments, substantially as described.

2. The sparred feeding-wheels H H^1, in combination with the spring-fingers g g^1, supporting-plate G', and cutter J, substantially as specified.



165,459. SLIDES FOR EXTENSION-TABLES. Anthony Weaver, Syracuse, N. Y. [Filed Jan. 12, 1874.]

Brief.—The H-formed metallic slides are notched on one side to accommodate the holding-pins.

The H-formed metallic slides, each consisting of the flanged side pieces a a a, notched or recessed on one side to accommodate the holding-pins p, and connected by a web, A, in combination with the wooden rails grooved to receive the side pieces a a a, and recessed to accommodate the web A, while permitting the faces of the said wooden rails to work in close contact at the edges.

165,460. HARVESTERS. Cyrenus Wheeler, Jr., Auburn, N. Y. [Filed June 4, 1874.]

165,460.

1. The hinged supports B B' for the outside supporting-wheel T, in combination with the adjustable slide S, for raising or lowering said wheel upon its supports, substantially as described.

2. The rake-stand 24, with its branched legs 26 28, in combination with the legs a^2 a^3, wrist-studs b^2 b^3, and eyebolts 26 28, for the purpose of readily attaching and detaching said rake-stand and its connected parts to or from the inside shoe, as described.

3. The hinged and swinging shield-board M, with its spring-arm a, to crowd the grain toward the platform, and prevent it from clogging or slugging, as and for the purpose described.

4. The vertically-adjustable rail 30, in combination with the rake-reels, for the purpose of adapting said rake-reels to the platform, as described.

5. The windlass or drum C', with its ratchet n^1, for adjusting the length of the chain k, by which the raising, lowering, and holding the rear of the cutter-frame at a regulated height above the ground is effected, as described and represented.

6. The vibrating beam E', pivoted to a stand, F, on the rear-frame, in combination with the lever G', links J', and chain-connection k^1, as and for the purposes described.

7. The clearer 23, rigidly attached to the frame B, and projecting into the groove of the chain-wheel 18, for forcing the chain out of said groove, should it clog thereto, as described.

165,461. MOWING-MACHINES. Cyrenus Wheeler, Jr., Auburn, N. Y. [Filed Mar. 17, 1875.]

1. The gag-lever f, in combination with the lever G', vibrating beam E', rocking bar d^1, and its crank-arms d^2 and b^1, and chain and link attachment, so as to be operated by the driver from his seat, substantially as described.

2. The pendent gag g^1, attached to the frame A, in combination with the projection f^1 on the frame B, to limit the free upward motion of frame B, as described and represented.

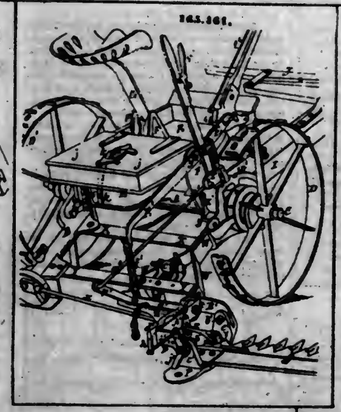
3. The hinged coupling-piece Z, for connecting the cutting apparatus to the cutter-frame, the said coupling serving also as a shield for the arm d^1 and rock-shaft d^2, as described and represented.

4. The combination of the frame B, wrought-iron Y-shaped frame W, and cross-braces X Y, to form a support for the coupling-piece Z, as and for the purpose described.

5. The construction of the gear-box, projecting rearward of the main axle, and slotted, as at 15, to allow the sleeve B to enter and play through, as and for the purpose described and represented.

6. The quadrant or arc W' on the rear frame, but projected over and forward of the axle C, in combination with the lever l^1, hinged to the rear frame below the axle, so as to bring said lever within convenient reach of the driver upon his seat, as and for the purpose described and represented.

7. The slotted abutment F, in combination with the seat-support G, for the purpose of transposing, reversing, and locking the seat, substantially as and for the purpose described.

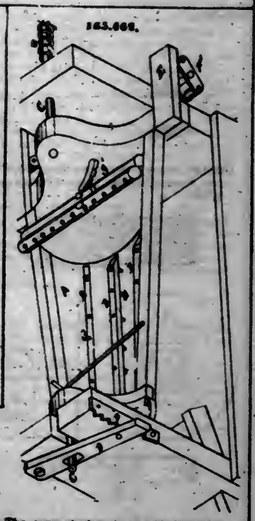


8. The rod q^1, in combination with the lever l^1 and arm r^1 on the coupling-piece Z, for the purpose of tipping the points of the guards or rocking the cutting apparatus about the pivotal rod or bar c, as described.

9. The gear-cover E and tool-box cover j, separately hinged, but both fastened by the same hook or hasp k l, as described and shown.

165,462. ORE-CONCENTRATORS. George W. White, San Francisco, Cal., assignor to Jas. M. Thompson, same place. [Filed Jan. 10, 1874.]

Brief.—The triple cam G, together with spring c on rod C, gives a concussive motion to the suspended cradle, while the double eccentrics F F and triple cam G give a rocking motion at the same time.

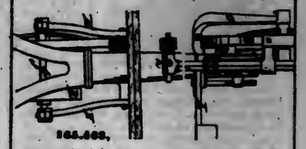


1. The concentrator A, having the double eccentrics F F, triple cam G, and rod C, with spring c, by means of which it has imparted to it oscillating and concussive movements, substantially as described.

165,461.

2. The concentrator A, provided with the suspended or raised longitudinal ledges or riffles B B, operating substantially as described, and for the purpose set forth.

3. The concentrator A, with its arms E E, adjustable suspending-rods C C', spring c, and adjustable lever D, with pawl and ratchet D^1, in combination with the shaft F', with its double eccentrics F F and triple cam G, substantially as described, and for the purpose set forth.



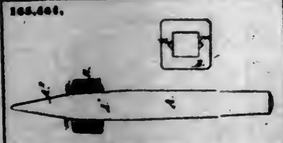
165,462.

165,463. BAND SAWING-MACHINES. R. D. Whitney, Winchendon, Mass. [Filed Sept. 21, 1874.]

Brief.—The axles of the wheels upon which the saw runs are provided with removable bearings placed in front of the saw.

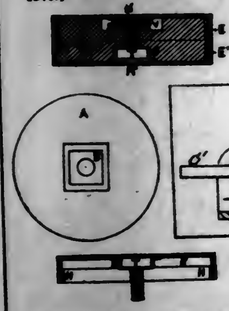
1. The yoke C, having bearings on both sides of the wheel E, in combination with the adjusting and compensating device, consisting of the slide D and the lever L, with its sliding weight W, the fulcrum of said lever being directly in the plane of the strain of the saw, substantially as herein shown and described.

2. The arrangement of the journal-boxes H H on both sides of the lower saw-wheel J, in the manner and for the purpose substantially as herein shown and described.



165,463.

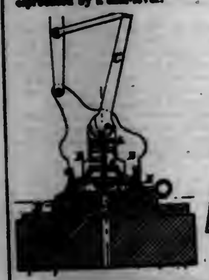
165,464. SAW-SETS. Joseph B. Whiting, Harford, Pa. [Filed Dec. 4, 1874.]



Brief.—A stock or body, A, having two inclines, A^1 A^2, on each side, the angle formed by their junction being at the point where the grooves a a are when the sleeve B is driven on, the difference between their inclinations being the amount of set given to each tooth.

The swage-set composed of two pieces, as described, the main part having diversely-beveled surfaces A^1 A^2, and the additional and inclosing part being beveled to correspond with the bevel A^2, and provided with notches a a, all adapted to serve as and for the purpose herein specified.

165,665.



165,666. PAPER-WEIGHTS. Frank E. Whitney, Cumberlandport, Mass. [Filed Jan. 18, 1875.]

As a new article of manufacture, the paper-weight consisting of the core or weight A, having cavities B C, said core A being inclosed within two thin metal caps, E E', each cap being secured together by an interior screw-bolt, f, and nut a, and provided with corrugations H H', which entirely surround and inclose all of the former, substantially as described, and for the purposes specified.

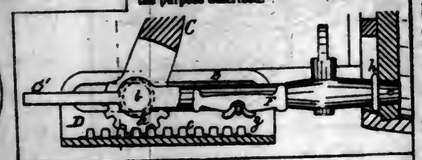
165,667. METAL-PUNCHING MACHINES. D. W. Beer, Richland Centre, Wis., assignor to Wm. T. Miller, same place. [Filed Apr. 10, 1875.]

Brief.—A sliding removable die-block, carrying a headed punch, which is operated by inserting the head in a groove in a grooved head-block, the head-block being vertically reciprocated by a cam-lever.

1. The die-block B, fitted in the channel A, between the bearings B, and having a stop-pin l, lever J, and spring K, combined with it, substantially as specified.

2. The combination, in a punching-machine, of the head-block L having an open-ended channel, B, and the bearings B provided with a channel, A, with the removable die-block B, headed punch M, and cam-lever C, as and for the purpose set forth.

165,668. APPARATUS FOR TAPPING BARRELS OR CASES OF PUMPKIN LIQUORS. John Barrett, Boston, N. J., assignor of one-half his right to Jos. H. Ellis, same place. [Filed Feb. 26, 1875.]



Brief.—An adjustable frame adapted to be fitted under the projecting edges of the chines of the cask or barrel, and provided with an auxiliary frame, having a lever operating in connection with other parts for the adjustment of the faucet within the head of the cask or barrel.

1. The hereinbefore-described apparatus for tapping casks or barrels of fermented liquors, consisting of the Y-shaped frame A, adjusted to the head of the barrel by means of a thumb-screw, and auxiliary frame D, provided with the lever c, post c', rollers d, shaft b, cogs a and e, all arranged to operate substantially in the manner and for the purpose set forth.

2. The Y-shaped frame A, having one foot or leg, B, made adjustable by means of a thumb-screw, so as to fit under the projecting edges of the cask, substantially as described.

3. The combination of the lever c, shaft b, rollers d, cogs a and e, and post c', with the punch F, provided with the spring-clamps, operated by the thumb-screw g, substantially as and for the purposes described.

4. The punch E, provided with the rim or collar l, and handle D', in combination with the notched post c', substantially as and for the purpose described.

165,669. VAPOR-BURNERS. Joseph Benson, Boston, Mass. [Filed June 3, 1875.]

1. The burner-tube d, provided with the openings f, in combination with an inside contraction or the passage l through said tube, substantially as and for the purpose described.

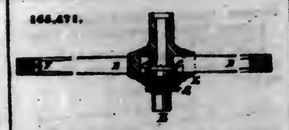
2. The burner-tube d, constructed with the openings f and inside contraction, as described, in combination with the chamber F surrounding the burner-tube, substantially as described, for the purpose specified.

165,669.

165,669. DEVICES FOR REGULATING CAR-VENTILATORS. George W. Birmingham, New York, N. Y. [Filed June 12, 1875.]

Brief.—The device consists of levers pivoted to a bracket. The former are joined to the windows by pivoted links. The windows are kept in desired position by springs, as shown.

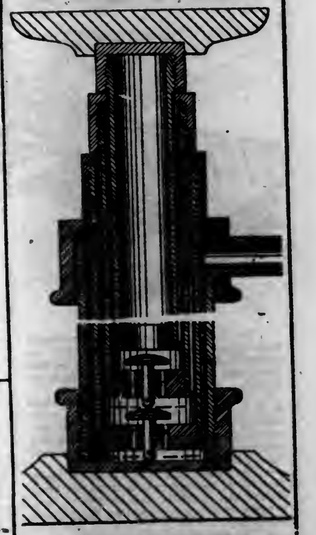
The combination of lever A pivoted to bracket, and having projecting shoulders, the pivoted link C, and the brake-spring E, all arranged on the inside of car, as and for the purpose specified.



165,670. NAILS FOR SHOEMAKING. Lyman R. Blake, Brooklyn, N. Y. [Filed Mar. 6, 1874.]

A headless nail having, in combination with a tapering point, a single notch, substantially as and located as described.

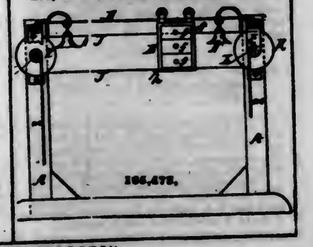
165,671. VELOCIPEDE-WHEELS. S. L. Reed, Columbia, S. C. [Filed May 1, 1875.]



165,671.

The combination of the threaded extension B, the internally and externally threaded nut A, screwed thereon against wedges C, and the face-plate E, screwed on the nut and against the spokes D, all constructed and arranged substantially as and for the purpose specified.

165,672. ELEVATORS. H. W. Brinckerhoff, Brooklyn, N. Y. [Filed Mar. 29, 1875.]

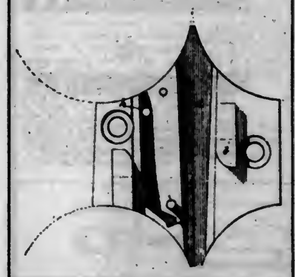


Brief.—The lower ends of the sections are provided with perforated caps, the orifices bearing such a proportion to the area of the caps that (if valves are not employed) all the sections will start together, and if valves are used the lowest space will fill first, then the next, and so on, the same order being preserved in exhausting when the elevator descends.

1. In a telescopic elevator, the sectional tubes thereof, partially closed, with diaphragms, as shown and described, for checking the free flow of the fluid through said sectional tubes.

2. In a telescopic elevator, a check-valve, combined with perforations in the diaphragms, covering the inner ends of the sections, and arranged to be opened by such sections successively, constituting their descent substantially as specified.

165,673. APPARATUS FOR TRANSMISSION OF GOODS, PACKAGES, &c. D. Brown, Lebanon, N. J. [Filed Feb. 1, 1875.]



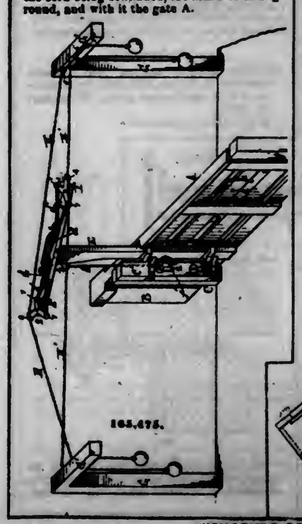
165,673.

HELIOTYPE RELIEF PROCESS. JAMES R. OSGOOD & CO. BOSTON

The mode of transmitting a package-carriage between two given points, by aid of wire rail D, endless rope J, and pulleys K, substantially as described and set forth.

165,676. CONDUCTORS FOR NAIL-ROLLING MACHINES. R. E. Cady, Boston, Mass., assignor to Globe Nail Company, same place. [Filed May 18, 1875.]

Brief.—A pivoted channel-piece is pressed back against the resilience of a spring when the channel becomes unduly crowded. A finger on the channel-piece, projecting through a slot in the removable front plate, disengages the intercepter-spring from its notched holder, and permits the intercepter to fall and cut off the supply to the conductor, when the locking-bar is turned, the front plate taken off, and the nails removed.



1. A conductor for nail-rolling machines, consisting of the back plate and the removable front plate and locking-bar, adapted to operate substantially as described.

2. In a conductor for nail-rolling machines, the removable front plate and the movable channel-piece and finger projecting therefrom, substantially as described.

3. The combination of the back plate e and the movable spring-operated channel-piece and its finger with the front plate and the notched holding-pin n, all adapted to operate substantially as described.

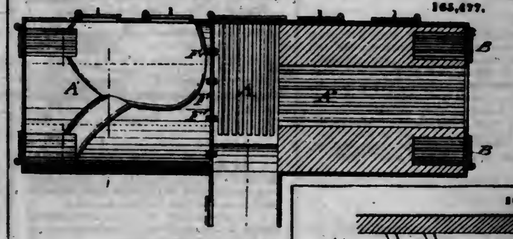
165,675. AUTOMATIC GATES. O. P. Clinton, Menasha, Wis. [Filed Oct. 2, 1874.]

Brief.—By pulling the shorter cord e chain when approaching the gate, the lever e turns on its axis, and by means of the levers f f' and rods g g', releasing the bolt h, the tension on the cord being continued, the arm F is swung round, and with it the gate A.

165,675.

The combination, with the cross-bar F upon the upright E of the balanced gate A, of the weighted cords or chains B B', the three-armed levers c, connected by the bifurcated cords or chains d d' d d', pulleys e, and the levers f f and rods g g', for operating the latch h and gate A, substantially as shown and described.

165,676. TRILEAF SCALES. L. H. Crane and Albert A. Miner, Brattleborough, Vt. [Filed June 12, 1875.]

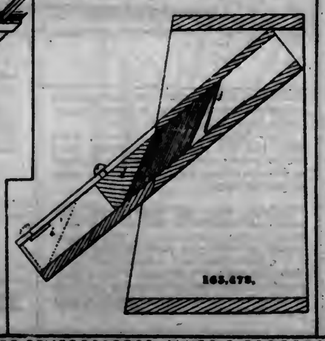


A "trileaf scale" having a central core (or rod) with the leaves grooved into it, substantially as shown and described, so that one or more may be withdrawn wholly or in part, as specified, for the purposes set forth.

165,677. SMELTING-FURNACES. Henry C. Creal, Cheyenne City, Wyo. [Filed Feb. 20, 1875.]

Brief.—The central fire and the lower-end fires make a draft up the main flue, and aid in heating the furnaces. The smaller upper-end furnaces act like the fires of reverberating furnaces.

165,677.



1. The combination of the lower central fire-place A and side fire-places A'' and A''', located beneath the ore-melting furnace A', all as specified.

2. The combination of the lower fire-places and flues with the furnaces above the same, being arranged symmetrically to the central fire-place, and with the separate direct acting fire-places at both ends, for accelerating the action of the furnaces, as shown and described.

3. The combination of the furnaces A', and their separate upper fire-places B, with the main flue, arranged at right angles thereto, and the partition-walls F, having openings F', as shown and described.

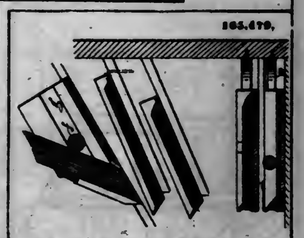
165,678. TICKET-CASES. W. H. Crowther, Boston, Mass. [Filed June 15, 1875.]

Brief.—A trough or box, with an inclined faced pusher and a bent spring for ticket-support, is used to insert tickets between inclined shelves, where they are held by detaining-springs, the bent spring serving as a follower.

165,678.

1. A filer, substantially as described, combined with a ticket-support, and adapted to insert tickets in a guideway, as set forth.

2. The combination of a stationary shelf and a filer with a movable ticket-support, substantially as described, to sustain the tickets on end or edge, both in the filer and on the shelf, and permit them to be drawn, as set forth.



3. The stationary shelves for local tickets, placed, as described, to guide the upper and lower edges of the tickets, combined with spring-gages at the forward ends of the division-plates of the guideways, and with spring-supports for the tickets to be drawn, all constructed substantially as described.

4. The filer, in combination with the hinged piece g to prevent the tickets rising from the filer, and with the inclined support f to sustain the tickets from being upset when moved by the inclined-faced pusher i, substantially as set forth.

165,679. TICKET-CASES. W. H. Crowther and T. Collins, Boston, Mass. [Filed Apr. 14, 1875.]

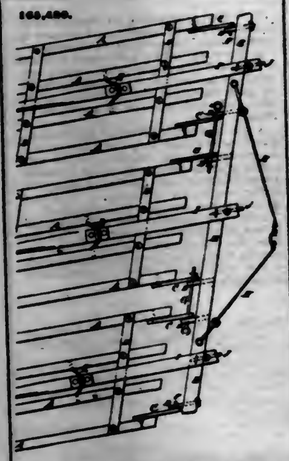
Brief.—The coupon-drawers are set one under the other at an incline, and have inclined fronts. A cylindrical follower-bolt is in grooves is provided for the stiff ticket drawers.

165,679.

1. Two or more inclined coupon drawers or shelves, with fronts beveled inside and out from the top edge of the front downward, and backward toward the back of the case, to facilitate the drawing of tickets, and to show their printed destination, substantially as described.

2. The ticket-drawers, provided with grooved side pieces, as at g, in combination with the follower-rod f, to press the tickets forward, as set forth.

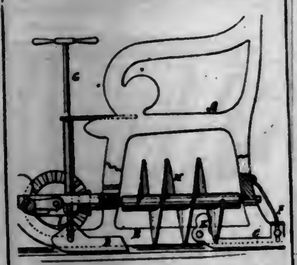
3. A ticket-case, consisting of coupon drawers or shelves, beveled outwardly from the inside, to facilitate the withdrawal of tickets, and provided with gages, and of drawers to contain local or stiff tickets, and provided with followers to hold the local or stiff tickets against the gage-strips, all combined, arranged, and operating substantially as described.



165,680. HARROWS. Adolphus W. Davis, Dwight, Ill. [Filed May 22, 1875.]

Brief.—Three independent frames are separately secured to a single draft-bar. Each section has a handle secured to the same draft-bar, having a hinged fulcrum a little forward of the middle of the frame. By lifting upon the handles the section is wholly raised from the ground, and by bearing down upon the handle the forward end of the section is raised.

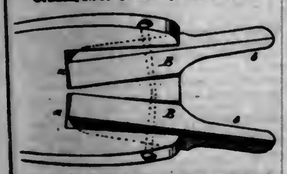
1. The combination of the three diamond shaped sections A B of the harrow-frame, the pivoted connecting-bars C, the pivoting-pins F G, the eyebolts D, and the long draft-bar E, with each other, substantially as herein shown and described.



HELIOTYPE RELIEF PROCESS. JAMES R. OSGOOD & CO. BOSTON

165,490.

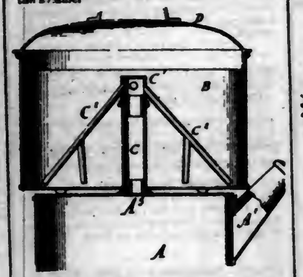
2. The combination of the levers I, the long hooks J, the cycloids or staples K, and the U-shaped pivoted standards L, with the draft-bar E, and the sections A B of the harrow-frame, substantially as herein shown and described.



165,491. ICE-VELOCIPEDE. Chas. M. Day, Elizabeth, N. J. [Filed Apr. 17, 1875.]

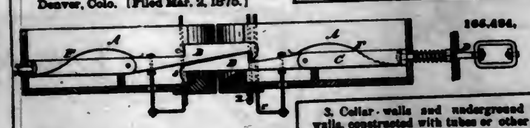
1. The combination, with sled, of revolving spiral propeller H, extending from front to rear, and the shaft I, having treadle-cranks J, the said shaft being connected with propeller-shaft by bevel-gears, as shown and described.

2. The body of the carriage, connected to the runners by springs, in combination with a screw-propeller, arranged to run at the edge of the blades or vanes on the surface of the ice, substantially as specified.



165,492. BOOT-JACKS. A. M. De Bass, Orrstill, N. J. [Filed Apr. 26, 1875.]

A boot-jack having beveled jaws, pivoted in longitudinal slots, which converge in rear of the pivotal point, and are braced in the block so as to diverge vertically, substantially as shown and described.



165,493. CULINARY VESSELS. J. Dumcan, Somerset, Ind. [Filed May 19, 1875.]

Brief.—Steam is conducted from the boiler through the branched pipe to the bottom of the steamer.

The combination of the boiler and steamer and intercommunicating steam-pipe with the bend C' and branch pipe C², substantially as set forth.

165,494. CAR-COUPLINGS. J. Dinsmore, Denver, Colo. [Filed Mar. 2, 1875.]

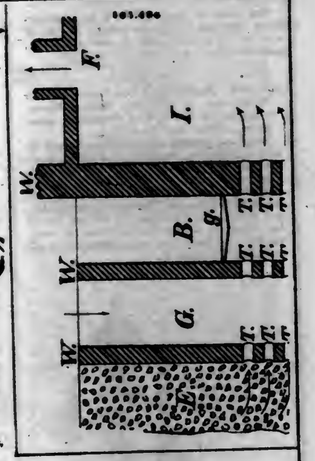
1. The double-catch latches B, pivoted to the square link or clevis C, in combination with the catches a of the draw-head, substantially as and for the purpose specified.

2. In combination with the double-catch latches B, the rods E and E', substantially as and for the purpose specified.

3. In combination with the double-catch latches, the strap-spring F, substantially as and for the purpose specified.

4. In a car-coupling the double-catch latches B, draw-head A, draw-head catches a, link or clevis C, draw-bar D, spring F, rods E and E', all arranged to operate in the manner set forth, and for the purpose specified.

165,495. LIFTING-JACKS. John B. Fayette and Lorenzo Meeker, Oswego, N. Y. [Filed June 26, 1875.]



An improved lifting-jack, formed by the combination of the tube A, provided with the base B, and the vertical and inclined slots a' a², the sliding tube C, provided with the cross-pin c', the sliding rod or tube D, provided with a head, E, the pivoted connecting-bar F, the lever G, and the pivot, stop, and guard H I J, substantially as herein shown and described.

165,496. CONSTRUCTING, VENTILATING, AND COOLING CELLARS. Jos. K. Frick, Evansville, Ind. [Filed Mar. 16, 1875.]

Brief.—Suitable openings are made in the cellar-wall, and pipes extend through them into the porous earth. The draft is obtained by flues extending from the top of the cellar up into the house.

1. Cellar-walls and underground vault-walls, constructed with tubes or other equivalent openings, communicating with the earth outside, as and for the purposes described.

2. Cellar-floors and underground vault-floors, constructed with tubes or other equivalent openings communicating with the porous earth underneath the floor, as and for the purposes described.

3. Cellar-walls and underground vault-walls, constructed with tubes or other equivalent openings extending into the earth, in combination with flues or other equivalent openings from the interior of the cellar to the external air, as and for the purposes described.

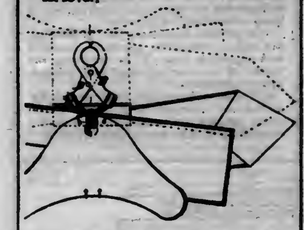
4. Cellar-floors and underground vault-floors, constructed with tubes or other openings communicating with the porous earth underneath the floor, in combination with flues or other equivalent openings from the interior of the cellar to the external air, as and for the purposes described.

5. The combination and arrangement of the coil G, with or without tubes or other equivalent openings communicating to the surrounding earth and passing through the outside wall, the ice-coil B, and its tubes or equivalent openings communicating with the coil G on one side and the interior of the cellar I on the other side, the cellar-wall W, constructed with tubes or other openings into the ice-coil B, together with the flues or other openings from the interior of the cellar to the external air, as and for the purposes specified.

165,497. WAGON-BRAKES. Geo. S. Garth and Wm. H. Rosser, Mill Hall, Pa., assignors to G. S. Garth, same place. [Filed Mar. 20, 1875.]

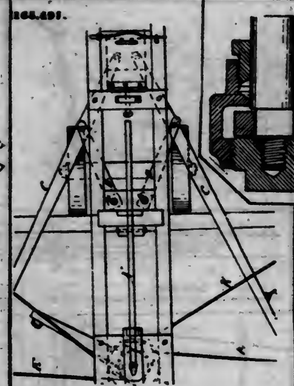
Brief.—Guides brake-bar.

165,495.



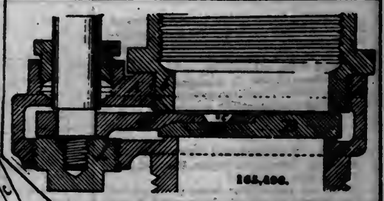
165,497.

The combination of the plates F J, and the block I, with the lock-bar G and the bounds D, substantially as herein shown and described.



HELIOTYPE RELIEF PROCESS. JAMES R. OSGOOD & CO. BOSTON

165,490. NECK-TIE FASTENERS. James H. Harrington, Providence, R. I. [Filed June 19, 1875.]



A neck tie fastener consisting of cross-pivoted fingers, curved at their upper ends to form an aperture for stud-shank, and connected at their other ends, by a spring, to each other, and to the lower edge of a neck-tie shield, substantially in the manner and for the purpose specified.

165,491. ICE-VELOCIPEDE. Chas. M. Day, Elizabeth, N. J. [Filed Apr. 17, 1875.]

The combination, with follower-levers C C, of arms having pulleys E E, the ropes K K, and a windlass having drums I J, as and for the purpose specified.

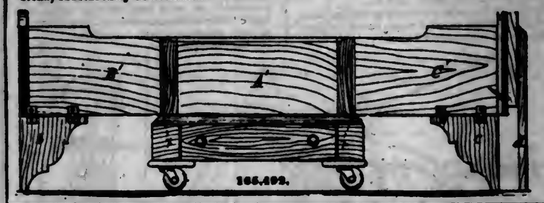
165,490.

165,494. KNOCK-DOWN BUREAUS AND WASH-STANDS. Wm. S. Moses, Lebanon, N. H. [Filed June 5, 1875.]

1. The rails for the front support of the drawers in a knock-down bureau or wash-stand, constructed in two parts, B D, and the part B permanently framed in the front A, and the part D being removable together with the other portion of the drawer-supporting frame, substantially as specified.

2. In a knock-down bureau, the combination of the front, sides, back, and top, connected by sliding dovetail joints, and arranged to lock the front, sides, and back by the top, and to lock the top by the back and the same L, substantially as specified.

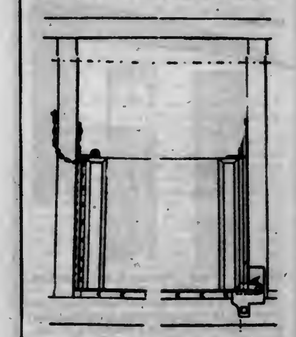
165,498. WEATHER-STRIPS. David L. Hoffman and Parker M. Shoemate, Aullville, Mo., assignors to G. W. Ennis, same place. [Filed Feb. 1, 1875.]



1. In combination with the weather-strip D, hinged and laying in a groove or recess e in the carpet-strip C', the door A, provided in its bottom edge with a deep groove or gutter, A', and curved hooks or catches a a, as and for the purposes described.

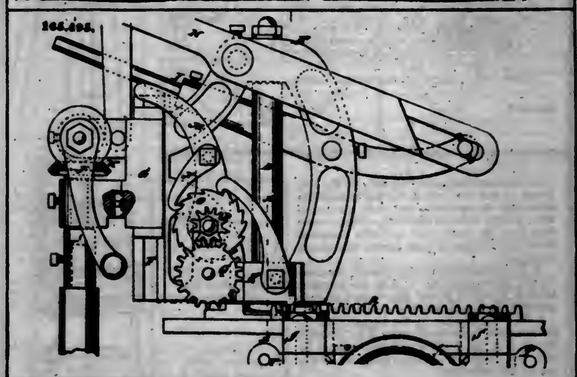
2. The weather-threshold herein described, consisting of the hinged strip D d, recessed carpet-strip C' e e, and door A, the bottom edge of which is deeply slotted, A', and provided with hooks a a, all constructed, arranged, and adapted to operate, as and for the purposes set forth.

165,492. FOLDING BEDSTEADS. H. Krieto, Newport, Ky. [Filed May 6, 1875.]



Brief.—The head-section of the bedstead is provided with a hinged mirror having legs attached thereto, which aid in supporting the head-section when the parts are unfolded, and hold the mirror in proper position for use when the parts are folded.

The hinged mirror D provided with legs d d, forming stops for said mirror, in combination with the head section of a folding bedstead, substantially as described.

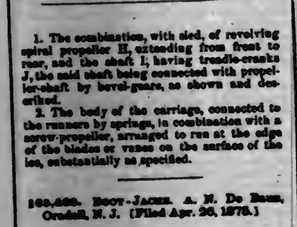


165,496. DOORS FOR GRAIN-CARS. Fredk. J. Kimball, Philadelphia, Pa. [Filed May 6, 1875.]

Brief.—Side standard pivoted at top swings outward when bottom catch is removed.

The swinging bar E, latch G, and permanent bars D and B, combined with the door, substantially as specified.

165,495.



165,499. SHOP-VALVES. Jos. Otis Moran, Englewood, N. J. [Filed May 20, 1875.]

The combination of the vibrating disk, the valve-spindle upon which the said disk is loosely mounted, and the two valve-seats arranged at a greater distance apart than the thickness of the valve-disk, substantially as before set forth.

165,500. BORING AND MORTISING MACHINES. Henry Neumann, Central City, Colo. [Filed May 28, 1875.]

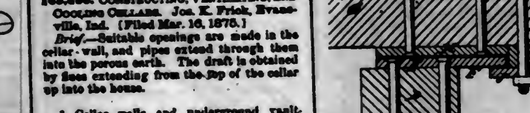
Brief.—The machine is intended for making mortises in timber, and is provided with rollers, so that it may be easily moved from one mortise to the next; it also has suitable clamping devices for holding it in position while in operation.

491. Ice-Velocipede. Chas. M. Day, Elizabeth, N. J. [Filed Apr. 17, 1875.]

1. The combination, with sled, of revolving spiral propeller H, extending from front to rear, and the shaft I, having treadle-cranks J, the said shaft being connected with propeller-shaft by bevel-gears, as shown and described.

2. The body of the carriage, connected to the runners by springs, in combination with a screw-propeller, arranged to run at the edge of the blades or vanes on the surface of the ice, substantially as specified.

492. Boot-Jacks. A. M. De Bass, Orrstill, N. J. [Filed Apr. 26, 1875.]



A boot-jack having beveled jaws, pivoted in longitudinal slots, which converge in rear of the pivotal point, and are braced in the block so as to diverge vertically, substantially as shown and described.

493. Culinary Vessels. J. Dumcan, Somerset, Ind. [Filed May 19, 1875.]

Brief.—Steam is conducted from the boiler through the branched pipe to the bottom of the steamer.

The combination of the boiler and steamer and intercommunicating steam-pipe with the bend C' and branch pipe C², substantially as set forth.

494. Car-Couplings. J. Dinsmore, Denver, Colo. [Filed Mar. 2, 1875.]

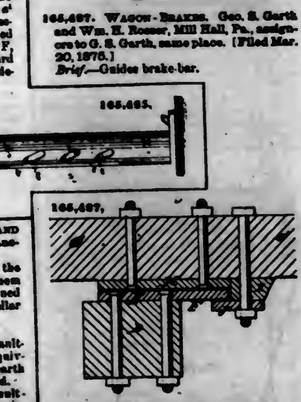
1. The double-catch latches B, pivoted to the square link or clevis C, in combination with the catches a of the draw-head, substantially as and for the purpose specified.

2. In combination with the double-catch latches B, the rods E and E', substantially as and for the purpose specified.

3. In combination with the double-catch latches, the strap-spring F, substantially as and for the purpose specified.

4. In a car-coupling the double-catch latches B, draw-head A, draw-head catches a, link or clevis C, draw-bar D, spring F, rods E and E', all arranged to operate in the manner set forth, and for the purpose specified.

495. Lifting-Jacks. John B. Fayette and Lorenzo Meeker, Oswego, N. Y. [Filed June 26, 1875.]



An improved lifting-jack, formed by the combination of the tube A, provided with the base B, and the vertical and inclined slots a' a², the sliding tube C, provided with the cross-pin c', the sliding rod or tube D, provided with a head, E, the pivoted connecting-bar F, the lever G, and the pivot, stop, and guard H I J, substantially as herein shown and described.

496. Constructing, Ventilating, and Cooling Cellars. Jos. K. Frick, Evansville, Ind. [Filed Mar. 16, 1875.]

Brief.—Suitable openings are made in the cellar-wall, and pipes extend through them into the porous earth. The draft is obtained by flues extending from the top of the cellar up into the house.

1. Cellar-walls and underground vault-walls, constructed with tubes or other equivalent openings, communicating with the earth outside, as and for the purposes described.

2. Cellar-floors and underground vault-floors, constructed with tubes or other equivalent openings communicating with the porous earth underneath the floor, as and for the purposes described.

3. Cellar-walls and underground vault-walls, constructed with tubes or other equivalent openings extending into the earth, in combination with flues or other equivalent openings from the interior of the cellar to the external air, as and for the purposes described.

4. Cellar-floors and underground vault-floors, constructed with tubes or other openings communicating with the porous earth underneath the floor, in combination with flues or other equivalent openings from the interior of the cellar to the external air, as and for the purposes described.

5. The combination and arrangement of the coil G, with or without tubes or other equivalent openings communicating to the surrounding earth and passing through the outside wall, the ice-coil B, and its tubes or equivalent openings communicating with the coil G on one side and the interior of the cellar I on the other side, the cellar-wall W, constructed with tubes or other openings into the ice-coil B, together with the flues or other openings from the interior of the cellar to the external air, as and for the purposes specified.

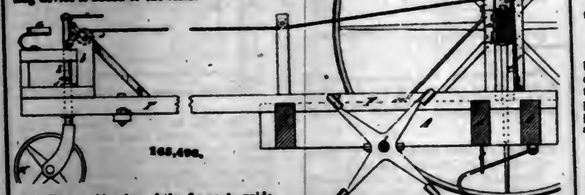
497. Wagon-Brakes. Geo. S. Garth and Wm. H. Rosser, Mill Hall, Pa., assignors to G. S. Garth, same place. [Filed Mar. 20, 1875.]

Brief.—Guides brake-bar.

495.

497.

The combination of the plates F J, and the block I, with the lock-bar G and the bounds D, substantially as herein shown and described.



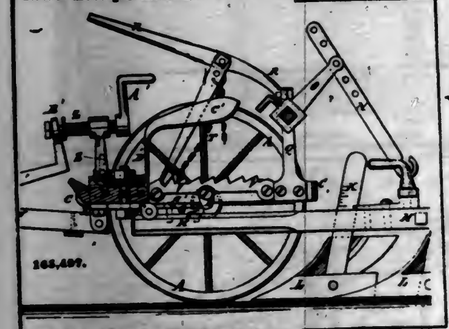
HELIOTYPE RELIEF PROCESS. JAMES R. OSGOOD & CO. BOSTON

The sliding tool-carrying frame E, arranged to receive horizontally, and the feed mechanism thereon, in combination with a feeding-rack, R, on both sides of the ways in which the frame slides, substantially as specified.

The clamp screws U, clamping-plates V, frame S, rollers T, and the ways A, constructed and arranged substantially as specified.

165,496. MACHINES FOR CUTTING CORN-STALKS. Terrence O'Bryan, Barnard, Mo. [Filed Nov. 10, 1874.]

Brief.—A rectangular frame is supported upon an axle and pair of wheels. This frame carries a pair of cutting-rollers and bifurcated drag-hooks. The middle beam of the frame extends rearwardly, and its rear end is supported upon a caster-wheel, near which is a windlass having a rope extending to the front of the frame, by which means the forward end of the frame is raised from the ground, upon standards erected upon the axle-tree. The cutting device is ahead of the team.



165,496.

1. The combination of the frame A, guide-standards B B, axle D, beam F, wheel H, and rotary cutters, substantially as described.

2. The windlass e, combined with axle D, standards B B, frame and bar A F, and wheel H.

165,497. GANG-PLOWS. Murry Opp, Belleville, Ill. [Filed May 1, 1875.]

Brief.—Adjustable connections for the front end of plow-beams, and crank screw adjustment of the tongue and frame.

165,497.

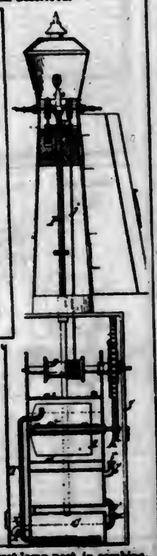
1. The combination of the bolts E, the eye-pieces F, and the bars G, having crank-heads upon their forward ends and short transverse slots in their widened rear ends, with the cross-bars D of the frame C D, and with the plow-beams H, substantially as herein shown and described.

2. The combination of the chain T, the pawl U, and the ratchet-bar V, with the compound lever M N O P Q R, and the frame C D, substantially as herein shown and described.

3. The combination of the lugged plate X, the standard Y, the crank-screw E A', the bent bar B', and the stud C', with the frame C D, and the tongue W, substantially as herein shown and described.

165,498. HARMONY CHAIRS. John Ott, Indianapolis, Ind. [Filed Oct. 30, 1874.]

In combination with the frame and hinged back, the hinged support H, fastened by a joint to the frame, and having a catch on the back, where it is confined by the ratchet and pawl K, substantially as set forth.



165,498.

165,500.

165,499. CONFINED STREET-LAMPS AND GAS-MACHINES. George Tracey Parry, Philadelphia, Pa. [Filed Apr. 20, 1875.]

1. The combination, with a street-lamp post, of a carbureting gas-machine, in which illuminating-gas is produced by the mixture of atmospheric air with hydrocarbon-vapor, said vapor being eliminated without the application of heat, substantially as described.

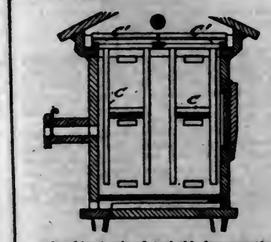
165,499.

2. A portable street-lamp post, in combination with a weight, which, through a cord and pulleys, imparts rotation to a blower, substantially as and for the purpose described.

3. A portable street-lamp post, in combination with a carbureting-machine, which has its supply of air automatically stopped at variant regulated periods of time, substantially as described.

4. A portable street-lamp post, in combination with a carbureting apparatus and with a gas-burner, which has its light automatically extinguished at variant regulated periods of time, substantially as described.

5. A portable street-lamp post, in combination with a carbureting apparatus, provided with adjustable nuts *g g'*, for regulating the number of hours the light shall burn, substantially as described.



6. The street-lamp post, constructed as described, and furnished on its inside with the within-specified carbureting apparatus, substantially as and for the purpose described.

165,500. BOOK-SUPPORTS. Wm. Patton, Vevay, Ind. [Filed July 12, 1874.]

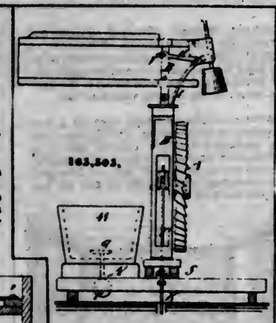
A blank-book holder composed of a bed, B, having a groove or depression, C, across its center, and a circular plate or rim, D, attached to its under side, in combination with a supporting-plate, E, provided with a central pivot, G, on which the said bed turns, substantially as herein specified.

165,501. BEE-HIVES. Hiram Pencoyer, Acme, Ill. [Filed Apr. 24, 1875.]

Brief.—The comb-frames are hung in removable frames.

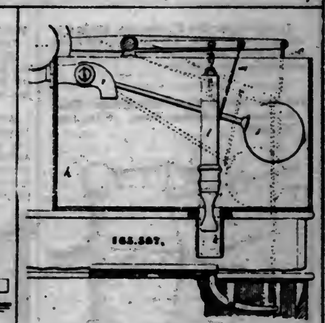
A bee-hive having detachable frame-sections C, hung in central chamber from a top frame, C', movable, as and for the purpose specified.

165,502.



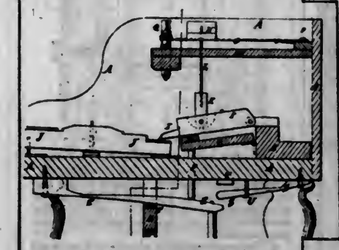
165,502. PICKS. Thomas R. Finks, Bristolville, Ohio. [Filed Apr. 28, 1875.]

Brief.—A wooden stock of suitable size, the lower end of which is square in cross-section, of diameter equal to the width of the pick, the square part being three or four inches in length. A strap of iron is bent at right angles, with a thickened portion at the middle, the parallel straps being riveted firmly to two sides of the square stock. A like-formed iron is fitted to the opposite sides of the square stock, leaving a square eye for the bit of the pick, which is secured by a pin inserted into a hole, one-half of which is in the stock, and the other half in the steel bit forming the pick.



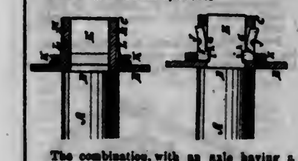
In combination with a pick a socket-handle, formed by combining the angular plates or straps B and B' with the square part of the stock or handle C, substantially in the manner as described, and for the purpose specified.

165,503. DAMPER MECHANISMS FOR PIANO-FORTES. Edward Porter, New York, N. Y. [Filed Apr. 10, 1875.]



Brief.—The damper-lever lift-bar has a shoulder or raised portion, extending over sufficient of its length to raise the bass-dampers first by pressure on the pedal as far as to the spring. Further pressure raises the remainder of the damper-levers also.

165,503.



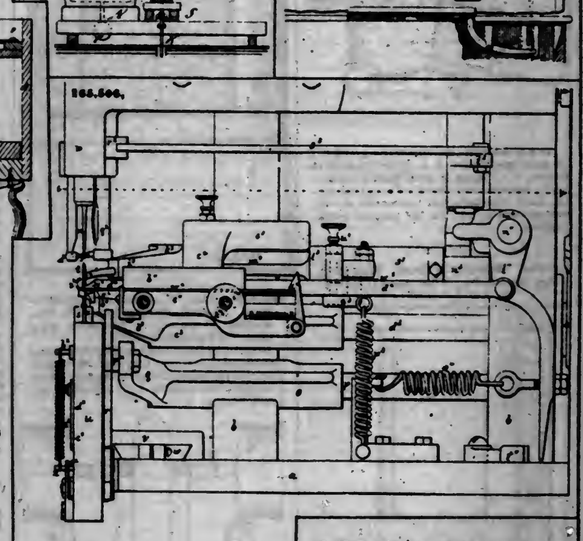
165,507.

1. The strip B, attached to the forward upper part of the lifter-rail G, and extending beneath the forward part of the damper-levers I of one or more octaves of the bass-strings, constructed and arranged substantially as herein shown and described.

2. The combination of the spring S with the damper-pedal spring E, and with the strip B, attached to the lifter-rail G, when constructed and arranged substantially as herein shown and described.

165,504. DEVICES FOR ATTACHING HUBS TO AXLES. Warren B. Pratt, Chesaning, Mich. [Filed Jan. 4, 1875.]

The combination, with an axle having a square or angular end portion, E, and recesses *f* therein, of the key-box C, washer B, shouldered keys F, the band K, and the springs L, substantially as and for the purpose set forth.



165,505. WINDMILLS AND WATERING APPARATUS. R. Richardson and F. Harkness, New Rutland, Ill. [Filed May 1, 1875.]

Brief.—The wheel has rigid vanes, and is mounted on the vertical shaft, which turns horizontally, and carries the tail-vane at its upper end, which is free to turn on the shaft. This vane has arms extending forward of the shaft, and on the outer end of the upper one the vane is pivoted, so as to be held up with its face to the wind by a weight, which is attached to its lower end. The arm of this vane is also connected below the pivot by a link and an eyebolt with the shaft eccentrically, so that when the vane is forced down the wheel and the tail-vane will be turned into the same plane, and the wheel will be held by the tail-vane with its edge to the wind.

1. The combination of tail-vane C, having arms D E, pivoted vane F, weight G, link H, bolt I, and shaft B, as and for the purpose specified.

2. The weighted regulating-vane F, pivoted to the arm of the tail-vane, and connected eccentrically to the wheel-shaft, on which the tail-vane is free to turn, substantially as specified.

3. The combination of the weighted trough M and valve Q with the receiver M, substantially as specified.

165,506.

165,506. MACHINES FOR SEWING TURNED SOLES. Everett P. Richardson, Lawrence, Mass. [Filed Dec. 1st, 1873.]

1. The combination of the rocker-sleeve *c'* and bearing *b* with the butt *r*, for imparting reciprocating movements to the needle-bar, substantially as shown and described.

2. The combination of the needle and cast-off bars with lever *d'*, arm *e'*, spring *e''*, and stops for imparting the movements to the cast-off, relatively to the movements of the needle, substantially as shown and described.

3. The combination, with the needle-bar and slotted link *r*, of mechanism for throwing the needle-bar out of connection with its actuating mechanism, substantially as shown and described.

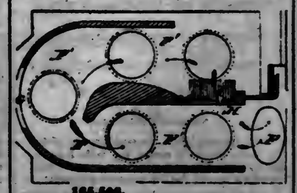
4. The combination of the rocker-sleeve *m'* and its arms, the bender-bar *d'*, and spring *o'* for moving the bender forward, substantially as described.

5. The combination, with the adjustable shoulder-piece, of the hook *x'*, and latch *y'*, for adjusting the position of the hook and holding it, substantially as set forth.

165,507. WATER-SUPPLY APPARATUS FOR WATER-CLOSETS. Isaac Riley, Boston, Mass., assignor to Baird & Riley, same place. [Filed Mar. 17, 1875.]

Brief.—When the seat is depressed the weight on the lever rises, the rock-shaft is turned, the escape-valve seats itself, and the float, falling, opens the supply-valve. The float rises with the accumulating water, and serves to shut it off at a certain point. When pressure is removed from the seat the weight falls, the rock-shaft turns, and the escape-valve is lifted, causing flow of water through the closet.

1. The combination of the elevated tank with the inlet-valve and its operating-lever and float, and the escape-valve and lever, all adapted to operate with relation to each other to stop the flow of water while the seat is depressed, and to permit the discharge of the water from the tank when the seat is relieved, substantially as described.

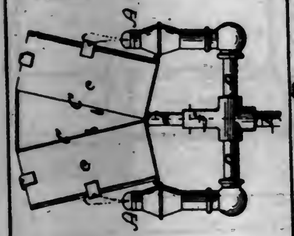


2. The combination of the seat *a* with the escape-valve *l* through intermediate mechanism, arranged to operate substantially as described.

3. The combination of the seat *a*, tank *h*, inlet-valve *i*, and escape-valve *l*, the valves being connected by intermediate mechanism, arranged to operate substantially as described.

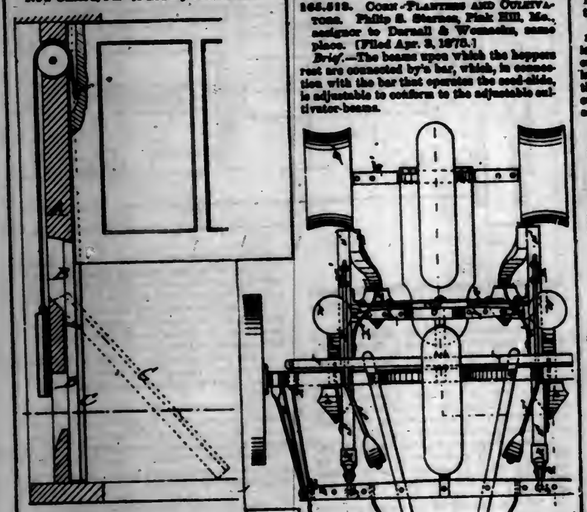
In testimony whereof I have signed my name to this specification in the presence of two subscribing witnesses.

165,508. STOVES. Jas. L. Roberts, Brunswick, Ga. [Filed May 8, 1875.]



Brief.—The smoke may pass directly to the exit, or around under the pot-holes, by means of the U-shaped flue, or, passing under the pot-holes of one side, may be sent down and around the oven.

165,508.



The U-shaped flue F, from the fire-box to the back of the stove, and thence to the front, having the rectangular O and H, with dampers, substantially as specified.

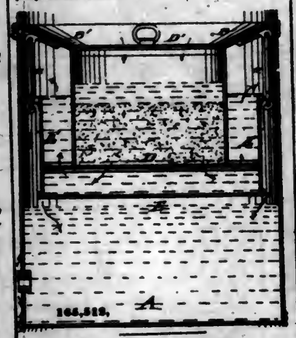
165,509. STREET-LAMP REFLECTORS. Chas. Robinson, Cambridge, Mass. (Filed June 28, 1875.)

In a street-lamp, the combination, with two or more gas-burners, A A, of two or more reflectors, C C, made of piano-wire b c c, concentrically arranged and placed between the burners, being removable and replaceable at will, substantially as and for the purpose herein specified.

165,510. WINDOW-FRAMES. Elias Roth, New Oxford, Pa. (Filed Apr. 17, 1875.)

The combination of the detachable strip U and the frame or casing A, having an opening at the upper end of groove B, as shown and described, for the purpose specified.

165,511. INCHING-TABLES. Chas. Emmons, Indianapolis, Ind. (Filed June 9, 1875.)

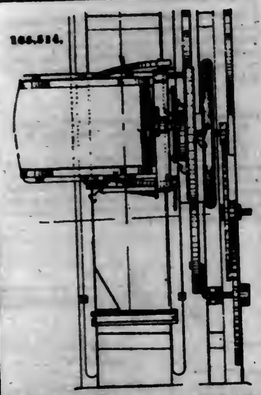


In an inching-board, the combination of the key a, the blades f and g, the bolts b and c, the diagonal slot at m, and the block r, substantially as and for the purpose set forth.

165,512. FILTERS. Henry F. Scherr, St. Louis, Mo. (Filed June 12, 1875.)

Brief.—The water is first filtered while passing down the central tube, and is again subject to the same action while rising in the pan, just before falling into the base-reservoir.

A filter composed of base reservoir A, top receptacle B, with central filtering tube, having perforated top and bottom, and of a surrounding filtering-pan fitted and secured around bottom of central tube, all arranged and operating substantially as and for the purpose set forth.



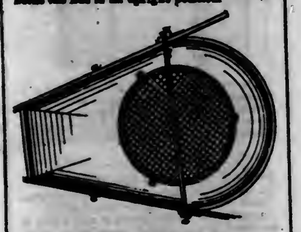
165,513. COAST-PLANTERS AND CULTIVATORS. Philip S. Stetson, Pink Hill, Mo., assignor to Darnall & Womacks, same place. (Filed Apr. 3, 1875.)

Brief.—The beams upon which the hoppers rest are connected by a bar, which, in connection with the bar that operates the seed-slide, is adjustable to conform to the adjustable cultivator-beams.

The combination of the extension-bar Y, connected with the dropping-slides X, and the extensible connecting-bar A', carrying the seed-slide-operating lever Z, with the plow-beams B and seed-hoppers W, as and for the purpose described.

165,514. STRAW-CUTTERS. C. F. Stewart and William Stewart, Muncie, Ind. (Filed May 8, 1875.)

Brief.—The box containing the straw is reciprocated in front of a rotating elevator knife. The straw is fed, to the knife automatically after a stroke is made. The mechanism operating the feed-rolls is independent of that which works the knife.

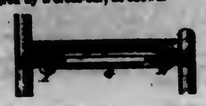


1. In straw and feed cutters, the combination of a revolving cutting disk or knife with a rock-seating feed-box, arranged to feed the material separately from the cutting-action after having passed beyond the cutting-knife, substantially in the manner and for the purpose set forth.

2. The combination of the lower fixed feed-roller with the upper sliding and spring-acted feed-roller, turning in bearings of the adjustable corrugating front gate, and with the gate, for expelling the material in compact state to the cutting-knife, as specified.

3. The reciprocating feed-box having feed-rollers, with retaining ratchets, pawls, and lever, in combination with the stationary comb of main frame, having a count of reciprocating motion of box, for the purpose of feeding the material only on the completion of the cutting action of the knife, substantially as set forth.

165,515. COAL-SCUTTLES. Richard M. Staub, Rensselaer, N. Y., assignor to himself and R. J. Hunt, same place. (Filed Oct. 20, 1874.)

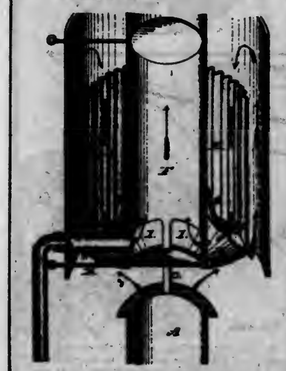


Brief.—When the device is not used for stiffing, the ball engages with the catches, and holds the lids in an upright position.

The combination of the lids a', catches c c, placed near the center of the lids, and ball b, all arranged as described, to allow the ball to be raised without raising the lids, or used to hold the lids open, all as and for the purpose set forth.

165,516. DETACHABLE SEATS FOR CHAIRS. William W. St. John, Fisgah, Mo. (Filed Mar. 29, 1875.)

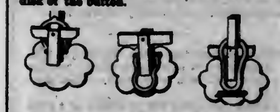
Brief.—The seat is attached to slats, the outer edges of which are grooved and bear against the upper rounds of the chair, and when the slats are turned in under the bottom of the chair, the seat is strained or stretched, as may be desired, and all the parts are secured by a cross-bar, as shown.



1. A seat of a chair, stool, or settee, strained and made detachable by means of slats F, substantially as described.

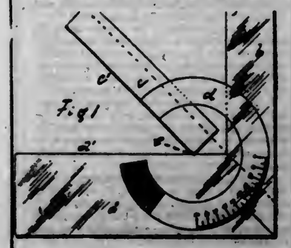
2. The cross bar G, connected with lower slats by a pivot-fastening at H and a hook at I, as and for the purpose specified.

165,517. STOVE-PIPE DRUMS. Benjamin F. Stockford, Sturgis, Mich., assignor of one-half his right to T. F. Thornton, same place. (Filed Apr. 3, 1875.)



Brief.—Smoke may be made to pass up between the external and the corrugated cylinder, and down between the latter and the central ascending smoke-flue.

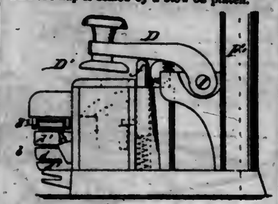
In combination with the stove-pipe A and with the jacket K, corrugated cylinder B and smoke-flue F, concentrically placed one within the other, and each inclosing flue or heating space, the annular space N at the bottom of the drum, and common to the spaces inclosed by the corrugated cylinder and the smoke-flue, by means of the inlet and exit openings H I, and the valve L, for turning the products of combustion through the drum, as shown by the arrows, and as described and represented.



165,518. FASTENINGS FOR BUTTONS. Philipp Sass, Providence, R. I. (Filed Jan. 20, 1874.)

Brief.—A button having L-shaped arms or wings is fastened or unfastened by means of an oval-shaped latch, which is hinged to the back disk of the button.

The latch or link, in combination with the L-shaped arms and upright post or shank, the whole constructed and arranged substantially as described, for the purposes specified.

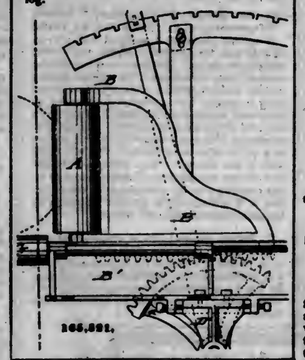


165,519. PROTRACTORS. Ambrose Swasey, Hartford, Conn. (Filed Jan. 26, 1875.)

The combination of the parallel straight-edged base-rule a, the arc d moving thereon, and the swinging rule c, all constructed and arranged substantially as shown and described.

165,520. MACHINES FOR ATTACHING STAMPS AND SEALING LETTERS. Eddy T. Thomas, Boston, Mass. (Filed Dec. 12, 1874.)

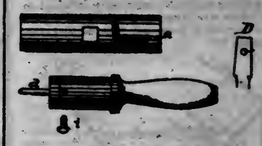
Brief.—Flap and envelope-corner are moistened by drawing across sponge. The envelope is then placed under a platen, and receives a stamp from a reservoir below at the same time the flap is sealed by a blow on platen.



1. The combination of sponge d, guides d' d', and self-adjusting roll d', as and for the purpose specified.

2. The combination of spring-lever D, having pressure-plate D' and sliding spring-rod f actuated thereby, with the cutting E, stamp-cup F', and stamp-feeding mechanism for producing the simultaneous sealing of envelope and the affixing of stamp, substantially as specified.

165,521. SAW-MILLS. William T. Wayne, Conyngham, Pa. (Filed May 22, 1875.)

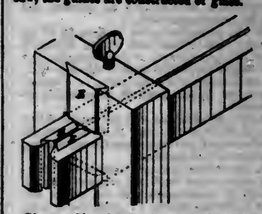


Brief.—The log is held so that any thickness of board can be cut in a uniform manner, and the spring of the board obviated by means of a vertical guide-roller turning in a sliding standard-frame, adjustable by a rack, sector-shaped pinion, and a lever that can be locked by a spring-latch to an arc-shaped guide-rack, and adjusted with the sector-shaped pinion to the exact position of a horizontal supporting-roller, bearing on the bottom part of the log.

The roller-carrying frame, having bottom rack, in combination with swinging sector-pinion, turning in adjustable hangers, an operating hand-lever with spring-latch, and an adjustable arc-shaped guide-rack, substantially as and for the purpose set forth.

165,522. AUGER-HANDLES. Frank Worts, Mahanoy City, Pa. (Filed June 1, 1875.)

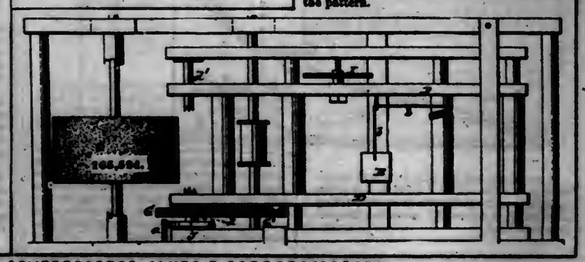
Brief.—The handle is formed in two sections, one of which is provided with a pin projecting from the center of its inner end, and the other with a suitable recess for the reception of said pin. The two sections are connected together by a center connecting-sleeve, provided with an obtuse-angled slot near one of its ends, and a square slot through the middle. The auger-shank is clamped by pressing inward the section having the pin, until the pin shall have passed through a hole in the shank, when said section is turned so that the screw operating in the slot shall have reached the end of the same.



1. The combination of the handle A having the slotted sleeve c, the handle B having the pin d and screw f, and the bit-shank D, substantially as and for the purposes herein set forth.

2. In the auger-handle A B C, constructed as described, the longitudinal slot c, and inclined slot b, formed in the sleeve C, and the screw or pin f passed through the same into the movable handle B, as and for the purposes herein set forth.

165,523. BAND-SAW GUIDES. Lewis K. Young and Charles M. Ferguson, Bridgeport, Conn. (Filed May 18, 1875.)

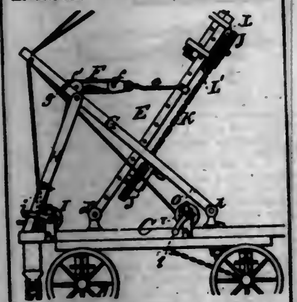


Brief.—For the purpose of diminishing the friction caused by the rapid motion of a band-saw, the guides are constructed of glass.

Glass guides for band saws, substantially as seen at E in the drawing.

165,524. MACHINES FOR DRESSING STONE AND MARBLE. Olif Abell, Walcott, Vt., assignor to Joseph Potter, Whitehall, N. Y. (Filed June 8, 1875.)

Brief.—The pattern borne on the sliding frame is held by a cord and weight against a stationary projection on the main frame, whereby the stone to be ground is presented to the emery-wheel, according to the shape of the pattern.



1. In a machine for grinding stone and marble, the sliding frame D, carrying the pattern and the piece to be ground, in combination with an emery-wheel and a weight, arranged substantially as and for the purposes herein set forth.

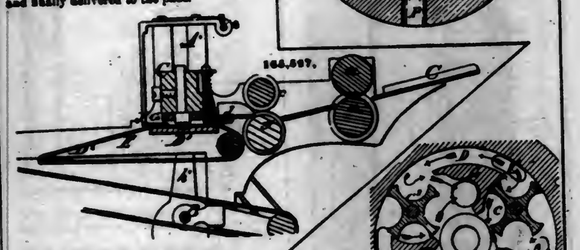
2. The combination of the sliding frame D, cord i, weight M, spindles *d d'*, gearing G G', pattern J, stop *e*, and emery-wheel C, all substantially as and for the purposes herein set forth.

165,526. FIREMEN'S EXTINGUISH-LADDERS. Adelbert Ames, Natchez, Miss. [Filed May 6, 1875.]

Brief.—The ladder is pivoted at the bottom to a turn-table, which has adjustable supporting-wheels. The sides of the ladder are provided with racks, into which pinion-wheels mesh, and are driven by a rag-wheel and chain. The ladder is raised to the proper incline by ropes and pulleys supported by a folding derrick, and when extended are locked by a spring-catch, the same being unlocked as the ladder is retracted by means of the pinion-wheels coming in contact with an endwise-movable bar.

1. The combination of the adjustable supporting-wheels D with a turn-table and a wagon-truck, substantially as specified, and for the purposes set forth.

2. The extension-ladder sections E' F', arranged face to face, each having a rack, *r*, upon the lateral edges of their uprights, and the former having the blank *a* above its rack, in combination with the pinion *l P*, supporting-ladder E, and catch M, substantially as specified.



3. The combination, with an extension-ladder, E F' F', of the guys N N', and the adjusting-rope P and their respective windlasses, substantially as specified.

4. The extension-ladder sections E' F', having racks *r* upon the lateral edges of their uprights, in combination with the ladder section E, having pinions *l P*, gear-wheels L L', chain-wheels J J', and endless belt K, substantially as specified.

5. The endwise-movable unlocking-arm P, extending completely across ladder E', and adapted to be automatically actuated by piston V to thrust upon *s* of spring-arm M out of engagement with the said ladder, substantially as specified.

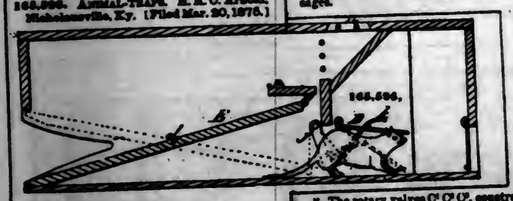
165,527. CRACKER-MACHINES. G. W. Baker, Wilmington, Del. [Filed May 15, 1875.]

Brief.—The sheet of dough is delivered by feeding-rolls to the splitting-rollers, by which it is cut longitudinally into ropes, which pass into guiding-troughs placed close behind the rollers. By the action of the latter mechanism the dough is pushed under a reciprocating head, which cuts off the projecting portion and throws it down upon the apron, where it is, by the same stroke, fastened to the proper size and form by the pressure of a spring-follower seated in a recess in the cutter-head. They are then carried forward by the apron over a concavity in the table, where they are "docked," after which the rows are "crossed," and finally delivered to the pans.

1. The yielding follower *e*, in combination with the cutting device *a*, substantially as described.

2. The combination of splitting-rollers *c c'*, guides *d*, cutter *a*, and a yielding follower, *e*, substantially as described.

3. In combination with the cutter *a*, having the yielding follower *e* and the stamps *l*, the bed D' and endless apron E, substantially as described.



4. The bed D', having concavities *p*, in combination with the stamp *l* and the stripper G, substantially as described.

5. In a cracker-machine, the combination of the feeding and joining rollers *a a*, split rollers *c c'*, the cutter *a*, the spring follower *e*, the stamp *l*, stripper G, stationary bed D', and the endless belt, substantially as and for the purposes set forth.

165,528. ROTARY PUMPS. Henry A. Barber, Watertown, N. Y. [Filed Mar. 23, 1875.]

Brief.—A piston-disk, studded with pins on its side near its periphery, forms one side of the main chamber. The pins travel in a circular channel, and intermesh with winged rotary valves, each of which always presents one wing in contact with a curved rear face of an abutment, another curved face of which forms one wall of the circular channel. As the pins intermesh with and actuate the valves, a wing or a pin is always in contact with the outer wall of the channel. The revolution of the disk effects the suction of water through inlets opening into the channel, and the expulsion of it through ports divided therefrom by the intermeshing pins and valves.

1. Rotary valves C' C' C', constructed with radial wings, and operating in combination with abutments G and the face-armed piston *b* B, substantially as herein set forth, to transfer the water from the pumping-chamber of a rotary pump to the discharge-chamber or passages.

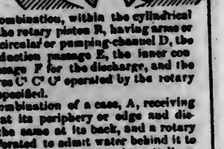
In an animal-trap the gate D, hinged or pivoted at its upper end, in combination with the swinging weight *j*, the arm *h*, and the tilting platform E, substantially as and for the purpose described.

2. The rotary valves C' C' C', constructed as described, and combined with the face-studded piston B *b*, to intermesh as the piston revolves and effect the rotary motion of the valves, thereby avoiding by such intermeshing the necessity of outside connecting-gearing, substantially as herein set forth.

165,529. CAR-COUPLINGS. William H. Bell, Platteville, Wis., assignor of one-half his right to C. Bell, same place. [Filed May 10, 1875.]

Brief.—The draw-bar is affixed to a head moving vertically in guides in the framing. The other end of the draw-bar is provided with an enlarged head, which passes through a T-shaped slot in the opposite draw-head, and is there held in the narrow part of the slot.

1. The combination, with a framing, A, provided with plates C D E, having slots therein, as described, of a movable draw-head, G, and draw-bar H, substantially as described.

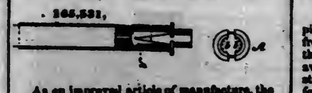


2. The combination, with a draw-head, G, capable of vertical movement in a frame, A, as described, of a draw-bar, H, provided with an enlargement or loop, H', and extending through or within the said draw-head, and restricted by a spring, I, substantially as described.

3. The combination, with the frame A, having plates C D E, formed with slots, as described, and guides *b b*, of the draw-head G, draw-bar H, rod K and ropes or chains L, or ropes and chains L and levers K', substantially as set forth.

4. The combination, with a framing, A, provided with a plate or surface, D, having a T or equivalent shaped opening, D', as described, of a draw-head, G, and draw-bar H, capable of adjustment in position, substantially as and for the purposes described.

165,530.

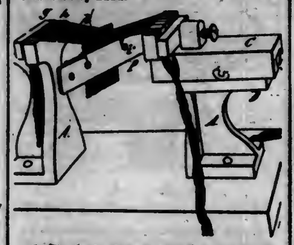


2. The combination, within the cylindrical case A, of the rotary piston B, having arms or pins *b*, the circular or pumping-channel D, the annular induction passage E, the inner concentric passage F for the discharge, and the rotary valves C' C' C' operated by the rotary piston, as specified.

4. The combination of a case, A, receiving the water at its periphery or edge and discharging the same at its back, and a rotary piston perforated to admit water behind it to equalize the pressure upon it, substantially as herein shown and described.

5. The water-waved and cored casting A, in combination with the sheeted cap A', and the water-waved cap A', to constitute the shell of the pump to receive the operating mechanism and to form the water-ways thereof, substantially as herein set forth.

6. The rotary valves and their abutments G, the piston B, and its effective surfaces arms *b*, combined for joint operation within the same chamber into which the water is pumped, and from which it is expelled, to render the pump more compact, substantially as described.



165,531. ERASER-HOLDERS. W. H. Bennett, New York, N. Y. [Filed June 17, 1875.]

As an improved article of manufacture, the herein-described eraser-holder, consisting of the V-split tube A, having inwardly-projecting edges or serrated jaws *b*, for holding the rubber.

165,532. MACHINES FOR POLISHING THE EYES OF MACHINE-NEEDLES. John Berry, Springfield, Mass., assignor to the National Needle Company, same place. [Filed Dec. 16, 1874.]

Brief.—The needles are held in a clamp with their eyes all in the same relative position. The threads, which are charged with the polishing mixture, after being passed through the eyes of the needles, are clamped by the blocks *g g'*. The clamp is reciprocated back and forth by hand.

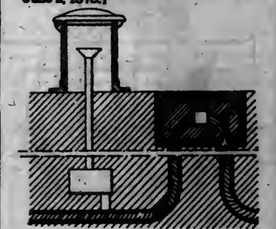
1. The device for polishing the eyes of needles, consisting of the fixed pieces A and A', the movable jaws *g* and *g'*, operating in combination with the pieces A and A', to grasp the threads extending through the series of needles, and the clamp P, for holding the needles with the eyes all in the same relative position, substantially as described.

2. The adjustable head-block C, arranged upon the upright A, in combination with the jaws *g* and *g'*, operating in connection with the parts A and A', to grasp and hold the threads upon which the needles are strung, substantially as set forth.

165,533. COMPOSITIONS FOR STONE ORNAMENTS. Alexander Doug, Jackson, Mich., assignor of seven-eighths his right to O. P. Coats, same place. [Filed Apr. 17, 1875.]

The herein-described stone cement, made by combining saltpeter with calcined gypsum, substantially in the manner and proportions set forth, and pulverizing the compound, as described.

165,534. CORSETS. Moses K. Bertron, Jackson, Mich. [Filed Feb. 12, 1875.]



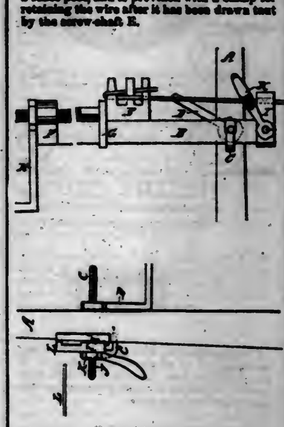
1. A corset-bone wherein two or more strips of whalebone or horn are placed one upon the other, substantially as and for the purposes set forth.

2. In combination, a corset-bone composed of two or more strips of whalebone or horn placed one upon the other, and a metallic tip, A, to hold the end of the same, substantially as and for the purposes set forth.

3. In a corset, the combination of the pieces A A' A' A' and the gores *a a'*, the several parts constructed and arranged substantially as and for the purposes described.

4. In a corset, the combination of the side pieces A' A', the bones in said pieces starting from a point under the arm, and diverging to the front and rear, avoiding the hips, the cut-away portion C, and the strap D D', all constructed and arranged substantially as and for the purpose set forth.

165,535. UNDERGROUND-TELEGRAPH LINES. David Brooks, Philadelphia, Pa. [Filed June 2, 1875.]



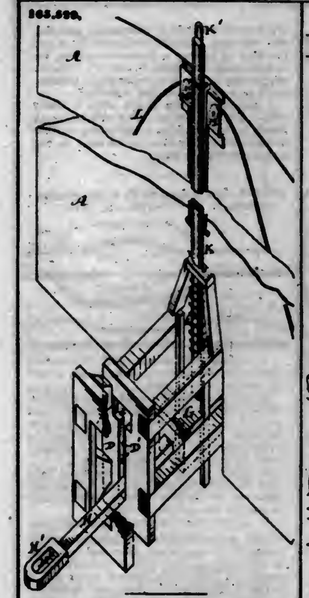
1. An underground-telegraph wire or cable clothed with absorbent material, covered with insulating substance, and contained within a pipe, in combination with a liquid insulating medium maintained under pressure within the said pipe, all substantially as set forth.

2. An underground-telegraph wire or cable surrounded by pipes arranged in sections, each section being bent upward at the ends, as set forth, and terminating in a box or receptacle, B, for the purpose specified.

165,536. FENCE-WIRE STRETCHERS. W. L. Brown and J. B. Cramer, Dunlap, Iowa. [Filed Feb. 13, 1875.]

Brief.—The device is detachably secured to a fence-post, and is provided with a clamp for retaining the wire after it has been drawn taut by the screw-shaft E.

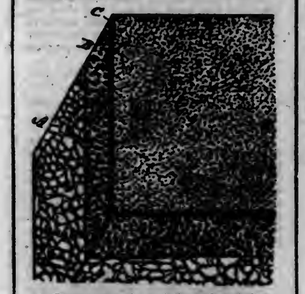
1. The combination of the forked straining-bar and its crank-nut H with bar B, having socket F, guide-ring G, and a device for holding to the post A, substantially as described.



2. The combination, with bars B and forked rod B, of the open-bolt or dog (), having a portion of its shank made polygonal, and a portion screw-threaded, and head-clamping nut D, as and for the purpose described.

3. The combination of the detachable clamping-jaw I', having screw J attached, with fixed jaw I, bar B, wire-straining screw-rod K, and nut H, all as shown and described.

165,537. GLOBE-VALVES. Hugh P. Bufton, Cleveland, Ill. [Filed May 17, 1875.]

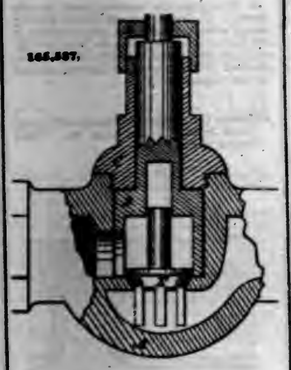


Brief.—The cheek-valve works within a bell-bow plug-valve.

165,538.

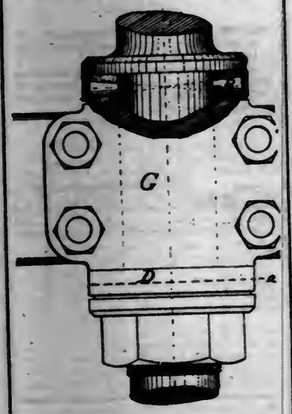
165,539. PAVEMENTS. Henry R. Bellamy, Indianapolis, Ind. [Filed Mar. 17, 1875.]

Brief.—Twenty-four pounds asphaltum and four gallons distilled coal-tar are boiled until the asphaltum is thoroughly dissolved. Five pounds of sulphur are dissolved in one gallon animal oil over a slow fire, and added to the asphaltum and coal-tar. Gravel of different degrees of fineness is then covered with this compound, and spread on a prepared foundation of gravel and broken stone, the coarser gravel beneath. A layer of the compound is spread as a top dressing, sanded and rolled in the usual manner.



1. The compound consisting of asphaltum, sulphur, animal oil, and distilled oil of coal-tar, when combined by heat, substantially in the manner and for the purposes herein set forth.

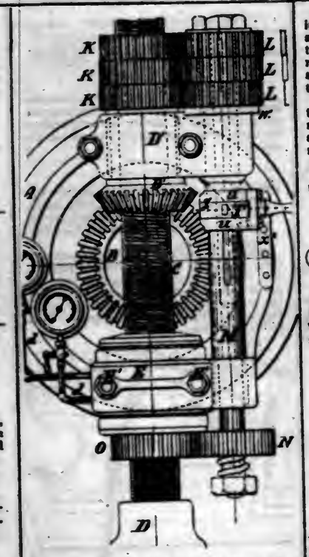
2. The combination of asphaltum, sulphur, animal oil, and distilled oil of coal-tar mixed with gravel or stone, substantially as and for the purposes herein set forth.



3. The within-described pavement, consisting of the coarsest grade of gravel or stone with compound A, second grade of gravel or stone with compound B, water-proof compound C, and finest grade of gravel and sand D, when combined substantially as herein set forth.

165,537.

The combination, with a hollow ping-valve, of a check-valve, having its seat in a partition formed in the valve-case, substantially as and for the purpose specified.



166,538. CONICAL-ROLLER THRUST-BEARING. Milan C. Bullock, New York, N. Y. [Filed May 20, 1874.]

The combination, with the disks C C and retaining-ring D, of the conical rollers B B, constructed without journals, and whose outer bases are spherical surfaces of less radius than that of the retaining-ring.

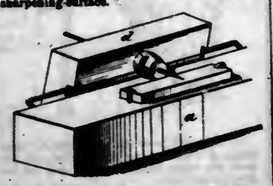
166,539. ROCK-DRILLING MACHINE. Milan C. Bullock, New York, N. Y. [Filed May 14, 1874.]

Brief.—The machine operates by rotation and continual pressure. The invention consists in the combination, with a revolving rock-drilling machine, of a screw-feed and a hydraulic vessel provided with a gage, whereby the thrust or pressure of the boring-bit upon the rock is indicated; also, in the combination, with a revolving rock-drilling machine, of a screw-feed and a hydraulic vessel provided with a gage, whereby the weight of the drill-rod is indicated; also, in the adaptation to the aforesaid vessels of a peculiar roller-bearing; and in the combination, with the differential gearing, of a shipping device, whereby the rate of feed may be changed, or the drill withdrawn, without stopping the revolution of the drill.

1. The combination, substantially as described, of a revolving rock-drill, a screw-feed, and a hydraulic vessel provided with a gage, whereby the pressure of the bit upon the rock is indicated.

2. The combination, substantially as described, of a revolving rock-drill, a screw-feed, and a hydraulic vessel provided with a gage, whereby the weight of the drill-rod is indicated.

3. The combination, with the hydraulic cylinder *c*, of the roller G and disks *a a*, one of which is fitted to slide in said cylinder like a piston, substantially as described.



4. The combination, with the screw-shaft and feed-nut, of the gears which feed said shaft at different rates of speed, and the shipping mechanism, whereby the rate of feed may be changed without stopping the revolutions of the drill.

5. The combination, with the hubs *m m* and gears L L L, of the slotted counter-shaft M, plunger S, keys *g* and E, shipping-handle R, tube *t u*, and ring T, operating as and for the purpose described.

6. The combination, substantially as described, of the fixed hub W and the shipping mechanism.

166,540. NEEDLE-SHARPENING. Thomas D. Conkin, Montrose, Pa. [Filed Nov. 21, 1874.]

Brief.—A cone-shaped elastic disk is attached to the end of a sleeve, which is journaled so as to revolve, and which slides on a guide-way, and through which the needle to be sharpened is passed and held obliquely to the sharpening-surface.

1. The elastic wheel *g*, journaled by means of an axial tube, *f*, and attached thereto at its inner or front end, and so as to project beyond the same, for grasping the needle near the point to hold it, and for graduating the pressure of the needle while it rotates the same in contact with a sharpening-surface, as herein illustrated and set forth.

2. The combination of the base *a*, supporting a block or strip of sharpening material, and provided with a pivotal guide-bar, *c*, and the slide *d*, having a transverse orifice, for reciprocating the needle in contact with the sharpening-surface at a proper angle, substantially as herein shown and described.

3. The combination of the slide *d*, rotary tube *f*, and elastic wheel *g*, for reciprocating a needle in contact with a sharpening-surface and simultaneously rotating the same, in the manner herein set forth.

166,541. CHAIN-CABLES. C. A. Chamberlin, Camden, N. J. [Filed Mar. 13, 1875.]

1. A chain-cable composed of links having the broad inner faces *c c*, substantially as and for the purpose set forth.

2. A chain-cable composed of links with increased depth and thickness at the points of junction of the sides and bends, and flattened at those points, so that the depth will be greater than the thickness, as at *a a*, substantially as and for the purpose set forth.

3. A flexible chain-cable composed of links with flattened bends of increased depth and thickness in the line of strain, substantially as and for the purpose set forth.

4. A chain-cable composed of links constructed with increased depth and thickness at the points of junction of the sides and bends, as at *a a*, and flattened at said points, and increased in depth and thickness in the bends in the line of strain, as at *y y*, said bends being likewise flattened, substantially as and for the purpose set forth.

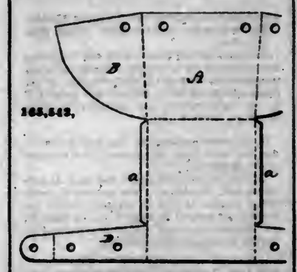
5. A chain-cable, the links of which have side bars with broad inner faces *c*, and of increased depth and thickness at the points of junction of the sides and bends, as at *a a*, and flattened at said points, substantially as and for the purpose set forth.

6. A chain-cable, the links of which have side bars with broad inner faces *c*, and flattened bends of increased depth and thickness in the line of strain, as at *y y*, substantially as and for the purpose set forth.

7. A chain-cable composed wholly or in part of links elliptical on the inner face, as at *c*, increased in depth and thickness at or about the points of junction of the sides and bends, as at *a a*, and increased in depth at the bends, as at *y y*, substantially as and for the purpose set forth.

166,542. DIES FOR HEADING AND SQUARING BOLTS. James B. Clark, Plantsville, Conn. [Filed May 10, 1875.]

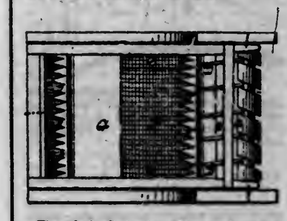
Brief.—The blocks gripe the blanks, and the dies square the neck. Dies project above the blocks, resting on springs, and present operative faces that are not parallel, but more widely separated at the lower part than at the upper end, permitting thus no accumulation of metal at the lower end of the square, as the header upsets the metal and forces it, together with dies *b*, downward.



The combination of the stationary holding-dies with the movable shaping-die *a* and heading-die, all operating together substantially as described.

166,543. ELEVATOR-BUCKETS. J. B. Cline, Jefferson, Iowa. [Filed Jan. 26, 1875.]

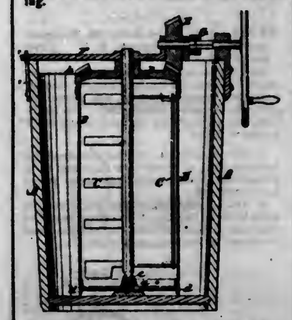
Brief.—A single piece is struck from a plate of metal, of form described, that will, by being bent and riveted, compose an elevator-bucket.



165,542.

The elevator-cup described, made from a single piece of metal, cut to form the part A, with ends B B, central piece C, with narrow strips *a a*, and bottom projecting bands D D, all as shown in Fig. 1, and then bent into shape, all substantially as set forth.

165,544. GRAIN-SEPARATORS. William S. Clymans, Burnt Cabins, Pa. [Filed May 16, 1875.]

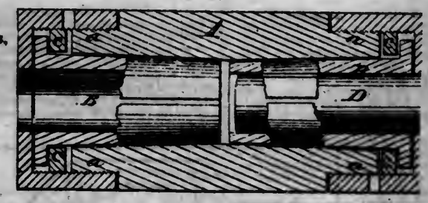


Brief.—A shaft, having cams at the ends and a series along its length of circumferential cam-grooves, imparts vibratory motion to a series of fingers pivoted to a fixed bar, and rocking motion to a separator-shoe, the rear end of which rests upon said shaft.

The shaft C, having the annular cam-grooves *d d d*, and the cams *f f*, in combination with the fingers D D D and shoe B, substantially as and for the purpose set forth.

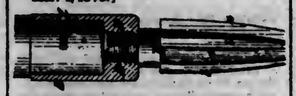
165,545. ICE-CREAM FREEZERS. John W. Condon, Baltimore, Md. [Filed June 7, 1875.]

Brief.—A sliding sleeve detaches the power-wheel and operating-gear. The covering-plate has depending flanges, which protect the gearing.



1. The combination of the top plate F, having flange *b*, with the teeth of the cover D, as and for the purpose specified.

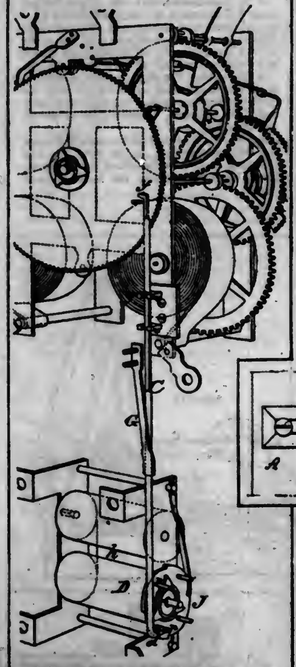
2. The combination, with the pinion-shaft and the shaft of the driving-wheel, of the single adjustable coupling-collar G, substantially as and for the purpose described.



165,546. SHAFT-COUPLINGS. ASA BROWN COOK, Erie, Pa. [Filed Mar. 27, 1875.]

165,546.

The screw-threaded nut C, having the interior ring or flange *c*, in combination with a screw-threaded hub, A, and split taper-sleeve B, operating substantially as described.



165,547. LANCES FOR PROPELLING SLEIGHS. Adolphe Corbett, Hicksville, N. Y. [Filed Mar. 4, 1875.]

The handle A and the metallic ferrule B attached thereto, and having the female screw-threaded socket D, in combination with the pointed head E having a screw nipple or boss, *c*, and longitudinal ribs *a b*, all substantially as and for the purpose set forth.

165,548. CALENDAR-CLOCKS. A. A. Cowles, New York, N. Y. [Filed May 6, 1875.]

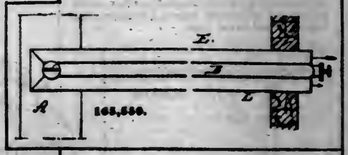
Brief.—The cylinder, carrying the calendar for the month, is moved through the medium of a lever actuated by certain devices connected with the striking mechanism.

1. In combination with the striking mechanism of a clock the leaf *a*, toothed wheel B, rod C, and calendar mechanism, substantially as described.

2. Studded disk J on the shaft of roller D, combined with hooked lifting-rod C, spring G, and the clock-actuating mechanism, substantially as described.

165,549.

165,549. BRACKET-STANDS. A. B. Denison, Guilford, Vt. [Filed May 19, 1875.]



As improved bracket-stand, consisting of the platform portion A, and the support E, both braced together with the pieces *c*, and also arranged with catches *c'* for attachment to the wall, and all formed and bent from wire, substantially as set forth.

165,550. DEVICES FOR THAWING FROZEN WATER-PIPES. Robt. R. Pleis, New York, N. Y. [Filed Apr. 2, 1875.]

Brief.—A pipe or tube adjoining the service-pipe, and running parallel from the main to and through the building-wall.

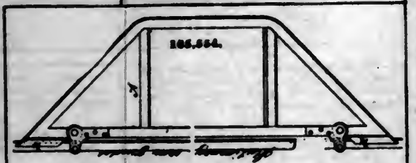
The combination of the branch pipe B and a tube, E, adjoining said pipe and extending parallel, or nearly parallel, thereto from a point at or near the main to and through the wall D of a building, as specified.

165,550.

165,551. TRACE-BUCKLES. Albt. G. Dodds, Charlton, Iowa, assignor, by mesne assignments, of a part of his right to R. T. Best and A. C. Wilcox, same place. [Filed Mar. 17, 1875.]

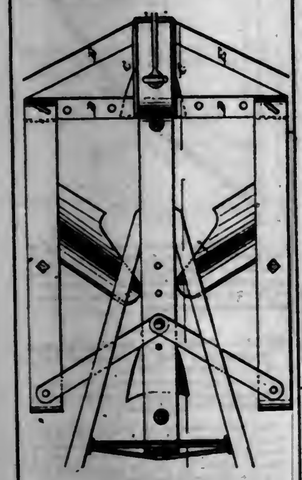
1. In a trace-buckle in which the trace is held by a pivoted tongue, a detachable metal protecting-plate, I, placed on the tongue between the trace and the rear-end tongue-bar, substantially for the purposes herein set forth.

2. The combination of the side bars A A with wedge-shaped braces *a a*, base-tug bar B, tongue-bar D, tongue F, loops J J, rear-end tongue-bar G, and protecting-plate I, all constructed substantially as and for the purposes herein set forth.



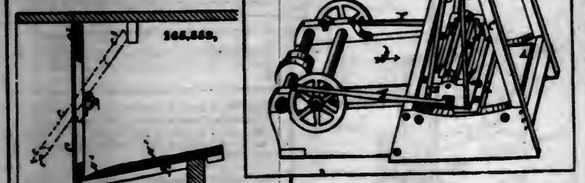
165,551.

1. A water or other similar closet, constructed with a pivoted seat, C, and a pivoted front-board, H, retained in position by a weight or spring, substantially as described.



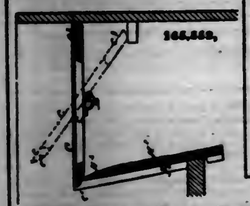
2. The combination, with a pivoted closet-seat, C, provided with an inclined end, C', of a pivoted front board, H, formed with a curved or inclined upper end, H', and retained in position by a weight or spring, substantially as and for the purpose described.

165,554.



165,556. CULTIVATORS. James U. Durrenvent and W. A. Hampson, Sylvatic, Miss. [Filed Mar. 15, 1875.]

Brief.—A light triangular frame strengthened by flanges, and secured to the front end of the center beam by longitudinal plates and cross-bands.



The flanged metal frame C D E, with its connecting-bands a a, adapted to allow of the adjustment of the side beams, all constructed and arranged as set forth.

165,555.

165,558.

165,559. SEATS FOR WATER-CLOSETS. Frank Feld, Galveston, Tex. [Filed May 10, 1875.]

Brief.—The seat and foot-board swing on pivots, so as to prevent persons standing on the seat; but when the occupant is in proper sitting posture the seat adjusts itself, so that it may be used.

165,564. SELF-CLOSING HATCHWAYS. John Fenson, Toronto, Canada. [Filed Nov. 4, 1873.]

Brief.—The doors are provided with pairs of rollers, that engage with flanged cams on the car, by which they are opened and closed, and a pivoted locking device, for locking the doors when closed, is secured to the sides of the hoistway, and is operated by the car in its ascent and descent.

1. The bracket G, with hinged bolt C and spring F, in combination with the projections H H' on the back of the cage A, as herein shown and described, and for the purposes set forth.

2. The bracket G, with hinged bolt C and spring F, in combination with the inner roller r' on the connection-bar D, attached to the hatch-door B, as specified and described, and for the purposes set forth.

3. In combination with the single flanged cams E E on case A, the pairs of rollers *r r' r r'* on the hatch-door, one of each pair engaging with and running on one side, and the other on the opposite side of its flange, as shown and described, and for the purposes set forth.

4. The spring F applied to a stationary part of the apparatus, and operating to hold the locking device in position to be automatically locked or unlocked, substantially as shown and described.

5. The combination, with the described cams and rollers, operating, as set forth, to close the hatch-door, of the described locking mechanism, operating to lock the hatch when so closed.

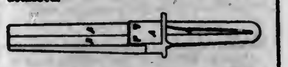
165,555. MACHINES FOR CUTTING HOOPS. Henry Fowler, Detroit, Mich. [Filed May 22, 1874.]

Brief.—The bolt from which the hoops are cut is placed in a feeding-box hung upon trunnions, so that in the reciprocation of the frame which carries it, the box will be canted by the bolt striking the cutting-knife, thus forming a beveled hoop.

1. In combination with the bolt-holder G and the bevel E, the set-screws H, for the purposes described.

2. The combination, with the bed A, provided with threats a, of the cutters B, oscillating holder or box G, pivoted within the bevel E, set-screws H, frame C, radial arms D, and connecting-rods F, all constructed and arranged as described and shown.

165,556. BOOT AND SHOE STRETCHERS. O. F. Garvey, Pawtucket, R. I. [Filed July 3, 1875.]



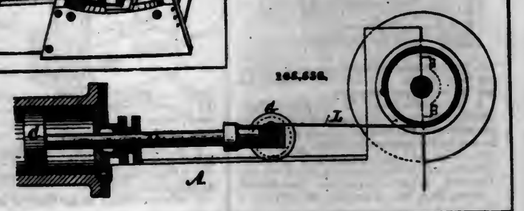
Brief.—The spur projecting from the bottom of the lower section prevents slipping, and adapts a single apparatus to varying sizes of boots and shoes.

In a last for stretching boots and shoes, the section A, provided with spurs g and slotted standards c, projecting from its bottom or lower surface, substantially as and for the purpose set forth.

165,557. FENCE-POSTS. Everard Gear, Beloit, Wis. [Filed June 23, 1875.]

Brief.—Twin posts in a metal socket, the end of which socket is driven into the ground. Each post is retained by a transverse bolt, so that by withdrawing a bolt the panels may be detached.

In a fence-post, the combination and arrangement of the twin-posts B B with the metal part A, substantially as and for the purpose herein set forth.



164,568. HYDRAULIC HOISTING-ENGINES. Geo. M. Gerrish, Brooklyn, N. Y. [Filed May 31, 1875.]

Brief.—The cross-head and drum are connected by flat metal bands, which, in winding upon and unwinding from the drum, are always in the direct line of draft. The bands being flat, the working diameter of the drum is least variable.

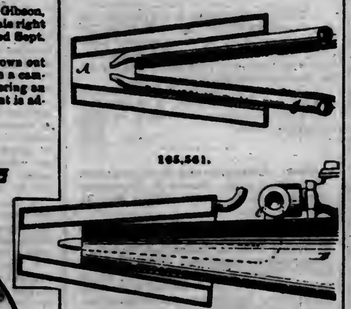
1. The combination, with the piston-rod and hoisting-drum, of one or more flat metal band connections, L, substantially as herein shown and described.

2. The combination of the piston-rod D, cross-head E, cranks G G, hoisting-drum and shaft and connections, arranged as shown and described, for the purpose specified.

165,536.

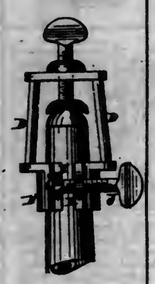
165,558. ROTARY ENGINES. Saml. Gibson, Shrewsbury, assignor of one-half his right to Hiram Young, York, Pa. [Filed Sept. 23, 1874.]

Brief.—The hollow pistons are thrown out by a pin attached to them working in a cam-groove, and are packed by steam entering an opening in the pistons. The abutment is adjusted by a screw.

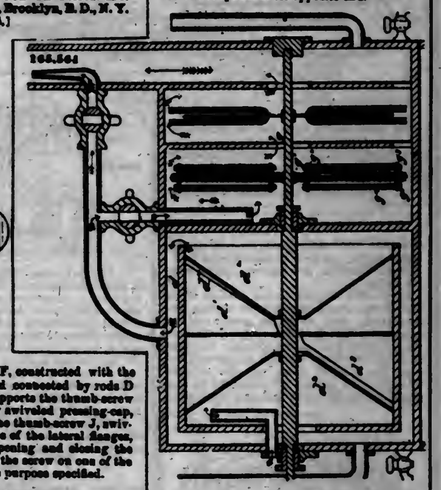


1. The combination, with the circular casing A, having the cam-groove a, as described, of the revolving wheel B, arranged within and concentric with the cylinder, and the hollow pistons C C, moving out and in in the wheel B, and provided with shoes C', and studs and rollers b to move in the cam-groove a, and with steam-inlets a, all substantially as and for the purposes herein set forth.

2. The combination of the casing A with passages *f f'*, and cam-groove a, revolving wheel B, hollow pistons C C, with shoes C C', steam-inlets a a, and studs and rollers b b, and adjustable abutment H, all substantially as and for the purposes herein set forth.

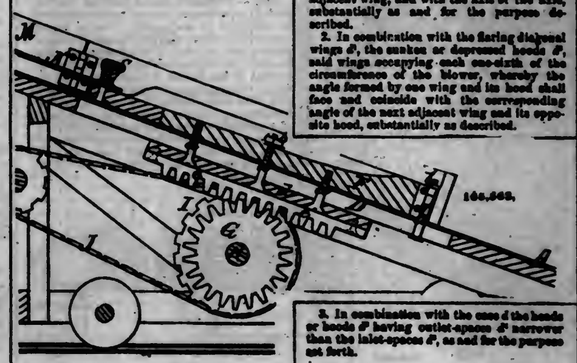


3. The combination of the casing A with passage *f f'*, cam-groove a, revolving wheel B, hollow pistons C C, adjustable abutment H, hollow cylindrical valve G, with ports *d* and *e e'*, and passages *i i'*, steam-chest D, and inlet and exhaust pipes E E, all substantially as set forth.



165,561.

The combination of the tuyere A, air-blast pipe B, arranged therein, and steam-tubes *c c* on the exterior of, and projecting in front of, the air-blast pipes, substantially as shown and described.



165,562. BILLIARD-CUE-TIP FASTENERS. Christian Grevelius, Brooklyn, S. D., N. Y. [Filed May 20, 1875.]

The hinged clamp F, constructed with the lateral flanges *l l*, and connected by rods D with the plate that supports the thumb-screw carrying the ordinary swiveled pressing-cap, in combination with the thumb-screw J, swiveled at one end to one of the lateral flanges, for the purpose of opening and closing the jaws by the action of the screw on one of the flanges, as and for the purpose specified.

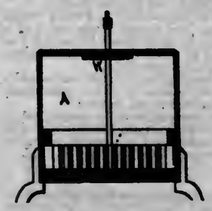
165,563. SNOW-PLOWS. Erastus G. Graves, Rome, N. Y. [Filed June 6, 1875.]

1. The wings M, hinged to the rear end of the double mold-board E, in combination with the pivoted and longitudinally-slotted arms N N', and clamping-screw S, substantially as and for the purpose set forth.

2. The combination, with a tapering shovel-plane, A, and an adjustable double mold-board, E, having platform F, of the vibrating and adjustable arms or rods N N', and set-screw S, substantially as specified.

3. The combination of an inclined shovel, A, having slot D, and the endwise-movable mold-board E, having rack-bar *e* of the pinion G, shaft H, sprocket-wheels I, endless belts J, sprocket-wheels K, and shaft L, substantially as specified.

165,564. AIR-CARBURETORS. George L. Gray and Comegys C. Linzey, Philadelphia, Pa. [Filed Apr. 10, 1876.]



Brief.—The air-blower and carburetor-wheel in separate chambers are fixed on the same shaft. The exit air-pipe from the blower extends to the exit gas-pipe from the carburetor-chamber, and has a branch extending direct into the carburetor. Each branch is provided with a cock for controlling the air-supply. The air-blower has flat, flaring, oblique leaves, and the heads of the blower are concave. The air-inlet spaces to the blower are wider than the outlet-spaces at its opposite end.

1. The blower, having oblique wings *f*, the upper edge of each wing being in the same plane with the lower edge of the next superadjacent wing, and with the axis of the axle, substantially as and for the purpose described.

2. In combination with the flaring discharge wings *f*, the cantion or depressed hoods *F*, said wings occupying each one-sixth of the circumference of the blower, whereby the angle formed by one wing and its hood shall face and coincide with the corresponding angle of the next adjacent wing and its opposite hood, substantially as described.

165,565. DASHERS OR GAS AND AIR BEATERS FOR FURNACES. Geo. H. Goodsell, Lockhaven, Pa. [Filed May 17, 1875.]

Brief.—The small pipes on the outside of the blast-pipe conduct steam or gas in front of the nozzle, by which arrangement the blast forces the steam, &c., into the furnace.

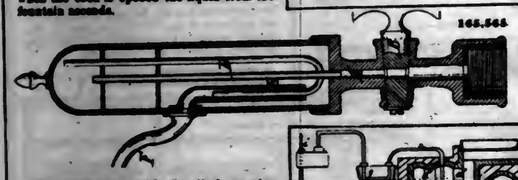
The dasher C, in combination with bottom of box A and cross-head H, and operated in the manner as and for the purpose set forth and described.

165,566. RECIPROCATING CHURNS. Alfred Goodnough and Thomas T. Drennen, Portland, Oreg. [Filed Nov. 21, 1874.]

Brief.—The two pivoted dasher-blades are forced together in the downward stroke by the double-inclined bottom. The cream is prevented from splashing out by the cross-head, which reciprocates as the dasher is moved, and effectually closes the opening through the lid of the churn.

The dasher C, in combination with bottom of box A and cross-head H, and operated in the manner as and for the purpose set forth and described.

165,565. DASHERS OR GAS AND AIR BEATERS FOR FURNACES. Geo. H. Goodsell, Lockhaven, Pa. [Filed May 17, 1875.]



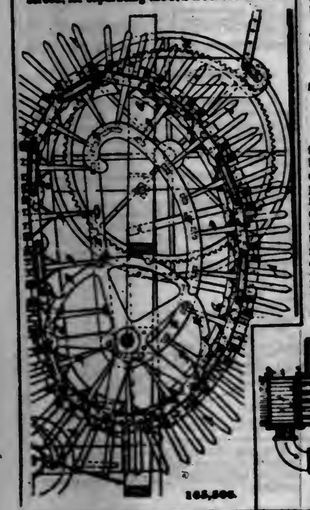
Brief.—The small pipes on the outside of the blast-pipe conduct steam or gas in front of the nozzle, by which arrangement the blast forces the steam, &c., into the furnace.

4. An evaporating-wheel composed of the disk f', central and circumferential rows of pins f' f'', and wick or other fibrous or textile material wound alternately from center to circumference, substantially as shown and described.

5. The combination, with a blower and carburetor upon a single shaft passing through the air and gasoline chambers, of a pipe leading from the blower-chamber to the outlet gas-tube, and having a branch entering the gasoline-chamber, said pipe and branch being furnished with cocks to regulate the quality of the gas, as and for the purpose specified.

165,565. APPARATUS FOR DRAWING EFFERVESCENT LIQUIDS. Charles Greiner, New York, N. Y. [Filed Dec. 17, 1874.]

Brief.—The discharge-pipe of a fountain containing effervescent liquid under pressure, in combination with a stop-cock, one or more sieves, an expansion-chamber, a siphon-shaped escape-pipe for the surplus gas, and a spout which connects with a pipe extending down near to the bottom of the expansion-chamber, and which embraces the discharge-shank of the gas-escape pipe, in such a manner that when the cock is opened the liquid from the fountain ascends.

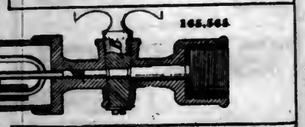


165,565.

The combination, with the discharge-pipe of a fountain containing liquid under pressure, of a stop-cock, B, a siphon-shaped gas-escape pipe, D, one or more sieves, c, a liquid-escape pipe, E, and spout F, all constructed and operating substantially in the manner shown and described.

165,566. POTATO-DIGGERS. Geo. W. Hasg, Milton, Pa., assignor to himself and Pembroke Churchill, same place. [Filed May 9, 1875.]

Brief.—The digging device consists of an endless belt armed with two sets of long concave teeth, which enter the ground by the forward movement of the machine, which is mounted upon four bearing-wheels. A system of fixed cams cause the teeth to approach beneath the potatoes, which, with the soil, are lifted from the ground and deposited upon a screen, for separating the soil from the tubers.



165,566.

1. The two sets of teeth A, to press into the ground and close under the roots by the forward movement of the machine, said teeth being mounted on endless chains, in combination with horizontally-elongated ways G for the chains, substantially as specified.

2. The teeth A, constructed in fluted or grooved transverse section, in combination with the endless chains and ways G, substantially as specified.

165,567. APPARATUS FOR CONCENTRATING SULPHURIC ACID. Gustav A. Hagemann, Copenhagen, Denmark. [Filed May 21, 1875.]

Brief.—One or more conical evaporating pipes or tubes extend through the flue, communicating with the cooler and condenser. These pipes are surrounded by heat from the flue. A current of air is induced by an injector in the vapor-pipe connected to the evaporating-pipe. The interior of the evaporating-pipes is provided with small chocks or rings, which serve to distribute the acid evenly over the interior surfaces, and regulate the flow. The acid-chamber is heated by the waste vapors given off.

165,567

1. In combination with a vertical flue, A', fire-places a a, one or more conical evaporating-tubes c, placed vertically within the flue, substantially as and for the purpose specified.

2. In combination with the conical tube c, within a suitable furnace, the eduction-pipe e, and a jet or injector, i, substantially as and for the purpose specified.

3. The conical evaporation-tube c, provided with a series of removable rings or chocks, c^2, substantially as and for the purpose specified.

4. The combination of the flues A' A^2, evaporating-tube c, and the evaporating-pan D, substantially as and for the purpose specified.

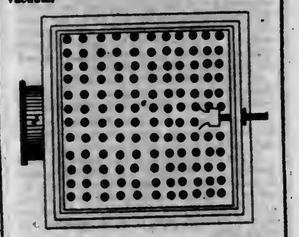
165,568. METHODS AND APPARATUS FOR EVAPORATING LIQUIDS. Gustav A. Hagemann, Copenhagen, Denmark. [Filed May 21, 1875.]

Brief.—The liquid escapes from the receiver through a perforated bottom, and is conducted by filaments to the cup-like mouths of the evaporating-tubes, where, by means of cuts or perforations, the fluid is distributed in a thin film over the interior surface of said pipes. A current of air, heated if desired, induced by fan or exhaust, passes up to hasten evaporation. Steam is admitted to the jacket, passing freely among the pipes, and is diffused by means of a series of diaphragms, through which the pipes pass loosely. The air passing up the pipes, becoming heated and charged with vapor, is reconducted by a pipe to the jacket and utilized.

165,568.

1. The process herein described for evaporating and concentrating liquids, consisting in exposing a thin, continuous, or flowing film of liquid to heat applied on both sides thereof, and to the action of an induced air-current, substantially as specified.

2. In an evaporator for evaporating and concentrating liquids, the combination of one or more vertical tubes or pipes, an inclosing jacket or cylinder, a series of perforated heads or diaphragms, and two or more induction and edduction pipes communicating with the jacket and vertical tubes, substantially as and for the purpose specified.



3. The combination of cylinder a, having perforated heads b c, and induction and edduction pipes t u, with tubes d, and blast or exhaust fan k, substantially as and for the purpose specified.

4. The combination of blower k, pipes d, cylinder or jacket a, having heads b c y, pipe m, and edduction-pipe u, substantially as and for the purpose specified.

5. The tubes d, having one end cut or perforated, and provided with a cup for receiving a liquid and directing it against the surface of the pipe, substantially as specified.

165,569. PNEUMATIC MACHINES. Gustav A. Hagemann, Copenhagen, Denmark. [Filed May 21, 1875.]

Brief.—The sucker-head has fine wires, crossing the chamber vertically, to make a large condensing-surface, and regulate the flow. The head is also provided with a slide covering the perforations. A Bunsen or Sprengel pump is attached to produce a vacuum.

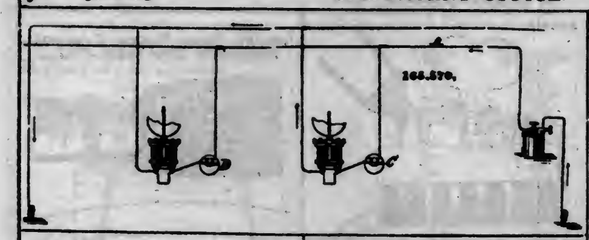
1. In combination with the vacuum or sucker-head a series of inlet and exit pipes. s s s s, substantially as and for the purpose specified.

2. In combination with the exit-pipes s s of the sucker-head, plate h, having cup-shaped depressions, as and for the purpose specified.

3. In combination with the inlet-pipes s s of the sucker-head the conical tips s' s', substantially as and for the purpose specified.

4. The combination of the inlet and exit pipes s s s s of a sucker-head, and a series of filaments or wires within the head, substantially as and for the purpose specified.

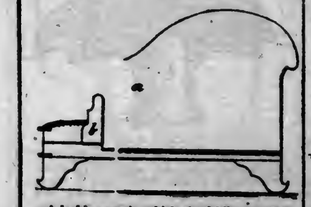
5. As an improvement in working vacuum apparatus, the method herein described of increasing the power thereof by means of films or sheets of water within the sucker-head, substantially as specified.



6. In combination with the water-head s, an adjustable slide or gate, c, substantially as and for the purpose specified.

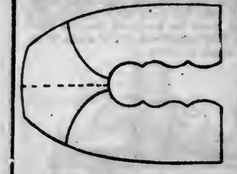
7. The combination of the sucker-head siphon-pipes x y, vat v, and cross pipe w, having a suitable stop-cock, substantially as and for the purpose specified.

165,570. CIRCUITS FOR ELECTRIC SIGNALS. Thomas S. Hall and Geo. H. Snow, West Meriden, Conn. [Filed June 28, 1875.]



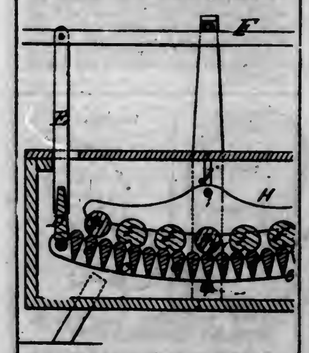
Brief.—Designed more particularly for railroad-signals, the purpose being that whenever the circuit is closed the current shall be compelled to traverse the same distance, and the resistance shall then always be the same.

The combination, with a series of keys or circuit-closers, O D, of a battery and two line-wires, A B, one pole of the battery and one of the line-wire B being grounded, while the other pole of the battery connects with the line-wire A, all constructed and operating substantially in the manner herein shown and described.



165,570.

165,571. BED-LOUNGE. Thomas Q. Hall, Indianapolis, Ind. [Filed July 6, 1874.]



A bed-lounge, in which the folding section is provided with the leg or foot b, constructed and arranged to form a part of the back a, when the folding section is folded upon the base of the lounge, substantially as and for the purpose set forth.

165,572. MOLDS OR CUTTING BOOT-FRONTS. Joseph T. Harper, Charleston, Ill. [Filed Apr. 9, 1875.]

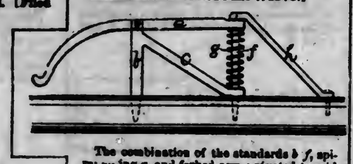
A boot in which the vamp is constructed of two or more pieces of material cut and united to each other and to the leg-front, in the manner and for the purpose specified.

165,573. WASHING-MACHINES. John H. Harris, Iola, Kans. [Filed Apr. 10, 1875.]

In a washing-machine, the oscillating rubbing-frame C, having transverse strips e, hinged boards D, at its ends, pivoted rods H F, actuating-lever F, in combination with the oscillating rubber-block H, having journaled ribbed strip f and rollers g.

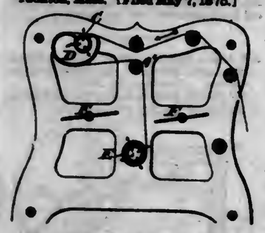
165,574. FEATHER DUSTERS. Henry L. Harrison, East Saginaw, Mich. [Filed June 5, 1875.]

Brief.—The duster is provided with a tonka-bean to repel moths.



1. A feather-duster charged with a fixed moth-protector, substantially as and for the purpose specified.

2. A moth-proof feather-duster consisting of the head, brush, and the contained Tonka or moth bean, substantially as herein set forth.

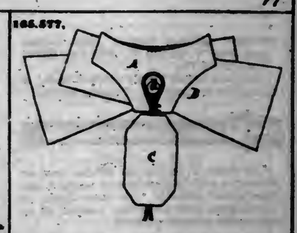


165,574.

165,575. HOLDBACKS. Willard H. Harvey, Kingston, Mo. [Filed June 7, 1875.]

The combination of the standards b f, spiral spring g, and forked arm e pivoted to said standard b as d, all operating as set forth, for the purposes described.

165,576. CLOTH STEAMING, SMOOTHING, AND DRYING. William Hebden, Boston, assignor to himself and A. Y. Conyers, Taunton, Mass. [Filed May 7, 1875.]

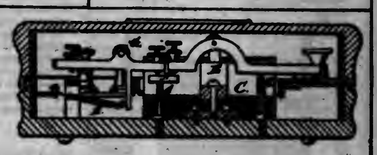


1. The combination, in a cloth steaming or sponging machine, of a stationary perforated steam-pipe, C, a smoothing-chamber, D, and a revolving perforated steam cylinder, E, substantially as and for the purposes specified.

2. The combination, in a cloth steaming or sponging machine, of the stationary perforated steam-pipe C, smoothing-chamber D, revolving perforated cylinder E, and drying fans F F, substantially as described, for the purposes specified.

3. The process of steam-sponging cloth, consisting essentially in steaming in single thickness, smoothing, steaming in bulk, and drying, substantially as described.

165,577. NECK-TIES. Adolph Hollenberg, New York, N. Y. [Filed June 22, 1875.]

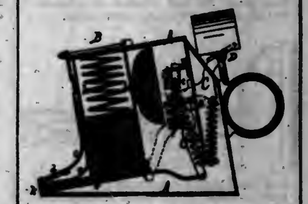


165,577.

1. The combination of a detachable and reversible cross-piece with the bow of a neck-tie, substantially as shown and described.

2. The loops b c and button d in combination with the shield A and cross-piece C of a neck-tie, substantially as set forth.

3. In combination with the neck-tie shield A and cross-piece C, a bow, B, fastened at one edge to the shield by a narrow band or equivalent fastening, and arranged so that said bow may be turned and reversed on the same side of the shield, substantially as and for the purpose described.



165,578. POCKET TELEGRAPH-RELAYS. R. A. Hill, Chicago, Ill., and H. J. Schneider, Philadelphia, Pa., assignors to R. A. Hill, Chicago, Ill. [Filed June 18, 1875.]

1. The combination of the magnets C, pieces E, for securing the magnets, and making a trunnion-support for the key, the stop-plate N, and the key G, as specified.

2. The combination of the magnets C, stop-plate N, sounder-lever F, spring H, and inclined thumb-piece spindle I, as specified.

165,579. FARE-BOXES. George J. Hill, Buffalo, N. Y., assignor of one-half his right to Jas. W. Roger and Augustus Roger, same place. [Filed Apr. 26, 1875.]

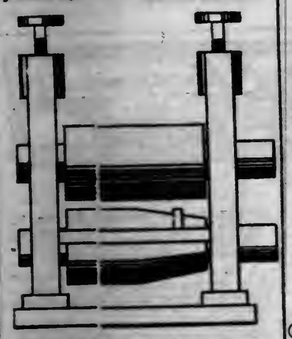
Brief.—Depressing the thumb-piece projects the ticket in the inspection-chamber, and forces another into its place; the recoil of the thumb-piece sounds the alarm.

1. The frame or case A having one or more compartments B, in combination with the slide c, having the catch $c g$, the lever C, connected with the said slide by the rod i, the thumb-plate D, connected with the lever C, for operating the slide and its catch, and an alarm mechanism connected with the levers U and D, for sounding an alarm when the same are operated substantially as and for the purpose described.

2. The mechanism for ringing the bell G, consisting essentially of the lever-arms r s, rod t, resting in cavities u u, hammer-v F, and spring y z, by which the single hammer operates for any number of the finger-levers, as hereinbefore specified.

3. The springs n n, in combination with the tubes J J, and delivery openings d d, by which a ticket cannot be returned through these openings, substantially as hereinbefore specified.

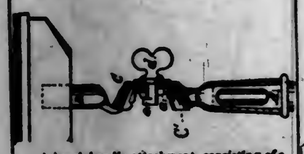
165,580. MINERS' TOOLS. John Holmes and Peter P. Quirin, St. Clair, Pa. [Filed June 23, 1875.]



Brief.—A hollow handle screw-threaded at the end for the reception of sundry heads.

The cutter B, having the beveled head or receiver *a*, and the four beveled points *b*, and open center provided with screw-thread, in combination with the hollow handle, all as and for the purposes specified.

165,581. METHODS OF MAKING PLOW MOLD-BOARDS. Josiah Holmes, Pittsburg, Pa. [Filed Dec. 8, 1874.]

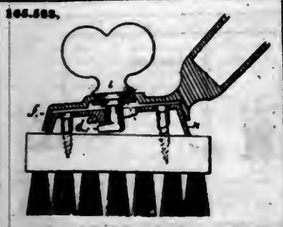


Brief.—The mold-board blank is of diamond shape, cut from a bar or plate of uniform thickness, equal to that required of the thickest part of the mold-board, and about six inches wide. This blank is passed through rolls, its major axis lying parallel to their axes, and its point abutting against the adjustable stop E.

As an improvement in the art of manufacturing plow mold-boards, the method herein described.

165,582. DEVICES FOR ATTACHING HANDLES TO BRUSHES. H. P. Hood and G. W. Joseph, Indianapolis, Ind. [Filed May 31, 1875.]

Brief.—The joint composed of the two conical plates is capable of adjustment to set the brush at different angles to the handle, and these plates are held together by a thumb-bolt having a lug working on an incline.



A brush-handle attachment, consisting of a socket, A, stem B, the conical plates C C', incline *c*, and clamp *d*, having lug *e*, as described.

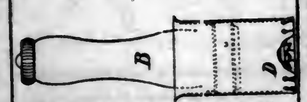
165,583. ADJUSTABLE HANDLE-ATTACHING DEVICES. H. P. Hood and G. W. Joseph, Indianapolis, Ind. [Filed Apr. 9, 1875.]

Brief.—The handle can be set at any angle desired by running its socket upon the inclined and tapering plate upon the brush. The two parts are clamped together by means of a thumb-bolt having a lug, which turns upon an inclined plane.

In a handle-attaching device, the conical and inclined plates *f* and *e*, clamped together by means of the lug-bolt *i*, provided with the lug *d*, operating upon the inclined plane *e*, substantially as shown and described.

165,584.

165,584. TEETH-PROTECTORS. A. Hopfe, New York, N. Y. [Filed June 10, 1875.]



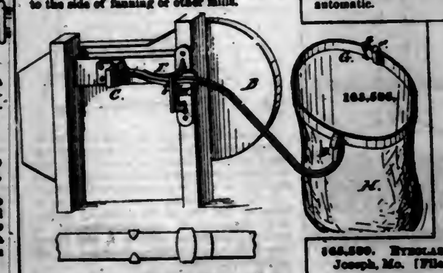
1. The channel-piece A, of rubber or analogous material, adapted to form a covering for the human teeth, substantially as and for the purposes herein specified.

2. The channel piece A, of rubber or analogous material, in combination with a backing of metal or analogous strengthening material, as herein specified.

3. An expansible covering for the teeth, composed of a soft fitting lining, A, two or more stiffening and supporting pieces, B' B', and connecting means D, adapted to allow the device to fit upon jaws of different sizes, and formed substantially in the manner and for the purposes herein set forth.

165,585. EGG-BEATERS. John Howes, Worcester, Mass. [Filed May 10, 1875.]

1. An egg beater or mixer provided with the oblique openings E *a*, giving a tangential discharge, in combination with tube A and piston B.



2. An egg beater or mixer consisting of the tube A, piston B, and head D, having a series of zigzag openings, as described.

3. An egg beater or mixer having a centrally-supported head, D, in combination with tube A and piston B, as set forth.

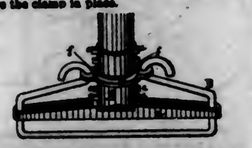
4. An egg beater or mixer consisting of the tube A and piston B, having an elastic packing, compressible by the rod and nut I without being removed from the tube A.

165,586. BAG-HOLDERS. Joseph James, Bosanquet Township, Lambton County, Canada. [Filed Apr. 17, 1875.]

Brief.—Especially adapted for attachment to the side of fanning or other mills.

A bag-holder constructed with an adjustable holding-spring, C, an arm or bracket, B, having a wedge-shaped tip, *c*, and projection *b*, held with capability of adjustment in a catch, E, by means of a spring, F, substantially as and for the purposes shown and described.

165,587. VEHICLE-WHEELS. C. Jeanteud, Paris, France. [Filed May 28, 1875.]



In a wheel for vehicles, the combination of a tire having a tongue or a groove on its inner surface, a metallic band, made in one or more pieces, serving as a continuous fully, and having a tongue or a groove on its outer surface, and an elastic packing-ring, interposed between said tire and band, and constructed to allow for its expansion and contraction and prevent its displacement, substantially as described.

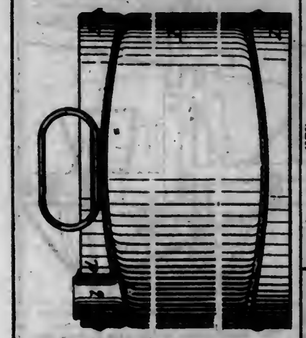
165,588. MOPS. R. Johnson and J. Barnes, Bellington, Vt. [Filed June 3, 1875.]

Brief.—A row of studs on the handle-socket are made to pass through slots in the upper rung in forcing the head down to clamp the mop-cloth, when the torsion of the side wires turns the ring under one of the studs, to secure the clamp in place.

1. The handle-socket A, provided with the studs *a a* and the cross head *a*, combined with the clamp-wire B and collar C, with notches for the passage of the studs *a*, a partial rotation whereof will cause said collar to interlock with one of said studs, as set forth.

2. The handle-socket A, provided with the studs *a*, combined with the clamp-wire B and collar C, provided with beveled notches *f*, so adjusted in relation to the said studs that the torsion of said wire constantly tends to lock said collar and studs and make said locking automatic.

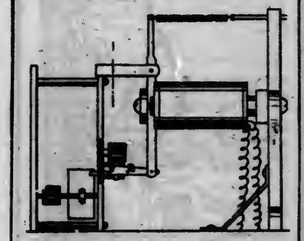
165,589.



165,589. EYEGLASSES. Israel Kahn, St. Joseph, Mo. [Filed May 7, 1875.]

1. In combination with the bar-springs A, constructed as described, and free to play at their lower ends, the soft-rubber pads or strips *a*, applied thereto and held thereby, in the manner set forth.

2. The soft-rubber pads applied to, and held by their own resiliency within, cavities or bezes made in the bridge or bows of a pair of spectacles, and projecting beyond the surface of the metal, all as shown and set forth.



165,590. CARRIERS FOR ACIDS. Franklin H. Kalbfleisch, Brooklyn, N. Y. [Filed Jan. 26, 1875.]

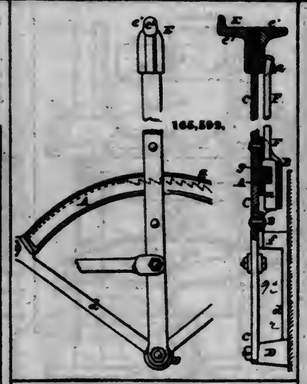
A carrier for caustic acids, provided with a pouring-nozzle and lined with lead extending through the nozzle and overlapping its upper surface or edge, as shown and described.

165,591. NON-INTERFERING FIRE-ALARM TELEGRAPHS. Jos. W. Eaton, Richmond, Va. [Filed Apr. 28, 1875.]

Brief.—To prevent operating instrument from locking itself, a rack-bar carried by a pinion on a shaft of the clock mechanism comes into the path of the locking-stop.

1. The herein-described method of preventing interference of signals by connecting the instruments at the various signal-stations by a second and independent electric circuit, which is opened or closed automatically, and operates the armature of an electro-magnet carrying a stop for the purpose of locking the clock mechanism to prevent the interference of signals, substantially as described.

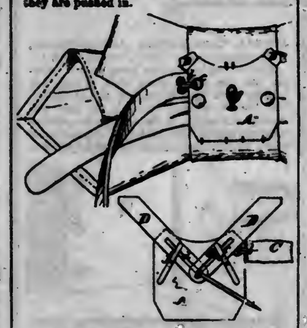
2. The herein-described method of automatically operating the armature provided with a stop for the clock-gearing, by a non-conducting tape disposed and operated upon the same drums with the signal-tapes, and having perforations at its extremity only, whereby the secondary circuit is closed when the instrument is not in operation, and is broken while the instrument is in operation, substantially as described.



3. The stop E, having the shoulder *f*, in combination with the rack-bar *g*, spring *f*, and pinion *h*, substantially as and for the purpose described.

165,592. WAGON-BRAKES. W. Lockman, New York, N. Y. [Filed May 10, 1875.]

Brief.—Ratchets so arranged that the reins cannot catch on them when thrown over brake-lever by driver.

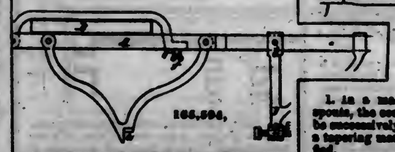


The combination of the serrated flange *g*, with the segment-bar A, lugs *f f*, hub D, arms *d d*, (the whole being cast in one piece,) with the lever C, bracket B, sliding dog *e*, rod F, spring S, and stirrup E *e'*, the whole constructed, arranged, and operated in the manner and for the purpose herein set forth.

165,592.

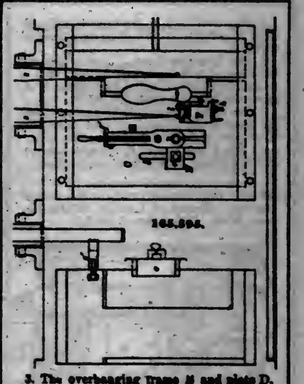
165,593. NECK-TIES. Adolph Landes, New York, N. Y. [Filed June 28, 1875.]

Brief.—When the bow is to be used in connection with a turn-down collar the slides are drawn out, and when with a standing collar they are pushed in.



1. A shield for a neck-tie or bow provided with slides D D, arranged to operate substantially in the manner herein shown and described.

2. The combination of a shield, A, slides D D, bow B, and tie or band C, substantially in the manner set forth.

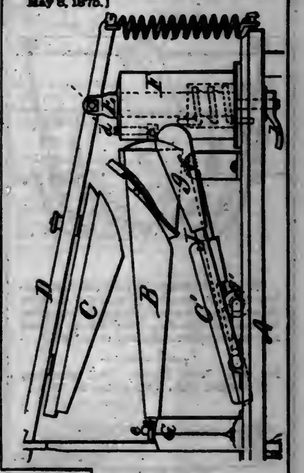


165,594. WINDOW-SCAFFOLDS. Andw. T. Large, Chicago, Ill. [Filed Apr. 14, 1875.]

In combination with bracket A and platform B, the hinged clamp-bar F, arranged to embrace and hold the platform, as specified.

165,594.

165,595.



3. The overhanging frame M and plate D, bolted together, as shown, combined with the knife *f* and sliding stop *f'*, the whole being adjustably connected to the base C of the table, substantially as and for the purposes specified.

4. In the heel-cutter, the combination of the block F, adjustable knife *g*, and hook *i*, substantially as specified.

5. The knife *g* of the heel-cutter, made adjustable by means of the stops *h h'*, bolt *h*, lock-nuts *i*, and curved slot *i*, substantially as set forth.

165,595. MAKING SHEET-METAL SPOUTS. Milton S. Leidy, Richmond, Va. [Filed May 8, 1875.]

1. As a machine for making sheet-metal spouts, the grooved formers C C', adapted to be successively operated in combination with a tapering mandrel, D, substantially as specified.

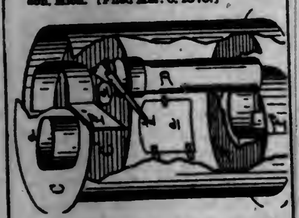
2. The die-bed I, having flanges *f* and recess *f'*, in combination with a mandrel, B, and the formers C C', adapted to be actuated to inclose the same, substantially as specified.

3. The combination of a rest, *c*, and a spring, *c*, applied thereon, with a horizontally-vibrating mandrel, B, adapted to be automatically returned by spring E to its rest C, substantially as specified.

4. The tapering mandrel B, having longitudinal groove *r*, in combination with a detachable flanged die-bed, I, having flange *s*, substantially as specified.

165,596. SHOE-SOLE MACHINES. John W. Lefferts, Baltimore, Md., assignor of one-half his right to John E. Poor, same place. [Filed June 9, 1875.]

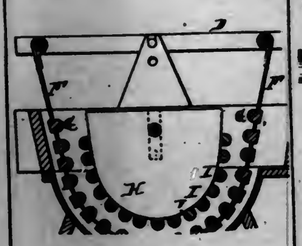
1. In a machine for trimming the edges of soles and heels of shoes, the combination of a cutter, adapted to slide upon the top thereof, and stirrup *b*, operated by means of a treadle, substantially as described.



2. The rigid arm-piece *c*, in combination with the adjustable rest *c* and T-stop *c*, substantially as described.

5. The mandrel B, in combination with cylinder F, rotating on rod E, substantially as specified.

6. The U-shaped lever J, having grooved anti-friction roller f, in combination with a gravitating former G and a fixed mandrel B, substantially as specified.



7. The sheet-metal blank K, having tapering edges k and an arrow-headed extension, k', adapted to be formed into a spout, c, having a neb, i, and flanges f', whereby it is riveted to a vessel, substantially as specified.

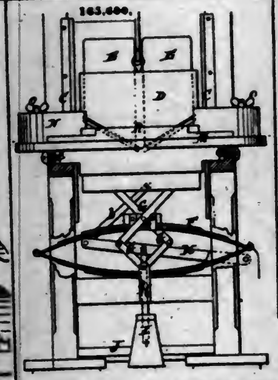
165,597. COMBINED STOVES AND HEAT-RADIATORS. Newton H. Lenherr, White Pigeon, Mich. [Filed Mar. 6, 1875.]

The combination of the shell A, bottom B, top U, partitions B' C', fire D, fire-strips F F', door a, socket b, collar c, damper d, and smoke-hole e, all constructed and arranged to operate as described.

165,598. WARMING-MACHINES. Samuel P. Lecraw, Chattanooga, Tenn. [Filed Apr. 12, 1875.]

The flexible straps F, provided with rubbers G G, and operated by means of the lever D, when used in combination with the rubber H, provided with slots I, and having vertical adjustment, all substantially as set forth.

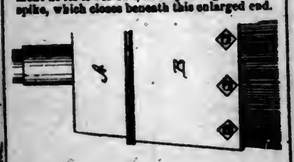
165,599. SAFE-DOORS. Neil Macneale, Cincinnati, Ohio. [Filed May 25, 1875.]



The flap D, attached to the inner wall of a safe around the door-opening, so as to entirely cover without wholly closing the joint or crevice between the door and opening, in manner substantially as set forth.

165,600. MITRE-PLANING MACHINES. Julius Mannchaeh, New York, N. Y. [Filed Apr. 28, 1875.]

Brief.—In a machine for planing mitres two or more plane-bits are attached to a reciprocating frame working between vertically-adjustable guides, and operated by a foot-lever, in connection with lazy-tongs supported upon a suitable spring, and disconnected from the frame carrying the bits, whereby a reciprocating motion is imparted to said frame, while the power exerted by the spring and foot-lever is equally distributed, and the equilibrium of the hinge is preserved at all times.



165,600.

In a miter-planing machine, the combination of the lazy-tongs G, with the foot-lever I, supporting-spring F, plane-guides C C, and plane D, carrying two or more knives, E, all constructed and operating substantially as shown and described.

165,601. CORN-BROOMS. Andrew Maurer, Evansville, Ind. [Filed June 10, 1875.]

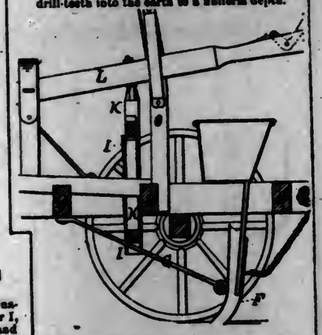
Brief.—The broom-corn being laid in a flaring box, the lid is closed upon it, and it is held by teeth both in the box and in the lid. The handle, entered through the box and through the socket, is detained by an enlargement at its lower end, and by a large tooth or spike, which closes beneath this enlarged end.

1. In a sheet-metal box for fastening broom-corn, the hinged lid B, provided at its center with spike b', for the purpose of securing the handle and enabling it to be easily removed from the box, substantially as set forth.

2. In a sheet-metal box for fastening broom-corn, the part A, provided with small teeth a a and large teeth b b, in combination with hinged lid B, provided with small teeth a and spike b', all as and for the purpose set forth.

165,602. CIRCUITS FOR ELECTRIC ALARMS. George C. Maynard, Washington, D. C. [Filed Apr. 24, 1875.]

Brief.—For use with show-windows, cases, &c., the breaking of the glass breaking the circuit controlling an alarm.



1. The combination, with a supporting base or plate of glass, in any desired form, of a metallic medium, applied thereto in the shape of letters, numerals, pictures, or ornamental work or device, and forming an electric circuit, or part of a circuit, adapted to be interrupted upon the breaking or cutting of the glass, substantially as and for the purposes set forth.

2. An electric conducting-edge formed of a conducting medium or pigment applied for an insulating base, substantially as set forth.

3. A sheet of glass of any desired form, provided with an electric conductor, arranged in the form of letters, numerals, pictures, or other ornamental work or design, substantially as set forth.

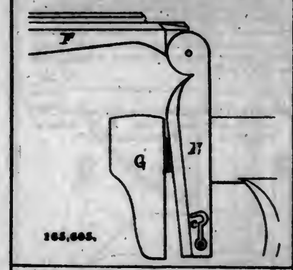
165,603. HEMP-DRILLS. W. A. McClintock, Pittsfield, Ill. [Filed Oct. 17, 1874.]

Brief.—Across the frame, and moving in vertical side guides, is an adjustable sash operated by a lever, for holding the drag-bars evenly above the surface, and pressing the drill-teeth into the earth to a uniform depth.

The combination of the hoes F, drag-bars G, guides I I, sash K, and lever L, substantially as and for the purpose specified.

165,604. FIRE-PLACES. John McHenry, Cincinnati, Ohio. [Filed Apr. 28, 1875.]

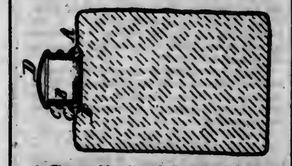
As an improvement in fire-places, the combination of external hood J, forming a blower, smoke-preventer, and reflector, the deflector I, placed athwart the chimney and inclining upward and forward, leaving a narrow passage between the rear wall and the top of the grate, the grate A, separated from the back and side walls so as to form the space F, the whole arranged to cause the commingling of the front and rear drafts in close-down contact with the incandescent mass of fuel, as set forth.



165,605. BOOT AND SHOE CRIMPING MACHINES. Joseph P. Mitchell, New Bedford, assignor to Wm. A. Brown, Lynn, Mass. [Filed Feb. 10, 1875.]

1. In a machine for crimping boots and shoes, hinged bifurcated jaws or clamps E F, curved and beveled on their interior faces, as shown, to fit one on the other and hold the material, to prevent its wrinkling as it is passed on a suitable former or last through the bifurcations of the jaws or clamps, substantially as specified.

2. In a boot and shoe crimping machine, in combination, the longitudinal screw-shaft B, former or last G, and bifurcated jaws E F, all substantially as and for the purpose described.



3. In a boot and shoe crimping machine, a rubber or yielding smoother attached to, around the bifurcations of, the jaw or clamp F, in combination with jaw or clamp E, former or last G, and screw-shaft B, all constructed substantially as and for the purposes specified.

4. The combination of the clamps or jaws E F, frame D, former or last G, screw-shaft B, and stand A'', all operating substantially as and for the purposes herein set forth.

165,606. MOUTH-PIECES FOR TOBACCO-POUCHES. Bernard Morahan, Brooklyn, N. Y. [Filed June 3, 1875.]

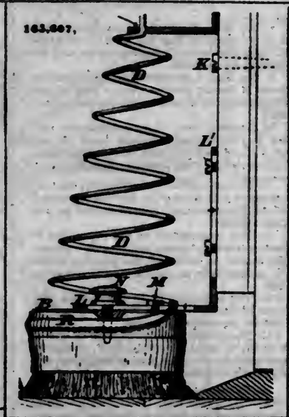
Brief.—The mouth-piece proper is a tube having a lower flange, which is placed in the flexible bag, and fitting over this tube is a screw-ring, which clamps the contracted end of the bag upon the flange. The cap or cover screws down upon the ring and upon the tube.

1. The combination of the threaded tubes B C, having flanges B' C', with the screw-cap D, and the pouch A, as and for the purposes specified.

2. The internal tube E, short external tube C, pouch A, and screw-cap D, the latter adapted to be removed without disturbing the grasp on the mouth of the pouch, as specified.

165,607. DOOR-CHECKS. Jas. Naughton, Cincinnati, Ohio. [Filed Apr. 26, 1875.]

Brief.—A small circular brush forms a yielding pad or cushion, which is held in place on the carpet or floor by a detachable spiral spring secured in a suitable plate or bracket attached to the door. The sliding attachments give vertical and lateral adjustability, and rotary adjustability is attained by a series of holes and a movable adjusting-screw. There is also a side pad or cushion arranged around the exterior edge of the brush or floor-pad, the whole serving to provide an inexpensive door-stop, with three separate adjustments.



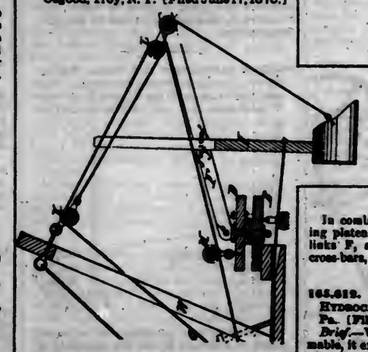
1. The improved door-stop, consisting essentially of the yielding and adjustable floor pad or brush A B, and the separable spring D, with the herein described sliding and adjustable attachments as set forth.

2. The combination, with a suitable spring and plates, of brush or pad A B, adjustable vertically, laterally, and circularly, by means of the attachment L L' and screw M, as specified.

3. The combination, in an adjustable door-stop, of brush or floor pad A B, and the side pad or cushion B, arranged and operating as set forth.

165,607.

1. A dipper-handle, which travels in its bearing on a boom and swings vertically independently of the boom, while said boom is capable of angular motion both horizontally and vertically, substantially as and for the purposes set forth.



2. The turn-table, with its boom, in combination with the suspending-standard W, substantially as and for the purpose described.

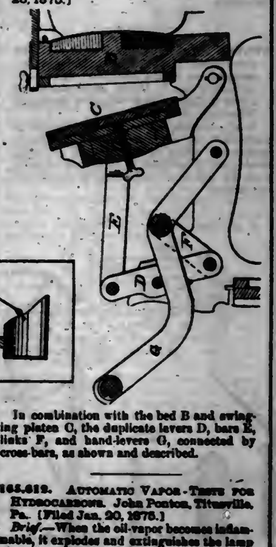
3. The brace of the boom, hinged to the turn-table on a line with the hinge of the boom, substantially as and for the purpose described.

4. The self-adjusting backing-chain sleeve, applied below the support of the turn-table, in combination with the backing-chain attached to the dipper-handle, substantially as and for the purpose described.

5. The combination of the self-adjusting and balancing sheaves K and M, chains O and P, boom F, turn-table D, and dipper-handle, substantially as and for the purpose described.

165,608. DREDGING-MACHINES. Ralph R. Osgood, Troy, N. Y. [Filed June 17, 1875.]

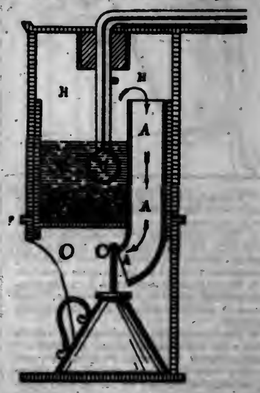
165,609. DUMPING WAGONS OR SLEDS. Jas. Pattison, Dearnley Mill, Hurlet, N. Britain. [Filed Feb. 24, 1875.]



The combination in a sled or wagon of a movable platform, loosely connected at one end to the frame, and a detachable cross-bar for supporting the opposite end of the platform, all as and for the purpose set forth.

165,610. LIFE-PRESERVERS. J. F. Peck, Springfield, Mass. [Filed Dec. 16, 1874.]

A filling for life-preservers, composed of the hair from deer, elk, antelopes, mountain sheep, or mountain goats, substantially as herein set forth.



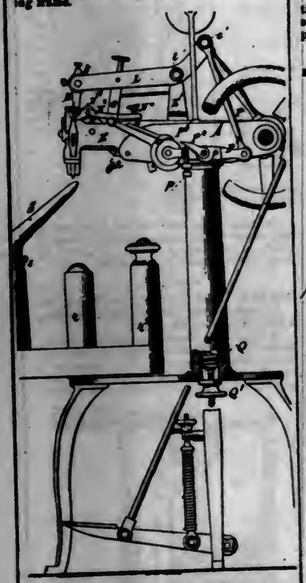
165,611. PRINTING-PRESSES. Marcellus A. Pendleton, Geneva Lake, Wis. [Filed May 28, 1875.]

In combination with the bed B and swinging platen C, the duplicate levers D, bars E, links F, and hand-levers G, connected by cross-bars, as shown and described.

165,612. AUTOMATIC VAPOR-TESTS FOR HYDROCARBONS. John Fenton, Titusville, Pa. [Filed Jan. 20, 1875.]

Brief.—When the oil-vapor becomes inflammable, it explodes and extinguishes the lamp whose heat generated it. Simultaneously a self-registering thermometer notes the temperature of the oil at the moment of explosion.

1. The method or process of determining the relative temperatures at which hydrocarbons will vaporize, by conducting the vaporized hydrocarbon to the flame of a lamp, by which they are exploded, and indicating the temperature at the time of the explosion by a registering device, substantially in the manner described.



2. The automatic vapor test, consisting of the combination of an oil and water chamber, O W, for vaporizing the oil-chamber H, and descending flue A for conducting the vapor below, and lamp for heating the oil and exploding the vapor, substantially as described.

3. The combination of the oil and water chamber O W and registering-thermometer D, provided with a registering-needle, S, for the purpose of indicating the temperature at which the vapor generated from the oil explodes, substantially as herein described.

4. The combination of the lamp O, oil and water chamber O W, chamber H, flue A, and registering-thermometer D, for the purpose of vaporizing the oil, exploding the vapor, and indicating the temperature at which the explosion takes place, substantially as herein described.

165,613. MACHINES FOR PRESSING BOOTS AND SHOES. Treat T. Prosser, Chicago, Ill., assignor, by mesne assignments, to himself and Oscar L. Noble, same place, and Allen C. Calkins and Winslow Bushnell. [Filed Apr. 6, 1875.]

Brief.—The shoe-supporting horn, shaped to conform to the angle of a boot, rests loosely in a socket rising from a balanced swinging frame, and is adapted to be turned laterally from the nail-tube independent of the swinging frame.

1. The nail-tube F and its arms E, in combination with the segmental rack E^1 and pinion E^2, substantially as specified.

2. The combination of the nail-tube and its arms with the rack E^1, pinion E^2, shaft F^2, ratchet-wheels F^3, pawls F^4, and levers F^5, substantially as and for the purpose specified.

3. The adjustable cut-screws p, in combination with the pawls F^4, ratchet-wheels F^3, and levers F^5, substantially as and for the purpose specified.

4. The combination of the nail-tube and its arms with the rack E^1, pinion E^2, shaft F^2, ratchet-wheels F^3, pawls F^4, levers F^5, connecting-rods F, rocking arms L, and driver K, substantially as and for the purpose specified.

5. The swinging nail-tube and its arms, in combination with the spring Q and adjusting-nut Q^1, substantially as and for the purpose specified.

6. The horn S, adapted to turn laterally in the socket r^1 independent of the frame R, substantially as and for the purposes specified.

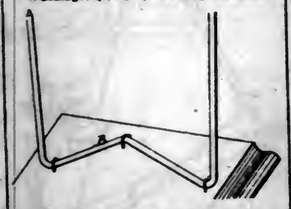
7. The horn S, provided with spring-catch s, in combination with the socket r^1 of frame R, having groove s^1, substantially as and for the purpose specified.

8. The horn S, supported by the balancing-frame R, having sockets r and r^1 and handle r^2, substantially as and for the purposes specified.

9. The feed-wheel N, in combination with bar O, yoke O^1, pawl o, check lever O^2, link O^3, and the nail-tube and its arms, substantially as and for the purpose specified.

10. The combination of the slotted bar $O\,o^2$, set-screw o^3, and pin o^4, in the rocking arms L of the driver, substantially as and for the purpose specified.

11. The combination of pawl o, spindle o^2, spring-crank o^3, having an inwardly projecting stud at its outer end, and groove s^1 in arm K, substantially as and for the purpose specified.

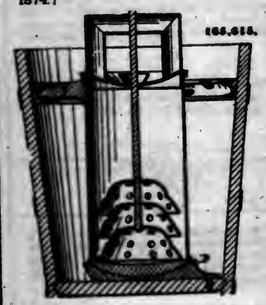


12. The feed-wheel N^1, in combination with yoke N^2, link N^3, and act N^4, substantially as and for the purpose specified.

13. The combination of the bent or curved feed-bar T, link t, loop t^1, lever T^1, pitman T^2, and trunnion k^2 on the head of the driver, substantially as specified.

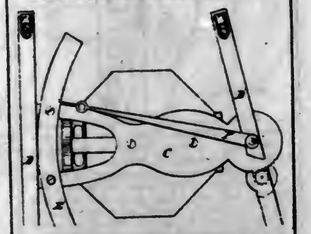
14. The feed-adjusting screw t^2, in combination with the adjusting-screw t^3, for governing the stroke of the feeder at the same time, substantially as and for the purpose specified.

15. The feed-bar T and link t, in combination with the spring t^4, guide or loop t^5, and set-screw t^6, substantially as and for the purpose specified.



165,614. PAPER-CLIPS. C. B. Ramus, Spring Forest, Spottsylvania Court-House, Va., assignor of one-half his right to G. Osorio, Washington, D. C. [Filed May 26, 1875.]

1. A paper-clip consisting of a single jointed wire strand, A, and the foot-brace B, formed with and standing to one side of the clip, whereby the clip is both fastened and braced to its holder, substantially as herein set forth.



2. The combination, with a paper-clip, having the foot-brace B, formed therewith to one side of the clip-wire, and a penetrating-point, b, of the locking and transferring portion formed into a spring, having a lateral force to open the clip-branches, and a downward force to close the points when joined, substantially as herein set forth.

165,615. ICE-CREAM FREEZERS. William Redheffer, St. Louis, assignor of two-thirds his right to W. H. Chick, St. Louis, and J. S. Chick, Kansas City, Mo. [Filed Dec. 4, 1874.]

165,616.

165,616. INSTRUMENTS FOR MEASURING DISTANCES AND ALTITUDES. E. C. Roberts, Broadford, Va. [Filed June 9, 1875.]

1. An instrument for measuring altitudes and distances, consisting of a pivoted plate, C, bars D D^1, notched arc-plates E J, and pointers F I, the bar D^1 turning in a horizontal, and the arc-plate J in a vertical, plane, as shown and described.

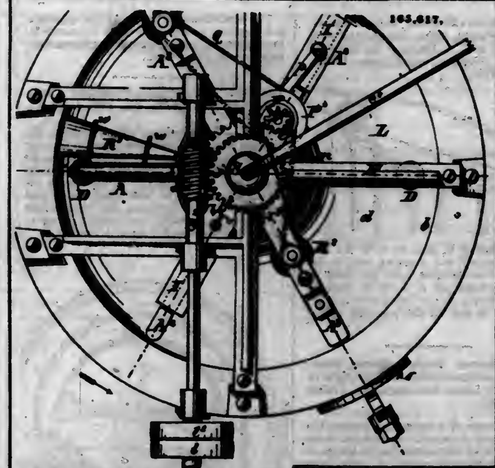
2. The combination, in a measuring instrument for finding altitude, with a bar, D, oscillating in a vertical plane, of a rotated arc-plate, J, and stationary pointer I, as shown and described.

165,617. LARD-COOLERS. F. H. Rockstroh, Baltimore, Md., assignor of one-half his right to John N. Pons and Charles Homer, same place. [Filed Apr. 23, 1875.]

Brief.—Lard is fed into a jacketed tank, in which it is agitated by means of radially-reciprocating stirrers, a series of cold-water pipes, revolving brushes, and a roller. The brushes and roller serve the double purpose of agitating the lard and keeping the sides and bottom of the tank clear of congealed lard. Cold water is fed into the space between the walls and into a central wall.

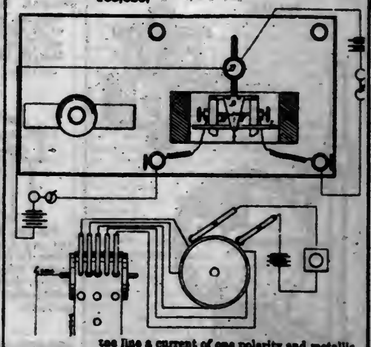
1. A jacketed cooling tank or tub, having an inner wall or curb, c, forming a water-space in the middle of the same, in continuation of the main water-chamber, as herein specified, to extend the cooling-surface.

2. The lard-cooling tank, consisting of the inner and outer walls, provided with a manhole, M, to give access to the water-chamber for cleaning the bottom of the same, in the manner herein set forth.



3. The hollow central shaft S, carrying the revolving arms A A, with the stirring and cooling coils C depending therefrom, in combination with the annular trough-shaped lard chamber L, as herein specified, for the purpose stated.

4. The combination of a central vertical shaft, S, having an axial cavity, m, stirring and cooling coils C leading therefrom, a water-supply pipe, s^1, leading to the axial cavity of the shaft, a central chamber, O, to receive the discharge, and an escape-pipe, f, leading from the latter.



5. One or more revolving stirrers, B, reciprocated radially simultaneously with their motion around the axis of the tub or tank, for throwing or pressing the lard alternately against the opposite vertical walls of the lard chamber or trough.

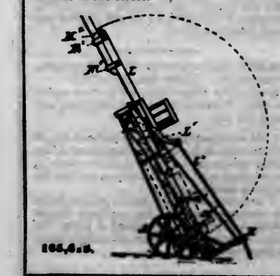
6. The combination of the central vertical shaft S, carrying arms A' above the lard chamber or trough, the slide or slides I, carrying the stirring-blades B, the sun-wheel W^1, planet-pinion F, crank-shaft S^1, and connecting-rod p, for revolving and simultaneously reciprocating said stirring-blades, in the manner set forth.

165,617.

165,620.

7. The combination, in a lard-cooler, of a tank or tub having circular jacketed walls, forming cooling-surfaces, and one or more rotary brushes revolving in contact with the latter, for keeping them clear of congealed lard, in the manner set forth.

8. The combination of the central vertical shaft S, carrying arms A^3 above the lard chamber or trough, the parallel shafts S^1, having the rotary brushes B B^1 depending therefrom, the sun-wheel W^1, planet-pinion F^1, shaft S^2, pulleys P^2 P^3, and endless bands Q, for supporting and operating the rotary brushes, in the manner set forth.



9. The combination, with the double arms A^3, of the sliding bearings c, bolts t, and slots u, for adjusting the depending rotary brushes B B^1 relatively to the surfaces they are to revolve in contact with, as described.

10. The combination, in a lard-cooler, of an annular lard chamber or trough, having a cooling-bottom, and a revolving roller, for preventing the formation of a coat of chilled lard on the latter, in the manner specified.

11. The combination of the central vertical shaft S, having arms A above the lard chamber or trough, depending stirrers C, carried thereby, and yoke w, attached to the latter, for operating a revolving crushing-roller, R^1, on the bottom of the lard chamber or trough, in the manner set forth.

165,618. FIREMEN'S EXTINGUISHER-LADDERS. James D. Rowland, Cleveland, Ohio, assignor of one-half his right to H. Hamley, same place. [Filed June 3, 1875.]

Brief.—The lower section of the ladder is secured to a truck; the next section is pivoted to this section, and provided at the pivoted end with a lever-arm, to which ropes are attached. The down-hauling of the ropes causes the section to describe a half-circle, where it stops and rests on the upper end of the first section, and is then extended for use. An adjustable support is secured to the folding base-frame, to adjust the same to any irregularities in the street.

165,618.

1. In a fire-escape, the combination, with the base-section C and frame E, of the adjustable support I, substantially as and for the purpose described.

2. The combination, with the two-wheeled truck A, support B, and base-section C, of the second section L, hinged thereto, and cords L^1, substantially as for the purpose described.

3. The combination, with the two-wheel truck A and the base-section C, of the extra length M, suspended beneath the said base-section, substantially as and for the purpose described.

4. The combination, with the hinged second section L, lever L^1, and cord L^2, of the extra length M, the clutches M^1, and grapples M^2, substantially as and for the purpose described.

165,619. HINGES. Francesco L. Sanderson, Wilmington, Ohio. [Filed Dec. 5, 1874.]

Brief.—The gate rides up when opened by means of double inclines on both upper and lower knuckles of the hinge, and projections on the upper knuckle drop into recesses in the lower, when the gate is at right angles to its closed position, thus holding the gate open in either direction.

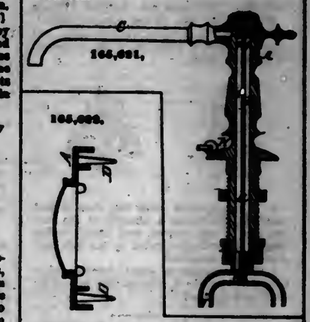
In a gate or door hinge, the knuckle f, provided with double inclines g and notches n n, situated diametrically opposite each other, in combination with the knuckle f, having double inclines, and projection i, adapted to fit into said notches n, when the gate is swung in either direction at right angles to its closed position, substantially as and for the purpose described.

165,620. AUTOMATIC ELECTRO TELEGRAPH. Wm. H. Rowyer, Washington, D. C. [Filed Feb. 2, 1875.]

Brief.—Polarized relay adjusted to rapid work, and restored to normal condition by adjustable permanent magnet O. Thrown into line currents, battery, and secondary of opposite polarities.

165,620.

1. In a polarized-needle telegraph-relay, the combination of a polarized needle and a projecting contact-piece operating with the needle, with a sliding-bar magnet to act upon the polarized needle in the place of a spring, substantially as shown and described.



2. The combination of a line, transmitting-battery and metallic contact-point, brush, or roller thereafter, with a magneto-electric or induction-coil apparatus which throws into the line a current of one polarity and metallic contact-point, brush, or roller therefor, substantially as shown and described.

3. The combination, in an automatic or chemical telegraph, with a transmitting apparatus, of a galvanic battery so arranged that galvanic currents of one polarity will be thrown into the line, and a magneto-electric or induction apparatus so arranged as to throw into the line induced currents of opposite polarity to the galvanic-battery currents, as and for the purposes specified.

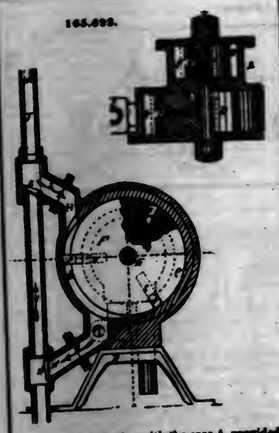
165,621. RAIL-FASTENER. Jas. F. Sheridan, New York, N. Y. [Filed June 11, 1875.]

The bifurcated coupling, provided with the flanged neck, and the vertical partition, having the groove d, in combination with the standard B, having the central partition c, formed with a lip, which rests within the groove of the partition, to form a continuous anti-creeping partition, and prevent turning, said standard and coupling constructed to be connected and drawn together by a flanged nut, substantially in the manner herein shown and described.

165,622. HINGE. Francesco L. Sanderson, Wilmington, Ohio. [Filed Dec. 5, 1874.]

165,622.

165,623. GRAVE-COVERS. Robt. H. Sipes, Everett, Pa. [Filed May 22, 1875.]



The metal cover A, constructed substantially as described, in combination with the supporting-legs D, for the purpose set forth.

165,624. BILGE-PUMPS. John P. Smethills, Chicago, Ill. [Filed Mar. 10, 1875.]

Brief.—A rotary engine and a rotary pump, both of well-known construction, are united and operate upon the same main shaft. An open pipe, extending from the vessel's deck through her bottom, is connected with inlet and outlet pipes of the engine, and with the outlet-pipe of the pump. The supply-pipe of the pump extends down to the bilge. Valves are so adjusted in the open tube that as the vessel settles in the water the lower valve closes, in the tube; but as the vessel rises, and the water in the tube seeks descent, it is diverted through the engine, and, operating it, operates the pump.

HELIOTYPE RELIEF PROCESS. JAMES R OSGOOD & CO BOSTON

165,622.

1. In combination with the case A, provided with partition C, the rotary piston-heads F and F', arranged on one and the same shaft, and provided with the sliding pistons f and f', as specified.

2. The pipes H and H', arranged to communicate one with the other through pipe J, and chamber d, in combination with the revolving piston-head F, as specified.

3. In combination with pipe J, passing through the head of the vessel, and adapted to fill with water as the vessel descends, the valves K and K', arranged to cause the column of water in the pipe above valve K to descend through chamber d when the vessel ascends, as specified.

4. The discharge-pipe L, communicating with chamber d, and pipe H', whereby the water in said chamber is discharged into pipe J, as specified.

165,623. RUNNERS FOR SLEDGES. Hugh Smith, Gray, Me. [Filed Apr. 22, 1875.]

Brief.—A metallic shoe, wooden runner, and blocks adapted to grasp the latter, connected by suitable bolts.

1. In combination with the shoe C and runner A, the blocks a, adapted to the convex face of said runner, and having a flat face, p, all confined together by the bolt, substantially as described.

2. The supplemental shoe C, having projections f and groove n, substantially as and for the object specified.

165,624. NECK-TIE. Samuel Solomon, New York, N. Y. [Filed June 28, 1875.]

1. A neck-bow made in two parts, A B, which are hinged together and to a shield, C, containing a photograph, F, or other illustration, substantially as described.

2. The combination, with the parts A B, hinged together and to the shield C, containing a photograph or other object or illustration, F, of springs E, substantially as described, for the object specified.

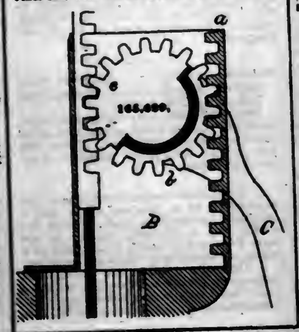
165,625. DOOR-SPRINGS. John B. Starkweather, Winona, Minn., assignor of part of his right to C. A. Bierce, J. H. Jenkins, and F. A. Johnston, same place. [Filed Mar. 20, 1875.]

The wire spring C, bent to form the central loop d, coils f, and arms e e, held in the frame D, in combination with the shaft a, central transverse pin b, lever E, with or without the notch s, and adjustable arm G, substantially as and for the purposes herein set forth.

165,627. SOAP. Stephen Strunz, Pittsburg, Pa., assignor of one-half his right to Christopher Lippe, Baltimore, Md. [Filed July 7, 1875.]

In the process of manufacturing soap, the employment of litmus in combination with the ordinary soap compounds, as herein specified, whereby the influence of the alkali and the oxygen of the air develops the peculiar coloring matter of the litmus, and rapidly changes the natural color of the soap upon its exposed surface, as set forth.

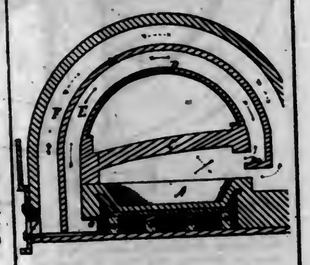
165,626. TRANSPARENT ADVERTISING-SOAP. Stephen Strunz, Pittsburg, Pa. [Filed June 26, 1875.]



Brief.—First print the advertising matter on a thin piece of soap or transparent paper, and place these pieces in molds, and cast the transparent soap around the said pieces, and allow it to harden.

As an article of manufacture, transparent advertising-soap, representing business or show cards having an inner body bearing the printed or impressed advertising-matter, surrounded by a body of transparent soap, substantially as described.

165,629. PUMPS. Saml. B. Strong, Albion, N. Y. [Filed May 24, 1875.]



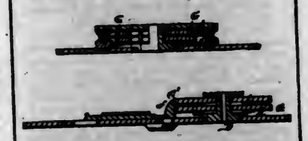
Brief.—The lever is attached to a rising and falling gear, which, on the side toward the lever, meshes with a fixed rack, and on the other side with a rack upon the piston-rod.

The combination of the racks a c, segments b b, segment c, rack D, handle C, casing E, pump-stock A, and piston-rod E, substantially as shown and described.

165,630. METALLURGIC FURNACES. Wm. Swindell, Allegheny, Pa. [Filed Feb. 15, 1875.]

Brief.—The products of combustion, air, and gas all pass in the same direction through the arched regenerator to the furnace, the air becoming heated by previously passing under the hearth. The products of combustion entering the flues H in both sides, the air and gas flows meet the incoming gas when it first enters the regenerator, thus highly heating it, and preventing the deposition of carbon.

1. In combination with the hearth A, the arched regenerator, located over the hearth and spanning the same, to permit a circulation of air over the hearth, substantially as specified.



2. A regenerator having air and gas flues B and F, arranged side by side, separated by a common wall, M, and alternating with flues H for the waste products, substantially as and for the purposes specified.

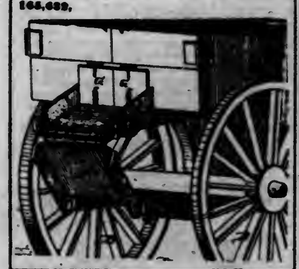
3. In a regenerator-furnace, the air and gas flues B F, separated by a common wall, M, in combination with the flues H, provided with deflecting-ledges H', substantially as and for the purpose specified.

4. The throat K of the furnace, in combination with the flue F, substantially as specified, so that the waste gases escaping from the hearth shall impinge upon the gas-flue near the point where the gas is admitted.

165,631. LOCKS. Warren H. Taylor, Stamford, Conn. [Filed Jan. 28, 1875.]

Brief.—A pin in the key-hub engages with the tumblers, so as to bring them always into proper position for the insertion of the key, by turning the key-hub in one direction.

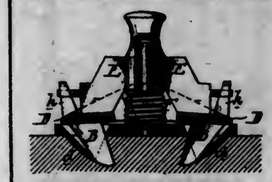
The combination of the slotted key-hub D, with pin a, and the tumblers G G', having apertures b and slots c l, as and for the purposes herein set forth.



165,632. CANE-CRUTCH. W. M. Thompson, Carlisle, Pa. [Filed June 18, 1875.]

Brief.—The chute folds away underneath the body, where it is properly secured, and not in the way.

1. In combination with the inclined box D and its doors G G, the stationary spout I, the bell or finder d, and the detachable chute J, having hook a, all substantially as and for the purposes herein set forth.



2. The combination of the box and its doors, the stationary spout I, the sectional hinged chutes J J' J'', and the finder d' under the axis for securing the chutes, all substantially as described.

165,633.

165,633. MOLDING-INSTRUMENTS. D. Walther, Reading, Pa. [Filed May 7, 1875.]

Brief.—The undercut recesses are formed by pressing upon the knob of the instrument.

1. A molding-instrument in which are combined the plate A and its recessed projections d and the pivoted frames D, with their plates B, substantially as set forth.

2. The combination of the pivoted frames D, and their studs A, the vertically-guided frame E, and the spring F, all substantially as set forth.

165,634. WINDMILLS. Wm. Walker, West Liberty, Iowa. [Filed May 6, 1875.]

Brief.—The wind-wheel is composed of a hub, radial arms, and vanes, forming the framework to support the vanes. These vanes are fastened to revolving arms, which move in journals in the rim, with the ends nearest the shaft resting in sockets in the hub. In each vane is cut a slot at or near the center on one side, which slot enables the vane to pass a circle or rim attached to the wheel-arms.

1. The combination, with the wheel A B C and circle C', of the revolving arms a a and the sails D D, attached to said arms and provided with slots b b, substantially as and for the purposes herein set forth.

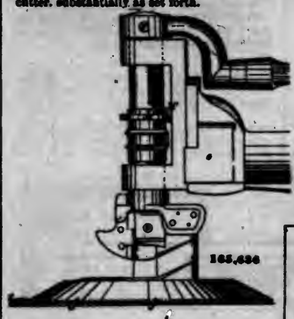
2. The rod d, with collar f and spiral spring k, arranged within the hollow main shaft to form a connection between the wheel f and the governor-arm H, substantially as and for the purposes herein set forth.

3. The combination of the hollow shaft G, slotted at its outer end, and the wheel f, having its arms e operating in said slots, substantially as and for the purposes herein set forth.

4. The springs m, in combination with the arms e of the wheel f, substantially as and for the purposes herein set forth.

5. The combination of the governor-arm H with adjustable vane I I', swivel h, rod d with spring k, wheel f, connecting-rods n, and sails D, all constructed substantially as and for the purposes herein set forth.

6. In a windmill provided with the ordinary tail-vane O and governor-vane I I', the stationary supplementary vane P, arranged on the opposite side from the governor-vane, substantially as and for the purposes herein set forth.



165,635. WATCH-KEY COMBINATION-TOOLS. Oliver D. Warfield, Chicopee, Mass., assignor to himself and George D. Bartlett, same place. [Filed May 19, 1875.]

The combination of the elastic-bars a a, the slide l, provided with flanges e, the knife-blade n, the pin b, and the pivoted stock f, all constructed and arranged substantially as herein described.

165,636. CLOTH-CUTTING MACHINES. Albin Warth, Stapleton, N. Y. [Filed May 20, 1875.]

1. The combination of a gravitating toe with the foot-plate which supports the cutting mechanism, said toe serving to catch beneath the material to be cut and to conduct the same up on the foot-plate and beneath the cutter, substantially as set forth.

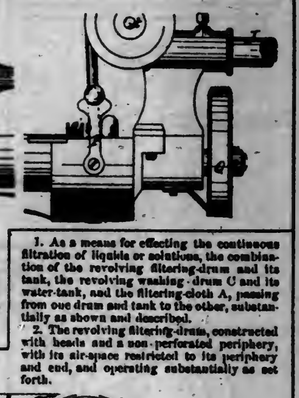
165,636

2. The combination of two detached and reversible cutting-blades with the knife-receiver pocket, and adapted to be secured to the standard containing the cutting mechanism, or the foot-plate, substantially as described.

3. The combination, with the foot-plate and with the knife-receiver, of a raised supporting-plate to carry the material to be cut freely over the knife-receiver, substantially as described.

4. The combination, with the presser-foot and its slide, of a vertical arm and legs, which project from the standard that supports the cutting mechanism, substantially as described, for the purpose set forth.

5. The combination, with the presser-slide with the standard containing the cutting mechanism, and with the presser-foot, of a set-screw for adjusting and retaining the presser-foot positively in the required position in regard to the material to be cut, substantially as described.



6. A perforated knife-slide provided with strengthening-rim, and with one or more cleaners extending across the slide, substantially as and for the purpose described.

7. The combination, with the eccentric wrist-pin and its supporting-disk, and with the cross-head transmitting motion from the main shaft to the knife-slide, of an oil-chamber provided with one or more doors to give free access to the bearings and to prevent the oil from dripping on the table or on the material to be cut, substantially as set forth.

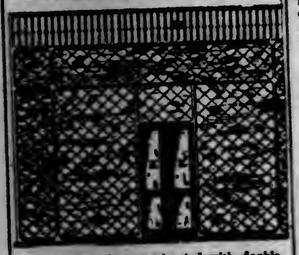
8. The combination, with the supporting-arm I and with the main shaft, of a fast and loose pulley contained in a chamber formed in the supporting-arm, and of a belt-shipper pivoted to the side of said chamber, to enable the workman to stop or start the cutting mechanism at any moment, substantially as described.

165,637. APPARATUS FOR FILTERING SACCHARINE SOLUTIONS. William H. Watson and Robert A. Robertson, Glasgow, Scotland. [Filed June 4, 1875.]

Brief.—An endless cloth, as a filter, passes over guide-pulleys onto the peripheries of two hollow drums—the one half immersed in the liquid to be filtered, the other in water. The periphery of the filtering-drum is corrugated longitudinally. The liquid passes along these corrugations, beneath the endless cloth, to the end of the drum, thence into its interior, either by pressure of the head of the liquid or by exhaustion from the air-spaces around and within the drum.

165,637.

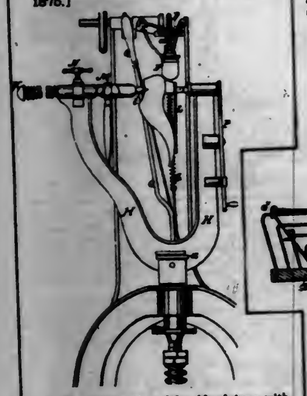
1. As a means for effecting the continuous filtration of liquids or solutions, the combination of the revolving filtering-drum and its tank, the revolving washing-drum C and its water-tank, and the filtering-cloth A, passing from one drum and tank to the other, substantially as shown and described.



2. The revolving filtering-drum, constructed with heads and a non-perforated periphery, with its air-space restricted to its periphery and end, and operating substantially as set forth.

165,638. LEMON-SQUEEZERS. A. C. Weeks, New York, N. Y. [Filed Apr. 26, 1875.]

The frame A, provided with the perforated bowl B and vertical standards E, attached at each side of the said frame, in combination with pivoted plate C, having the plunger D, the spring or springs J, attached to the plate and to the vertical standards, and the transverse shaft f, journaled in the vertical standards and provided with the cam-lever G, all substantially as herein shown and described.



165,639. AQUARIUMS. J. Wenmackers, Philadelphia, Pa. [Filed June 23, 1875.]

1. An aquarium constructed with double walls of glass, or other transparent material, arranged to inclose an inner space or saloon, and provided with one or more passages or door-ways in its sides to afford ingress and egress to and from said saloon, substantially as described.

2. The combination, with the glass plates of an aquarium, of the metallic net-work covering, substantially as and for the purpose set forth.

165,640. HEEL-POLISHING MACHINES. W. Westcott, Syracuse, N. Y. [Filed June 10, 1875.]

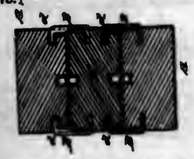
1. The combination of the side plates a, with the soap-stone block b, and the pivoted attachment d, as and for the purpose specified.

2. The pivoted branched frame H, in combination with the shoe-holding devices and the clutch cushion o, as and for the purpose set forth.

3. The swivel-jointed rod I, having spring J, in combination with the pivoted branched frame H, as and for the purpose described.

4. The hand-lever and pawl Q, in combination with the rod I, and frame H, substantially as and for the purpose described.

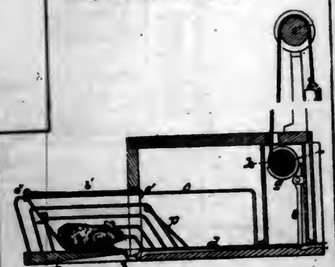
5. The shoe-holding devices, consisting of the pivoted plate L, the rod K, cam-sleeve M, spring O, and set-screw N, all combined and arranged substantially as and for the purpose described.



165,641. STRINGS FOR VIOLINS. Wm. F. Whitney, New Paltz, assignor of one-half his right to John C. Snyder, Kingston, N. Y. [Filed Dec. 30, 1874.]

165,641.

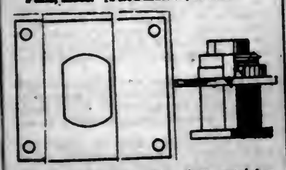
The combination of the front axle K, the bolster H, having its ends carved forward, and the arms G², having eyes h at their lower ends, for the reception of the carved ends of the bolster, substantially as shown and described.



165,642. EXTENSION-TABLE SLIDE. L. N. Willard, Jamestown, N. Y. [Filed June 1, 1875.]

In combination with the section A A, having the side grooves b b, stops a a, and the tongues a a, sliding loosely in the grooves b b, the hooks B, fastened in one section, and sliding in grooves d on the adjoining section, all constructed and arranged as and for the purpose set forth.

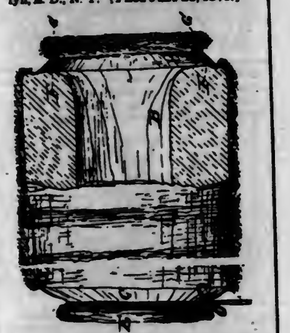
165,643. ANIMAL-TRAPS. J. M. Wilkinson, Jackson, Tenn. [Filed Apr. 17, 1875.]



Brief.—The hinged gate is made to pass out above the victim's head, and, upon its return stroke, to force him into the cage.

1. In an animal-trap, the hinged sliding gate B b', having the eyes c c', or their equivalents, in combination with the elevated track or way a a, constructed to operate substantially as and for the purpose set forth.

2. The pivoted platform c, bell-crank or trigger b, rod d, and pawl or detent e, having the spring, in combination with the drum b', operated by a weight or spring, the axis b', cranks m m, rods n n, elevated track a a, and gate B, substantially as and for the purpose set forth.

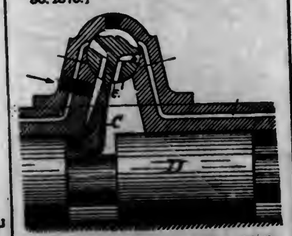


165,644. FASTENING LOCK-SHELLS TO BOLT-CASES. Henry Winn, Shelburne Falls, Mass. [Filed Mar. 17, 1875.]

1. A key combined with a shell containing tumblers and a fence, when the case has one or more grooves fitting two or more projections on the other, or one or more projections fitting two or more grooves of the other, whereby said shell is fastened, as described, to a bolt-case, to which said key is attached in different positions relative to the thickness of doors, when said shell passes freely into an opening in said bolt-case before the key is in place to fasten said shell, and is held from rotation by one or more of the sides of said opening when said key is in place to fasten said shell.

2. A key attached to a bolt-case combined with a shell containing tumblers and a fence, when the one has one or more projections fitting one or more grooves of the other, whereby said shell may be fastened, as described, in an opening in said bolt-case, when said shell is constructed to enter said opening in two positions, in the one of which it is turned a half-revolution from its place in the other, and when said shell is held from rotating by one or more of the sides of said opening in either of said positions.

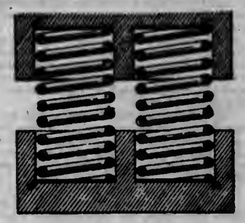
165,645. MUFFS. Egbert Winkler, Brooklyn, E. D., N. Y. [Filed June 23, 1875.]



1. The wrist-protectors E, provided with the stiffening-frames F, for attaching the protectors to a muff, the whole constructed and arranged substantially as described.

2. The combination, with the stiffening-frame F and the protectors E, of supplemental frames G, constructed and arranged substantially as described, for the object specified.

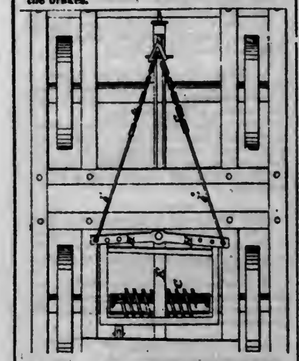
165,646. ROCK-DRILLING MACHINES. H. S. Winchester, Boston, Mass. [Filed Apr. 30, 1875.]



1. The solid plug-valve provided with the steam-passages c, less in diameter than the ports b, to prevent the entrance of fragments of rock or other foreign material.

2. The solid plug-valve provided with the ports b, with the steam-passages c arranged at right angles thereto, whereby elongated articles entering the passages c are prevented from passing through the ports b, as set forth.

3. In combination with the oscillating valve provided with the arm C, the inlet-passage O, arranged to deliver the inflowing steam or air directly against said arm, and thereby assist in completing the full movement of the valve, whereby the engine is prevented from stopping on its forward stroke when the piston stops short of its full movement, as set forth.



165,647. CAR-SPRINGS. John E. Wootten, Reading, Pa. [Filed Feb. 14, 1874.]

The combination of the series of spirals, the wooden cellular blocks, and metallic plates interposed between the bottoms of the cells and the ends of the spirals, as specified.

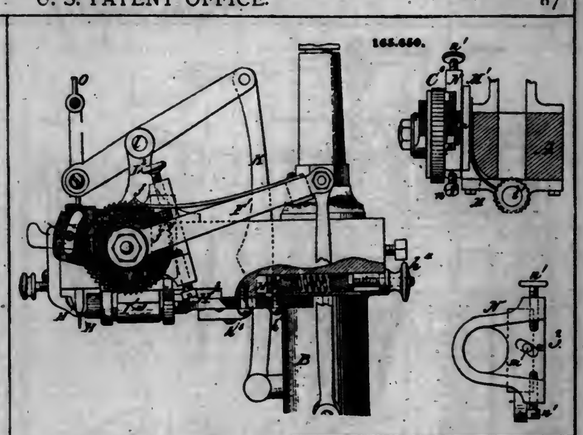
165,648. CAR-BRAKES. John B. Worthman, Mobile, Ala. [Filed Apr. 6, 1875.]

Brief.—Series of devices for bringing a pin into engagement with a worm on an axle. The lateral traveling of the pin in either direction operates the lever-chains, and finally the brakes.

1. The combination, with the worm on the axle, of the lever-arm E, adjustable pin D, the right-angular arms H H, moving with the arm E, the rods b', chains c, and the brake-lever K, substantially as and for the purpose set forth.

2. The combination of lever F, collar L, rock-shaft N, having arms M and O, the indented disk Q, connecting-rod P, pawl R, pinions e and f, ratchet-wheel g, and setting-lever S, substantially as and for the purpose set forth.

3. The combination, with a continuous rope passing the entire length of the train, of the rod J, carrying pulley k, crank-piece i, ratchet g, and spring-seated pawl h, substantially as and for the purpose set forth.



4. The combination of the worm C, lever-arm E, right-angular arms H H, lever F, pin D, sliding collar L, rock-shaft N, arms M and O, and connecting-rod P, substantially as and for the purpose described.

165,649. AIR-DRIED BRICKS. J. Wurmser, Chicago, Ill. [Filed June 22, 1875.]

As a new article of manufacture, a brick composed of lime, sawdust, ashes, and plastering-hair, substantially in the proportions set forth.

165,650. PEGGING-MACHINES. Treat T. Prosser, Chicago, Ill., assignor, by mesne assignments, to himself and O. L. Noble, same place, and Allen C. Calkins and W. Bushnell. [Filed July 21, 1874.]

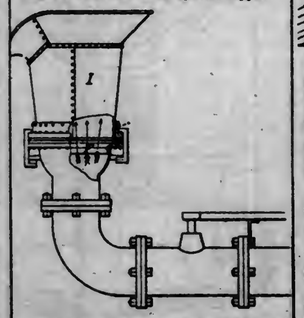
1. The combination of the feed-wheels C and D, and cutters H H', with the tube E, adapted to oscillate toward one of the cutters in response to the action of the other on the wire, substantially as and for the purpose specified.

165,650.

2. In a machine for pegging boots and shoes, the combination of the following successively-acting elements, viz: A device for forcing the end of the wire into the sole; cutters for severing the nail from the wire; a feed mechanism for advancing the boot or shoe; and a plunging for forcing the previously-inserted nail home.

3. The combination of the feed-wheels C and D, oscillating tube E, cutters H H', feed-roller f, and plunger O, substantially as specified.

4. The ratchet-wheel C' and pawl F, provided with spur f', in combination with the adjustable cam-plate F' f', substantially as specified.



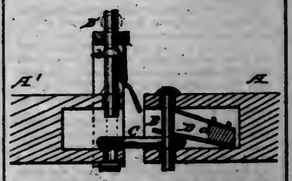
5. The combination of the oscillating arm F', oscillating yoke H a, provided with adjustable screws n' n', sliding plate M' m, pawl M, and ratchet-wheel C on the shaft I of the feed-roller f, substantially as specified.

6. The combination of the cutter H, plunger H', pivoted plate H' b', cam k on the reciprocating connecting-rod K, and springs H', connecting to the plunger H', substantially as specified.

REISSUES.

6,538. ORE-SEPARATORS. Hiram F. Minot, Chicago, Ill., assignor, by mesne assignments, to F. A. Bowen, same place. Patent No. 140,441, dated Dec. 9, 1873. [Filed Apr. 17, 1875.]

Brief.—A regulated current of the separating fluid, as water, flows upward through a screen in the bottom of the spouted hopper.

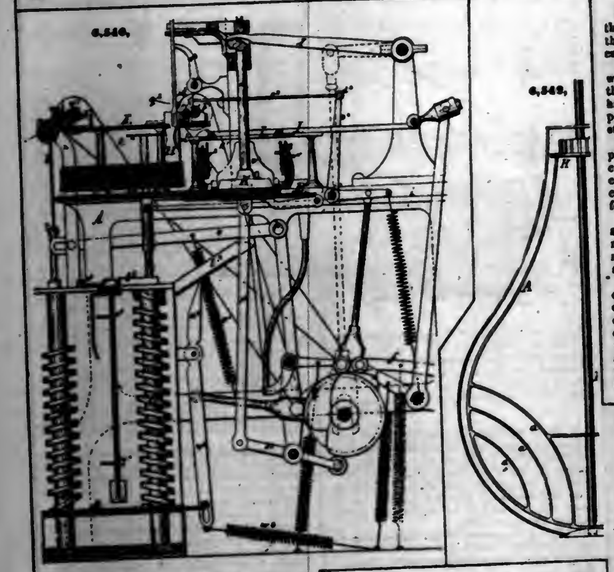


1. A separator for separating granular substances of different specific gravity by fluid agitation, consisting of a hopper or receptacle for receiving the granular substances to be separated, an overflow from the said hopper or receptacle, a perforated screen or surface, through which fluid can enter the hopper to agitate the mass, a fluid-supply pipe, and valve for regulating the supply of fluid, substantially as and for the purposes described.

2. In a separator designed for separating granular substances of different specific gravity by fluid agitation, the screen or perforated surface b, connecting directly with a tapering hopper or receptacle, I, and overflow i, substantially as and for the purpose described.

3. In a separator for separating granular substances of different specific gravity by the action of a current of fluid flowing in a direction contrary to the gravity of the particles, a hopper or receptacle for holding the substances while being acted upon, provided with the overflow b, as described, and of a form substantially as described, whereby the velocity of the fluid required to agitate the granular particles at its entrance is gradually reduced in force to that necessary for the removal of particles of lighter specific gravity, substantially as and for the purpose described.

6,539. CAR-COUPLINGS. Josiah Outland and Robt. P. Thomas, Barnesville, Ohio. Patent No. 151,615, dated June 2, 1874. [Filed Apr. 28, 1875.]



1. In combination with a draw-head, coupling-pin, and link, the reversible plate D, provided with the spring b, and placed loosely within the draw-head, substantially as and for the purposes set forth.

2. The draw-head A, pin B, and reversible plate D, with spring b, in combination with the link C and automatic coupling device, substantially as and for the purpose set forth.

6,540. ENVELOPE-MACHINES. James Ball, Brooklyn, N. Y., assignor to Saml. Raynor & Co. Patent No. 78,262, dated May 26, 1868. [Filed May 4, 1875.]

Brief.—The envelope-blank is automatically pasted, folded, dried, and delivered.

1. The combination of a revolving gummer having a suitable projection, with a reciprocating table supporting the pile of blanks, said gummer moving at a different speed from the table, substantially as described, so that the gummer in revolving against the first blank in the pile will apply the gum evenly on the seal-flap of said blank.

2. In combination with the gummer of an envelope-machine, the mechanism, substantially as described, for imparting to said gummer a compound rising and falling and revolving motion, whereby the same is depressed on the pile of blanks, and caused to revolve thereon, for the purpose of applying the gum, and then raised clear of the pile of blanks and revolved in contact with the gumming-rollers to receive a fresh supply of gum.

3. The combination of a cam-stop and weight or spring with the shaft of the revolving gummer, and with the pinions mounted on said shaft, substantially as described, whereby said pinions are always retained in the proper position to drop in gear with the appropriate pinions or racks.

4. The combination of the clamp *s* and slide *n* with the vertical rods and bracket *p*, for operating on the pile of blanks, substantially as described.

5. The combination, with the blank-supporting platform, and with the gummer and picker, of the mechanism, substantially as described, for imparting to said platform a motion under the gummer and picker, whereby the pile of blanks is alternately brought under the gummer, which applies gum to the seal-flap, and then under the picker, which applies gum to the lower flap.

6. The combination of an automatic stop-motion, substantially as described, with the gummer, the picker, and the blank-supporting platform, whereby said gummer and picker are thrown out of operation when the platform is turned out to receive new work.

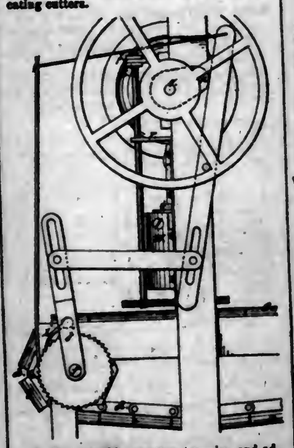
7. The combination, with the creasing-box, of distinct strips, which catch over the edges of said box, substantially as described, so that the same can be set to variations in the blanks.

8. The combination of detachable bevels with the folding-wings and with the folding-table, substantially as described, so that envelopes of more or less thickness can be made to suit the demand of the trade.

9. The combination, with an envelope-folding machine, constructed substantially as described, of spiral carriers or worm-screws for carrying the envelopes until the gum on the seal-flap has dried.

10. The combination of two or more sets of spiral carriers or worm-screws running in opposite directions, substantially as and for the purpose set forth.

11. The combination of threads, having an increased pitch, with the receiving ends of the spiral carriers, to facilitate the entrance of the envelopes, substantially as described.



12. The combination, with a device for carrying the envelopes of a separator acting at suitable intervals on the envelopes, while the same are supported by the carrying device, substantially as and for the purpose described.

13. The combination of a reciprocating conveyer, substantially as described, with two or more sets of envelope-carriers, for transferring the envelopes from one carrier to the other.

14. The combination of a transparent panel with the receiving-table of an envelope-folding machine, and with the envelope-carriers, substantially as and for the purpose described.

6,541. MACHINES FOR SPLITTING WOOD. J. A. Conover, New York, N. Y. Patent No. 12,607, dated May 15, 1855; extended seven years. [Filed Apr. 16, 1875.]

Brief.—The blocks to be split are placed upright upon a sectional, flanged, and traveling bed, and fed forward under angular reciprocating cutters.

1. The movable carriage, carrying and advancing the block of wood under the cutter, in combination with the reciprocating cutters, operating in the line of the grain of the wood, substantially as set forth.

2. In combination with the bed or frame, the movable carriage, carrying and advancing the blocks under the cutters, and the reciprocating cutters, substantially as set forth.

3. In combination with the flanged bed, which supports the pieces of wood so that the grain is in line with the cutters, the blades having a rectilinear reciprocating movement positively communicated by the crank, substantially as set forth.

4. In combination with the bed, (which supports the wood with its grain in line with the cutters,) the blades having a rectilinear reciprocating movement, positively actuated by the crank, and a clearing-plate, substantially as set forth.

5. In combination with the blades, having a reciprocating movement positively communicated by a crank, the clearing-plate, a carriage, and an intermittent feed, substantially as set forth.

6. Providing the said clearing-plate with an elastic pad, and imparting to it an up-and-down motion, substantially as specified, in its combination with the bed or carriage and reciprocating cutters, as specified, by means of which the said plate, under the combination specified, performs the double office of holding the blocks and clearing the cutters, as specified.

6,542. BOG-BEATERS. Timothy Earle, Lincoln, R. I., assignor, by mesne assignments, to the Dover Stamping Company, Boston, Mass. Patent No. 30,154, dated July 7, 1863. [Filed June 8, 1875.]

1. The revolving beater-frame formed of thin plain blades or cutters, arranged to cut edgewise through the material by their rotation, substantially as described.

2. The combination of the fixed frame, which contains and supports the operative machinery, provided with a foot or support at the bottom, the handle at the top, and suitable mechanism for rotating the beater, substantially as described.

6,543. LINES FOR CONNECTING THE HANDLE AND PITMEN OF PUMPS. Lewis W. Olds and Clark Olds, Erie, Pa. Patent No. 130,627, dated Aug. 13, 1872. [Filed Dec. 17, 1874.]

Brief.—The head is cast upon the bolt, and has an eye, which may be placed eccentrically, leaving a greater mass of metal on the side that takes the most wear.

1. The part *b*, having an eye, *d*, and cast upon the part *c*, as shown, and for the purposes mentioned.

2. The parts *a b*, with the eye *d* placed therein, in the manner and for the purposes shown.

6,544. REGISTERING-THERMOMETERS. John V. Raymond, West Hoboken, N. J., assignor of one-half interest to Adolph Bayer. Patent No. 157,633, dated Dec. 8, 1874. [Filed June 30, 1875.]

A thermometer having a twist, *d*, in its tube *a*, to operate in combination with the index *c*, substantially as shown and described.

6,545. PROCESSES FOR THE MANUFACTURE OF INDIA-RUBBER HOSE. Thos. J. Mayall, Boston, Mass. Patent No. 26,276, dated Nov. 29, 1859; reissue No. 5,111, dated Oct. 22, 1872; extended seven years. [Filed Dec. 15, 1873.]

Brief.—The canvas or fibrous foundation of the hose is treated with a solution containing an antiseptic, as carbolic acid, previously to the vulcanization of the hose.

1. In india-rubber hose, the application of the preservative compound herein mentioned, or an equivalent antiseptic, so as to preserve the same, substantially as described.

2. The improved india-rubber hose prepared by combining the substance herein named, or an equivalent antiseptic, with the fibrous material of the same, substantially as described.

HELIOTYPE RELIEF PROCESS. JAMES R. OSGOOD & CO. BOSTON

COMMISSIONER'S DECISIONS.

HANKINSON.—*Trade-Mark.*

[*Appeal from the Examiner of Trade-Marks in the matter of the application of William H. Hankinson for the registration of a trade-mark.—Decided June 2, 1875.*]

A carpet-cleaner is not, in the strict sense of the term, either a merchant or a manufacturer, and a mark used by him upon wagons with which he transports carpets back and forth, upon tags attached to the carpets, and upon his business-cards, circulars, bill-heads, &c., is not a trade-mark.

Although he may have a proprietary interest in his mark for the particular use to which he has appropriated it, which the courts will protect, it does not follow that it is a trade-mark registerable in the Patent Office.

To be entitled to registration, the applicant must comply specifically with all the requirements of the statute.

As carpets in the hands of a cleaner are not, as respects him and his purposes, merchandise or manufactures within the meaning of the statute, he cannot comply with the statutory requirements for registration. (*Smith* vs. *Reynolds*, 3 OFFICIAL GAZETTE, cited and followed.)

THACHER, *Commissioner:*

The applicant in this case is not, in the strict sense of the term, either a manufacturer or a trader. He represents his business to be that of cleaning carpets, in the pursuit of which business he receives from his patrons carpets to be cleaned, and, after cleansing, delivers them to their owners. Upon the wagons with which he transports these carpets back and forth, and upon the tags which he attaches to the carpets, as well as upon his cards, circulars, bill-heads, &c., he uses a certain mark, and it is this which he desires to register as a trade-mark.

As he is not a manufacturer or a trader, the goods with which he deals are not *manufactures* or *merchandise*, within the meaning of the terms as used in the statute. Applicant cannot, therefore, comply with one requirement of the statute, which is, that he shall cause to be recorded in the Patent Office—

The class of merchandise, and the particular description of goods comprised in such class, by which the trade-mark has been or is intended to be appropriated. (U. S. Rev. Stat., Sec. 4937.)

It was held in *Smith* vs. *Reynolds*, (3 OFFICIAL GAZETTE, p. 213,) that—

The certificate of the Commissioner that the parties otherwise complied with the act cannot be substituted for the judgment which a court must pass as to whether there was a declaration filed, and one under oath, and one complying, as to its contents, with the statute. The court is to judge from the "statement" whether the requirement of recording "the class of merchandise and the particular description of goods comprised in such class, by which the trade-mark has been or is intended to be appropriated," has been complied with, and whether the requirement of recording a description of the mode in which the trade-mark "has been or is intended to be applied and used" was complied with. So it is equally for the court to judge whether the requirement as to the filing of the proper declaration was complied with. The general certificate of the Commissioner cannot be taken as evidence on the subject.

Applicant may have a proprietary interest in the mark described, for the particular use to which he has appropriated it, which the courts will sustain. This is not denied. It is not a question for discussion here. But, admitting that he has, it does not necessarily follow that he can register this mark in the Patent Office as a trade-mark. Whether he can register or not has no effect upon his common-law right to the mark in question. The question of registration is to be determined by the provisions of the law, and, from the decision quoted above, it appears that unless applicant complies *specifically* with all the requirements of the law he cannot obtain a valid certificate of registration.

As this applicant, in my judgment, cannot truthfully make the statement required by law, inasmuch as the conditions of the use of his mark are not contemplated by the statute, I cannot properly grant the registration which applicant desires.

It is as plainly erroneous to register a trade-mark without compliance with requirements of the law as to grant a patent under like circumstances.

The decision of the Examiner is accordingly affirmed.

DECISIONS OF THE COURTS.

U. S. CIRCUIT COURT, SOUTHERN DISTRICT OF NEW YORK.

GEORGE H. TAYLOR *vs.* ALLEN L. WOOD.

[*In equity.—Before* BLATCHFORD, *J.—May*, 1874.]

The apparatus described in letters patent granted to Allen L. Wood, December 7, 1869, for an "improved apparatus for treating diseases by mechanical movement," is an infringement of the first, second, and fifth claims of Letters Patent No. 75,218, granted to George H. Taylor March 3, 1868, for an "apparatus for exercise," and of the first and fourth claims of Letters Patent No. 77,933, granted to said Taylor May 12, 1868, for an "oscillating rubbing-machine for medical uses," and of the first claim of Letters Patent No. 75,217, granted to said Taylor March 3, 1868, for an "apparatus for exercise."

Although in Patent No. 75,218 the handle and the foot-holder are described as having an *oscillating* or *vibrating* motion communicated to them, the return movement being in the same path as the outward movement, yet the to-and-fro motion in defendant's machine, in view of the action on the limb, is equally oscillating or vibrating, although the parts describe an ellipse or a circle in passing out and returning.

In each machine there is mechanical uniformity and precision, and the movements are two in number, outward to an extreme point and inward from it, and are alternating.

The muscles and joints may be brought into different play by the difference of motion; but that is aside from the mechanical operation of giving play to the muscles and joints and the particles of the legs and arms by the movement to and fro in passing rapidly from a given position and returning to the same position.

Although in Patent No. 77,933 the "rubber" is described and claimed as having an external surface of corrugated india-rubber, the patent is infringed by a rubber the external surface of which is of cloth or leather, but corrugated, and which is stuffed so as to be but slightly elastic.

Both are more or less adhesive, and they are applied similarly and with substantially the same object.

A patent cannot be defeated by a single experimental machine, when the recollection of the mechanism that constituted it has passed away from the mind of the witness, who deposes to its existence thirty-five years before, so that it cannot from such recollection be reconstructed, and there being no other record of it.

The burden of proof is on the defendant to show a prior invention, and, if the evidence is too vague and unsatisfactory to establish affirmatively, as against the patent, that the patentee was later in time of invention, the patent must stand.

[*F. H. Betts*, for complainant.
O. H. Judson, for defendant.]

BLATCHFORD, *J.*:

[This suit is brought on three several letters patent granted to the plaintiff—namely, No. 75,218, granted March 3, 1868, for an "apparatus for exercise;" No. 77,933, granted May 12, 1868, for an "oscillating rubbing-machine for medical uses;" and No. 75,217, granted March 3, 1868, for an "apparatus for exercise."]

The specification of No. 75,218 states that the plaintiff has invented an "oscillating vibrating machine for medical purposes." It refers to three figures of drawings—

Figure 1, a front view; Fig. 2, a top view; and Fig. 3, an end view.

It says:

This invention relates to the application of oscillating or vibrating motion to various parts of the human body, under the direction of a competent physician, to aid in the recovery of health by inducing the following effects—to increase the production of heat in such parts as are subjected to the action; to cause blood to flow in larger amount into such parts; to attract blood from other portions where it may be retained in too large measure to excite capillary activity; to counteract the tendency to local congestion; to restore nervous action and power; to perfect and equalize the nutritive operation of the body; and to render healthful the tissues of the body. My invention consists of, first, a handle of convenient shape and size to be grasped by the hands, to which an oscillating or vibrating motion is communicated by any suitable mechanism; second, a shoe or foot-holder, of convenient size and shape, and adjusted in a suitable position to receive and retain the foot of the person to be operated upon, the said foot-holder having oscillating or vibrating motion communicated to it by proper mechanism; * * * fifth, the combination and arrangement of the several parts or devices forming the machine, hereinafter fully described, for producing the effects stated.

The handle B is hung on a shaft, and vibrates or rocks with it; and to such shaft is hung a crank, to which is connected, by a rod, a shorter crank, on the driving-shaft F. When the shaft F revolves the shorter crank revolves with it, and gives a reciprocating or rocking motion to the shaft on which the handle B is hung and to such handle. The foot-holder B' is hung on another shaft, which is in like manner driven by two cranks and a rod, which obtain their motion from the driving-shaft F. The working parts are hung or attached to a frame. There is a pulley, H, on the driving-shaft F and a driving-pulley, G.

The machine may be driven by the hand through a crank, or by the foot through a treadle, or by power. The extent of the vibrating motion given to the hand or body may be increased or diminished by shortening or lengthening the cranks by which the handle or foot-holder is driven; and, by running the machine faster or slower, the rapidity of the vibrations may be increased or diminished to suit different cases.

The first, second, and fifth claims of this patent are those which are claimed to be infringed, and are as follows:

1. The handle B, driven by any suitable mechanism, by which a vibrating or oscillating motion is imparted to it, substantially as and for the purpose set forth.
2. The shoe or foot-holder B', driven by any suitable mechanism, by which a vibrating or oscillating motion is imparted to it, substantially as and for the purpose set forth.
5. The combination, with the handle B and foot-holder B' and their immediate connections, of the driving-shaft F, and pulleys G and H, and a suitable means for applying power, as described, the whole constituting a machine constructed and operating substantially as and to the effect set forth.

The specification of No. 77,933 says:

The object of my invention is to produce effects on different parts of the human body similar to those produced by a rubbing with the hands, and to produce these effects in an increased degree, but without the fatigue to the operator occasioned by that operation.

For this purpose my invention consists, first, in a new and improved rubber, hereinafter fully described, which, when operated by any suitable mechanism, rubs the surface to which it is applied in such a manner as to produce effects similar to those produced by the human hand; * * * fourth, in the combination, with the said rubber and the mechanical devices for imparting motion thereto, of a suitable couch, bed, or table, over which the person to be operated upon may sit or recline, the said couch having a suitable opening in it, through which the said rubber may be made to protrude, in order that it may be brought in contact with and caused to operate on that portion of the body of the patient which rests on or across said opening. * * *

A is the rubber. It consists of a core of wood or other similar material, of the form of the middle frustum of a prolate spheroid, somewhat resembling a very long cask or barrel. On this core a triangular band of india-rubber is wound from end to end, covering its entire surface, except the ends, and securely fastened to the said core; a strip or band of india-rubber of a square section may be used, by previously cutting out of the wooden core a triangular spiral groove, to receive one-half of it. India-rubber bands of other shapes may also be used in a similar manner; or the india-rubber surface, containing the requisite corrugations, or projecting points, cones, or ridges, to make it adhere to the surface to be operated upon, may be prepared in a sheet of proper size and fastened on the core; or a hollow cylinder of india-rubber having the requisite outer surface may be stretched over or secured to the core, or upon the rod or pivot upon which the rubber turns. In this last case no core would be used, but circular end plates of metal or other stout material ought to be put on at the ends of the rubber to keep it in place. The rubber is hung in the fork of a rod by means of a shaft, so as to turn freely. Such rod is hung on a pivot in a cross-piece at any convenient height, being capable of being raised or lowered by means of a series of holes, in any one of which such pivot may be placed. By shortening the upper end of such rod the lateral motion of the rubber is shortened, and the convexity of its motion is increased. The middle part of such cross-piece is made double, and such rod passes down between the two parts, such pivot passing through both, so as to have a firm and even bearing. The lower end of such rod is connected to a double crank by means of an arm, and thus has a reciprocating or vibrating motion imparted to it by a shaft on which such double crank is hung; such shaft is turned by a crank, and is hung in bearings in two bangers secured to the frame of the machine. The lower part of the machine consists of a strong rectangular frame of wood, O, with legs similar to a common lounge-frame. To this frame, at one end, is secured by hinges, a bed or couch having a hole or opening, R, through it, to permit the rubber A to work against that portion of the body of the patient which is placed over the opening. There is an arrangement for fixing and holding the couch at any desired elevation or inclination. In using the machine, the patient sits or inclines on the couch and brings a portion of the body directly over and partially resting on the rubber A; the attendant turns the crank, or connects the power by which the shaft is revolved, and sets the rubber A in motion.

The claims which are alleged to be infringed are the first and fourth. They are as follows:

1. The rubber A, composed of india-rubber, and having its outer surface coated or covered with india-rubber, the said outer surface being furnished with projecting ribs, points, or corrugations, and the said rubber A being constructed substantially as and for the purpose specified.
4. The combination, with the rubber A, driven by suitable mechanism, substantially as set forth, of the couch S, properly connected to the frame O, and having an opening, R, through it, for the said rubber A to work through, substantially as and for the purpose set forth.

The specification of No. 75,217 says that the invention is a medical kneading and vibrating machine, the purpose of which is to apply kneading and vibrating motions to the body, or any of its parts, under the direction of a competent physician, to aid in securing the following therapeutic effects: re-enforcing the circulation of the blood in weak parts and obstructed capillaries, removing congestion, promoting intestinal and digestive absorption, increasing the attraction of the products of waste for oxygen and their consequent removal from the body, solidifying the tissues, equalizing and invigorating the nutritive operations of the body. The arrangement described, so far as it is involved in this suit, is to construct a couch so arranged as to be capable of elevation and depression, so as thereby to adjust the position of the body lying thereon to the desired action and effect of the machine. The top of the couch has an opening, of size and shape suitable to admit one or more headed rods, F, which in size, shape, and position are adapted to impinge against that portion of the body resting on the couch, immediately over the before-described opening. The lower ends of the headed rods are attached to a lever at equal distances from its fulcrum, which distances may be varied to produce more or less motion, as may be desired. The fulcrum of the lever is on a vertical bar, which turns freely on pivots or centers at each end, and the lever is driven by a crank on a shaft, which gives to its ends a circular motion. The upper ends of the headed rods pass through rings, which guide them, and, in conjunction with the lever, give to the upper ends of said rods a compound motion, which is, at the same time, lateral, vertical, and circular. The distance of the rings from the axis of the swinging or pivoted bar is fixed and kept equal by a parallelogram of levers, to the outer corners of which, respectively, the rings are attached. The lower corner of the parallelogram of levers is attached to the vertical bar before mentioned by a pivot or pin, on which the two levers composing the lower corner freely swing, while the upper corner is held in position, and adjusted to any desired height, by a bolt or nut. The shaft may be driven by any suitable means, as by a crank, by a belt acting on a pulley, or by a suitable treadle. By a modification, the lever to which the lower ends of the headed rods are attached is hung on a rock-shaft, which is driven by a crank or arm, and the upper ends of the rods pass through holes in the frame of the couch, and the motion thereby imparted to the upper ends of the headed rods is thus confined to one vertical plane, being a circular reciprocating motion. Such lever may be driven, if desired, by the hand or foot, applied to an extension of one of its arms. For the purpose of producing a kneading motion the machine is driven at such a speed as will produce from fifty or less to two hundred or three hundred upward motions per minute, while, for producing a vibrating motion, consisting of or caused by a rapid succession of slight shocks or blows, the form of the machine which produces a circular reciprocating motion is used, and it is driven at a speed of from about two hundred to twelve hundred or more upward motions per minute. The effects of these two degrees of motion are different, becoming more similar as they approach the common speed of about two hundred per minute. The slow or kneading motion is, in its effects, laxative, soothing, and calculated to increase muscular action and development; while the rapid or vibrating motion stimulates absorption of the fluids, equalizes their distribution throughout the body, and promotes the excretion of all those products which in health are thrown off from the system. When it is desired to give to the machine the rapid motion above stated it is most convenient to drive it by steam or other power, or, if driven by hand, additional gearing facilitates obtaining the desired speed.

Only the first claim of this patent is alleged to be infringed. It is in these words:

1. The headed rods F, driven by any suitable mechanism for producing a reciprocating or circular motion of the headed ends of said rods, substantially as and for the purpose set forth.

The apparatus employed by the defendant, and alleged to infringe the claims above referred to, is substantially such a one as is described in a patent granted to him December 7, 1869, for an "improved apparatus for treating diseases by mechanical movement." The specification of this patent says:

The object of my invention is to devise a machine in which mechanical action is adapted to produce motion of various kinds, in a manner applicable to the treatment of various diseases, with salutary effect; and it consists essentially in the employment of certain mechanism whereby circular or rotary motion, properly converted and applied, is made to perform the several operations of rubbing, kneading, and giving vibrating and other action to the muscles and various parts of the system.

The defendant's machine has a vibrating bar, lying horizontal, which has a rotary motion at the end actuated, and the opposite extremity of it is connected with a vertical vibrating support, and it produces the operations of kneading and vibrating through the medium of fixed or removable attachments. It is capable of imparting vertical, horizontal, or circular vibrations. Tables or platforms are placed on either side of such bar, on which the patient is supported, with the part to be operated upon lying upon and across the bar, the upper surface of which is provided with a friction or rubbing device, or with cushions adapted to the particular mode of operation required. In the application of kneading, an attachment which has undulations in its upper surface is applied to the top of the vibrating bar, and the opposite end of the bar is so connected by a bolt with a disk which rotates freely that a circular vibration of such attachments is produced, and, as the patient lies on the tables in such position that the part to be operated upon is in contact with such attachment, the operation of kneading is closely simulated, the effect being heightened by the undulation on the surface of the attachments. The motion thus obtained

is an elliptical vibration, and not a regular vibration on the same plane. Special arrangements convert the motion of the vibrating bar from a circular vibration to one which is vertical, or to one which is horizontal. The latter consists of rapid vibrations on a horizonal plane, and is adapted to friction or simple rubbing, and the attachment then employed consists of a series of transverse ribs, alternated with grooves or space between. Provision is made for increasing or diminishing the rapidity of the vibrations.

The specification states that—

The attachments for friction, kneading, &c., are preferably covered on the surface with leather, and may be stuffed with any suitable material possessing but a slight amount, if any, of elasticity.

To give motion to the feet of the patient a disk is employed, to the face of which is affixed, by means of a bolt or pivot at the center of its length, a bar, having at each side of said pivot, which forms its axis, a foot-piece. To these foot-pieces the feet of the patient are secured. The rotation of the disk imparts like motion to the axis, which carries the center of the bar around in a true circle, while the extremities on which the feet rest are free to follow the uniform rotation or to oscillate. For motion to the hands and arms a bar is affixed in the same manner to another disk. This bar is grasped by the hands of the patient on either side of its axis, the motion being the same as that of the feet. The axis of these bars and of the vibrating bar may be adjusted at a greater or a less distance from the center of the disk, to increase or diminish the motion.

"Oscillate" is defined "to vibrate as a pendulum." "Oscillating" is defined "moving alternately one way and another, as a pendulum; swinging; vibrating." "Vibrate" is defined "to move or play to and fro, as a pendulum; to oscillate; to swing" "Vibrating" is defined "vibrating; moving up and down, or to and fro; oscillating." It is contended by the defendant that his apparatus does not infringe patent No. 75,218, for the reason that the plaintiff's handle and foot-holder are required to have a vibrating or oscillating motion, as contradistinguished from a rotary motion, while the defendant's handle and foot-holder have a rotary motion.

In seeking to maintain this distinction it is urged that the defendant's handle and foot-holder, because they move each in a circle, have a continuous motion in one direction. This is a fallacy; the matter must be looked at in view of the action on the arms and legs of the patient. In each machine the hand or the foot is moved from a given position with relation to the parts of the body with which, through the points, it is connected, and returns again to that portion, to start anew. The motion to and fro is equally oscillating or vibrating, in view of the action on the limb, whether such motion takes place in both directions in the same line, or whether an ellipse or a circle be described in passing away and returning. The muscles and joints may be brought into different play by the difference of motion; but that is aside from the mechanical operation of giving play to the muscles and joints, and particles of the legs and arms, by the movement to and fro in passing rapidly from a given position and returning to the same position. In the sense of the plaintiff's patent and invention, the defendant's handle and foot-holder have a vibrating motion to and fro, although the return is made in a different path from the outward path; but in each machine there is the same point of departure; an extreme point is reached by an outward movement; there is a return by an inward movement to the point of departure; between every arrival at the point of departure the path of the outward movement is gone over once and but once, and the path of the inward movement is gone over once and but once; and there is no departure from the prescribed path. There is, therefore, mechanical uniformity and precision; the movements are two in number, outward to an extreme point, and inward from it, and are alternating, vibrating, and oscillating, although the plaintiff uses one and the same path for each movement, and the defendant uses two different paths, one for each movement.

It is contended for the defendant that he does not infringe patent No. 77,933. He uses a rubber with a surface of cloth or leather, stuffed with some material, and very slightly elastic, and corrugated. It projects and is applied through an opening between two couches, the patient reclining on the two couches and across the opening, and it is driven by suitable mechanism. All these features are those of the patent; but it is contended that the plaintiff's rubber is required to be made of india-rubber on its external surface. It is said that the india-rubber surface is adhesive, and the leather or cloth surface is not, and that the corrugated india-rubber surface yields horizontally in rubbing, while there is no such horizontal yielding in the corrugated leather or cloth surface; but there is more or less adhesion in either surface. Where the adhesion is less, so that the rubber passes more readily over the surface that is being rubbed, the greater must be the corrugations to produce a given effect. The object stated in the patent is to produce, by rubbing, effects on the body similar to those produced by a rubbing with the human hand. The hand, when applied to rub, controlled by the will, is adhesive, and needs not to be corrugated, because its contact and presence, as it rubs, can be always maintained to make the rubbing continuous and effective.

Where a very adhesive substance like india-rubber is used as the surface to rub with, impelled by machinery, the corrugations necessary to maintain continuous contact in rubbing are less than when a less adhesive surface is used; the corrugations must be greater in order to compensate for the want of surface adhesiveness, by causing the surface of flesh to enter between the walls of the corrugations, and thus be rubbed in the movement of the rubber.

The patent states that the object of the corrugations or ridges is to make the surface of the rubber adhere to the surface to be operated upon.

The invention set forth in the patent granted to Charles F. Taylor December 8, 1863, for an "improvement in machines for exercising the human body," in adducing as anticipating what is claimed in patent No. 77,933; but it is sufficient to say that the Charles F. Taylor implements are not corrugated, and do not work from below through an opening in a couch, or between couches, as the patient reclines thereon and over such opening. The patient lies on a lounge, and two pads are applied to opposite sides of the person, which pads are hinged to arms capable of being adjusted higher or lower, or more or less obliquely, or in a vertical position. The pads have a reciprocating or vibrating movement imparted to them by machinery, and act upon the parts of the body to which they are applied. The pads are not represented as being at any time out of contact with the body of the patient, and the operation is strictly one of rubbing.

The defendant uses substantially the headed rod of Patent No. 75,217, driven by suitable mechanism for producing a circular motion of the headed end of the rod. The heads of the plaintiff's rods are described as being, in size, shape, and position, adapted to impinge against the portion of the body presented to it. In the kneading motion the rod is driven more slowly, and its upper end has a compound motion, which is described as being lateral, vertical, and circular at the same time, and which produces, through the motion of the end of the rod, an operation like that of kneading. The defendant performs the operation of kneading by giving a circular vibration to his kneading attachment, which has on it protuberances, the equivalents of the heads of the plaintiff's rods.

As to Williamson's evidence in regard to the horse-machine, it shows nothing which can avail to defeat any of the plaintiff's claims.

The motion of the horse-machine was so slow as not to produce any motion which can be properly called vibrating or oscillating, in the sense of the plaintiff's patents—a motion sufficiently rapid to accomplish the results accomplished by the plaintiff. Whatever there was of the horse-machine, it rose only to the dignity of an experiment, and was abandoned.

But one was built, and that more than thirty-five years ago, and the recollection of the mechanism which constituted it has passed away from the mind of the witness, if he ever knew, so that it cannot from such recollection be reconstructed, and there is no other record of it.

The defendant claims to have himself constructed and used, prior to the plaintiff, the inventions covered by the plaintiff's claims. As to Patent No. 75,218 the evidence is entirely clear that the plaintiff was prior in time. As to the other two patents, the burden of proof is on the defendant to show his priority. His evidence is too vague and unsatisfactory to establish affirmatively, as against the plaintiff's patents, that the plaintiff was later in time of invention.

There must be a decree for the plaintiff on all the claims in question.

DECREE.

GEORGE H. TAYLOR *vs.* ALLEN L. WOOD.

[At a stated term of the Circuit Court of the United States, for the southern district of New York, held in and for said district at the court-house in the city of New York, on the 30th day of May, 1874. Present, Hon. SAMUEL BLATCHFORD, District Judge.]

This cause having come on to be heard at this term, upon the pleadings and proofs, after hearing counsel for the respective parties, and due proceedings had, it is, upon consideration, ordered, adjudged, and decreed:

That the several letters patent granted to the complainant for apparatus for exercise, dated March 3, 1868, No. 75,217, March 3, 1868, No. 75,218, and May 12, 1868, No. 77,933, are good and valid in law.

That the said George H. Taylor was the first and original inventor and discoverer of the inventions described and claimed in said letters patent, and in the specifications annexed thereto, and is the exclusive owner of said letters patent.

That the defendant Allen L. Wood has infringed upon said letters patent, and upon the exclusive rights of the complainant under the same—that is to say, by making, using, and selling, without right or license from the complainant, certain machines, substantially described in letters patent granted to him, dated December 7, 1869, and machines similar thereto in certain particulars, which said machines contain and embody the inventions described and claimed in the first, second, and fifth claims of said Letters Patent No. 75,218, and in the first and fourth claims of said Letters Patent No. 75,217, and in the first claim of the said Letters Patent No. 77,933.

And it is further ordered, adjudged, and decreed that the complainant do recover of the defendant the profits, gains, and advantages which the said defendant has received or made by reason of the infringement of the complainant's patents, set forth in the bill, or either of them, by any manufacture, use, or sale, and that said complainant do also recover any and all damages he has sustained by reason of any infringement of said letters patent by the defendant.

And it is hereby referred to Joseph Gutman, Jr., one of the masters of this court, to take and state the account of said gains, profits, and advantages, and to assess such damages, and to report thereon with all convenient speed; and the defendant is hereby directed and required to attend before said master from time to time as required, and to produce before him such books, papers, and documents as relate to the matters in issue, and submit to such oral examination as the master may require.

And it is further ordered, adjudged, and decreed that a perpetual injunction issue out of and under the seal of this court, restraining the defendant, his clerks, agents, and workmen from making, using, or selling any machine or machines containing or embodying any one or more of the following features described and claimed in said letters patent—viz:

The handle B, driven by any suitable mechanism by which a vibratory or oscillating motion is imparted to it, substantially as and for the purposes set forth.

The shoe or foot-holder, driven by any suitable mechanism by which a vibratory or oscillating motion is imparted to it, substantially as and for the purposes set forth.

The combination of the handle and foot-holder and their immediate connections, of the driving-shaft, palleys, and a suitable means for applying power, as described, the whole constituting a machine constructed and operated substantially as, and to the effect, set forth.

The rubber, composed of india-rubber, and having its outer surface coated or covered with india-rubber, the said outer surface being furnished with projecting ribs, points, or corrugations, and the said rubber being constructed substantially as and for the purposes specified.

The combination, with the rubber driven by suitable mechanism, substantially as set forth, of the couch properly connected with the frame, and having one opening through it for the said rubber to work through, substantially as and for the purpose set forth.

The headed rods, driven by any suitable mechanism for producing a reciprocating or circular motion of the headed ends of said rods, substantially as and for the purpose set forth.

Or from infringing upon any of the claims of said letters patent, or either of them, in any way whatsoever.

And it is further ordered, adjudged, and decreed that the complainant do recover of the defendant the costs

of this suit, and that the question of increase of damages, and all further questions, be reserved until the coming in of the master's report.

SAMUEL BLATCHFORD.

U. S. CIRCUIT COURT—DISTRICT OF MASSACHUSETTS.

STEWART HARTSHORN *vs.* JAMES F. ALMY *et al.*

[*In equity.—Before* SHEPLEY, *J.—Decided April*, 1875.]

The invention covered by the reissued patent of Stewart Hartshorn, dated August 27, 1867, for "Improvement in Spring-Fixtures for Shades," consists in dispensing with the weights, counterpoises, and pulleys that had been previously employed, and also with the cord which had been employed to operate the pawl and disengage it from the ratchet-notch, and so arranging the pawl and ratchet that the shade may be stopped and retained at any desired point within the scope of its movement by a simple manipulation of the shade itself, the arrangement of the pawl and ratchet being such that the former will engage with the latter by simply checking the rotation of the roller and the upward movement of the shade under the influence of the spring.

The claim of the patent—"The application to a shade-roller, provided with a spiral spring for automatically raising or rolling up the shade, of a pawl and a ratchet or a notched hub, so arranged that the former will engage with the latter at any point or height of the shade by simply checking the rotation of the roller and the upward movement of the shade under the influence of the spring, substantially as set forth"—so construed as to include the use of a loose pin, which falls into the notch of the roller-hub by the force of gravity when the roller is revolved slowly, but which is raised from the notch and held up by *centrifugal force* when the roller is revolved rapidly, while the pawl of the patented device is raised and held up by a portion of the periphery of the hub.

[*S. D. Law*, for complainant.
J. E. Maynadier, for defendants.]

SHEPLEY, *J.*:

The bill in this case is brought for alleged infringement of reissued Letters Patent No. 2,756, dated August 27, 1867, granted to Stewart Hartshorn, for improvement in spring-fixtures for shades.

The claim is for—

The application to a shade-roller, provided with a spiral spring for automatically raising or rolling up the shade, of a pawl and a ratchet or notched hub, so arranged that the former will engage with the latter at any point or height of the shade by simply checking the rotation of the roller and the upward movement of the shade under the influence of the spring, substantially as set forth.

Upon the construction of this claim depends the question of infringement in this case. Defendants contend for a construction which will limit the claim to the peculiarly-shaped pawl and the peculiarly-shaped ratchet described in the specification of the patent. Complainant contends for a construction which will embrace, in combination with the other elements, any pawl and ratchet or notched hub so arranged that the former will engage with the latter at any point or height of the shade by simply checking the rotation of the roller and the upward movement of the shade under the influence of the spring, substantially as set forth.

The state of the art before the invention of Hartshorn was this: A roller was used, having within it a coiled spring, one end fixed to the roller and the other end to a loose journal of the roller. A pawl and ratchet were so applied to the roller that the pawl would hold the roller against turning under the action of the spring, but allow the roller to be turned against the action of the spring. The ratchet lifted and disengaged the pawl from the ratchet in a downward pull of the curtain. These rollers were adapted, like the Hartshorn, to be hung in brackets. In the form of spring-fixtures for shades, which was known as "The Conch Fixture," and in use prior to Hartshorn's invention, a cord was used to lift the pawl and disengage it from the ratchet when it was desired to allow the curtain to roll up under the action of the spring. Hartshorn's invention differed from those which had preceded it, in that it dispensed with the cord used to disengage the pawl from the ratchet when the curtain is to be rolled up, and operated the fixture wholly by means of the shade or curtain.

The operation of Hartshorn's fixture, so far as concerns winding up the curtain and stopping it at any desired height, is as follows: A pawl is attached by a pivot to one of the brackets in which the shade-roller is hung. The end of the pawl opposite the pivoted end has a tendency to fall by gravity on a hub attached to one end of the roller. Two notches are made in the periphery of this hub. The width of these notches is but slightly in excess of the width of the toe of the pawl. The ratchet supports the pawl for the full extent of its periphery, except as to the slight difference in excess between the width of the ratchet-notch and the width of the toe of the pawl. Should the roller be revolving rapidly the width of the ratchet-notch will pass under the width of the toe of the pawl before the toe of the pawl has had sufficient time to gravitate into the ratchet-notch. This space of time is very short, for it is only while the excess of width between the width of the notch and the width of the toe of the pawl is passing under the toe of the pawl. This only allows the pawl-toe to gravitate into and engage with the ratchet-notch under a slow movement of the roller. Under a quick revolution of the roller the pawl-toe will not be unsupported by the periphery of the ratchet for a space of time sufficiently long to allow it to gravitate a sufficient distance into the ratchet-notch to become engaged with it while the ratchet-notch is passing under it.

The patentee also states that, if desired, the pawl may be placed underneath, or at one side of, the hub, instead of over it, as represented, and a spring may be made to bear against it, in order that its projection may engage with the notches.

It will thus be seen that the invention of Hartshorn consisted, so far as concerned the spring-roller shade-fixture, in dispensing with the weights, counterpoises, and pulleys which had been previously employed, and also with the cord which had been employed to operate the pawl and disengage it from the ratchet-notch, and so arranging the pawl and ratchet that the shade may be stopped and retained at any desired point within the scope of its movement by a simple manipulation of the shade itself, the arrangement of the pawl and ratchet being such that the former will engage with the latter at any point by simply checking the rotation of the roller and the upward movement of the shade under the influence of the spring.

In the fixture of the defendants the pawl or pin engages with the notch by the force of gravity acting on the pin. This mode of engagement is like that in the Hartshorn fixture. In the Hartshorn fixture the pawl is kept away from its engagement in the ratchet-notch by being raised by the periphery of the hub, and kept up by portions of the periphery of the hub until the notch is under it; and it is raised so high by the non-holding wall of the notch that, when the roller is rotating freely under the action of the spring, it will not have time to fall far enough to engage with the holding-wall of the notch during the time the notch is passing under it. In the defendants' fixture the pin or pawl is kept from engagement in the ratchet by centrifugal force. It is not supported by the periphery of the hub, or raised by the non-holding wall of the ratchet, or knocked up slightly by the blow of the holding-wall of the ratchet, as in Hartshorn's fixture.

In the Almy roller there is a thimble with a side aperture, surrounding the hub, forming a closed chamber when covered by the end cap of the roller. In this chamber is placed a little roller or pin, lying horizontally, and allowed to revolve loosely, and in the rapid revolution of the roller to be thrown above the periphery of the notched hub by centrifugal force; but when the roller is revolved slowly, or its motion is arrested, the loose pin, roller, or pawl falls onto the hub and into the notch, and in rolling up the curtain it is caught between that part of the notch which is at right angles with the axis of the hub and the shoulder formed in the thimble at the pin-chamber. In this respect the pawl and ratchet in the defendants' may properly be said to have a different operation from the pawl and ratchet in the Hartshorn fixture. In a similar sense the pawl and ratchet in the Hartshorn patent operate in a different manner when actuated by a spring in one of the modes described in the patent, and when left to engage by the pawl falling into the ratchet-notch by gravitation, as in the mode stated as the preferable mode in that patent.

In both the Hartshorn and the Almy roller the pawl and ratchet are so arranged that the one will engage with the other at any point or height of the shade by simply checking the rotation of the roller and the upward movement of the shade under the influence of the spring, by simply manipulating the shade, dispensing with counterpoises, or the usual cord for operating the roller, or the cord for holding the pawl disengaged.

In this respect, wherein Hartshorn differed from all that had preceded him, the mode of operation is the same; and, even if Almy's fixture has some advantages over Hartshorn's, it clearly embraces what was his invention, and is secured by the claim of his patent, and is an infringement. As stated by Judge Blatchford in the case of *Hartshorn* vs. *Tripp et al.*, in the circuit court for the southern district of New York—

there is no difference between these two modes of operation in the withholding from engagement, *so far as regards the real invention of the plaintiff and the scope of the claim of his patent.*

Decree for complainant for injunction and account, as prayed for in the bill.

DESIGNS PATENTED DURING THE WEEK.

[Each Design bearing date July 20, 1875.]

8,488.—**Drinking-Fountain.**—JOSEPH W. FISKE, New York, N. Y. Application filed July 6, 1875. Term of patent 7 years.

8,489.—**Lamp-Shade.**—CHARLES F. A. HINRICHS, Brooklyn, N. Y. Application filed January 8, 1875. Term of patent 7 years.

8,490.—**Gas-Burner.**—MATHEW STEWART, Philadelphia, Pa. Application filed July 6, 1875. Term of patent 3½ years.

8,491.—**Knob-Shanks.**—ALONZO E. YOUNG, Boston, Mass. Application filed June 26, 1875. Term of patent 7 years.

8,492.—**Center-Piece.**—HENRY BERGER, New York, N. Y. Application filed July 9, 1875. Term of patent 14 years.

8,493.—**Tobacco-Pipe Stem.**—LÜDER G. HUSSMANN, Guttenberg, N. J. Application filed July 9, 1875. Term of patent, 7 years.

8,494.—**Leaves of Albums.**—WILLIAM MAYER, Brooklyn, N. Y. Application filed June 30, 1875. Term of patent, 7 years.

TRADE-MARKS REGISTERED DURING THE WEEK.

[Each certificate bearing date July 20, 1875.]

2,744.—**Sheet or Plate Iron.**—ALAN WOOD & Co., Philadelphia, Pa. (Re-registration.) Application filed August 11, 1871.

"'Best Charcoal Bloom, from Alan Wood & Co. X X X.'"

2,745.—**Sheet and Plate Iron.**—ALAN WOOD & Co., Philadelphia, Pa. (Re-registration.) Application filed August 11, 1871.

"letters A. W."

2,746.—**Lubricating-Oil.**—FREDERICK M. BACKUS, Cleveland, Ohio. (Re-registration.) Application filed March 27, 1871.

"words 'Fine Engine Oil.'"

2,747.—**Castor-Oil.**—H. J. BAKER & BRO., New York, N. Y. (Re-registration.) Application filed June 9, 1871.

"word 'Crystal.'"

2,748.—**Castor-Oil.**—H. J. BAKER & BRO., New York, N. Y. (Re-registration.) Application filed June 9, 1871.

"letters 'A. A.'"

2,749.—**Bitters.**—F. C. CLEMSON, Philadelphia, Pa. Application filed April 23, 1875.

"the representation of Abraham Lincoln's cabinet seated around a table, and the word 'Cordial' on the table-cover front."

2,750.—**Corn and Wheat Mills.**—H. DUDLEY COLEMAN, New Orleans, La. (Re-registration.) Application filed June 11, 1872.

"words 'Maid of the South.'"

2,751.—**Braids.**—FLUEH, SPIELMANN & WOLFF, New York, N. Y. Application filed May 31, 1875.

"Below and above, on the left, the head of a man with a laurel wreath, on the right an angel holding a quadrangle, underneath which is standing an eagle in front of the angel, the figures representing two wheels. On the side of each wheel is a wing, as if a bird flying, and below on each side is a piece of ribbon hanging. The middle constitutes the front and back of the French medal awarded at the exhibition in Paris in 1867. Each side of the medal has an outspread wing. The whole rests against the sunburst.

2,752.—**Whisky.**—ALLEN H. GILLETT, Syracuse, N. Y. (Re-registration.) Application filed January 26, 1871.

"'A. H. GILLETT'S,' arranged in the arc of a circle on the upper part of the head of the barrel, and on the lower half of the head of the barrel the word 'Woodcock,' on a line with the chord of the arc above, and the word 'Rye' on a line below the word 'Woodcock' and parallel with it, with a peculiar cut of a bird in the center representing a woodcock.

2,753.—**Gimlets.**—EDWARD A. GODDARD, Brooklyn, N. Y. Application filed May 21, 1875.

"In the inside of a circle is the figure of a bee with outstretched wings, and within said circle is also contained the words 'The Bee Gimlet,' 'Trade-Mark,' around the periphery of said circle, and that on the outside of said circle, and immediately below the words 'Trade-Mark,' is the figure or cut of a gimlet with looped head or handle."

2,754.—**Cologne.**—GEO. C. GOODWIN & Co., Boston, Mass. Application filed May 28, 1875.

"the words 'American Farina Cologne' and the engraving of the English coat of arms surmounted by the American eagle."

2,755.—**Bitters.**—Dr. S. B. HARTMAN & Co., Lancaster, Pa. (Re-registration.) Application filed March 8, 1871.

"streamer, shield, scroll-work, and vines."

2,756.—**Whisky.**—DANIEL V. B. HENARIE, San Francisco, Cal. (Re-registration.) Application filed January 26, 1871.

"'J. F. Cutter's Extra Old Bourbon Whisky.'"

2,757.—Cotton Prints.—HAMILTON WOOLEN COMPANY, Southbridge, Mass. Application filed April 9, 1875.

"words 'Holland Prints,' used in connection with an ornamental figure."

2,758.—Clothiers' and Tailors' Trimmings.—HARRIS, RICHMOND & SHAFER, New York, N. Y. (Re-registration.) Application filed May 27, 1871.

"a coronet surmounting drapery, in the center of which is a shield bearing a 'Greek cross,' and with a chain embracing every side except the top.

2,759.—Clothiers' and Tailors' Trimmings.—HARRIS, RICHMOND & SHAFER, New York, N. Y. (Re-registration.) Application filed May 27, 1871.

"a representation of the continent of North America or the northern half of a hemisphere, surmounted by a spread eagle standing near the north pole, and holding in his beak a scroll.

2,760.—Leaf-Tobacco.—SIMON HERSHEIM, New Orleans, La. (Re-registration.) Application filed February 27, 1871.

2,761.—Boiler-Rivets.—HOOPES & TOWNSEND, Philadelphia, Pa. Application filed June 3, 1875.

"an outlined keystone, the keystone being raised above the surface-level of the head of the boiler-rivet.

2,762.—Double-Barrel Breech-Loading Guns.—B. KITTREDGE & CO., Cincinnati, Ohio. Application filed May 21, 1875.

"words 'CLUB GUN.'"

2,763.—Axes.—KLOMAN, PARK & CO., Pittsburg, Pa. Application filed May 5, 1875.

"words 'The Eagle Axe' and 'Kloman, Park & Co.'"

2,764.—Carbolic Acid.—CHARLES LOWE and JOHN GILL, Manchester, England. Application filed March 30, 1875.

"four arrows diverging from a common center, and all inclosed within a circle."

2,765.—Tea.—C. ADOLPHE LOW & CO., San Francisco, Cal (Re-registration.) Application filed April 15, 1871.

"letter L, inclosed within a diamond-shaped outline or lines."

2,766.—Whisky.—E. MARTIN & CO., San Francisco, Cal. (Re-registration.) Application filed January 26, 1871.

"'Miller's Extra Old Bourbon Whisky.'"

2,767.—Playing-Cards.—WILLIAM F. MILLER and FRANK D. MONTGOMERY, Boston, Mass. Application filed May 17, 1875.

"words 'The Globe Playing-Card Company' and a globe, as placed on a circular playing-card.

2,768.—Woolen Hose.—ABRAHAM P. OLZENDAM, Manchester, N. H. (Re-registration.) Application filed August 5, 1870.

2,769.—Base-Balls.—PECK & SNYDER, New York, N. Y. (Re-registration.) Application filed August 30, 1870.

2,770.—Churns.—PORTER BLANCHARD'S SONS, Concord, N. H. (Re-registration.) Application filed November 8, 1870.

"words 'The Blanchard Churn.'"

2,771.—Tobacco and Cigars.—M. J. SWANK, Philadelphia, Pa. Application filed January 16, 1875.

"words and monogram 'Happy Hours, M. J. S.'"

2,772.—Pamphlets.—GEORGE TALLCOT, Brooklyn, N. Y. Application filed June 5, 1875.

"words 'Red Book.'"

2,773.—White Lead.—THE ATLANTIC WHITE LEAD COMPANY, New York, N. Y. (Re-registration.) Application filed November 3, 1870.

"word 'Atlantic.'"

2,774.—Reduced Boiled Linseed-Oil.—THE ATLANTIC WHITE LEAD COMPANY, New York, N. Y. (Re-registration.) Application filed November 3, 1870.

"letters 'A. W. L. Co.' in capitals."

2,775.—Seamless Metal Tubes.—AMERICAN TUBE-WORKS, Boston, Mass. (Re-registration.) Application filed September 28, 1870.

2,776.—Leaf-Tobacco.—DE FORD & THAYER, Baltimore, Md. Application filed July 13, 1875.

"An arrow passing through the center of a target or ring."

2,777.—Bronze Alloy and Articles Made Therefrom. CHARLES J. A. DICK, Pittsburg, Pa. Application filed July, 10, 1874.

"words 'Phosphor Bronze.'"

2,778.—Perous Plasters.—GEORGE E. MITCHELL, Lowell Mass. Application filed January 29, 1875.

"a portrait of Geo. E. Mitchell, surrounded by a border, outside of which, surrounding the sides, top, and bottom, are the words 'Improved India Rubber Perous Plasters contain Belladonna. Compound patented Sept. 12, 1871. Genuine signed Geo. E. Mitchell,' the name being a fac-simile of the autograph of the said Mitchell."

2,779.—Leather.—GEORGE F. PAGE and CHARLES T. PAGE, Franklin, N. H. (Re-registration.) Application filed November 28, 1870.

"the representation of a 'Patna' cow, or sacred cow of India, surrounded by a serrated border inclosing the words 'Page's Patent, May 8, 1866.'"

2,780.—Leather.—GEORGE F. PAGE and CHARLES T. PAGE, Franklin, N. H. (Re-registration.) Application filed August 17, 1871.

"words 'Page's Patent Tanned Leather, manufactured under Patent May 8, 1866.'"

2,781.—Curtain-Fixtures.—SILAS S. PUTNAM, Boston, Mass., assignor to S. S. PUTNAM & CO. (Re-registration.) Application filed July 17, 1871.

"words 'The Putnam Curtain-Fixture.'"

2,782.—Gin.—I. D. RICHARDS & SONS, Boston, Mass. (Re-registration.) Application filed October 8, 1870.

"figure of the lily."

2,783.—Photographic Albums.—WILLIAM MAYER, Brooklyn, N. Y. Application filed June 30, 1875.

"words 'CENTENNIAL ALBUM.'"

2,784.—Woven Cotton Fabrics.—MINOT, HOOPER & CO., New York, N. Y.—Case B. Application filed July 17, 1875.

"the figure of Atlas supporting a globe on his shoulders, with the word 'Atlas' inscribed beneath.

153.—Title: "**Igniting-Tape.**"—WM. G. MORGAN, Brooklyn, N. Y. Application filed December 26, 1874. Registered January 6 1875.

154.—Title: "**John G. Payn's Sure-Raising Flour.**"—JOHN G. PAYN, New York, N. Y. Application filed December 26, 1874. Registered January 6, 1875.

155.—Title: "**Liebig's San Antonio Meat-Extract.**"—SAN ANTONIO MEAT-EXTRACT FACTORY, San Antonio, Tex. Application filed December 26, 1874. Registered January 6, 1875.

156.—Title: "**Lavelle's Celebrated Pit-Powders.**"—MONTGOMERY & Co., Philadelphia, Pa. Application filed December 29, 1874. Registered January 6, 1875.

157.—Title: "**Ozonized Ox-Marrow.**"—BUCK & RAYNER, Chicago, Ill. Application filed December 29, 1874. Registered January 19, 1875.

158.—Title: "**The Great Pawnee Indian Remedy.**"—F. M. PETERS, Olney, Ill. Application filed January 15, 1875. Registered January 19, 1875.

159.—Title: "**The Pivot-Brace.**"—NATIONAL SUSPENDER COMPANY, New York, N. Y. Application filed December 21, 1874. Registered January 22, 1875.

160.—Title: "**Stripped—Sample Warranted.**"—FREDERICK C. LINDE & CO., New York, N. Y. Application filed January, 18, 1875. Registered January 22, 1875.

161.—Title: "**Dr. Ruttley's Great Cough and Lung Syrup.**"—JOHN HARVEY RUTTLEY, San Francisco, Cal. Application filed January 26, 1875. Registered February 2, 1875.

162.—Title: "**Kendall's Pleasant Regulating Lozenges.**"—W. H. KENDALL, Boston, Mass. Application filed January 20, 1875. Registered February 2, 1875.

163.—Title: "**The Carbonized Lamp-Wick.**"—CHARLES A. SHAW, Boston, Mass. Application filed January 22, 1875. Registered February 2, 1875.

164.—Title: "**1776. Stevens' Celebrated. 1876. German Stove-Polish.**"—BENJAMIN L. STEVENS, Philadelphia, Pa. Application filed January 22, 1875. Registered February 2, 1875.

165.—Title: "**Forest Tar in Solution.**"—FOREST TAR COMPANY, Portland, Me. Application filed February 1, 1875. Registered February 20, 1875.

166.—Title: "**Forest-Tar Troches.**"—FOREST TAR COMPANY, Portland, Me. Application filed February 1, 1875. Registered February 20, 1875.

167.—Title: "**Forest Tar for Consumption.**"—FOREST TAR COMPANY, Portland, Me. Application filed February 1, 1875. Registered February 20, 1875.

168.—Title: "**Forest-Tar Salve.**"—FOREST TAR COMPANY, Portland, Me. Application filed February 1, 1875. Registered February 20, 1875.

169.—Title: "**Sticking-Salve and Strengthening-Salve.**"—HENRY H. KELLOGG, Watertown, Jefferson county, N. Y. Application filed February 10, 1875. Registered February 20, 1875.

170.—Title: "**Gillet's Kitchen Castile-Soap.**"—GILLET MCCULLOCK & CO., Chicago, Cook county, Ill. Application filed January 25, 1875. Registered February 20, 1875.

171.—Title: "**Alexander's Texas Tonic Pills.**"—ALEXANDER & BROTHER, Austin, Travis county, Tex. Application filed February 5, 1875. Registered February 20, 1875.

172.—Title: "**Alexander's Compound Elixir of Stillingia.**"—ALEXANDER & BROTHER, Austin, Travis county, Tex. Application filed February 5, 1875. Registered February 20, 1875.

173.—Title: "**Alexander's Pectoral Syrup.**"—ALEXANDER & BRO., Austin, Travis county, Texas. Application filed February 5, 1875. Registered February 20, 1875.

174.—Title: "**Alexander's Neutralizing Cordial.**"—ALEXANDER & BRO., Austin, Travis county, Texas. Application filed February 5, 1875. Registered February 20, 1875.

175.—Title: "**Alexander's Compound Extract of Buchu.**"—ALEXANDER & BRO., Austin, Travis county, Texas. Application filed February 5, 1875. Registered February 20, 1875.

176.—Title: "**For Singer, New Family, Elias, and Home. No. B A 100-140.**"—DAVID C. COOK, Chicago, Cook county, Ill. Application filed February 8, 1875. Registered February 20, 1875.

177.—Title: "**Bronchine.**"—EDWARD K. AL BURTIS, Ridgefield, Bergen county, N. J. Application filed January 30, 1875. Registered February 20, 1875.

178.—Title: "**Rough on Rats.**"—EPHRAIM S. WELLS, Jersey City, Hudson county, N. J. Application filed February 3, 1875. Registered February 20, 1875.

179.—Title: "**Dr. Tremaine's Improved Hair-Oil.**"—GEORGE W. GATES, Providence, R. I. Application filed February 11, 1875. Registered February 20, 1875.

180.—Title: "**Frank Miller & Son's Improved French Blacking.**"—F. MILLER, SON & CO., New York, N. Y. Application filed February 12, 1875. Registered February 20, 1875.

181.—Title: "**Goodrich's Tuck-Folder.**"—H. C. GOODRICH, Philadelphia, Pa. Application filed February 10, 1875. Registered February 25, 1875.

182.—Title: "**Stall's Unrivalled Filing.**"—WILLIAM B. STALL, Providence, R. I. Application filed February 15, 1874. Registered February 25, 1875.

183.—Title: "**Pastiles Aromatic.**"—AUGUST HOHL, Philadelphia, Pa. Application filed February 15, 1875. Registered February 25, 1875.

184.—Title: "**Mrs. Van Sicklen's Carbolated Family Salve.**"—W. H. LAURENCE, Brooklyn, N. Y. Application filed February 19, 1875. Registered February 25, 1875.

185.—Title: "**George W. Hunt's Great Dyspepsia Cure.**"—GEORGE W. HUNT, West Baltimore, Preble county, Ohio. Application filed February 19, 1875. Registered February 25, 1875.

186.—Title: "**Harris' Anodyne Liniment.**"—C. P. HARRIS, Damariscotta, Me. Application filed February 23, 1875. Registered March 8, 1875.

187.—Title: "**King's German Invigorating Cordial.**"—D. G. KING, Newport, Me. Application filed February 26, 1875. Registered March 8, 1875.

188.—Title: "**SX 110 CB.**"—KEBBE, CHAFFEE & CO., Philadelphia, Pa. Application filed February 19, 1875. Registered March 8, 1875.

189.—Title: "**Rose Glycerine Jelly.**"—WM. M. BICKLEY, Philadelphia, Pa. Application filed February 23, 1875. Registered March 8, 1875.

190.—Title: "**Tyler's Compound Honey of Boneset.**" BOSWELL & HUNTINGTON, Norwich, New London county, Conn. Application filed February 23, 1875. Registered March 8, 1875.

191.—Title: "**This case has been regularly stripped and sampled.**"—F. & A. MCALEER, New York, N. Y. Application filed March 2, 1875. Registered March 8, 1875.

192.—Title: "**Stripped and Guaranteed.**"—F. & A. MCALEER, New York, N. Y. Application filed March 2, 1875. Registered March 8, 1875.

193.—Title: "**Egg Baking-Powder.**"—CHARLES D. WELD, Malden, Middlesex county, Mass. Application filed March 3, 1875. Registered March 8, 1875.

194.—Title: "**Castilian Acidulae.**"—JAMES E. WOODWARD, Boston, Mass. Application filed January 16, 1875. Registered March 8, 1875.

195.—Title: "**Alkaline Resolvent.**"—JANE SCOTT, New York, N. Y. Application filed February 23, 1875. Registered March 8, 1875.

196.—Title: "**Blood and Bone Ointment.**"—JANE SCOTT, New York, N. Y. Application filed February 23, 1875. Registered March 8, 1875.

197.—Title: "**Extract of Cancer-Plant.**"—JANE SCOTT, New York, N. Y. Application filed February 23, 1875. Registered March 8, 1875.

198.—Title: "**Catarrh Specific.**"—JANE SCOTT, New York, N. Y. Application filed February 23, 1875. Registered March 8, 1875.

199.—Title: "**Ethereal Phosphorus.**"—JANE SCOTT, New York, N. Y. Application filed February 23, 1875. Registered March 8, 1875.

200.—Title: "**Lithia.**"—JANE SCOTT, New York, N. Y. Application filed February 23, 1875. Registered March 8, 1875.

201.—Title: "**Neuralgo-Rheumatic Elixir.**"—JANE SCOTT, New York, N. Y. Application filed February 23, 1875. Registered March 8, 1875.

202.—Title: "**Nerve-Food.**"—JANE SCOTT, New York, N. Y. Application filed February 23, 1875. Registered March 8, 1875.

203.—Title: "**Pile-Extract.**"—JANE SCOTT, New York, N. Y. Application filed February 23, 1875. Registered March 8, 1875.

204.—Title: "**5-Minute Fragrant Pain-Curer.**"—JANE SCOTT, New York, N. Y. Application filed February 23, 1875. Registered March 8, 1875.

205.—Title: "**Haggi's Chewing-Gum.**"—GREAT AMERICAN CONFECTIONERY COMPANY, New York, N. Y. Application filed February 20, 1875. Registered March 16, 1875.

206.—Title: "**Hydrated Oxymel.**"—JANE SCOTT, New York, N. Y. Application filed February 25, 1875. Registered March 16, 1875.

207.—Title: "**Dr. Wengert's Ague Remedy.**"—JOHN J. RICKER & Co., York, Pa. Application filed February 26, 1875. Registered March 16, 1875.

208.—Title: "**C. T. Raynolds & Co.'s Superfine Gold-Size.**"—C. T. RAYNOLDS, New York, N. Y. Application filed March 8, 1875. Registered March 16, 1875.

209.—Title: "**Carbolic Cream.**"—P. J. NOYES, Lancaster, Coos county, New Hampshire. Application filed March 8, 1875. Registered March 16, 1875.

210.—Title: "**1-2 Doz. Coils Percussion-Primers.**"—HENRY O. MORGAN, Brooklyn, N. Y. Application filed March 15, 1875. Registered March 16, 1875.

211.—Title: "**Stir Well Before Pouring.**"—ISAAC L. BAKER, Dayton, Ohio. Application filed March 11, 1875. Registered March 17, 1875.

211 1-2.—Title: "**Stall's Consummatum Polish.**"—WILLIAM B. STALL, Providence, R. I. Application filed February 15, 1875. Registered March 18, 1875.

212.—Title: "**Dennis's Vegetable Horse Syrup.**"—WILLIAM S. DENNIS, Woodstock, Conn. Application filed October 5, 1874. Registered March 17, 1875.

212 1-2.—Title: "**Directions for Using Stall's Consummatum Polish.**"—WILLIAM B. STALL, Providence, R. I. Application filed February 15, 1875. Registered March 19, 1875.

213.—Title: "**Relief.**"—J. B. RAGLAND, Jackson, Madison county, Tenn. Application filed December 28, 1874. Registered March 17, 1875.

214.—Title: "**Judd's Medicated Liquid Cuticle.**"—CHARLES A. PELTON, Middletown, Conn. Application filed March 13, 1875. Registered March 17, 1875.

215.—Title: "**Tucker's Chafing-Powder.**"—FRANK TUCKER, Boston, Mass. Application filed March 1, 1875. Registered April 2, 1875.

216.—Title: "**Toilet Levigated Soap.**"—WILLIAM CRANSHAW, Pittsburg, Pa. Application filed February 8, 1875. Registered April 2, 1875.

217.—Title: "**Brown's American Dressing.**"—J. H. BROWN & CO., St. Louis, Mo. Application filed March 20, 1875. Registered April 2, 1875.

218.—Title: "**Drink for the Million. Bower's Sarsaparilla Mead.**"—GEORGE C. BOWER, Philadelphia, Pa. Application filed March 11, 1875. Registered April 2, 1875.

219.—Title: "**Livingston's Cough-Soother.**"—SLOCUM & WHITE, Lancaster, Ohio. Application filed March 18, 1875. Registered April 2, 1875.

220.—Title: "**Dr. Dawson's Cough-Syrup.**"—RACHEL DAWSON, canal, Winchester, Franklin county, Ohio. Application filed March 22, 1875. Registered April 2, 1875.

221.—Title: "**Levigated Toilet Soap.**"—LEVI L. MILLER, Canton, Ohio. Application filed March 15, 1875. Registered April 2, 1875.

222.—Title: "**Cleansing Fluid for Destroying Bed-Bugs, their Eggs, and Embryo.**"—JOSEPH W. HARRIS, Providence, R. I. Application filed March 16, 1875. Registered April 2, 1875.

223.—Title: "**The Leader Shirt.**"—WALTER R. ROWE, Lawrence, Mass. Application filed March 18, 1875. Registered April 2, 1875.

224.—Title: "**Warrantee.**"—HEATH, MEAD & CO., Mount Clemens, Macomb county, Mich. Application filed March 20, 1875. Registered April 2, 1875.

225.—Title: "**Chilblain Specific.**"—DRAKE & BROWN, West Lebanon, N. H. Application filed March 27, 1875. Registered April 17, 1875.

226.—Title: "**The Celebrated Ribbon Crisp Candy.**"—C. B. HILL, Roxbury, Mass. Application filed March 27, 1875. Registered April 17, 1875.

227.—Title: "**Pocare's Salve.**"—SINGER & WHEELER, Peoria, Ill. Application filed March 29, 1875. Registered April 17, 1875.

228.—Title: "**Dr. F. Girard's Liniment.**"—FRANCIS GIRARD, Philadelphia, Pa. Application filed March 25, 1875. Registered March 17, 1875.

229.—Title: "**Vitalized Phosphates.**"—F. CROSBY, New York, N. Y. Application filed March 25, 1875. Registered April 17, 1875.

230.—Title: "**Music-Manuscript Ink.**"—WM. H. WOOLLEM, New York, N. Y. Application filed April 1, 1875. Registered April 17, 1875.

231.—Title: "**Forest-Tar Soap.**"—FOREST TAR COMPANY, Portland, Cumberland county, Me. Application filed April 8, 1875. Registered April 17, 1875.

232.—Title: "**Mrs. Nichols' Cure for Nervous or Sick Headache.**"—Mrs. H. C. NICHOLS, East Cambridge, Mass. Application filed April 17, 1875. Registered May 4, 1875.

INDEX OF INVENTIONS PATENTED JULY 20, 1875.

	Class No.	No. of Patent.
Air ship, steerable, F. W. Schroeder	143	165,821
Alarm, burglar, S. Searight	24	165,833
Alarm, burglar, Silva, Merriam, and Sedgwick	24	165,691
Anvil, E. Hodgdon	60	165,732
Auger, earth, G. Taylor	51	165,890
Baking stand, J. A. Watson	154	165,869
Barrel head, H. M. Smith	40	165,766
Bed lounge, W. H. L. Gabbe	62	165,815
Bell, door, H. A. Dierkes, (reissue)	24	6,548
Blower, rotary, T. S. Dieston	12	165,835
Bobbin winder, J. Dornan	142	165,807
Boiler alarm and register, electric, W. C. Baker	148	165,700
Boiler for portable engines, J. Enright	149	165,810
Boiler for ranges, J. A. Gibson	154	165,724
Boilers, heater and feed pump for, J. A. T. Overend	148	165,860
Bolt work for safe and vault doors, Naylor and Brooks	93	165,752
Bosom form, E. Leetch	80	165,842
Box dressing machine, J. W. Bowers	30	165,764
Brake shoe, W. Robinson, Jr	122	165,872
Bridle bit, Lockard and Agens	72	165,678
Bridle bit, W. A. Pierson	72	165,863
Brush, J. Earnshaw	23	165,719
Buckle, W. H. Williamson	23	165,905
Butter pail, J. F. Crawford	45	165,796
Butter worker, M. Hutchinson	45	165,824
Calendar, T. J. Thorp	146	165,709
Can, milk, J. W. Smith	45	165,768
Candy spinner, S. B. Hymer	135	165,836
Car coupling, Hien and Koch	122	165,826
Car coupling, L. E. Musick	122	165,857
Car coupling, F. W. Nash	122	165,751
Car lamp, F. Rhind	90	165,753
Car, stock, J. R. McPherson	121	165,849
Car, stock, J. R. McPherson	121	165,850
Cars, combined blind and screen for railroad, W. H. Fletcher	121	165,812
Carbureter, J. A. Pierce	27	165,862
Carding machine, J. and J. Dobson	23	165,716
Carpet sweeper, J. J. Hatlinger	62	165,730
Carriage, child's, W. Stewart, (reissue)	31	6,553
Carriage poles, machine for bending, A. G. Snyder	31	165,867
Cart saddle, P. McFadden	78	165,848
Chair and step ladder, combined, C. B. Rawson	62	165,688
Chair base, W. T. Doremus	62	165,717
Chair base, W. T. Doremus	62	165,718
Chair, folding rocking, G. McAleer	62	165,745
Chair spring attachment, R. H. Ober	62	165,684
Cheese cutter, J. W. Row	23	165,760
Chisel for stone cutting, C. C. Simpson	153	165,692
Chlorine, manufacture of, H. Deacon	35	165,801
Chlorine, manufacture of, H. Deacon	35	165,802
Churn, rotary, T. Lands	25	165,739
Cigar box, W. Ellis	160	165,694

	Class No.	No. of Patent.
Clock calendar, L. L. Kellogg	36	165,840
Cloth fricsing machine, G. G. Bishop	37	165,657
Clothes drier, J. P. Hill	91	165,674
Clothes line reel, A. Thompson	91	165,696
Coal hod, U. D Alexander	154	165,698
Cock, stop, T. Holland	167	165,827
Commode or stand, F. Mahler	62	165,743
Corn drill, J. Campbell	133	165,788
Corn sheller, E. C. Morgan	50	165,750
Cracker machine, J. W. and A. Ruger	6	165,675
Crackers, device for glazing, D. Foerster	6	165,813
Cribs and cradles, screen supporter for, H. B. Fairbanks	62	165,805
Crucible, J. Felix	115	165,811
Curtain roller, P. W. Phillips	62	165,861
Cutter head, S. P. Randolph	173	165,893
Cyclophore, R. C. Gwathmey	97	165,818
Dental forceps, N. A. Durham	46	165,808
Dental plugger, C. Bilharz	46	165,701
Dial, sun, W. H. McCoy	36	165,746
Docks, &c., vessel for removing foul water from, H. H. Vogeding	82	165,894
Door, W. C. Hurd, (reissue)	30	6,549
Door check, J. H. McClymonds	24	165,847
Dredging box, Goodwin and Ives	88	165,670
Drier for paint, O. Russell	107	165,761
Drill, expansion, M. C. Bullock	124	165,787
Drilling machine, rock, J. W. Moyer	124	165,681
Egg tester, Henckler and Troegeler	116	165,824
Engine, governor, H. S. Maxim	69	165,744
Engine lubricator, steam, M. L. Waring	87	165,770
Engine lubricator, steam, J. Wheelock	87	165,901
Engine, rotary, W. Weyhe	120	165,772
Engine, steam, W. Read	150	165,869
Engines, boiler for portable, J. Enright	94	165,810
Engines, carriage for portable, C. M. Miller	31	165,854
Engines, valve and gearing for steam, J. A. Prince	152	165,687
Envelope, document, J. Pritchard	109	165,865
Fare register, W. H. Hornum	42	165,829
Fare register, W. H. Hornum	42	165,832
Felly plate, T. Beatty	31	165,656
Fences, device for making tabs for wire, Doolittle and Ellis	170	165,661
Fences, device for tightening wire, P. S. Crawford, (reissue)	62	6,546
Fertilizer distributer, W. F. Wheeler	133	165,773
Fire arm, breech loading, A. F. W. Timner	18	165,892
Fire, escape, A. J. Culbertson	30	165,714
Fishing and similar floats, W. T. Quinn	143	165,867
Floor, lint room, J. N. Stitt	30	165,889
Fountains, ornamental jet for, T. Galvin	167	165,668
Furnace grate, S. J. La Rue	149	165,740
Furnace, hot air, C. B. Chace	154	165,712
Furnace, steam boiler, C. D. Smith	149	165,690
Gage, taper, C. B. Hunt	132	165,734
Gas and water regulator, A. L. Smith	64	165,767
Gas, apparatus for purifying, O. Braun	66	165,765
Gas machines, pressure blower for, J. H. Bean	27	165,782
Gas making retorts, apparatus for supplying liquid hydrocarbon to, F. H. Richbaum	66	165,809
Gases, apparatus for hydrating, B. H. Jenks	35	165,837
Gate, L. S. Cohn	52	165,792
Gate, automatic, L. N. Allendorf	52	165,653
Gate, farm, A. Callahan	52	165,709
Gate, farm, Miller and Hillson	52	165,748
Gems, setting, T. W. Fry	66	165,729
Governor, steam, W. Mein	69	165,851
Grain tally, W. Schnebly	132	165,763
Graining roller, W. H. Burns	54	165,708
Hand rest, accountants, W. D. Sloan	146	165,885
Harrow, Chamberlain and Seiple	73	165,790
Harrow, S. G. Jones	73	165,736
Harrow, W. H. Parlin	73	165,753
Harrow, W. H. Parlin	76	165,735
Hatters, sizing plank for, M. F. Johnson	41	165,841
Hay knife, R. Kellogg	77	165,902
Hay loader, E. R. Whitney	148	165,880
Heater and feed pump for boilers, J. A. T. Overend	65	165,775
Heater for rollers, &c., T. S. Wiles	78	165,825
Hemp and flax machine, Herschaft and Lawrence	81	165,707
Hose spanner, J. Burke	58	165,778
Ice hook, D. C. Wood	68	165,729
Ice pick and can opener, combined, T. Hagerty	136	165,799
Inhaler, pocket, T. E. Daniels	148	165,843
Injector, G. H. Little	113	165,658
Iron and other metal, compound for coating, Brownlow and Francis	79	165,713
Jack, lifting, D. Cilley	67	165,780
Journal bearings, heat indicator for, S. Alley	93	165,794
Key holder, F. W. Coleman	20	165,663
Kiln, brick, J. G. Eberhart	44	165,841
Knife, bay, R. Kellogg	90	165,726
Lamp, J. B. Godwin	90	165,753
Lamp, car, F. Rhind	64	165,846
Lamps and chandeliers, extension fixture for, G. R. Lyon	92	165,680
Leather dressing, J. Miller	92	165,731
Leather, manufacturing, G. Herrick	92	165,822
Leather, tanning, G. W. Hatch	36	165,783
Lever safety pinion, G. Bement	153	165,900
Lime kiln, A. B. Weeks	91	165,705
Lime fastener, Brown and Peer	155	165,853
Liquid mixer, J. B. Meyers	93	165,678
Lock, time, J. Sargent	95	165,777
Loom shuttle, N. J. Willis	95	6,547
Looms, wire heddle for, D. C. Brown, (reissue)	87	165,800
Lubricator, Davis and Du Bois	87	165,756
Lubricator, Richter and Merkel	87	165,770
Lubricator, steam engine, M. L. Waring	87	165,901
Lubricator, steam engine, J. Wheelock	4	165,781
Mantel, iron, T. F. Baker	125	165,804
Metal bending machine, E. Devine	45	165,858
Milk strainer, F. L. Oliver	57	165,677
Mill, flour, A. Lenz	125	165,819
Mill, rolling, I. Hahn	62	165,738
Mirror, window, D. J. Kennedy	173	165,720
Molding machine, Frank and Spire	173	165,660
Molding machine, A. S. Gear	118	165,879
Motor, hydraulic, A. Schmid	103	165,893
Nail plate feeder, L. Soule	117	165,833
Newspaper forms, imposing and printing from, W. D. Hughes	14	165,697
Nut lock, J. M. Whitmore	3	6,554
Ore stamp feeder, J. Tullock, (reissue)	20	165,855
Oven for firing pottery, T. M. Minton	93	165,741
Padlock, H. S. Lockwood	107	165,761
Paint, drier for, O. Russell	107	165,893
Paper bag machine, J. Hatfield	109	6,551
Paper barrel and cylindrical box, B. Rhodes, (reissue)	109	165,863
Paper collar machine, C. H. Denison	108	165,706
Paper stock grinding machine, J. M. Burghardtt	110	165,882
Pavement, wood, J. J. Schroyer	110	165,695
Pavement, wood, H. M. Stow	110	165,896
Paving block, Von Versen and Bickel	16	165,806
Peg cutting machine, J. F. Smith	146	165,723
Pen and pencil case, J. U. Gerow	157	165,764
Photometer, O. Schuette	112	165,609
Piano forte case, H. J. Baker	54	165,737
Picture frame, A. D. Judd	157	165,870
Picture holder, stereoscopic, J. D. Rice	160	165,814
Pipe stem, H. C. Frits	20	165,710
Pipes, machine for forming sockets on curved earthenware, H. B. Camp	29	165,704
Plane, bench, C. Bridges	29	165,884
Plane, bench, H. Shogren	29	165,742
Plane, joiner's, J. Look	133	165,765
Planter, corn, G. W. Shepherd	114	165,652
Plow, W. K. Allen	114	165,876
Plow, J. R. Sample	114	165,877
Plow, O. P. Sanford	114	165,903
Plow, G. and T. Wiard	114	165,866
Plow, gang, E. P. Pulliam	114	165,703
Plow point, reversible, M. M. Bowers	146	165,654
Pocket book, C. Arms	146	165,864
Pocket book safety attachment, T. Potter	90	165,855
Pottery, oven for firing, T. M. Minton	118	165,891
Press, hydraulic, J. F. Taylor	117	165,859
Printers' leads, machine for cutting, J. A. T. Overend	117	165,871
Printing plates, numbering, T. Richards	117	165,838
Printing press, rotary, C. Kahler	87	165,852
Pulley for shafting, loose, C. B. Mellor	118	165,727
Pump, double acting, C. Gordon	146	165,683
Punch, conductor's, Nye and Zapf	120	165,906
Railway, elevated, J. G. Wilson	120	165,845
Railway rail chair, R. C. Ludlow	120	165,795
Railway switch signal, W. W. Colley	154	165,660
Range, portable, Cox and Hopkin	154	165,724
Ranges, boiler for, J. A. Gibson	58	165,651
Refrigerator, ice cream, G. D. Adams	58	165,733
Refrigerator, show case, J. H. Hoffman	147	165,797
Register and ventilator, ceiling, H. N. Creamer	147	165,721
Register, ventilating, H. Frits	66	165,667
Retorts, apparatus for charging, W. Foulis	70	165,806
Rifles, sharpening, S. P. Doane	73	165,839
Roller, land, J. A. Keeler	73	165,839
Roller, land, J. A. Keeler	126	165,771
Roof, metallic, E. Watson	97	165,650
Rule, registering board, W. M. Bullock	91	165,821
Sad iron, Harris and O'Neil	173	165,762
Sandpapering machine, O. Sawyer	24	165,856
Sash holder, P. Mullane	24	165,750
Sash holder, O. Rock	130	165,749
Saw, drag, H. H. Miller	40	165,910
Sawing machine, hoop, E. Young	130	165,757
Sawing machine, scroll, J. H. Roberts	51	6,555
Scraper, rotary road, J. W. Wilson, (reissue)	29	165,685
Screw driver, W. F. Patterson	134	165,711
Sewing machine, J. Carter	134	165,788
Sewing machine, C. S. Cushman	134	6,550
Sewing machine, A. F. Johnson, (reissue)	97	165,852
Shafting, loose pulley for, C. H. Mellor	136	165,909
Sheet iron barrel, C. M. Wyvell	29	165,880
Shingling gage, C. Schneider	146	165,686
Sketching and phonographic case, T. J. Phillips	146	165,747
Slate, school, C. H. Meigs, Jr	94	165,663
Spark arrester, J. Du Bois	94	165,907
Spark arrester, Wiser and Schniedere	31	165,895
Spoke tenoning machine, W. H. Von Behren	153	165,692
Stone cutting, chisel for, C. C. Simpson	154	165,694
Stove, coal, L. B. Sprout	154	165,893
Stove pipe joint, G. D. Umland	70	165,898
Stove polish, J. M. Watson		

	Class No.	No. of Patent.
Strainer, milk, F. L. Oliver	45	165,858
Table, ironing, E. S. Heath	91	165,672
Table, ironing, J. N. Wunderlich	91	165,908
Telegraphs, transmitter for electro-harmonic, E. Gray	50	165,728
Thermometer, G. Gano	101	165,816
Ticket stamp, L. J. Blades	146	165,702
Tile, illuminating, T. Hyatt	126	165,835
Time check, H. Greene	42	165,817
Tool, T. Hagerty	29	165,671
Transit, S. Holton	157	165,828
Tree protector, R. F. Williams	63	165,176
Trunks, &c., fastening, J. Hall	93	165,820
T-squares to drawing boards, attaching, W. B. Stevenson	97	165,788
Valve gear, reversible, N. E. Nash	152	165,682
Valve, relief, G. H. Clemens	152	165,791
Vessel for removing foul water from docks, &c., H. H. Vogeding	82	165,894
Vessels, manufacture of irregular shaped, B. Rhodes, (reissue)	109	6,552
Vessels, shoal indicator for, Wagner and Rumpus	137	165,697
Wagon jack, J. Sawyer	31	165,689
Wagon rack, J. F. Cass	31	165,789
Washing machine, T. A. Irick	91	165,675
Washing machine, M. Loughran	91	165,844
Washing machine, P. Markley	91	165,679
Washing machine, O. V. Roe	91	165,874
Watch, M. G. Cole	36	165,793
Watch escapement, J. R. Hopkins	36	165,830
Watch, stem winding, J. D. Bres	36	165,786
Watches, barrel arbor for, J. R. Hopkins	36	165,631
Watchmaker's box, P. H. Wheeler	36	165,774
Watchmaker's eyeglass, M. W. Ward	157	165,904
Water meter, W. Helme	167	165,673
Wells, grab for removing detached drills from artesian, B. Kent	124	165,676
Windmill, E. Dewald	118	165,715
Windmill, R. N. Rockwell	118	165,873
Wood, preserving, L. S. Robbins	35	165,758
Wrench, R. S. Battles	100	165,655
Wrench, pipe, L. Glynn	100	165,725
Wringer, M. A. Richardson	91	165,754
Yarn beam, J. A. Gould	95	165,666
Yarn to set the twist, treating, D. Wright	142	165,779

INDEX OF PATENTEES TO WHOM PATENTS WERE GRANTED JULY 20, 1875.

	Patent No.
Adams, A. P., assignee	165,775
Adams, G. D., Ice cream refrigerator	165,651
Agens and Lockard	165,678
Aiken, J., assignee	165,809
Alexander, U. D., Coal hod	165,698
Allen, W. K., Plow	165,652
Allendorf, L. N., Automatic gate	165,653
Alley, S., Heat indicator for journal bearings	165,760
Arme, C., Pocket book	165,654
Baker, H. J., Piano forte case	165,699
Baker, T. F., Iron mantel	165,781
Baker, W. C., Electric boiler alarm and register	165,700
Battles, R. S., Wrench	165,655
Bean, J. H., Pressure blower for gas machines	165,782
Beatty, T., Felly plate	165,653
Bement, G., Lever safety pinion	165,783
Bickel and Von Versen	165,896
Bilharz, C., Dental plugger	165,701
Bishop, G. G., Cloth frieszing machine	165,657
Blades, L. J., Ticket stamp	165,702
Blood, F. A., assignee	165,731
Bowers, J. W., Box dressing machine	165,784
Bowers, M. M., Reversible plow point	165,703
Braun, O., Apparatus for purifying gas	165,785
Bres, J. D., Stem winding watch	165,786
Bridges, C., Bench plane	165,704
Brigham, Litchfield, and Vining, assignees	165,742
Brooks and Naylor	165,743
Brown, A. B., and P. A. Peer, Line fastener	165,705
Brown, D. C., Wire heddle for looms, (reissue)	6,547
Brownlow, D. R., and G. W. Francis, Compound for coating iron and other metal	165,658
Bullock, M. C., Expansion drill	165,787
Bullock, W. M., Registering board rule	165,659
Burghartt, J. M., Paper stock grinding machine	165,706
Burke, J., Hose spanner	165,707
Burns, W. H., Graining roller	165,708
Callahan, A., Farm gate	165,709
Camp, H. B., Machine for forming sockets on curved earthenware pipes	165,710
Campbell, J., Corn drill	165,788
Carter, J., Sewing machine	165,711
Case, W. G., assignee	165,664
Cass, J. F., Wagon rack	165,789
Chace, C. B., Hot air furnace	165,712
Chamberlain, J., and H. H. Seiple, Harrow	165,790
Cheney, A. J., assignee	165,732
Cilley, D., Lifting jack	165,713

	Patent No.
Clemens, G. H., Relief valve	165,791
Coal, K. P., assignee	165,755
Cochrane, E. W., assignee	165,689
Cohn, L. S., Gate	165,792
Cole, M. G., Watch	165,793
Coleman, F. W., Key holder	165,794
Colley, W. W., Railroad switch signal	165,795
Colt, W. D., assignee	165,830, 165,831
Corning, H., assignee	165,731
Cox, J., and G. E. Hopkin, Portable range	165,660
Cox, Whiteman & Cox, assignees	165,660
Crawford, J. F., Butter pail	165,796
Crawford, P. S., Device for tightening wire fences, (reissue)	6,546
Creamer, H. N., Ceiling register and ventilator	165,797
Culbertson, A. J., Fire escape	165,714
Cushman, C. S., Sewing machine	165,798
Cutting, A., assignee	165,659
Daniels, T. E., Pocket inhaler	165,799
Davis, S. H., Jr., and H. M. Du Bois, Lubricator	165,800
Deacon, H., Manufacture of chlorine	165,801
Deacon, H., Manufacture of chlorine	165,802
Denison, C. H., Paper collar machine	165,803
Devine, E., Metal bending machine	165,804
Dewald, E., Windmill	165,715
Dierkes, H. A., Door bell, (reissue)	6,548
Disston, T. S., Rotary blower	165,805
Doane, S. P., Sharpening rifles	165,806
Dobson, J. and J., Carding machine	165,716
Doolittle, T. B., and J. M. Ellis, Device for making tabs for wire fences	165,661
Doremus, W. T., Chair base	165,717
Doremus, W. T., Chair base	165,718
Dorman, J., Bobbin winder	165,807
Draper, G., & Son, assignees	165,779
Du Bois and Davis	165,800
Du Bois, J., Spark arrester	165,662
Durham, N. A., Dental forceps	165,808
Eames, M. C., assignee	165,838
Earnshaw, J., Brush	165,719
Eberhart, J. G., Brick kiln	165,663
Eichbaum, F. H., Apparatus for supplying liquid hydrocarbon to gas making retorts	165,809
Ellis and Doolittle	165,661
Ellis, W., Cigar box	165,664
Emrath, P., assignee	165,838
Enright, J., Boiler for portable engines	165,810
Fairbanks, H. B., Screen supporter for cribs and cradles	165,665
Felix, J., Crucible	165,811
Fletcher, W. H., Combined blind and screen for railroad cars	165,812
Foerster, D., Device for glazing crackers	165,813
Foulis, W., Apparatus for charging retorts	165,667
Francis and Brownlow	165,658
Frank, A. H., and G. Spire, Molding machine	165,720
Fraser, W., assignee	165,751
Frits, H., Ventilating register	165,721
Fritz, H. C., Pipe stem	165,814
Fry, T. W., Setting gems	165,729
Fugitt, N. B., assignee, (reissue)	6,551, 6,552
Gabbe, W. H. L., Bed lounge	165,815
Gail, G. W., assignee	165,881
Galvin, T., Ornamental jet for fountains	165,668
Gano, G., Thermometer	165,816
Gear, A. S., Molding machine	165,669
Gerow, J. U., Pen and pencil case	165,723
Gibson, J. A., Boiler for ranges	165,724
Glynn, L., Pipe wrench	165,725
Godwin, J. B., Lamp	165,726
Goodwin, F. T., and A. Ives, Dredging box	165,670
Gordon, C., Double acting pump	165,727
Gould, J. A., Yarn beam	165,666
Gray, E., Transmitter for electro-harmonic telegraphs	165,728
Greene, H., Time check	165,817
Gwathmey, R. C., Cyclophore	165,818
Hagerty, T., Tool	165,671
Hagerty, T., Combined ice pick and can opener	165,729
Hague, W. and J., assignees	165,867
Hahn, I., Rolling mill	165,819
Hall, J., Fastening for trunks, &c	165,880
Harris, E. M., and M. H. O'Neil, Sad iron	165,821
Harris, S., assignee	165,872
Hatch, G. W., Tanning leather	165,822
Hatfield, J., Paper bag machine	165,823
Hatlinger, J. J., Carpet sweeper	165,730
Heath, E. S., Ironing table	165,672
Helme, C. A., assignee	165,882
Helme, W., Water meter	165,673
Henckler, W., and H. A., Troegeler, Egg tester	165,824
Henry, J., assignee	165,877
Herrick, G., Manufacturing leather	165,731
Herschaft, C., and J. Lawrence, Hemp and flax machine	165,825
Hien, P., and J. Koch, Car coupling	165,826
Hill, B. F., assignee	165,652
Hill, J. P., Clothes drier	165,674
Hillson and Miller	165,748
Himelreich, P. W., assignee	165,760
Hoddell, J., & Co., assignees	165,793
Hodgdon, E., Anvil	165,732
Hoffman, J. H., Show case refrigeraror	165,733
Holland, T., Stop cock	165,827
Holton, S., Transit	165,828
Hopkin and Cox	165,660

	Patent No.
Hopkins, J. R., Escapement for watches	165,830
Hopkins, J. R., Barrel arbor for watches	165,831
Hornum, W. H., Face register	165,829
Hornum, W. H., Face register	165,832
Horton, W. W., assignee	165,809
Hough, C. W., assignee	165,903
Hughes, W. D., Imposing and printing from newspaper to me	165,833
Hunt, C. B., Taper gage	165,734
Hurd, W. C., Door, (reissue)	6,549
Hutchinson, M., Butter worker	165,834
Hyatt, T., Illuminating tile	165,835
Hymer, S. B., Candy spinner	165,836
Irick, T. A., Washing machine	165,675
Ives and Goodwin	165,670
Jacobs, J. M., assignee	165,736
Jenks, B. H., Apparatus for hydrating gases	165,837
Johnson, A. F., Sewing machine, (reissue)	6,550
Johnson, M. F., Sizing plank for hatters	165,735
Jones, S. G., Harrow	165,736
Judd, A. D., Picture frame	165,737
Kahler, C., Rotary printing press	165,838
Keeler, J. A., Land roller	165,839
Kellogg L. L., Clock calendar	165,840
Kellogg, R., Hay knife	165,841
Kennedy, D. J., Window mirror	165,738
Kent, B., Grab for removing detached drills from artesian wells	165,676
Kock and Hieu	165,926
Landt, T., Rotary churn	165,739
La Rue, S. J., Furnace grate	165,740
Lawrence and Herschaft	165,925
Leetch, E., Bosom form	165,842
Lenz, A., Flour mill	165,677
Little, G. H., Injector	165,843
Lockard, H., and T. Agens, Bridle bit	165,678
Lockwood, H. S., Padlock	165,741
Look, J., Joiner's plane	165,742
Loughran, M., Washing machine	165,844
Ludlow, R. C., Railroad rail chair	165,845
Lyon, G. R., Extension fixture for lamps and chandeliers	165,846
Mahler, F., Commode or stand	165,743
Markley, P., Washing machine	165,679
Martin, C. J., assignee	165,692
Maxim, H. S., Engine governor	165,744
McAleer, G., Folding rocking chair	165,745
McCallum, J. and A., assignees	165,789
McClymonds, J. H., Door check	165,847
McCoy, W. H., Sun dial	165,746
McFadden, P., Cart saddle	165,848
McPherson, J. R., Stock car	165,849
McPherson, J. R., Stock car	165,850
McWilliams, M., assignee	165,804
Meigs, C. D., Jr., School slate	165,747
Mein, W., Steam governor	165,851
Mellor, C. H., Loose pulley for shafting	165,852
Merkel and Richter	165,756
Merriam, Sedgwick, and Silva	165,691
Meyers, J. B., Liquid mixer	165,253
Miller, C. M., Carriage for portable engines	165,854
Miller, H. H., Drag saw	165,749
Miller, J., Leather dressing	165,680
Miller, R., and J. D., Hillson, Farm gate	165,748
Minton, T. M., Oven for firing pottery	165,855
Morgan, E. C., Corn sheller	165,750
Morton, G. M. and F. H., assignees	166,902
Moyer, J. W., Rock drilling machine	165,681
Mullane, P., Sash holder	164,856
Musick, L. E., Car coupling	165,857
Nash, F. W., Car coupling	165,751
Nash, N. E., Reversible valve gear	165,682
Naylor, J., Jr., and E. Brooks, Bolt work for safe and vault doors	165,752
Nogel, E. C., assignee	165,760
Nye, C. H., and E. Zapf, Conductor's punch	165,683
Oser, R. H., Chair spring attachment	165,684
Ogden, W. L., assignee	165,858
Oliver, F. L., Milk strainer	165,621
O'Neil and Harrie	165,859
Overend, J. A. T., Machine for cutting printers' leads	165,860
Overend, J. A. T., Heater and feed pump for boilers	165,770
Palmer, C. B., assignee	165,753
Parlin and Orendorff, assignees	165,753
Parlin, W. H., Harrow	165,685
Patterson, W. F., Screw driver	165,705
Peer and Brown	165,861
Phillips, P. W., Curtain roller	165,686
Phillips, T. J., Sketching and phonographic case	165,862
Pierce, J. A., Carburetor	165,863
Pierson, W. A., Bridle bit	165,864
Potter, T., Pocket book safety attachment	165,777
Potter, W. R., assignee	165,687
Prince, J. A., Valve and gearing for steam engines	165,865
Pritchard, J., Document envelope	165,866
Pulliam, E. P., Gang plow	165,867
Quinn, W. T., Fishing and similar floats	165,868
Randolph, S. P., Cutter head	165,688
Rawson, C. B., Combined chair and step ladder	165,869
Read, W., Steam engine	165,735
Rhind, F., Car lamp	165,754
Rhodes, B., Paper barrel and cylindrical box, (reissue)	6,551
Rhodes, B., Manufacture of irregular shaped vessels, (reissue)	6,552

	Patent No
Rice, J. D., Stereoscopic picture holder	165,870
Richards, T., Numbering printing plates	165,871
Richardson, M. A., Wringer	165,754
Richter, J., and G. Merkel, Lubricator	165,756
Robbins, L. S., Preserving wood	165,758
Roberts, J. H., Scroll sawing machine	165,757
Robinson, W., Jr., Brake shoe	165,872
Rock, O., Sash holder	165,759
Rockwell R. N., Windmill	165,873
Roe, O. V., Washing machine	165,874
Rorbach, J., assignee	165,890
Rothschild, S., Jr., assignee	165,671, 165,729
Row, J. W., Cheese cutter	165,760
Ruger, J. W. and A., Cracker machine	165,875
Rumpus and Wagner	165,897
Russell, O., Drier for paint	165,761
Salter, J. T., assignee	165,809
Sample, J. R., Plow	165,876
Sanford, O. P., Plow	165,877
Sargent, J., Time lock	165,878
Sawyer, J., Wagon jack	165,689
Sawyer, O., Sandpapering machine	165,762
Schemerhorn, J. P., assignee	165,763
Schmidt, A., Hydraulic motor	165,879
Schmieders and Wiser	165,907
Schnebly, W., Grain tally	165,763
Schneider, C., Shingling gage	165,880
Schroeder, F. W., Steerable air ship	165,881
Schroyer, J. J., Wood pavement	165,882

TITLES, DRAWINGS, AND CLAIMS

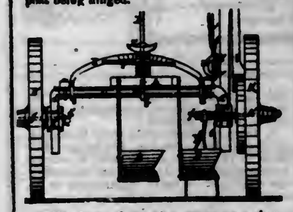
OF

PATENTS GRANTED JULY 20, 1875.

165,651. ICE-CREAM REFRIGERATORS. Geo. D. Adams, Worcester, Mass. [Filed May 31, 1875.]

Brief.—Earthenware ice-cream holders revolve with their metallic supporting-cups.

1. The combination, with the refrigerator-box A and supporting-rings E, of the revolving cups F, substantially as and for the purposes set forth.



2. The combination, with the socket-piece h, of revolving cup F, having stem e, substantially as and for the purposes set forth.

3. The combination, with rings E and revolving supporting-cups F, of the ice-cream cup D, substantially as and for the purposes set forth.

4. The peculiarly-constructed earthenware ice-cream cup D, provided with a flange, e, upon its upper open end, substantially as and for the purposes set forth.

165,652. PLOWS. William K. Allen, Kansas City, Mo., assignor to Benjamin F. Hill. [Filed Oct. 23, 1874.]

Brief.—The plow-frame is balanced upon a flexible upright post or lever, which turns upon the axle, and has three motions, by rocking vertically upon the axle, horizontally upon the post, and tilting from side to side by the post being hinged.

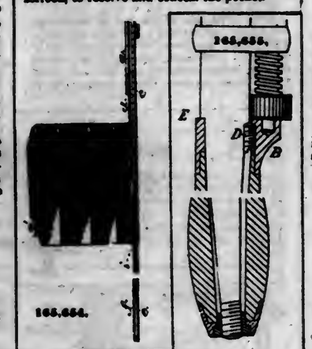
1. The frame A, carrying one or more plow-shares, B, pivoted to the axle C, the cross-bar E, spring-bar F, and the pivoted hand-lever D, whereby the frame is capable of having either a horizontal, vertical, or tilting motion, substantially as and for the purpose set forth.

2. The combination of the middle beam G of the frame A, and the upright bar K, extending above and below the said beam, and provided with holes, as and for the purpose specified.

3. The lever G', the brake-lever H', the latch N', with its lock-piece g', having the slotted opening n', the stop-piece q', and the lever r', with its adjustable spring-lock attachment t' located in front of the axle-shaft C, combined, arranged, and operating as and for the purposes specified.

165,653. AUTOMATIC GATES. Lewis N. Allendorf, Poughkeepsie, N. Y. [Filed Jan. 26, 1876.]

The gate A, hinged at its upper end to the post a, and at its lower end to the swinging or oscillating rod c, which is connected with the latch d by means of rod e, in combination with the operating mechanism, consisting of the crank-rod h, rod and chain connections g g' i, and weight u, substantially as and for the purpose specified.



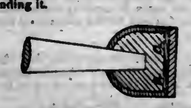
165,654. POCKET-BOOKS. C. Arms, South Deerfield, Mass. [Filed July 10, 1875.]

Brief.—Conceals a secret "note-pocket" between the back of the book and its lining, by pulling the locking or closing strap to which it is attached.

1. In a wallet or pocket-book, a secret pocket, constructed substantially as described, to slide into and be concealed between the back of the book and its lining.

2. The secret pocket, consisting of the parts e f, having the folding flap g and strap h, substantially as described.

3. The secret pocket, consisting of the parts e f, having the folding flap g and the strap h, in combination with a book or wallet having a recess, constructed substantially as described, to receive and conceal the pocket.



165,655. WRENCHES. Rush S. Bettles, Girard, Pa. [Filed Mar. 6, 1876.]

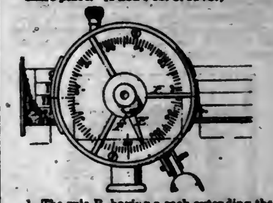
The ferrule B of a wrench, held in position by screw D, which enters a thread cut in part on the ferrule, and in part on the bar, substantially as shown, and for the purposes mentioned.

165,656. FELLY-PLATES. Thornton Beatty, Vermillion, Ill. [Filed Mar. 16, 1875.]

Brief.—The felly is strengthened and protected by a metallic sheathing entirely surrounding it.

In a vehicle wheel, the combination of the following elements: first, the tire; second, the felly; third, the casing A, having inwardly-projecting cylindrical parts a, and entirely inclosing and exactly fitting the exterior surface of the felly, as and for the purposes described.

165,657. CLOTH-FRINGING MACHINES. Geo. G. Bishop, Norwalk, Conn., assignor to the Union Manufacturing Company, same place. [Filed June 19, 1876.]



The combination of the platen F with a vulcanized gum-elastic frisker having its surface sub-divided by a series of obliquely-transverse elastic walls or partitions H, marginal wall K, and intervening depressed channels J, all constructed substantially as described, and for the purposes set forth.

165,658. COMPOUNDS FOR COATING IRON AND OTHER METALS. David B. Brownlow and Geo. W. Francis, Middletown, Conn. [Filed Dec. 29, 1874.]

Brief.—Take ordinary slag and borax and place them in a suitable vessel or retort, and apply heat between 2,000° and 3,000° Fahrenheit, to reduce them to a fluid condition. May use, instead of slag, equal parts of sulphuret of iron, arsenic, and plumbago, with borax.

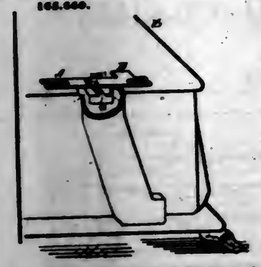
A compound for coating iron and other metals, consisting of slag and borax, substantially as described.

165,659. REGISTERING BOARD-RULER. Wm. M. Bullock, La Grange, Ind., assignor of one-half his right to Adolphus Cutting, same place. [Filed Feb. 8, 1875.]

1. The rule B, having a rack extending the length of its graduated scale, in combination with a sliding registering device having a dial-plate and a register, substantially as and for the purpose described.

2. The combination of the worm-wheel P and pinion B' with the sliding rod c, the lever C', and wheel K, substantially as and for the purpose set forth.

3. The worm-wheel P and pinion B', sliding rod c, and lever C', in combination with rule B, having rack a, and with wheel K, screw H, and register J, as and for the purpose set forth.



4. The screw H, provided with movable hand F and rigidly-attached hand E, in combination with register J, having longitudinal slot a, and with dial I and mechanism for operating screw, substantially as and for the purpose described.

165,660. PORTABLE RANGES. Joseph Cox and George R. Hopkins, Philadelphia, Pa., assignors to Cox, Whiteman & Cox, same place. [Filed May 31, 1875.]

Brief.—The damper in the dust-flue is operated by a sliding plate on the top of the stove, which indicates by its position whether the flue is open or closed.

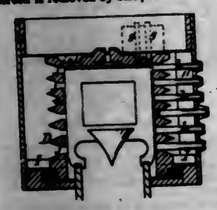
HELIOTYPE RELIEF PROCESS. JAMES R. OSGOOD & CO. BOSTON

165,660.

1. The top plate E, provided with the words "open," "shut," in combination with the sliding plate and cover A and B and damper D, as and for the purpose herein set forth.

2. The damper D, provided with arms a and hang upon points at the top of the dust-flue e, as and for the purpose herein set forth.

165,661. DIVIDER FOR MAKING TABS FOR WIRE FENCES. Thomas B. Doolittle and James M. Ellis, Bridgeport, Conn. [Filed Mar. 18, 1875.]



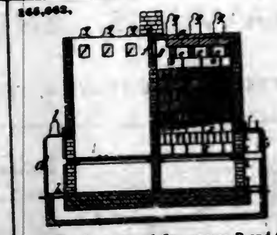
Brief.—Punches on the one block co-operate with openings in the other to form the points. A shoulder on A, along the line of its junction with the part E, cuts off the blank, and a shoulder on B, formed by an extension of said block, bends the points to a right angle.

The punches and dies for cutting sheet-metal barb-blanks, constructed as described, and so arranged relatively to the sheet-metal strip to be operated upon, as that the points shall be cut and bent, substantially as and for the purposes hereinbefore set forth.

165,662. SPARK-ARRESTERS. John Du Bois, Williamsport, Pa. [Filed June 16, 1875.]

Brief.—A cylindrical screen is adapted to be revolved, and the soot adhering to the screen is removed by scrapers.

1. A movable or revolving screen, provided with scrapers to remove all of the soot and cinders that may adhere to both the out and inside of the same, and points to clean the apertures through which the smoke and exhaust steam escape, operated by its movement or rotation, as herein set forth.



2. A revolving screen provided with series of elongated apertures around the sides and top, in combination with an outer case, substantially as and for the purposes herein shown and described.

3. The series of arms I I on the base of the screen D, to remove the soot and cinders caught in and outside of the same, and discharge them at the place provided at each revolution of the screen.

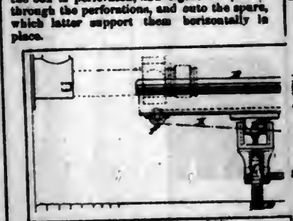
165,663. BRICK-KILNS. John G. Eberhart, Baltimore, Md. [Filed May 11, 1875.]

Brief.—To avoid the labor and expense of arched flueways, and to expedite the burning.

165,663.

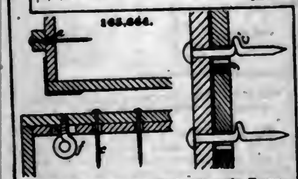
1. The flueways and flue-spaces B and C and *b* and *c*, under the flat tops of the brick-kilns, and in the relation to the draft communications / between the several kilns, substantially as and for the purpose described.

2. The portable hood G^1, in combination with the ground-flue F, chimney or stack E, and kilns A^1 A^2, substantially as described.



3. The portable hood G^2, in combination with the ground-flue F, chimney or stack E, and kilns A^2 and A^3, substantially as described.

4. The portable hoods G^1, G^2, and G^3, in combination with the ground-flues F F', kilns A^2 A^3, and chimney or stack E, substantially as described.



5. The portable hoods G^2 and G^3, in combination with the ground-flue F, kilns A^2 and A^3, and chimney or stack E, substantially as described.

165,664. CIGAR-BOXES. Wm. Ellis, Columbia, Pa., assignor of one-fourth his right to William G. Case, same place. [Filed May 15, 1875.]

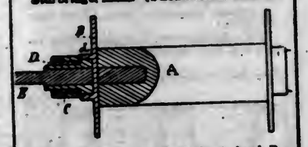
Brief.—The side of the box is perforated, and fitting against it is a bar carrying spurs, which enter the slots. The opposite side of the box is perforated, and cigars are passed through the perforations, and onto the spurs, which latter support them horizontally in place.

165,664.

1. A cigar-box provided with racks B, perforations *r* and spurs *c*, as and for the purpose set forth.

2. A cigar-box provided with the slots *g*, racks B, and coiled spurs *c'*, as and for the purpose set forth.

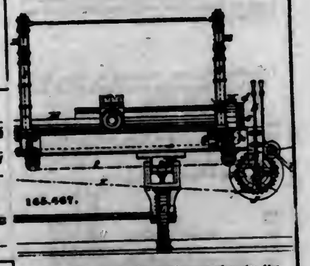
3. In a cigar-box, provided with slots or perforations, racks B carrying spurs, slot *a*, and button *f*, as and for the purpose set forth.



165,665. SCREEN-SUPPORTERS FOR CRIBS AND CRADLES. Henry B. Fairbanks, Manchester, N. H. [Filed Aug. 13, 1874.]

165,665.

As a new article of manufacture, a screen-supporter for cribs consisting of the parallel bars A A, connected together by the horizontal rods *a*, and having their ends bifurcated to form branching arms *b b* for supporting the frame on the side rails of the crib, substantially as and for the purpose described.



165,666. YARN-BEAMS. John A. Gould, Sturbridge, Mass. [Filed June 2, 1875.]

A yarn-beam having the body A, head B, thimble D, nut C, and journal E, constructed and arranged to operate substantially as and for the purpose set forth and specified.

165,667. APPARATUS FOR CHARGING RETORTS. William Foulis, Glasgow, North Britain. [Filed Sept. 3, 1874.]

Brief.—The hoeing-chains which operate the charging-scoop are wound on a drum. The one which moves the scoop forward also turns it over in the retort, and the one which withdraws it rights it at the end of its backward stroke.

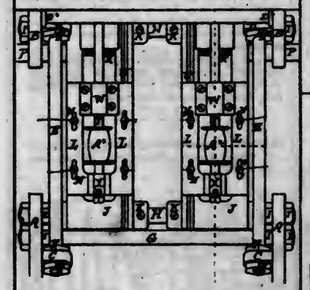
165,667.

1. The combination of the scoop, capable of both longitudinal and rotary movements, a hoeing-chain connected at both ends to and lapped in opposite directions round the scoop, and appliances for imparting motion to the chain in either direction, substantially as and for the purpose set forth.

2. The combination of the scoop B, chain I, for imparting longitudinal and rotary movement to the scoop, and a pawl, K, moving longitudinally with the scoop and controlling the rotation of the latter, substantially as described.

165,668. ORNAMENTAL JETS FOR FOUNTAINS. Theodore Galvin, Detroit, Mich. [Filed June 8, 1875.]

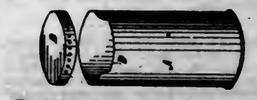
Brief.—When water is admitted to the fountain, the sleeves and radial arms revolve, while water is thrown from the recess E and the sprinkler D in spray or jets.



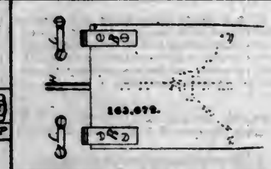
1. The compound fountain-jet, consisting of the two sets of rotating arms C, with the stationary part E and cap D, all constructed to operate substantially as described.

2. A jet for fountains, composed of a series of jets, constructed and united in sections, substantially as set forth, whereby the sections may be used separately or together, substantially as shown and described.

165,669. MOLDING MACHINES. Alonzo S. Gear, Boston, Mass. [Filed Feb. 6, 1875.]



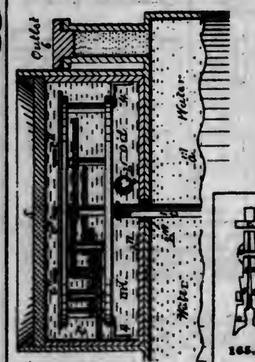
Brief.—The principal parts of the frame are composed of metallic tubes united to the bases, and caps, screw threads, and nuts.



1. In a molding-machine, a frame consisting of the castings A B, held firmly in position by the hollow rods E, G, and H, said rods H forming the supports for the yokes J, and vertical spindles Y, substantially as herein described.

2. In a molding-machine, a frame made up of castings and hollow tubes, as described, in combination with the laterally-adjustable yokes J, spindles Y, and cutters Z, substantially as and for the purpose herein set forth.

165,670. DREDGING-BOXES. Frederick T. Goodwin and Addison Ives, Boston, Mass. [Filed Feb. 3, 1875.]

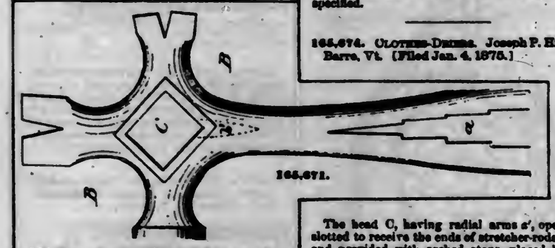


The dredging-box described, the same consisting of the body A, having the apertures D and the cover B, provided with the holes C, constructed and arranged to operate substantially as specified.

165,672.

165,673. WATER-METERS. Wm. Helme, Philadelphia, Pa. [Filed May 24, 1875.]

Brief.—The registering-apartment is filled with a transparent lubricating-oil, which always remains separate from and above the surface of the water, so preventing access of water to the registering mechanism.

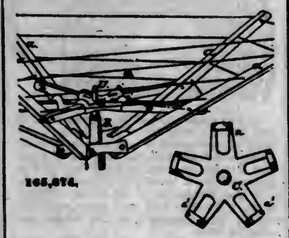


165,673.

165,676.

In combination with a water-meter, a transparent lubricating-oil supported upon the water of the measuring apartment, so as to keep the registering apparatus wholly submerged in the said oil, substantially in the manner described and set forth, and for the purpose specified.

165,674. CLOTHES-DRIERS. Joseph P. Hill, Barre, Vt. [Filed Jan. 4, 1875.]



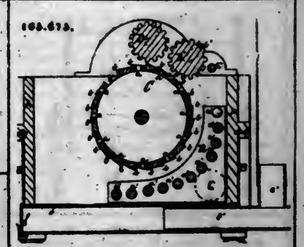
165,671.

The head C, having radial arms *c'*, open-slotted to receive the ends of stretcher-rods *b*, and provided with arched stops, placed between the pivotal points, all as and for the purpose described.

165,671. TOOLS. Thomas Hagerty, New York, N. Y. [Filed May 17, 1875.]

Brief.—A screw-driver, hammer, tack-puller, gas-meter wrench, and nail-extractor are arranged in one implement; the handle of which is slotted, and provided with shoulders upon each side of the slot, which form a graduated wrench.

The within-described tool, consisting of the handle A, with graduated notches forming wrench *a*, screw-driver *b*, body B, with wrench C, and nail-puller *b'*, hammer D, tack-puller E, and box-opener G, all as herein shown, and for the purpose set forth.



165,674.

165,675. IRONING-TABLES. Edwin S. Heath, North Hope, Pa. [Filed May 6, 1875.]

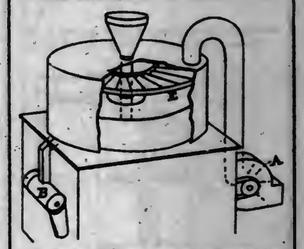
The braces F F, socket D, provided with the thumb-screw *d*, and the adjustable leg H, in combination with the ironing-board A, provided with the hooks B B and the horizontal irons C C, all constructed to operate substantially as and for the purpose set forth.

165,675. WASHING-MACHINES. T. A. Irick, Rumansville, Mo. [Filed Feb. 27, 1875.]

165,675.

1. The combination, in a washing-machine, of the perforated ribbed cylinder C, and the rack R, carrying the rollers *a'*, and provided with the air cylinder or float G, as described.

2. The combination, in a washing-machine, of the perforated ribbed cylinder C, the rack R, carrying the rollers *a*, and provided with the air cylinder or float G, and the fluted rollers D and D', when the said rollers are arranged vertically above the said cylinder C, and operate to press upon said cylinder by the force of their own weight only, as described.



165,676. GRABS FOR REMOVING DETACHED DRILLS FROM ARTESIAN WELLS. B. Kent, Binghamton, N. Y. [Filed May 12, 1875.]

Brief.—An upward extension of the serrated jaws forms a bisected cone and stem, sliding, respectively, in a socket and slot of a bar, which also slides at its upper end in the slot of a sinker-bar, with the effect that, when the whole is dropped, the fastened tool is jarred and seized simultaneously. The upward haul causes the cone-jaws to close.

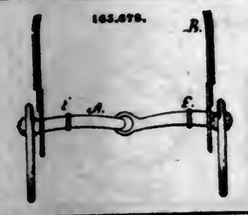
The combination of the grab A, having a tapering neck, *g*, working in a corresponding bearing in the end of the socket *e*, with the jar-bar C and its guide-extension *f*, working in the groove *i* in the sinker-bar, and the sinker-bar B, all constructed substantially as herein described, for the purpose set forth.

165,677. FLOUR-MILLS. August Lenz, Oshkosh, Wis. [Filed Dec. 3, 1874.]

Brief.—The parts are arranged to exclude the air from the stones. A section-fan removes the steam, &c.

1. The air-tight curb, provided with the screen E, combined with the exhaust-fan A and pipe, substantially as specified.

2. The fan A, conveyer B, and screen E, in combination with an air-tight curb, substantially as shown and described, when used in the manner and for the purposes set forth.



165,678. BRIDLE-BITS. Hiram Lockard and Thomas Agens, Newark, N. J.; said Lockard assignor of one-half his right to said Agens. [Filed Nov. 6, 1874.]

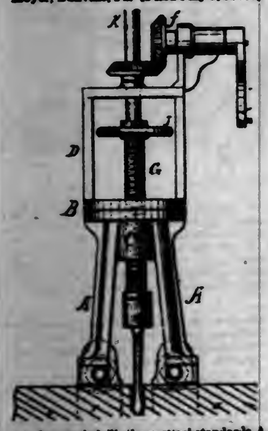
1. In a bridle-bit, the metal spring nose-band B, substantially as and for the purposes specified.

2. The nose-band, in combination with the stops *a a* on the mouth-piece, substantially as described, and for the purposes set forth.

3. The mouth-piece covered with an elastic coating of gutta-percha, for the purposes set forth.

165,679.

1. The combination of corrugated rollers A and B B, steel spring or springs E, and pieces C C, plates *f f*, and swivels, *g g* with the stationary coupling-piece D as part of the frame-work of the machine, substantially as described and set forth.



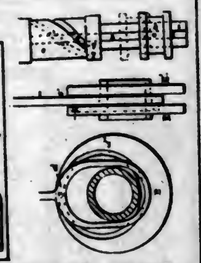
2. The combination of corrugated rollers A and B B, and pieces C C, with plate F, pieces G, and piece H, as separate and stationary fastenings on the machine and on the top, substantially as and for the purposes herein set forth.

166,680. LEATHER-DRESSING. John Miller, Philadelphia, Pa. [Filed Jan. 6, 1875.]

Brief.—Scraps of leather are dissolved in alkali, and the solution combined with any suitable coloring material.

The composition of matter consisting of a solution of leather and coloring material, substantially as and for the purpose set forth.

165,681. ROCK-DRILLING MACHINES. J. W. Moyer, Danville, Pa. [Filed July 8, 1875.]



1. In a rock-drill, the vertical standards A, secured to the adjusting screw-rods E, in combination with independent separate adjusting-clamps H, threaded correspondingly with screw-rods E, substantially as and for the purposes herein set forth.

2. In a rock-drill, the frame A B C D, in combination with the screw G, drill I, wheel J, rod K, adjusting-rods E, and the independent separate adjusting plates or clamps H, and operating mechanism, substantially as and for the purpose set forth.

165,682. REVERSIBLE VALVE-GEARS. N. B. Nash, Westerly, R. I. [Filed Dec. 29, 1874.]

1. The eccentrically-grooved disk E, guard-disk E', sleeve *e*, shaft *i*, collar E, rod A, block *g*, and sliding clutch *k*, combined and operating substantially as and for the purposes herein specified.

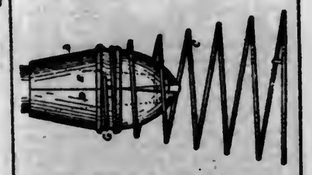
2. In combination with the eccentrically-grooved disk E and guard-disk E', secured upon the spirally-grooved sleeve *e*, the stirrup-shaped valve-stem extension *c'*, provided with the pin *d*, substantially as set forth, for the purpose designated.

165,683. CONDUCTORS' PUNCHES. Charles H. Nye, New York, N. Y., and Edwd. Zapf, Cincinnati, assignors to Henry Nye, Cincinnati, Ohio. [Filed Jan. 30, 1875.]

Brief.—A ribbon strip of paper is stored within the case. At each reciprocation of the lever, the strip is fed forward, and a ticket or piece cut from it.

1. The combination of the register-wheel E and brake *g* with the ratchet-wheel F and pawl *f*, constructed to operate substantially as described, by which the ribbon is fed a certain distance, and then held while the knife is pressed down to sever the strip, as set forth.

2. The combination of the sliding standard J, roll *i*, provided with a set-screw, and feed-rolls D, all substantially as and for the purpose set forth.



3. The lever A, in combination with pawl *f* and link *e*, whereby the strip is fed forward and the knife reciprocated, substantially as shown and described.

4. The combination of the lever A, link *e*, slotted plate *b*, vertically-reciprocating knife *a*, and stationary cutter *c*, all arranged to operate substantially as described.

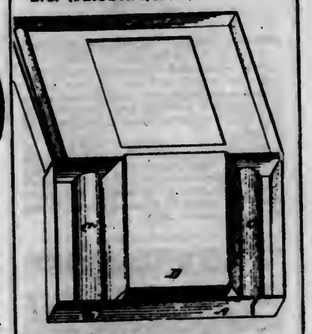
5. The knife *a*, having its operating link connected to it by a lateral projection, whereby pressure on the knife tends to press it up toward the stationary lip or blade, substantially as described.

6. In combination with the feed-rolls D, having their inner edges milled, the roll *i*, provided with a central circumferential projection, substantially as described.

165,684. CHAIR-SPRING ATTACHMENTS. R. H. Ober, Garrettsville, Ohio. [Filed Apr. 19, 1875.]

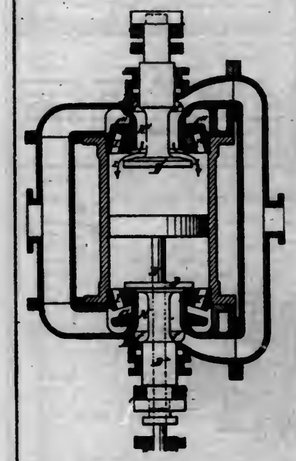
1. The herein-described clamp B, consisting of the sections D, E, and F, provided with a groove, G, and blocks *c*, in combination with the spring C and the leg of a chair, A, in the manner substantially as described, and for the purpose set forth.

2. The combination of the three sections, D E F, having the projecting blocks *c*, and their corresponding notches, and bound around the middle thereof, substantially as described, whereby the fulcrums of the clamp are retained in their relative positions, in the manner set forth.



165,685. SCREW-DRIVERS. Wm. F. Patterson, Boston, Mass. [Filed June 2, 1875.]

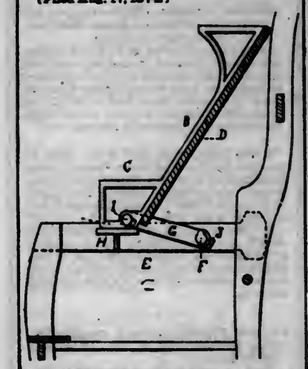
Brief.—The main blade of a screw-driver has pivoted to its outer end an auxiliary reversible double-pointed blade, secured in position by a step, which is adjustable by means of a set-screw working in an elongated slot in the main blade, and operated by a coiled spring.



The improved screw-driver herein described, consisting of the haft A, provided with the ferrule B, body *c*, reversible double-pointed blade I, spring E, dowel or stud D, and adjustable step F, provided with the screw H, all constructed and arranged to operate substantially as and for the purpose set forth.

165,686. SKETCHING AND PHONOGRAPHIC CASES. Thomas J. Phillips, Washington, D. C. [Filed Dec. 7, 1874.]

In a sketching or phonographic apparatus, the case A, formed in two parts, (a body and a lid,) having a raised platform, D, flush with the top or lid of said case, rollers C C, and the aperture in lid of said case, whereby the tablet or paper to be sketched or written upon will be always exposed, substantially as described.

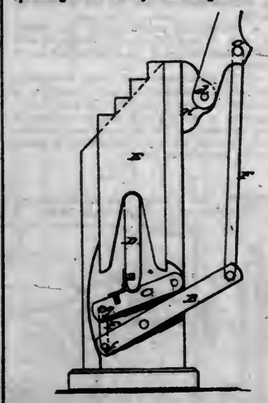


165,687. VALVES AND GEARINGS FOR STEAM-ENGINES. John A. Prince, Pittsburg, Pa. [Filed May 10, 1875.]

1. The combination of the double tubular valve-seat B', having direct passages H and I leading respectively to and from the interior of the cylinder, with the valve D and annular valve O, substantially as and for the purpose set forth.

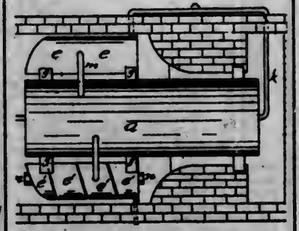
2. The combination of the frames F and G and valves C and D, substantially as and for the purpose described.

165,688. COMBINED CHAIRS AND STEP-LADDERS. Chas. B. Rawson, Worcester, Mass. [Filed Aug. 17, 1874.]



1. The combination, in a combined chair and step-ladder, of the seat B C D with the foot O, provided with a slot to receive the stud upon the link G, and projecting horizontally forward as far as the edge of the lower step, as described, and for the purpose set forth.

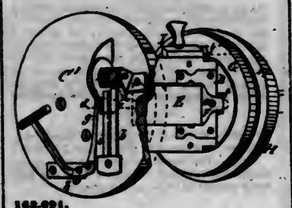
2. The combination, with the rail E, having a suitable rest, the seat D, and brackets C C, of a link, G, having a stud, L, with a spur, as shown and described, and hole F', with slot J, as described, and for the purpose set forth.



165,689. WAGON-JACKS. Joshua Sawyer, Northfield, Vt., assignor of one-half his right to Edmond W. Cochrane, same place. [Filed June 7, 1875.]

Brief.—An interior sliding block, with a sloping series of shoulders at top, has a vertical pressure given to it by an outside lever, operating foot-levers by connecting-links.

The combination of the three ...s A, B, and C, with rods F F, post D, and sheave E, substantially as and for the purpose set forth.

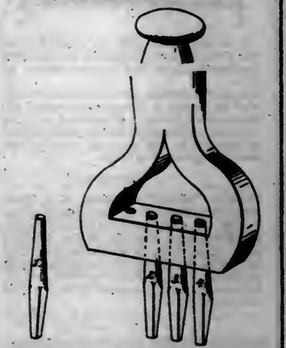


165,690. STEAM-BOILER FURNACES. Chas. D. Smith, Boston, Mass. [Filed June 4, 1875.]

The combination of two or more angular water stand-pipes or water-receptacles, each connected with a horizontal boiler by means of steam-pipes, with the fire-box of a furnace, the columns having angular passages through them from the fire-box to a space formed between the outer surfaces of the water-columns and the inner side of the wall of the furnace, substantially as and for the purpose set forth.

165,691. BURGLAR-ALARMS. Albt. F. Silva, Russell B. Merriam, and Edwin Sedgwick, Binghamton, N. Y. [Filed Mar. 12, 1875.]

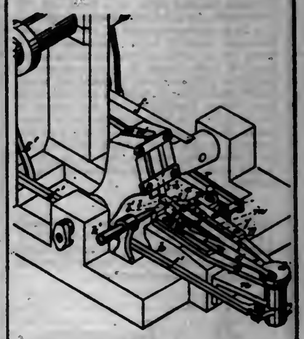
Brief.—The inside knob of a lock-spindle contains a bell, which is struck through the medium of the combinations claimed, when the spindle is turned. A sliding pin connects or disconnects the parts, so that the device can be thrown into or out of gear.



165,694.

1. The combination of the dishes G H, lever F, jaws *d*, sliding bar E, and springs *i* and *b* with the ratchet D for actuating the hammer, substantially as set forth.

2. In combination with the lever F, sliding plate E, cam D, and the dishes G H, the sliding pin I, substantially as set forth.



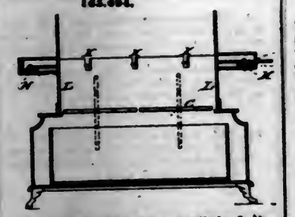
165,692. CHISELS FOR STONE-CUTTING. C. C. Simpson, Santa Clara, assignor of one-half his right to Chas. J. Martin, San Jose, Cal. [Filed Feb. 3, 1875.]

A toothed chisel for stone-cutting, having detachable teeth, substantially as and for the purposes hereinbefore set forth.

165,693. NAIL-PLATE FEEDERS. L. Soule, Taunton, Mass. [Filed May 6, 1875.]

Brief.—One of the two griping-jaws upon the plate which slides in ways on the vibrating carriage is provided with a bent arm, connected by a rod with a crank-pin projecting from a rocking disk. The pivotal swing of the said jaw is limited by a pin which fits into a slot therein. A spring presser-bar upon the upper cutter-lever holds the plate while the jaws move back to take a fresh hold. A blast-pipe is employed to blow off the waste or stub ends of the plate from the anvil.

1. The jaw *d' V*, secured to the sliding plate *m*, in combination with the vibrating frame D, cutter A, and presser-bar *i*, substantially as and for the purpose described.



2. The jaws *d' V*, secured to the sliding plate *m*, vibrating frame D, bent lever 19, rod *c'*, shaft *c*, arm 5, rod *f'*, and lever H, in combination with the presser-bar *i* and cutter A, all constructed to operate substantially as and for the purpose set forth.

165,694. COAL-STOVES. Lewis B. Sprout, Muncy, Pa. [Filed Sept. 15, 1873.]

Brief.—The rods are thrust into the mass of fuel when it is desired to damp the grate.

HELIOTYPE RELIEF PROCESS. JAMES R. OSGOOD & Co BOSTON

165,694.

1. In combination with the cylinder L, the rods G G, the movable plate H, and the lever J, substantially as and for the purpose set forth.

2. In combination with the cylinder L of a stove or furnace, a support, constructed and operating substantially as described, attached to the outside thereof to hold the rods or prongs in position, so that they will readily enter the openings in the cylinder.

165,695. WOOD PAVEMENTS. H. M Snow, San Francisco, Cal. [Filed June 19, 1875.]

Brief.—A wood pavement of round blocks of different sizes arranged so that blocks of about the same circumference are laid in the same rows or groups, and the smaller blocks are placed upon a higher foundation than the larger ones, and then rammed down to a level with the same.

1. In a pavement made of round or split blocks of wood of varied diameters or end areas, the arrangement of such blocks in lines, sections, or groups, so that those of uniform, or nearly so, end areas shall constitute such lines, sections, or groups, whereby each and every block will be capable of sustaining without sinking an uniform or equal weight with those around or adjacent to the same, substantially as described.

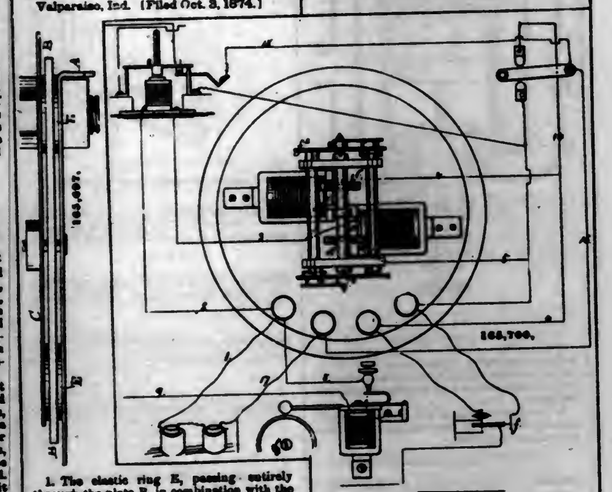
2. In a pavement made of round or split blocks of wood of varied diameters or end areas, the arrangement of such blocks in lines, sections, or groups, those of lesser end area being set upon a bed or foundation of a higher grade or level than those of greater end areas, and then rammed down to a level with the other blocks, as and for the purpose described.

3. In a pavement made of round or split blocks of wood of varied diameters or end areas, but of different lengths, the arrangement of such blocks in lines, sections, or groups so that the blocks of lesser end areas, but of greater length, may set upon the same level bed or foundation, and be rammed or driven down to a level with the other larger blocks, so that those of lesser end area setting upon or in a more solid bed will be capable of sustaining, without yielding, an equal weight as the larger ones, substantially as described.

165,696. CLOTHES-LINE REELS. A. Thompson, Shark, N. H. [Filed Sept. 16, 1874.]

Brief.—The flanges, hub, and shaft are made so as to be detachable from the other devices, for packing in a small compass.

1. The combination of the detachable flanges D D', with the hub A and shaft I', substantially as and for the purpose set forth.

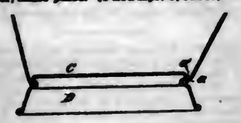


4. The hollow shaft I', provided at one end with the ratchet-wheel M and disk N, the disk projecting above the ratchet, substantially as and for the purpose described.

3. The combination of the hollow shaft I', the base F, and the arm and pawl H I, the shaft having a ratchet, M, and disk N, the base a rod, d, and slot e, and the pawl a lug, J, substantially as and for the purpose set forth.

4. The shaft I', provided with the ratchet M, disk N, and lug P, in combination with hub A and flanges B B', substantially as described.

5. The within-described device for holding the reel in position on the axle, consisting of the pawl L, having lug J, and the base F, having slot e, the pin that fastens the pawl to the base being of less circumference than the hole through the pawl, substantially as and for the purpose set forth.



165,697. NUT-LOCKS. Joe. M. Whitmore, Valparaiso, Ind. [Filed Oct. 3, 1874.]

1. The elastic ring E, passing entirely through the plate B, in combination with the plates A and C, substantially as and for the purpose set forth.

2. The combination of the plates A B C and the interposed elastic ring E, the latter being encircled within the aperture in the plate B; and the plate A bent to prevent the nut from turning, substantially as shown and described.

165,698. COAL-HODS. U. D. Alexander, Chicago, Ill., assignor to Margaret Alexander, same place. [Filed Apr. 6, 1875.]

A coal-hod consisting of the body A, having an inwardly-turned lower edge, a, continuous therewith, combined with the bottom C and hoop D, the latter having the groove d' sunken inwardly into its periphery, and being made in one and the same piece with the bottom, the said parts being united to the body by setting down the groove d' upon the flange a, substantially as shown and described.

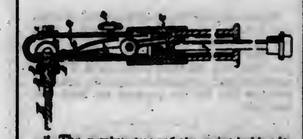
165,699. PIANO-FORTE CASES. Henrietta J. Baker, Chicago, Ill. [Filed Apr. 17, 1875.]

Brief.—The square piano-forte case is arranged and adapted to receive a lid and key-cover similar to those on the grand.

As an improvement in square piano-forte cases, the hinged lid A' and key-cover C, said parts being constructed, combined, and arranged substantially as described and shown, for the purpose specified.

165,700. ELECTRIC BOILER-ALARMS AND REGISTERS. William C. Baker, New York, N. Y. [Filed June 23, 1875.]

Brief.—Circuit closed by high or low pressure through magnets, controlling a dial and step-by-step escapement, thus registering how often the rules as to maximum and minimum of pressure have been violated. An intermediate magnet in same circuit closes branch circuit to self-acting magnetic bell.



1. The combination, with a low water or pressure alarm and an electric circuit-closing apparatus, of an electro-magnet, step-by-step movement, and dial, to indicate the number of times the boiler has been neglected, substantially as set forth.

2. The combination, with a boiler-alarm and electric circuits, substantially as specified, of a branch circuit, electro-magnet, alarm-bell, and automatic circuit-breaker, operated by the hammer, substantially as and for the purposes set forth.

165,701. DENTAL PLUGGERS. Cauldius Blakers, Pittsylvania C. H., Va. (Filed May 28, 1875.)

Brief.—A point-holder is adjusted at right angles to a tubular casing. A lever is pivoted within the casing, and strikes upon the head of the point-holder, the blows being regulated by a spring and set-screw. The lever is operated by a cam-head upon a rotating shaft.

1. The combination of the adjustable guide B and the U-spring C, with the notched case A, and with the point-holder D, substantially as herein shown and described.

2. The combination of the point-holder D, the lever F, the spring G, head I, the rod J, and the cam K, with each other, and with the case A, substantially as herein shown and described.

3. The combination of the set-screw H with the case A, the spring G, and the lever F, to regulate the force of the blow, substantially as herein shown and described.

165,702. TICKET-STAMPS. L. J. Bladen, Boston, Mass. [Filed June 9, 1875.]

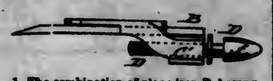
Brief.—Platen and bed are both movable. One operates by leverage, the other by a blow.

1. A stamp slotted to receive the tickets as set forth and arranged, to print when tipped, and to operate also as a strike-stamp, substantially as set forth.

2. The frame of the combined strike and pressure stamp provided with the opening *d*, having side guides, and with an opening, *f*, adapted to receive both local and coupon tickets to be canceled, substantially as described.

3. In a hand-stamp a pivoted frame, and a bed or carrier for the type, combined with a hand-strike and platen, substantially as described.

165,703. REVERSIBLE PLOW-POINTS. M. M. Bowers, Richmond, Va., assignor to himself and John P. Schoenerhorn, same place. [Filed Dec. 19, 1874.]

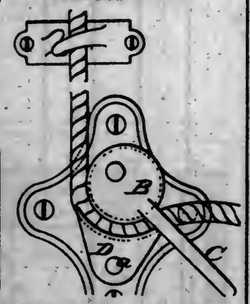


Brief.—Flanges upon either side of the shank fit over the socket. The point is reversible.

A detachable and reversible plow-point, B, made with lips upon the upper and lower edges of the sides of its shank *b'*, whether said shank be made tapering or with parallel sides, substantially as herein shown and described.

165,704. BENCH-PLANES. Chas. Bridges, Lowell, Mass. [Filed Mar. 20, 1875.]

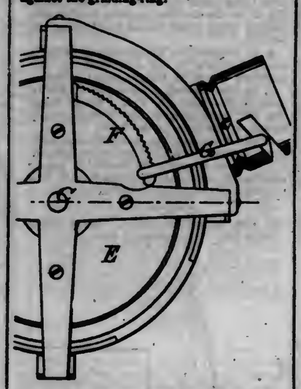
Brief.—The plane-bit is provided with a narrow rear shank, and adjustable in a slotted holder by means of a swiveled screw-bolt working in a threaded socket of said holder, whereby the bit can be extended until worn out. The hollow-socketed handle is secured by a sliding adjustable arm-piece on wedge-pieces on the sides, and inclined ribs on the bottom of the stock, and resting on a circular partition of the same.



1. The combination of plane-iron B, having narrow rear shank, the holder C, having a slot to receive said shank, and the swiveled screw D *f*, working in a threaded socket of said holder, as and for the purpose described.

2. The combination of stock A, having wedge-pieces *g g* on the sides, and ribs *f f* on the bottom, with hollow handle E, having socket *i*, the screw *F*, and the arm F, having lugs *l*, as and for the purpose specified.

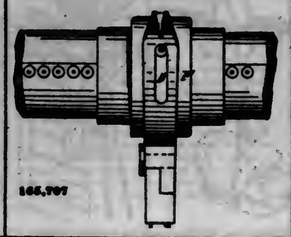
165,705. LINE-FASTENERS. Alden B. Brown and Perry A. Peer, Kalamazoo, Mich., said Brown assignor to said Peer. [Filed Oct 17, 1874.]



Brief.—A circular clamp with a grooved edge and handle is pivoted eccentrically above a curved and grooved pivoted jaw, so as to clamp a line between them.

The pivoted eccentric B, having a handle, C, and groove *c*, in combination with the automatic pivoted concave jaw D, by means of which a long bite on the rope is obtained, substantially as described.

165,706. PAPER-STOCK-GRINDING MACHINES. John M. Burghardt, Great Barrington, Mass. [Filed Jan. 9, 1875.]

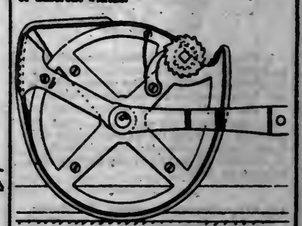


Brief.—The swinging wing, with corrugated face, holds blocks with yielding pressure against the grinding-ring.

In combination with the revolving grinding-ring B, the support E, and pan D, the pressure-wing F, actuated substantially as described.

165,707. HOOK-STAPLES. John Burke, Newburyport, Mass. [Filed Apr. 17, 1875.]

Brief.—The jaws are provided with extended slots, to receive the lugs on the coupling, and are thereby adapted to couplings of various sizes.



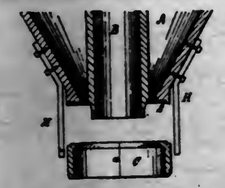
165,707

The jaws of a base-spreader, provided with slots D D at some distance back from the ends thereof, as and for the purpose specified.

165,708. GRAINING-ROLLERS. William H. Burns, Chicago, Ill. [Filed Mar. 20, 1875.]

Brief.—The shoulders enable the roller to reach into corners. One of these shoulders is adjustable to make the machine fit panels of different widths.

As an improvement in painters' graining-rollers, the combination, with a roller having a stationary projecting shoulder, of a movable shoulder for adjusting the stretched transmitting-belt to any width of panel, substantially in the manner and for the purpose set forth.



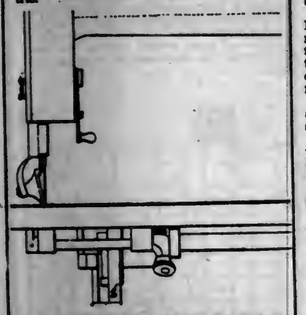
165,709. FARM-GATES. Amos Callahan, Marysville, Tenn. [Filed Jan. 11, 1875.]

Brief.—The diagonal cross-braces have hooks at their upper ends, which, after the central connecting-bolt is loosened, are shifted to the desired holes near the tops of the end braces, and again secured, whereby the front end of the gate is elevated to overcome sagging.

The combination, with horizontal bars C and vertical bars A B, having holes at the top, as specified, of the diagonal crossed bars D, their central connecting-bolt H, the straps E, and hooks G, as shown and described, whereby said hooks may be adjusted to effect the adjustment of the front or latch end of the gate.

165,710. MACHINES FOR FORMING SOCKETS OF CURVED EARTHENWARE PIPES. Horace B. Camp, Cuyahoga Falls, Ohio. [Filed Mar. 24, 1875.]

Brief.—The die for forming the socket is separate from the machine, and consists of a two-part ring, which is held in place during the formation of the socket, its upper part being held in a groove in the lower part of the outside die, and its lower part in a groove in a flanged projection extending from the base of the die which forms the inside of the socket.



1. The divided ring C, when arranged to fit into grooves in the disc A and D, respectively, in combination with said disc, substantially as and for the purpose herein before set forth.

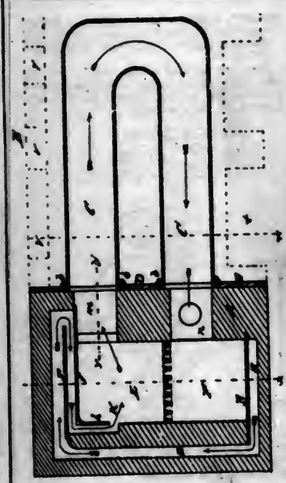
2. The herein-described manipulating device, consisting of the arms L L', hinged on the wrist F, carrying the segments of the ring C, and moved by the lever G and links M, N, N', substantially as and for the purpose here inbefore set forth.

166,711. SEWING-MACHINES. Jas. Carter, Hartford, Conn., assignor to the Wood Sewing-Machine Company, same place. [Filed Mar. 17, 1875.]

Brief.—The shuttle-carrier is operated by a rotating slotted link, that receives its motion from a crank on the main shaft. A pin on the crank fits into the slot, which allows the shuttle to have the desired varying speed. The lower portion of the link is fitted on an adjustable eccentric, and the positions at which the shuttle shall vary speed are regulated by adjusting the position of the eccentric.

1. The combination, with the rotating shaft and its attached crank, of an intermediate rotating crank-link, supported concentrically to the crank on the rotating shaft, and operated by the crank of the rotating shaft at a variable speed, substantially as described.

2. In combination, the rotating shaft, its attached crank, a shuttle carrier or driver, and an intermediate rotating crank-link, supported substantially as described, and operated at variable speed by the crank of the shaft, and a link for connecting the crank-link and shuttle driver or carrier, substantially as set forth.



3. The combination, with the rotating shaft and its attached crank, of the adjustable bearing *e'* and slotted crank-link *g*, all constructed and operating substantially as described.

166,712. HOT-AIR FURNACES. C. R. Chase, Loudonville, Ohio. [Filed Nov. 26, 1874.]

1. The air-induction flue *a*, formed by furnace bottom, wall, and top, and diaphragms *E*, *F*, *f*, and *h*, substantially as and for the purposes set forth.

2. The furnace A, and heating-chamber B, in combination with the smoke-tubes C, shaped so that, regarding them in cross-section, the height of each is more than its width, arranged in vertical rows, and having their ingress and egress mouths attached to a common side of the fire-chamber, and free to expand from or contract toward said chamber.

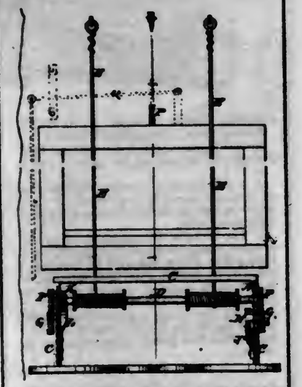
3. The combination of the flue *a* and the tube C, the flue being every way smaller than the tube, and so arranged upon the latter that the edge of the tube is on every side set back from the edge of the flue, as and for the purposes set forth.

4. The sustaining-plate D, substantially as described, in combination with the ⊃-shaped heating-tubes, and the side of the fire-chamber, for the purposes set forth.

5. The combination of the hot-air chamber B, forming a chamber distinct from the furnace, and constructed with ⊃-shaped smoke-flues C, by which the entire work of heating the air for the distributing-pipes is performed, cold-air inlets *t*, and hot-air distributing orifices V.

6. In combination the chamber B, tubes C, sustaining-plate D, and a fire-chamber, substantially as and for the purposes specified.

7. In combination, a fire-chamber, flue *a*, plate D, ⊃-shaped tube C, in a hot-air chamber, and smoke-passage way *n*, substantially as and for the purposes set forth.



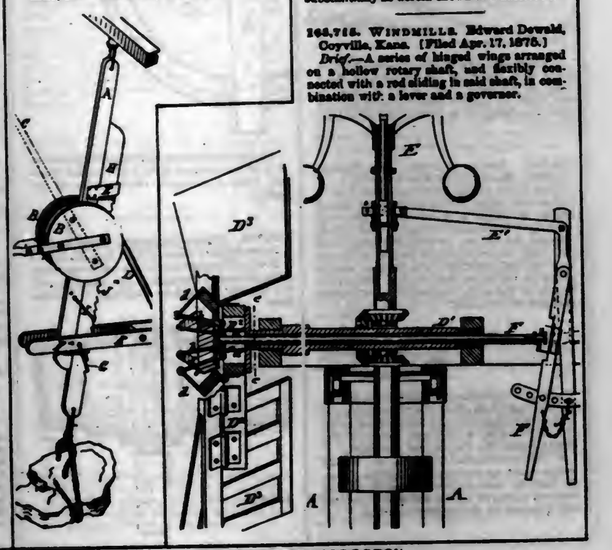
8. In combination, fire-chamber I, ash-pit F, flue *a*, formed by furnace and diaphragms *f* P *f* *h*, flues *n*, plate D, tubes C in hot-air chamber B, and smoke-passage way *n*, substantially as and for the purposes set forth.

166,713. LIFTING-JACKS. David Cilley Milo, Me. [Filed May 17, 1875.]

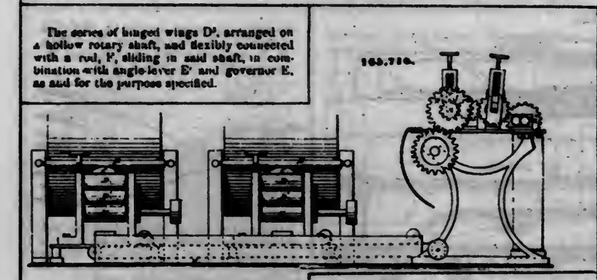
The improved lifting-jack described, consisting of the bar A, provided with the link I, the bar H, provided with the teeth J, the lever E, provided with the link G, and the drums B E, provided with the lever C and cords D D, all combined and arranged to operate substantially as and for the purposes set forth and specified.

166,714. FIRE-ESCAPES. A. J. Culbertson, San Andreas, Cal. [Filed June 6, 1875.]

Brief.—A platform and cage, containing a reel on which ropes are wound, attached to the side of the building. When wound up the apparatus rests above the window, but may be projected therefrom in case of fire by a lever and rope, when it drops down to the window-sill, or lower, and affords means for escape. The rapidity of descent is regulated by means of a friction-brake and screw applied by the person descending.



1. An improved fire-escape formed by the combination of the frame C, reel D, wires E, gear-wheels F G, friction-wheel H, brake and hand-screw I J, and ratchet-wheel and pawl K L, and a platform or strap connected with said frame, substantially as herein shown and described.

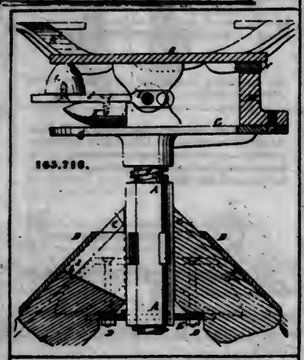


2. The combination, with the device C M, of the bent lever P and the lever and cord Q R, for pushing it from its seat above a window, substantially as herein shown and described.

166,715. WINDMILLS. Edward Dewald, Coyville, Kans. [Filed Apr. 17, 1875.]

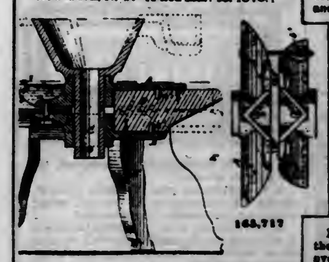
Brief.—A series of hinged wings arranged on a hollow rotary shaft, and flexibly connected with a rod sliding in said shaft, in combination with a lever and a governor.

The series of hinged wings D', arranged on a hollow rotary shaft, and flexibly connected with a rod, F, sliding in said shaft, in combination with angle-lever E' and governor E, as and for the purpose specified.



166,716. CARDING-MACHINES. John Dobson and James Dobson, Philadelphia, Pa. [Filed June 7, 1875.]

Brief.—An improvement upon their Patent No. 144,849. Between the doffer and the delivery-apron are a pair of drawing-rolls, and at the end of the apron is the delivery-head of the above-named patent, so that the fleece of wool is drawn before being delivered into the can.



1. The combination, with a carding-cylinder and an endless apron to carry the sliver, of a pair of rolls to take the sliver of wool from the cylinder, operated by pinions or belts, and placed intermediately between the carding-cylinder and the endless carrying-apron, substantially as described.

2. The combination, with a carding-cylinder and an endless apron, of a pair of drawing-rolls set between them, and a pair of drawing-rolls situated at the other end of said carrying-apron, substantially as described.

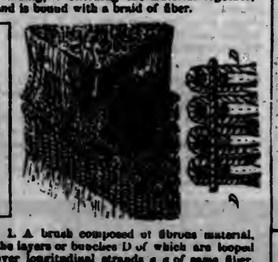
3. The combination of a carding-cylinder and an endless apron with a pair of drawing-rolls situated between them, and weighted single rolls superincumbent upon the endless apron, substantially as described.

166,717. CHAIR-BASES. Wm. T. Doremus, New York, N. Y. [Filed Mar. 13, 1875.]

1. The plates A B, made with a central socket to receive the pivot or screw, and with angular half-sockets to receive the legs, and provided with pins and screw-holes for securing said legs in place, substantially as herein shown and described.

2. The legs D E, made in two parts, jointed to each other by two or more tapering tongues and grooves, substantially as herein shown and described.

3. The hollow pins *a' b'*, cast in the angles of the half-sockets of the plates A B, to adapt them to receive bolts for securing the legs in said sockets, and clamping the plates to each other and to the legs, substantially as herein shown and described.



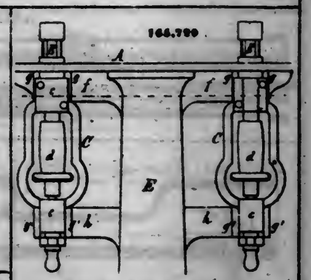
166,718. CHAIR-BASES. Wm. T. Doremus, New York, N. Y. [Filed May 10, 1875.]

1. The central tubular socket A, the surrounding face-plate B, and their connecting-ribs, the plate E, and bolts for securing or supporting the same combined, substantially as shown and described.

2. The combination of the bolt I, the arm J, and the rubber springs K L, with the plates G H, provided with perforated legs, substantially as herein shown and described.

166,719. BRUSHES. John Barnshaw, East Greenwich, R. I. [Filed Sept. 4, 1874.]

Brief.—The entire brush is composed of fibrous material, and may have woven into the back stripe of wood to stiffen the same. The back of the brush is formed by weaving, braiding, or stitching the material together, and is bound with a braid of fiber.



1. A brush composed of fibrous material, the layers or bunches D of which are looped over longitudinal strands *a a a* of same fiber, and are held together by the stitches or strands *c c* passed transversely through the bunches of fiber D, as shown plainly in Fig. 1, all substantially as and for the purposes as herein shown and described.

2. The back of a brush composed of fibrous material, constructed as described, reinforced by interweaving into the same a series of strips of wood, S S, substantially as herein shown and described.

3. The brush, composed of fibrous materials and constructed as described, having the binding *g* of the same fibrous material, substantially as herein shown and described.

166,720. MOLDING-MACHINES. Andrew H. Frank and George Spire, Buffalo, N. Y. [Filed June 16, 1875.]

Brief.—Two cutter-carrying spindles are mounted in vertically-adjustable frames, and supported upon a hollow column arranged centrally under the bed and between the spindles, and provided with two horizontal arms at its upper end, which support the bed, and a suitable distance below said arms with two similar arms, which support the lower ends of the spindle-frames. The arms are provided near each end with vertical guideways. The column-arms and guideways are all cast in one piece.

166,721. VENTILATING-REGISTERS. Herman Fritz, Cleveland, Ohio. [Filed May 24, 1875.]

Brief.—The springs tend to open the register, and the cord passing over pulleys holds it in any desired position.

Having described my invention, I claim—

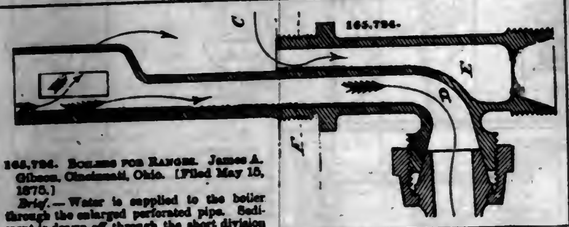
In a register, the combination, with the sprung-hinged damper C, opening automatically, of a cord, arranged and operating as described, for the purpose of closing and retaining said damper in any desired position, substantially as specified.

166,722. SETTING GEMS. Thomas W. Fry, Providence, R. I. [Filed June 23, 1875.]

Brief.—The receiving-cup protects the gem from dust, &c.

In a setting for stones of jewelry, the combination of a crown or other open setting with a stone-receiving cup, substantially as and for the purpose described.

166,723. PEN AND PENCIL CASES. Joseph U. Gerow, Brooklyn, N. Y. [Filed Feb. 2, 1875.]



Brief.—The pencil is extended by the reverse movement of the pencil-slide, which at the same time projects the extension-tube. Projecting the pen retracts the pencil if it be extended. Either pen or pencil may be projected separately, and the pencil is retracted by pressing in the extension-tube.

The combination, with a pencil, *a*, that is projected from the case by a band, *f*, moved in the opposite direction, of a pen-holder, *c*, projected from the same end of the case as the pencil *a* by a band, *i*, around the case *g*, and of an extension-tube, *r*, at the other end of the case, passing within the pen-holding slide and surrounding the stationary tube *h*, as and for the purposes set forth.

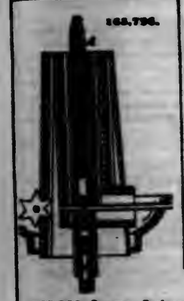
165,722.

165,724.

165,724. BOILERS FOR RANGES. James A. Gibson, Cincinnati, Ohio. [Filed May 15, 1875.]

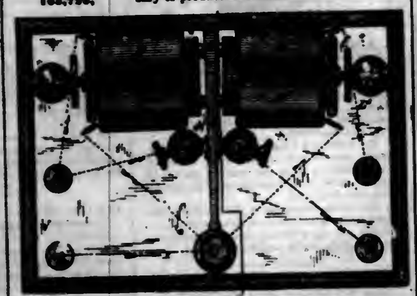
Brief.—Water is supplied to the boiler through the enlarged perforated pipe. Sediment is drawn off through the short division of the pipe.

In an upright boiler, the combination of pipe D, waste-pipe E, enlarged and elongated perforated pipe C, male screw F, and female screw G in the bottom of said boiler, all substantially as and for the purposes specified.



165,725. PIPE-WRENCHES. L. Glynn, Cambridgeport, Mass. [Filed Feb. 15, 1875.]

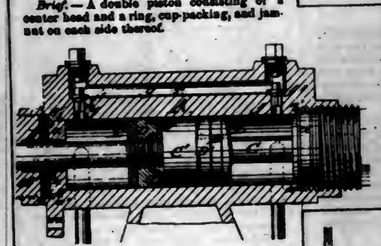
Brief.—A gripping-hook is pivoted to the actuating-lever, and pressed toward a serrated jaw, which passes adjustably through the lever between the hand and hook-pivot.



The combination of the handle a, hook-jaw b, hinge c, spring h, and adjustable toothed jaw d e f arranged and secured in a slotted opening through the handle a, substantially as and for the purpose herein shown and described.

165,725.

165,726.



165,726. LAMPS. Joshua R. Godwin, Washington, N. C. [Filed May 1, 1875.]

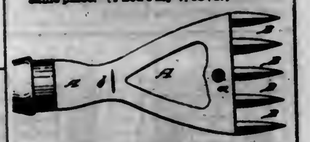
Brief.—A supplementary or taper tube for a small wick, to give a sufficient light for a sick-chamber.

The taper tube A, placed in a lamp-burner parallel to, and in connection with, the ordinary wick-tube, as and for the purpose specified.

165,727. DOUBLE-ACTING PUMPS. C. Gordon, Savannah, Ga. [Filed May 8, 1875.]

Brief.—A double piston consisting of a center head and a ring, cup-packing, and jam-nut on each side thereof.

The double piston, consisting of center-head C, with packing and packing-rings D D', and jam-nut E on each side of it, and secured as shown, in combination with rod C, and the cylinder and water-ways of a pump, substantially as described.



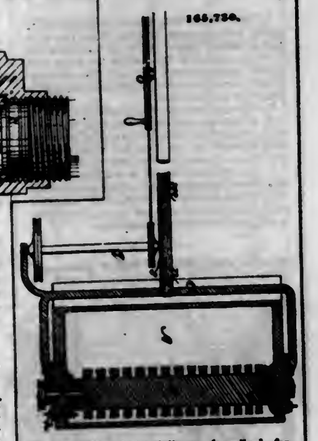
165,728. TRANSMITTERS FOR ELECTRO-HARMONIC TELEGRAPHS. Elisha Gray, Chicago, Ill. [Filed June 26, 1875.]

Brief.—For securing greater uniformity of action of the magnets upon a steel reed vibrating to produce a certain note, and to transmit upon the line electrical impulses corresponding to the number of vibrations necessary to produce such note.

1. The combination, substantially as hereinbefore set forth, of the vibrating electro-tuns and magnets arranged on opposite sides thereof, of such relative capacity as to impart impulses of equal force at equal intervals upon each side of the vibrating electro-tuns alternately, whereby its isochronous vibration is secured.

2. The combination, substantially as hereinbefore set forth, of the vibrating reed, its counterpoise-magnets, a local circuit, and the chant-wire, whereby the current is automatically changed to each set of magnets.

165,729.



165,729. COMBINED ICE-PICKS AND CAN-OPENERS. Thomas Hagarty, New York, N. Y., assignor to Samuel Rothschild, Jr., same place. [Filed July 7, 1875.]

As a new article of manufacture, the pick and can-opener herein described, consisting of the triangular frame A, the series of teeth or picks B, pin a, and cutter b, substantially as and for the purpose herein set forth.

165,730. CARPET-SWEEPERS. Jos. J. Hastinger, Hyde Park, Mass. [Filed Apr. 20, 1875.]

1. The cage or bushings h, having the projections i, flanges k', and orifices for the reception of the journals e f, in combination with

165,730.

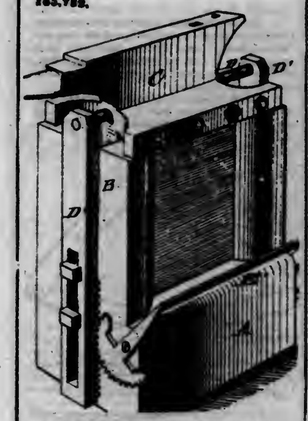
the brush B, substantially as described, for the purpose specified.

2. In combination with the rotary brush B, the journal f, threaded at its end, and having the pulley j, substantially as described.

3. The bent rod or bail C, having the socket n, and arms c c', in combination with the handle m, shaft q, and box or casing A, substantially as described.

4. The combination of the inclined strip t with the notched shoes v, substantially as described.

165,731. PROCESSES FOR MANUFACTURING LEATHER. George Herrick, Kilbourn City, Wis., assignor of one-half his right to F. A. Blood and Herbert on Corning, same place. [Filed June 11, 1875.]



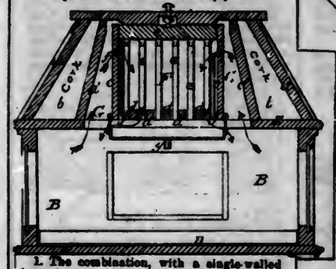
As an improvement in tanning compounds, the solution named, consisting of sulphate of potash, sulphate of soda, alum, sulphur, solar salt, common starch, tormentilla, or sept-foil, and Aleppo galls, combined with any one or more of the tanning extracts named.

165,732. ANVILS. Edwin Hodgdon, Springdale, Me., assignor to himself and Ansel J. Cheney, same place. [Filed Apr. 17, 1875.]

Brief.—The anvil, constructed of four radial sections, rests upon a base-block, slotted to receive one of the sections, while the horizontal sections rest upon the block. A shaft, passing longitudinally through the anvil, is supported at each end in two side bars, which can be raised to permit any one section being brought into position.

HELIOTYPE RELIEF PROCESS. JAMES R. OSGOOD & CO. BOSTON

165,733.

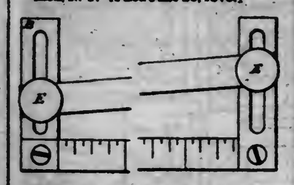


1. The combination of a rotary anvil, C, a supporting recessed base-block, the shaft D, and vertically-movable bars D', substantially as and for the purpose specified.

2. The anvil C, having radial working-faced parts or sections, in combination with the base-block A, having its top portion and central socket of a shape conformed to the said sections, whereby the anvil is firmly seated and supported when adjusted with any one of its spaces uppermost, as shown and described.

165,733. SHOW-CASE REFRIGERATORS. J. H. Hoffman, Baltimore, Md. [Filed May 26, 1875.]

Brief.—The only inside metal is the drip-pan and the bottom of the case. Air passes upward between the close sides of the ice-box and the packed chambers into the top of the ice-box, and down through the ice. Condensation passes down grooves in the slats, and off the points thereof into the drip-pan.



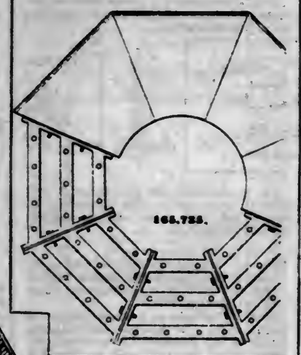
1. The combination, with a single-walled base-chamber section, B, of an upper ice-box composed of a crib, F, double end and side walls b b, and intervening chambers G G communicating with said crib all round its open bottom, substantially as and for the purpose herein set forth.

2. The combination of the chambers G G, on two opposite sides only, with the ice-crib F, having a closed top and sides, two of the latter perforated at or near their tops, and ending at their bottoms both in the horizontal plane of the bases of the double walls b b, and above the isolated drip-pan I, as and for the purpose herein set forth.

3. The combination, with the vertical walls c of the ice-crib, of the side channels f f, and the beveled or pointed ends j, substantially as described, whereby the inner side walls of the ice-crib are kept dry, and the water passed from the bar-points into the drip-pan.

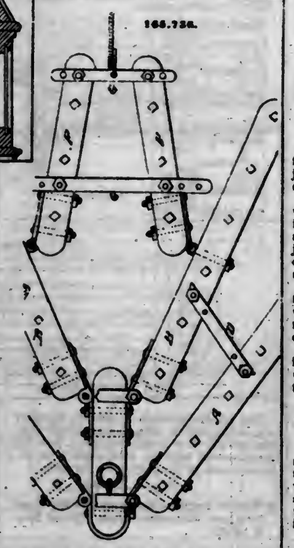
4. The ice-crib F, provided with channeled and pointed wall-bars c, in combination with the drip-pan I, below and isolated from the crib, the side chambers G G, double end and side walls b b, and the single-walled receiving-chamber B, constituting the refrigerator herein described.

165,734.



165,734. TAPER GAGES. Charles B. Hunt, Elon, N. Y. [Filed June 26, 1875.]

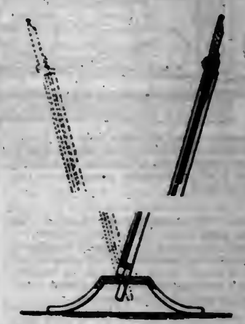
The taper gage, consisting of the graduating main bar A, having at its ends the graduated slotted arms B, and the adjustable sliding bar D connected with said slotted arms by the clamp screws E E, substantially as specified.



165,735. SIZING-PLANKS FOR HATTERS. M. F. Johnson, Newark, N. J. [Filed Nov. 27, 1874.]

The within-described hatters' sizing-plank, consisting of the metallic skeleton-frames D, united in sections, as shown, and provided with a wood surface attached to and arranged in sections, substantially as shown, and for the purpose set forth.

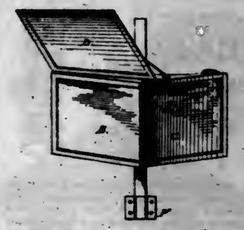
165,735.



165,736.

165,736. HARROWS. Samuel G. Jones, Shawneque, Ill., assignor to himself and J. M. Jacobs, same place. [Filed June 12, 1875.]

The combination, in a harrow, of wings A B, spaced by bars D, with rearwardly-converging bars F F, spaced by bars G, as and for the purpose specified.



165,737. PICTURE-FRAMES. Albt. D. Judd, New Haven, Conn. [Filed May 21, 1875.]

The picture-frame made with the recess or projections below its lower edge, in combination with the base, containing holes receiving such projections, and allowing the frame to be inclined either forward or backward, substantially as set forth.

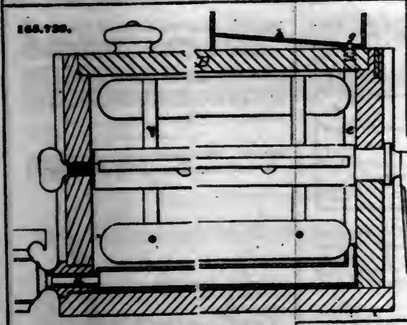
165,738. WINDOW-MIRRORS. David J. Kennedy, Philadelphia, Pa. [Filed June 23, 1875.]

Brief.—Two mirrors arranged at right angles, and provided with one or two overhanging adjustable mirrors.

1. A window-mirror having a supporting arm, A, for its attachment to the window frame, upon which the mirror-frame is adjustable horizontally to and from the window, substantially as described.

2. A window-mirror having reflectors diverging outwardly to reflect objects approaching from a distance in either direction, and a single detachable reflector, adapted to be adjusted over either horizontal mirror to reflect objects beneath it, all substantially as described.

3. A window-mirror having horizontal reflectors B C, surmounted by a reflector, D, whose angle of deflection is changeable by means of stay-rods or braces a a' and holding eyes b b a a, substantially as described.

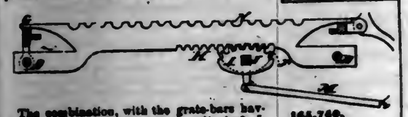


4. A window-mirror whose upper reflector is adjustable in horizontal and vertical angles with relation to the main reflector, substantially as described.

165,739. ROTARY CHURNS. Tilson Lamb, Elon, N. Y. [Filed Apr. 24, 1875.]

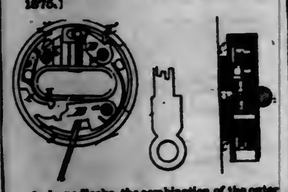
Brief.—On the top of the churn is placed a reservoir, from which leads a pipe to a large tube situated in the bottom of the churn, provided with a small tube passing through the end of the churn, and provided with a faucet, to regulate the flow of hot or cold water placed in the reservoir.

HELIOTYPE RELIEF PROCESS. JAMES R. OSGOOD & CO. BOSTON



165,739.

A rotary churn furnished with the detachable water-reservoir G, the current-bottom E, the connecting tube *d*, and the discharging-faucet *F*, all substantially as and for the purpose set forth.



165,740. FURNACE-GRATES. Samuel J. La Boe, Russell, Mo. [Filed Mar. 6, 1875.]

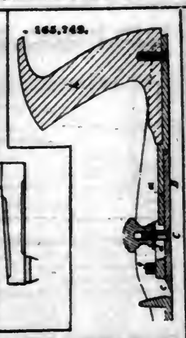
Brief.—The fuel upon the grate is agitated by means of an eccentric toothed pinion operating in a rack on the bottom of the bars, by which a vertical and horizontal motion is imparted to each alternate grate-bar.

The combination, with the grate-bars having teeth H, of the pinions I, rock-shaft J, the rods M, and lever L, as shown and described, for the purpose specified.

165,741. PADLOCKS. Henry S. Lockwood, South Norwalk, Conn. [Filed June 5, 1875.]

1. In padlocks, the combination of the outer ring, having notched projecting portion at the inside and entrance slot, with a key and a number of pivoted, recessed, and spear-headed spring-tumblers, for being released from the notched inner projection and allow turning of ring, substantially in the manner and for the purposes set forth.

2. The outer rotating ring, provided with notched inner projection, in combination with a swinging bar, and the sliding and guided bolt of the lock, substantially as set forth.

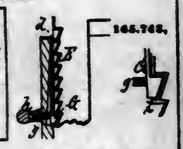


3. The combination of curved guard-arm *a* with central catch *b* and tumblers B, for declining the current of rotating motion of outer ring in either direction, substantially as shown and described.

4. The combination of the check-spring *c* with a recess, *f*, of the inner projection of rotating ring, for retaining the same when the key hole or slot is carried beyond the tumbler-recesses, substantially as and for the purpose specified.

165,742. JOURNAL-PLANER. Joseph Lock, South Abington, Mass., assignor to Blanchard, Archbald & Young, same place. [Filed Mar. 10, 1875.]

Brief.—The plane-bit is disposed oppositely parallel to the bearing-surface of the plane, and arranged within a longitudinal recess in the stock. The under surface of the bit back from the cutting-edge is slightly arched transversely. The downward arrangement of the bit is for planing across the grain of wood perpendicularly.

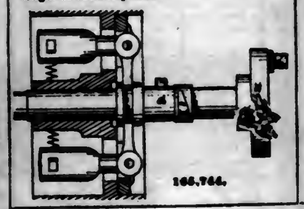


165,742.

In the improved plane, the cutter B, its receiving-recess *a*, chip-throat *c*, and holding and adjusting screws C D, *g g*, arranged in and with the slotted bottom of the stock A, all substantially as described and shown.

165,743. COMMODES OR STANDS. Fredk. Mahler, Rochester, N. Y. [Filed May 15, 1874.]

Brief.—By means of a square offset on one of the ratchet-teeth, the desk-top can be locked in the lowered position.



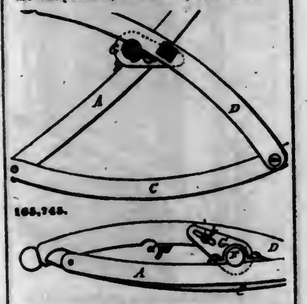
165,743.

165,740.

The combination, with the ratchet E and catch G, of the square offset or shoulder *d*, screw *g* and nut A of the catch, as and for the purpose specified.

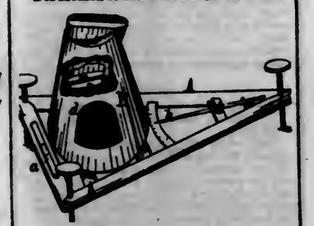
165,744. ENGINE-GOVERNORS. Hiram S. Maxim, Brooklyn, N. Y., assignor of one-half his right to A. T. Welch, same place. [Filed Mar. 17, 1875.]

Brief.—Two cams on a sleeve operate the throttle-valve. The cams have inclined ends, so that as they are moved forward or back by the governor the valve will be opened a longer or shorter period.



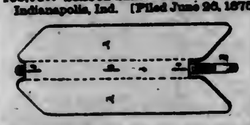
165,744.

---



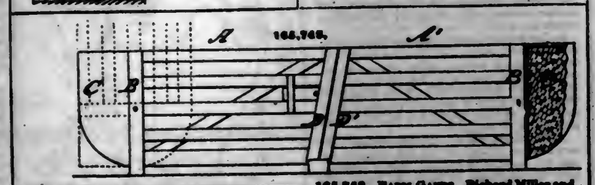
1. The combination, with the rockers C, of the pivoted and extended legs A D, respectively forming parts of the back and seat frames, and a link-connection, as described, to allow for the play in folding the chair, substantially as specified.

2. The combination, with the extended legs A B, of the fulcrum-bar F, the rests *d*, and the link-plates G, substantially as specified.



165,745.

165,746. SUN-DIALS. William H. McCoy, Des Moines, Iowa. [Filed Sept. 10, 1874.]



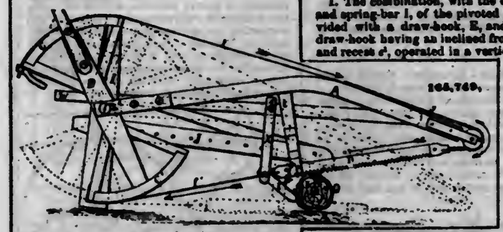
The tubular case B, carrying shades *h*, *m*, and *n*, and having opening *d*, substantially as described, mounted upon an adjustable stand, A, provided with a level, *e*, and magnetic needle *k*, substantially as and for the purpose set forth.

165,747. SCHOOL-SLATES. C. D. Meigs, Jr., Indianapolis, Ind. [Filed June 26, 1875.]

In combination with the frame F of a slate, E, the cover A, when provided with a flexible backing, *h*, and attached to the slate-frame by means of staples *s*, substantially as and for the purpose specified.

165,748. FARM-GATES. Richard Miller and Jas. D. Hilleon, Stephensville, Wis. [Filed June 27, 1874.]

165,748.



A gate constructed with the sections 'A A,' pivoted as shown, having their meeting ends D D' inclined, and with weight-bars C C on their outer ends, and hung so as to vibrate vertically, whereby a tight joint is secured and a central post dispensed with, substantially as shown and described.

The adjustable sleeve G, carrying the cams *n n*, having spiral ends, in combination with the cut-off valve *d*, the dash-pot I, and the three-armed lever E, substantially as described, and for the purpose as set forth.

165,749. FOLDING ROCKING-CHAIRS. Geo. McAleer, Worcester, Mass. [Filed May 8, 1875.]

165,749. DRAG-SAWS. Horace H. Miller, Lyndon, Vt. [Filed Sept. 23, 1874.]

Brief.—The saw is driven by bands connected with its ends, and with the arch heads of a vibrating lever.

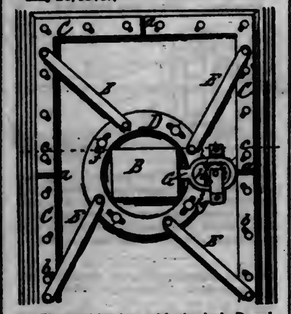
165,749.

1. The drag-saw frame, consisting of the beam A, the pulley *c*, and the vibrating segmental lever B, in combination with the drag-saw D, metallic bands or straps *f* and *f'*, and chain *g*, in such manner that a reciprocating motion can be given to the saw without imparting said motion to the frame, substantially as herein described.

2. In combination with a drag-saw and its frame, the standard I, pivot E, bar J, levers *k* and *l*, chain I', dogs *o*, and lever *w*, substantially as and for the purposes set forth.

165,750. CORN-SHELLERS. B. C. Morgan, Valdosta, Ga. [Filed Dec. 3, 1874.]

1. The combination, with a revolving tapering screw-pin, *c*, of a pivoted yielding breast or conduit, *f*, arranged to embrace and close with the opposite sides of the screw-pin, whereby the latter will revolve within the trough, while said trough swings over the pin, substantially as and for the purpose herein set forth.



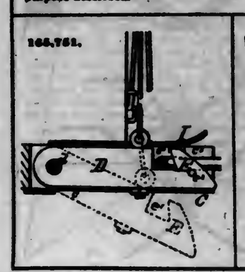
2. The combination, with the revolving tapering screw-pin *c*, of the pivoted yielding breast or conduit *f*, formed with downwardly-tapering sides *f'* *f'* and back *f''*, as and for the purpose described.

165,751. CAR-COUPLINGS. Frank W. Nash, Plano, assignor of one-fourth his right to Wm. Fraser, Sandwich, Ill. [Filed June 11, 1875.]

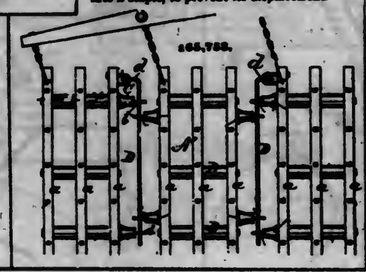
1. The combination, with the draw-head C, and spring-bar I, of the pivoted lever D, provided with a draw-hook, E, and pin *c'*, said draw-hook having an inclined front surface, *e*, and recess *e'*, operated in a vertical direction, and retained in position by means of a rod or other connecting means, F, substantially as described.

2. The combination, with the draw-head C, spring-bar I, and the pivoted lever D, provided with a draw-hook, E, (having an inclined front surface *e* and recess *e'*,) operated vertically, of the rod or connecting means F, lever G, rods L M, and hooked projection or catch H, substantially as and for the purposes described.

165,752. BOLT-WORKS FOR SAFE AND VAULT DOORS. James Naylor, Jr., and Edward Brooks, Rochester, N. Y. [Filed May 26, 1875.]



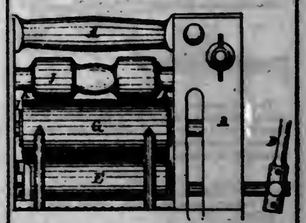
1. The combination, with the lock B and ring D, of the stirrup-bolt G, connected with the ring through the medium of the pinion *h* and gears *k g*, and constituting an automatic shifting device for locking the door-bolts in position when the safe-lock is locked, as herein shown and described.



2. The toothed ring D, pinion *h*, stirrup-bolt G, connections E E, and elbow-plates C C, combined and arranged to operate in the manner and for the purpose specified.

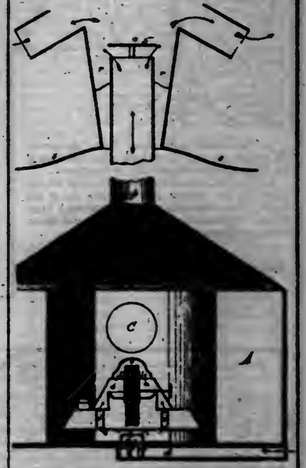
165,753. HARROWS. William H. Parlin, Canton, Ill., assignor to Parlin & Orendorff, same place. [Filed May 11, 1875.]

Brief.—The harrow is made of three sections, the inner sides of which are provided with eyebolts, stay-blocks, and connecting-rods, having a hook upon one end to hook into a staple, to prevent its displacement.



165,753.

The harrow-sections A A', provided with stay-blocks, eyebolts, and staples, substantially as described, in combination with the rods D, having hooks *d* on their ends, for the purpose specified.

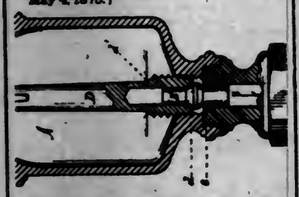


165,754. WRENCHES. Milo A. Richardson, Bridgeport, Conn. [Filed May 28, 1875.]

The large soft-rubber roller G, loosely placed on a small smooth round shaft, in combination with the pressure-roller J, and friction-roller E, all set in the frame A, and operated by the crank D, and wedge N, substantially as and for the purposes herein set forth.

165,755. CAR-LAMPS. Frank Rhind, Brooklyn, assignor of two-thirds his right to Keys P. Coal, New York, N. Y., and Jane E. Smith, Crawford, N. J. [Filed Feb. 11, 1875.]

Brief.—A tube from without communicating with tubes passing through the lamp to the flame; a rod with valve at one end to close the outer tube, and a catch on the other to fasten the door, and tubes with surrounding jacket and plate surmounting the case.

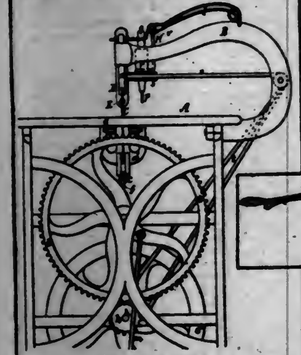


1. The frame A, having the air-tube *d*, in combination with a lamp having one or more air-tubes passing through it, substantially as described.

2. In combination with the door *a*, the rod *f*, having the valve *w* secured to its inner end, and a catch on its outer end, whereby the valve is opened when the door is locked, and closed when the door is opened, substantially as set forth.

3. In a lamp for street-cars, the combination of the air-tubes *i*, perforated plate *l*, and covering *c*, substantially as shown.

4. In combination with a lamp for street-cars, the tube *p*, jacket *r*, tubes *s*, and plate *t*, whereby the flame is prevented from being extinguished by currents of air, substantially as described.



165,756. LUBRICATORS. Joseph Richter and Gustaf Merkel, Cincinnati, Ohio. [Filed May 4, 1875.]

The adjustable sleeve D, having concave valve-seat *d* and inlets *d'*, in combination with double-seated valve E and concave seat *e* within stem C, substantially as and for purpose herein before described and set forth.

165,757. SCROLL-SAWING MACHINES. John H. Roberts, Boston, Mass. [Filed Apr. 20, 1875.]

Brief.—The machine is provided with a boring-tool, for the purpose of forming an opening in the material for the passage of the saw.

1. The pitched point screw E and its carrier D, combined and arranged, with the arm B and fly-screw *c*, substantially as specified.

2. The boring-tool spindle depressor H, applied to the spindle and the arm B, as set forth, in combination with the spring I fixed to said depressor and arm, and arranged therewith as represented.

165,758. PROCESSES OF PRESERVING WOOD. Louis S. Robbins, New York, N. Y. [Filed Apr. 2, 1875.]

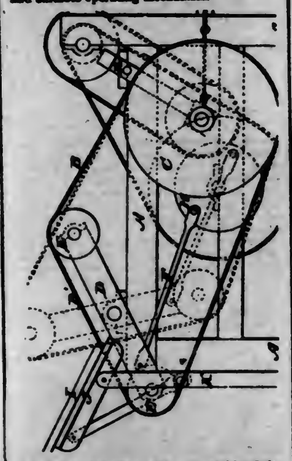
The process herein specified of curing wood by heating the same to a temperature of about 212° Fahrenheit in a vessel to expel the atmosphere from the pores of the wood, then increasing the temperature and simultaneously increasing the pressure in about the proportion specified by forcing into such vessel atmosphere or gas, for the purposes and substantially as set forth.

165,759. SASH-HOLDERS. Oliver Rock, Hudson, Mass. [Filed June 2, 1875.]

Brief.—An interposed concave-faced pressure-block bears against the loose-fitting friction-roller, and is acted on by a suitable spring, the whole suitably housed and fitted in an auger-hole of the frame or sash, thereby dispensing with journals, and bringing the force of the concave pressure-block to bear all the time upon the entire face of one-half of the roller.

In a sash-holder, the combination of recessed holder *d*, spring *e*, concave-faced pressure-block *f*, and loose friction-roller *g*, substantially as shown and described, for the purpose set forth.

165,760. CHEESE-CUTTERS. John W. Row, Lewisburg, Pa., assignor of two-thirds of his right to Edwin C. Nogel and Peter W. Himebrech. [Filed May 31, 1875.]



In a cheese-cutter, the knife F, with its heel *f*, and pinion-like appendage G, lever I, and pinion-like fulcrum-head H, standard E, base A' A, in combination with the revolving table D, the whole substantially constructed and operating as and for the purpose specified.

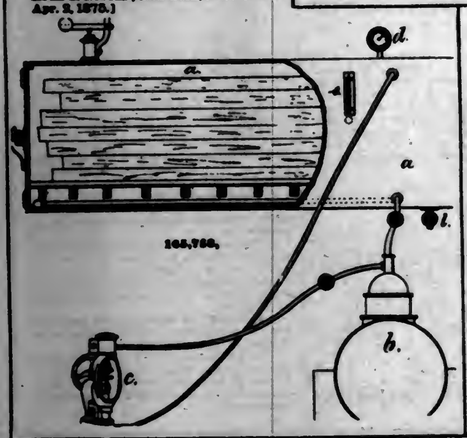
165,761. DRYING FOR PAINT. Oscar Burrell, Sycamore, Ill. [Filed July 1, 1875.]

The herein-described process of preparing drying for paints, consisting in first boiling refuse paint; then adding turpentine in about the proportion herein stated; then reducing the compound to ashes, and then grinding said ashes to powder, substantially as and for the purpose hereinbefore set forth.

165,762. SAND-FEATHERING-MACHINES. Oliver Sawyer, Winchendon, Mass. [Filed Mar. 27, 1875.]

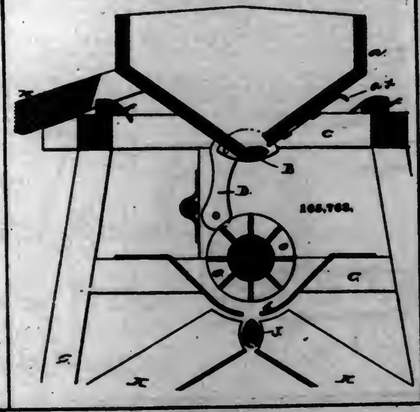
Brief.—The smoothing-belt of a polishing-machine is automatically operated upon rounded or convex surfaces, without changing the position of such surfaces, by means of two supporting-pulleys pivoted upon an oscillating arm, adapted to be automatically reciprocated simultaneously in opposite directions, for oscillating the intermediate portion of the belt in connection with an adjustable table and suitable operating mechanism.

1. In combination with a smoothing-belt, two supporting-pulleys, E E, adapted to be automatically reciprocated simultaneously in opposite directions, and thereby oscillate the intermediate portion of the belt, substantially as described, for the purpose specified.



2. The combination of the pivoted oscillatory arm D, having the supporting-pulleys E E, with the smoothing-belt B and driving-pulleys C, substantially as described, for the purpose specified.

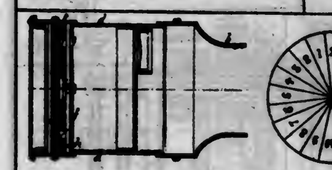
3. The combination of the arm D, having the pulleys E E, supporting the belt B, with the pitman F and disk H, substantially as and for the purpose specified.



4. The combination of the adjustable shelf or table J with the oscillating belt B, substantially as described.

5. The combination of the pendent frame E, spring S, and pulley C with the belt B, substantially as described.

165,763. GRAIN-TALLIES. Wm. Schnebly, Hackensack, N. J. [Filed Apr. 21, 1875.]



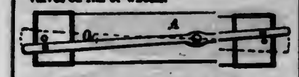
165,763.

165,763.

The combination of the swinging hopper, the compartment-wheel, the fixed or silent hopper and port, the shifting valve, the inclined troughs, and registering apparatus, substantially as and for the purpose represented and described.

165,764. PHOTOMETERS. Otto Schnotte, Paris, France. [Filed June 16, 1875.]

Brief.—Rotating disk of sections of varying degrees of transparency. Sections successively brought between the eye and a lens and the light to be tested. The power of a given light determined by the section through which its rays are powerful enough to pass, and just enable the marks thereon to be read.



1. The photometric disk *a*, or its equivalent, constructed with a graduated series of varying degrees of transparency, and with its numbers corresponding with its various thicknesses.

2. The instrument, or its equivalent, composed of the stationary parts *b d e f* and the rotating disk *a*, with or without a focusing-tube.

3. The rotating cap *k*, provided with holes *i*, in combination with the piece *f*, as and for the purpose set forth.

165,765. CORN-PLANTERS. Geo. W. Sheppard, Afton, Iowa. [Filed Jan. 2, 1875.]

Brief.—Cams on wheels operate pivoted bar working through seed-hoppers. Branch tube on hollow spokes for receiving and discharging seed. Projecting valves on outside of rim of wheels, one fixed and the other operated by levers, to discharge seed in ground. Scrapers conforming in shape with projecting valves on rim of wheels.

1. In a seed-planter, the combination of the pivoted bar *a c*, having seed-cups in its ends, the seed-boxes Nos. 1 and 2, and the carriage-wheels D D, having fingers *e e* in diverse positions, substantially as and for the purposes shown and described.

2. The branch tube *b* on the hollow spoke of the seed-wheel, to form a cup and U-shaped seed carrier and conductor, substantially as shown and described.

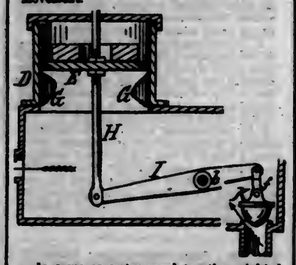
3. The valves *d d f g*, in combination with the spoke-branch *b* and U-shaped conveyors, substantially as and for the purposes shown and described.

4. The scrapers *k k m*, conforming in shape with the projecting valves *d d*, and pivoted to the rock-shaft A, as and for the purposes shown and described.

5. The bench A, carrying the seed-boxes Nos. 1 and 2 and the pivoted bar *a c*, the carriage-frame B B, carrying the cams *g g*, the wheels D D, carrying the fingers *e e*, and branch spokes *b b*, forming U-shaped conveyers, and the valves *d d f g*, arranged and combined substantially as and for the purposes shown and described.

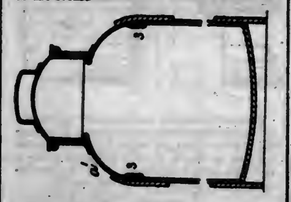
165,766. BARREL-HEADS. H. M. Smith, Chicago, Ill. [Filed Apr. 1, 1875.]

Brief.—A barrel, the sides of which are made of paper, straw-board, or similar flexible sheets, is provided with a solid head, having upon its outer surface a central circular cavity, which forms an unobstructed shoulder, serving as a grasp for the head or a grapple.



The rigid or wooden head for barrels with flexible sides, made with the exterior central circular cavity *a*, forming the unobstructed shoulder *b*, substantially as and for the purpose specified.

165,767. GAS AND WATER REGULATORS. Andrew L. Smith, Geneva, N. Y. [Filed Dec. 22, 1874.]



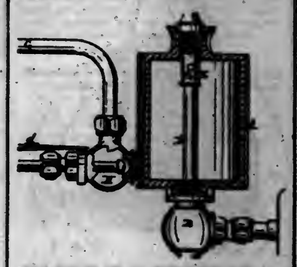
Brief.—The weights on the plates can be changed without opening the case. The flexible bellows-packing allows extended vertical movement.

In a gas or water regulator, the weighted plates E and bellows-packing G, resting loosely in the cylinder D outside of the case, in combination with the connecting-rod H, attached fast to the said plates, and the pivoted lever I, carrying the valve K inside of the case, as herein shown and described, and for the purpose specified.

165,768. MILK-CANS. Jay W. Smith, Philadelphia, Pa. [Filed June 9, 1875.]

Brief.—The cylindrical can and its breast are united by invaginations of the sheet-metal, and an external hoop of cylindrical form is swaged at its upper side, to fit the convexity of the breast.

The combination, with the body A and its hemispherical top *a'* and joint 3, of the band *a''*, provided with the curved inwardly-contracted upper edge, substantially as and for the purpose hereinbefore set forth and described.

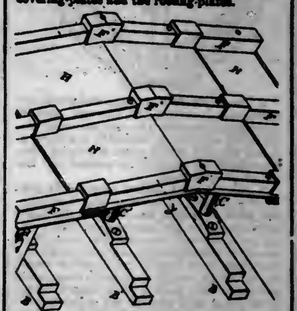


165,769. CALENDARS. Thomas J. Thorpe, Novara, Ohio. [Filed Dec. 21, 1874.]

The combination of the disk A, having recess, annular flange *f*, and hub *g*, with the disk B, and the disk C having central slot *h*, all connected by the screw *a*, substantially as set forth.

165,770. STEAM-ENGINE LUBRICATORS. M. L. Waring, Detroit, Mich., assignor to himself and C. B. Palmer, same place. [Filed Feb. 24, 1874.]

Brief.—The supply-stem within the cup has upon its top a valve-case, within which a valve is inclosed, its square end projecting above the case and engaging with the screw, by means of which, and the apparatus in the valve-case and the valve, the flow of oil is regulated.



1. In combination with the valve-case E, having aperture *a'* and opening *a''*, the cup-valve F, fitting inside the valve E and having the aperture *a* and angular head *c*, the latter being adapted to be turned by means of its square head from the outside of the cup A, to regulate the size of the opening, and, consequently, the flow of the oil, as and for the purpose set forth.

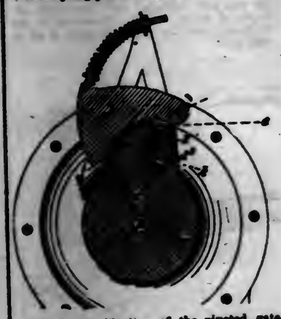
2. The combination, with the cup A, valve B, plug C, and stem D, of the case E, cup-valve F, pipe G, and valve H, as and for the purpose set forth.

165,771. METALLIC ROOFS. Elphalet Watson, Northwood Centre, N. H. [Filed Apr. 17, 1875.]

Brief.—A metal roof supported by beams and posts, having an elongated base and a cap with recess for the rib of the beams. The bearers are provided with ribs and side projections, having elongated orifices to allow of contraction and expansion. The wall-pieces have a deep groove, into which the covering-plates fit to prevent leakage. The supporting-plates on the wall are connected to the covering-plates and the roofing-plates.

1. The supporting-posts C, having the elongated base, and enlarged cap with the recess *d* for the reception of the rib *c* of the bearers D, as specified.

2. The bearers D, provided with the ribs *c* and projections *f*, the latter being perforated by the elongated orifices *g*, as and for the purpose set forth.



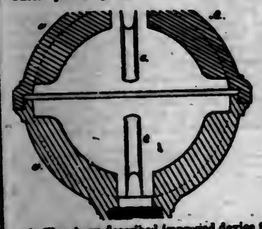
3. The wall-pieces I, provided with the deep groove, as described, in combination with the covering-plates H and gutters G, as and for the purpose set forth.

4. The supporting-plates E resting upon the wall A, in combination with the roofing-plates H and the covering-pieces F, as set forth.

5. The combination of the beams B with the supports C, bearers D, roofing-plates H H', and covering-pieces F and F', all being constructed and arranged as and for the purpose specified.

165,772. ROTARY ENGINES. W. Weyhe, Bremen, Germany. [Filed July 3, 1875.]

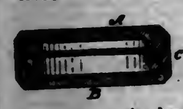
Brief.—The end of the swing-gate is rounded, and the piston is grooved, so as to make a close fit, and prevent steam passing from the induction to the eduction port. The coiled spring pushes the piston.



1. The combination of the pivoted gate-valve *f* with the elongated grooved piston, substantially as and for the purposes set forth.

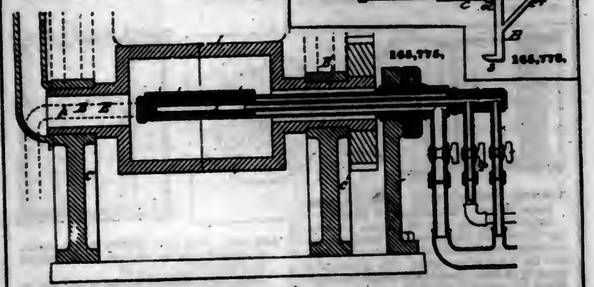
2. The combination of the coiled spring *e* with the piston *d*, provided with the perforations *h h h h* in its face, substantially as and for the purpose described.

165,773. FERTILIZER-DISTRIBUTERS. Wm. F. Wheeler, Dorchester, Mass. [Filed Apr. 7, 1875.]



Brief.—The fertilizer compound is formed into a homogeneous mass, and placed in a reservoir, through which water is forced by a hose, the water wearing away the compound, which is discharged from a nozzle with the water upon the plants.

1. The above-described improved device for attachment to a hose-pipe or other conduit through which water is to pass, the same consisting of a holder, A, formed in two parts, *a a*, and provided with a series of internal ribs, *g*, arranged substantially in manner and for the purpose set forth.

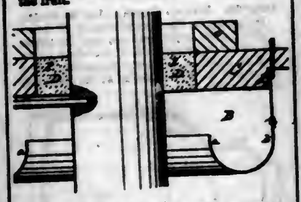


2. The improved method of gradually and speedily impregnating water with fertilizing and other materials, and diffusing the same upon plants, &c., the same consisting in forming the elements or materials into a solidified or semi-solidified homogeneous mass, and placing the same, so formed, in a holder or chamber connected with or arranged in a hose-pipe or other conduit, through which water is forced or caused to pass, whereby the action or friction of the water shall gradually disintegrate the compound, and the impregnated water be diffused, substantially in manner and for the purpose set forth.

165,774. WATCH-MAKERS' SOCKS. Phillip H. Wheeler, Rockford, Ill. [Filed Oct. 21, 1874.]

A transparent or glass box for watch-makers, composed of parts A and B and packing-ring C in groove *b'*, constructed substantially as and for the purposes described.

165,775. HEATERS FOR ROLLERS, &c. Thos. S. Wiles, Albany, N. Y., assignor of one-half his right to Alonzo P. Adams, same place. [Filed June 26, 1875.]



1. A burner having a jet-aperture in communication with a supply of mixed gas and air under artificial pressure, and an adjacent outside jet-aperture in communication with a supply of air under artificial pressure.

2. In combination with a chamber having an exit-passage, a burner having an aperture from which a jet of mixed gas and air is discharged into said chamber, and an aperture from which air under artificial pressure is discharged into said chamber in a jet alongside of the said jet of mixed gas and air.

3. In combination with a roller having a chamber therein, and an exit-passage therefrom, a burner in said chamber, and having a jet-aperture in communication with a conduit for supplying gas or mixed gas and air, and also having an adjacent outside jet-aperture communicating with an air-supply passage, substantially as set forth.

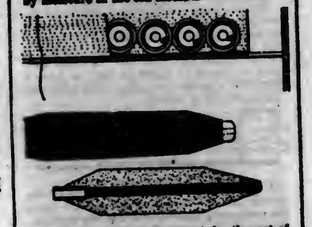
165,776. TREE-PROTECTORS. Robert F. Williams, Hampton, N. H. [Filed May 20, 1875.]

Brief.—Around and in the tree is secured a trough by supporting-rods, for the reception of poison *fluid*, the outer wall being somewhat higher than the inner wall. The space between the tree and the trough is filled with an elastic substance. The trough is covered with an adjustable flanged cover to protect the fruit.

The combination, substantially as herein shown and described, of the trough B, having the walls *a b*, flanged cover C, with a central opening or space, D, and supporting-rods *c*, and the elastic substance E filled into the space D, for the purpose described.

165,777. LOOM-SHUTTLES. Newell J. Wilkin, Cumberlandport, assignor to himself and W. H. Potter, Tunstown, Mass. [Filed June 16, 1875.]

The described improved loom-shuttle body, composed of two cores, A A', the two outer B B', of layers or thickness, *a*, of leather or analogous material, and the connection-plates H H', all arranged and applied substantially as specified.



165,778. ICE-HOOKS. Daniel C. Wood, Quincy, Ill. [Filed Apr. 28, 1875.]

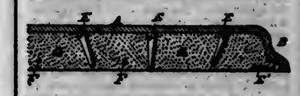
1. The improved ice-hook, consisting of the handle A, attachments *a a'*, and laterally-projecting cant-hook B, substantially as described.

2. The rigid cant-hook B, having the bifurcated shank and arms *c c'*, in combination with the handle A, having the handle *d* receiving said arms, as shown and described.

165,779. ART OF TREATING YARN TO RESIST TENDENCY. Daniel Wright, Lowell, assignor to George Draper & Son, Milford, Mass. [Filed Apr. 24, 1875.]

Brief.—The object of using dry heat is to prevent the swelling of the cops or bobbins and the matting together of the yarn, caused by moisture in the old method.

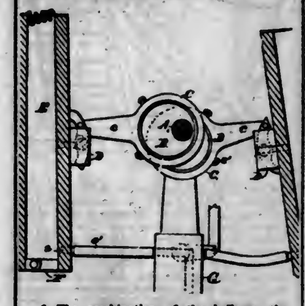
The described improvement in the art of treating yarn on bobbins or cops, to reduce the tendency of the yarn to kink in subsequent operations, consisting in subjecting the yarn to the action of heated air in a chamber, substantially as set forth.



165,780. HEAT-INDICATORS FOR JOURNAL-BEARINGS. Stephen Alley, Glasgow, Scotland. [Filed May 31, 1875.]

The combination of the spring-rod D, an alarm mechanism connected therewith, and a fusible plug, B, applied to the end of the spring-rod, the whole being constructed to be used in connection with a journal-bearing, substantially as described, whereby, when the journal becomes heated, the fusible plug will melt, release the spring-rod, by the action of which upon the mechanism an alarm will be sounded, substantially as described.

165,781. IRON MANTELS. Thos. P. Baker, St. Louis, Mo. [Filed Mar. 1, 1875.]

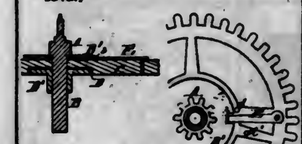


Brief.—A mantel-piece consisting of a metallic shell with recess underneath filled with cement, which is held in place by projecting pins.

As a new article of manufacture, the iron mantel-shelf A B C D, having recess G filled with cement F, anchored by pins E, substantially as set forth.

165,782. PRESSURE-BLOWERS FOR GAS-MACHINES. Joseph H. Bean, Cincinnati, Ohio. [Filed Dec. 12, 1874.]

Brief.—The pitman is connected to the upper arm of the valve-shaft. The forward movement of the pitman closes the valve, and presses back, by means of the upper arm of the valve-shaft, the movable side of the bellows, for the purpose of expelling the air contained therein. The rearward movement of the pitman opens the valve and draws out the movable side of the bellows.

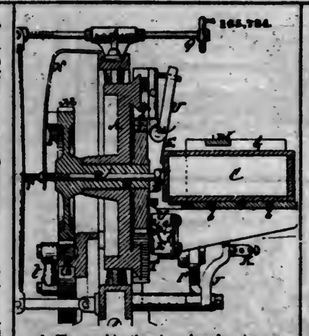


1. The combination of the bellows, the valve, and the operating-pitman, substantially as described, the pitman being adapted to operate the valves in advance of the bellows, as and for the purpose described.

2. The combination of the bellows, so arranged that its movable side swings outward by gravity, with a valve and pitman or crank, adapted, when operated, to move the bellows against the force of gravity, substantially as described.

3. The combination of the bellows E and valve *d d'* with the valve H and air-chamber, as described.

165,783. LEVER SAFETY-PISTONS. George Bement, Belvidere, Ill. [Filed Oct. 20, 1872.]



1. The self-retaining device for a watch, consisting of a rigid pivoted pawl E, a stop, *d*, and a circular flange, B', having a notch, *b*, formed in its periphery, in combination with the center-wheel C and pinion A, as herein set forth.

2. The steel collar D, recessed into the wheel C, in combination with the setting-post E, and a pinion, A, as set forth.

165,784. BOX-DRESSING MACHINES. John W. Bowers, South Carver, Mass. [Filed June 11, 1875.]

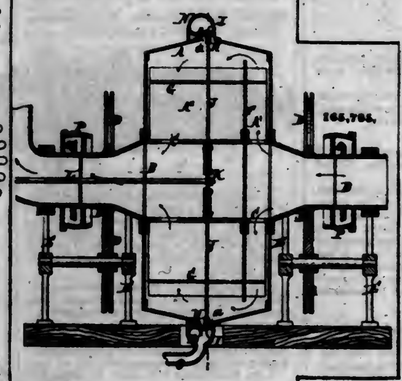
Brief.—The box is held upon a table, and the ends trimmed by four reciprocating knives acting simultaneously upon the four sides of the box.

1. The combination, in a box-dressing machine, of two or more reciprocating knives, E E', arranged to operate in transverse relation with each other, and so that each adjacent knife finishes its cut at the place where the other commenced its dressing action, substantially as specified.

2. The knives, constructed of duplicate cutters *c c'*, arranged so that as the one cutter, *c'*, trims the end of the stock, the other cutter, *c*, shaves, by a drawing cut, in an outward direction on the end of the box, essentially as described.

3. The combination of the automatically-adjustable guide and clamp H with the stationary guide and clamp G, made adjustable by hand in relation to the guide and clamp H, substantially as specified.

4. The expansible connecting-rod K, in combination with the automatically-operating guide and clamp H, essentially as described.



5. The automatically-adjustable stop and box-discharger D, with the knives which dress or trim the ends of the box, substantially as specified.

6. The adjustable hand-stop *r*, in combination with the automatic stop and box-discharger D, essentially as described.

7. The combination of the adjustable table B, the adjustable guides and clamps G H, and the automatic stop and box-discharger D, for operation in relation with each other and the knives, substantially as specified.

165,785. APPARATUS FOR PURIFYING GAS. Otto Braun, Berlin, Prussia. [Filed June 11, 1875.]

Brief.—Impurities separated from the gas by centrifugal action of drum and vanes. The liquid part escapes from the drum into an annular gutter. The openings in the periphery of the drum are closed by valves, whose rods extend to the center of the drum, where they are connected to a swiveling head, operated by a shaft extending to the outside of the

1. The apparatus constructed of the drum A, hollow shaft B, and valves I, for the purpose of purifying gases, substantially as described.

2. In combination with the valves I, the swivel K, for opening and closing the valves, substantially as described.

3. The annular gutter N, in combination with the rotating drum A, and valves I, substantially as described.

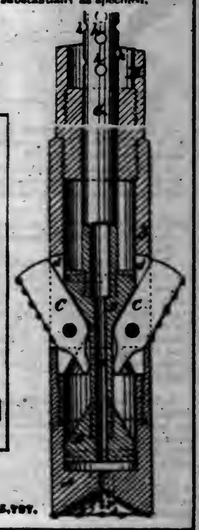
4. The rotating drum A, divided into two unequal compartments, A' A'', as shown, in combination with the vanes G, connected tangentially with the plate F, substantially as described, whereby the rotary velocity of the gases, &c., passed into the said drum is alternately increased and diminished, and the impurities separated therefrom, as set forth.

165,786. STEM-WINDING WATCHES. John Daniel Brez, Brooklyn, N. Y. [Filed June 23, 1875.]

Brief.—A coupling-piece, connecting the winding-arbor with the stem proper, permits removal of the movement from the case without disturbing the stem.

In a stem-winding watch, the combination of a coupling-piece, I, with the stem D extending from the crown-piece C, and with the winding-arbor G, substantially as described.

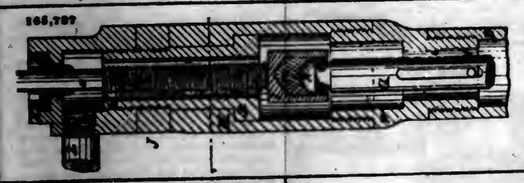
165,787. EXPANSION-DRILLS. Milan G. Bullock, New York, N. Y. [Filed Nov. 28, 1874.]



Brief.—The enlarging bits are pivoted in the bit-stock, and held in the desired position by two cones, that are vertically adjustable. The drill-rod and stem of the adjusting-screw are made hollow, and the cones recessed centrally, so as to furnish a conduit for supplying water to the cutting-surfaces.

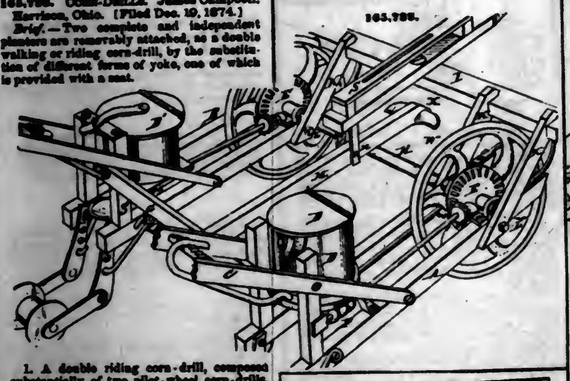
1. A rock drill or bit constructed with cutting-wings C, for enlarging the diameter of the bore, operated by adjustable cones D E, substantially as shown and described.

2. In a rock drill or bit, the combination of a nut, L, adjusting-screw *o*, tubular stem G, and cones D E with hinged cutting-wings, substantially as and for the purpose described.



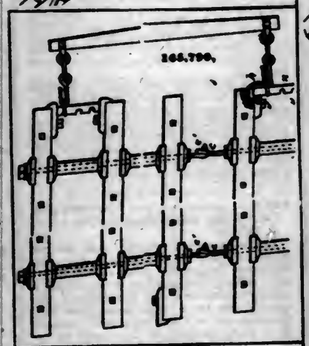
3. The combination, with the screw *o* and stem G, of the coupling I, substantially as and for the purpose described.

4. In a rock drill or bit, the combination of the connected cones, recessed centrally, stem G, tubular nut I, and perforated base A, forming a conduit for supplying water to the cutting-surfaces, substantially as specified.



165,787.

165,787

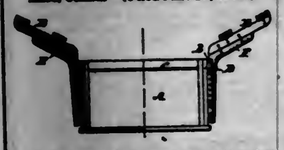


165,788. CORN-DRILL. James Campbell, Harrison, Ohio. [Filed Dec. 19, 1874.]

Brief.—Two complete and independent planters are removably attached, as a double walking or riding corn-drill, by the substitution of different forms of yoke, one of which is provided with a seat.

165,788.

165,790.



1. A double riding corn-drill, composed substantially of two pilot-wheel corn-drills, connected by means of the yoke G and frame I K, substantially as herein set forth.

2. In a double or riding corn-drill, the yoke G, tilting-bar M, and frame I K, constructed and combined substantially as herein set forth.

3. The combination of the two single pilot-wheel corn-drills by means of the riding-frame I K, yoke G, and roller H, substantially as herein set forth.

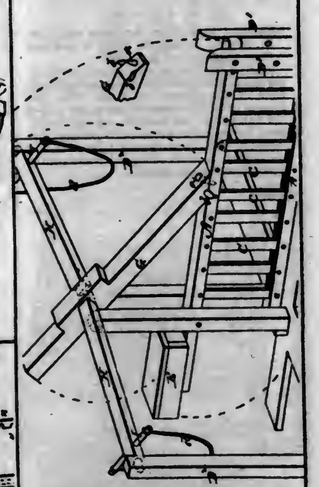
4. The combination of the loose yoke G and roller H with the two single pilot-wheel corn-drills, substantially as described.

165,789. WAGON-RACKS. James F. Case, L'Original, assignor of two-thirds his right to Jas. McCallum and Alpheus McCallum, Kent, Canada. [Filed June 26, 1875.]

1. The dovetailed sockets B and brackets F, in combination with a wagon-body, A, as and for the purpose set forth.

2. The sockets B, fastened to the wagon-box by rods C passing transversely therethrough, and secured by nuts D, as set forth.

165,790. HARROWS. Jas. Chamberlain and Henry H. Scipio, Melmore, Ohio. [Filed May 1, 1875.]



Brief.—The frame of the harrow is composed of longitudinal bars, which carry the teeth. These are secured at the desired distance from each other by means of cast blocks that fit upon the bars, the opposite side being recessed to receive the end of the cross-bars. A rod passes through each set of blocks and braces, and through the longitudinal bars, the inner ends forming hooks for uniting two sections together.

1. In a harrow, the perforated clamps or washers *g*, provided with the recesses *d* and *f* on opposite sides, in combination with the hooked rods C, passing through the longitudinal and cross-bars, substantially as described, and for the purpose set forth.

2. The draw-bars A A', in combination with a slotted main bar and the serrated cross-bar *a*, constructed and arranged substantially as specified.

165,792. GATES. Leopold S. Coim, Berlin. W. [Filed Mar. 6, 1876.]

Brief.—In which the gate rises to a vertical position when a locking-lever is lifted from its place, and returns to a horizontal position when the locking-lever is made to press upon the upper bar of the gate. The locking-lever is manipulated by means of two bars mortised into it on opposite sides, said bars being journaled into two upright posts placed at a convenient distance from the gate. Levers pass through the ends of these bars near the posts, by means of which a rotary motion is given to them, which raises the locking-lever or presses it down.

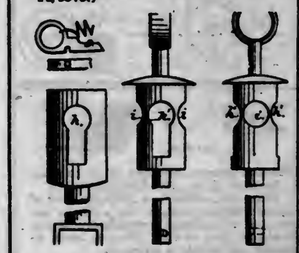
1. The combination of the weighted pivoted gate A B C, and the pivoted locking-lever G, provided with the pin *a* and guide-projections *b b*, substantially as and for the purposes herein set forth.

2. The combination of the locking lever G, bars H H, and levers I I, with or without the side bars G' G', as and for the purposes herein set forth.

165,791. RELIEF-VALVES. G. H. Clemons, Chicago, Ill. [Filed Apr. 17, 1875.]

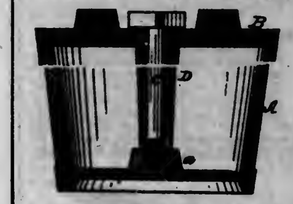
A banking device consisting of a circular, or nearly circular, spring, *f'*, formed with bent ends *f''* and a stud or pillar, *f*, and the shank *f'*, arranged and constructed substantially as shown and described.

165,794. KEY-HOLDERS. F. W. Coleman, Rodney, Miss. [Filed July 10, 1875.]



165,794.

1. A key-holder, consisting of a core with end caps combined with disks of pliant material arranged to alternate with the bows of the keys, substantially as described.



2. The sections A A' of the core, having end caps *a a'*, in combination with the screw-threaded stem B and the disks C, arranged to alternate with the bows of the keys, substantially as described, and for the purpose set forth.

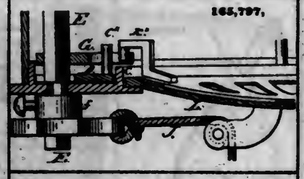
165,795. RAILROAD-SWITCH SIGNALS. W. W. Colley, Philadelphia, Pa. [Filed May 14, 1875.]

A signal-box consisting of a case having side-apertures and a hollow post, in combination with a movable lantern-chamber constructed with side apertures and glass-covered openings, the whole so arranged that when the side apertures of the lantern-chamber coincide with those in the case *h'* a signal of safety is indicated, and when the glass-covered openings *f* of the lantern-chamber are exposed a signal of danger is shown, substantially as set forth.

165,796. BUTTER-PAILS. J. F. Crawford, Canisteo, N. Y. [Filed June 7, 1875.]

1. The combination of the pail A, lid B, rod C, and post or sleeve D, substantially as shown.

2. In combination with the pail A, rod C, and sleeve D, the washer or button E, applied as and for the purpose described.

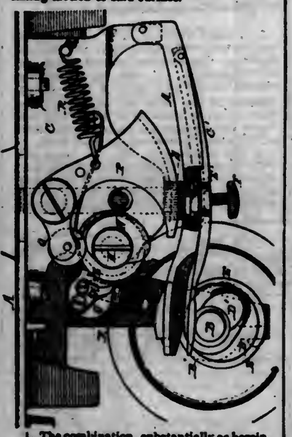


3. In a butter-pail, a hollow post or sleeve D of decreasing diameter toward its lower end.

165,797. CEILING-REGISTERS AND VENTILATORS. Horatio M. Cranmer, Boston, Mass. [Filed May 31, 1875.]

Brief.—The central register is removable, to allow the introduction of pipe. When the central register is in use, it is operated by the same slotted arm on the shaft that operates the exterior annular register.

1. The combination, with the center-piece K L, of the vertical shaft E, arm G, lever H, cords or chains J, and pulleys *i*, substantially as and for the purpose herein described.



2. The combination of the center-piece or register K L and outside annular register C D, the pins *c' b'*, arm G, and shaft E, whereby the two registers are operated simultaneously, substantially as described.

165,797.

165,798. SEWING-MACHINES. Cyrus S. Cushman, Philadelphia, Pa., assignor to Nesbitt D. Stoops, same place. [Filed May 14, 1875.]

Brief.—An eccentric on the driving-shaft of the machine actuates, through a suitable connection and pawl, a ratchet, on the sleeve of which is secured a pattern-cam, that operates upon an arm projecting from a cogged segment, and vibrates the same on its pivot. This segment meshes with a pinion on the lower end of a hollow shaft, in the hollow of which is pivoted a lever, having its upper end roughened and projecting above the surface of the bed, and its lower end sharpened off in the form of a wedge, against which a tapering bar operates, that is connected with a lever which is moved by a cam, so that a combined rotary and lateral motion is imparted to the feed-surface at one and the same time. A third cam, in connection with a lever and spring, serves to give the requisite rising and falling motion to said surface.

1. The combination, substantially as hereinbefore set forth, of an eccentric attached to the driving-shaft, a pawl and ratchet wheel for imparting motion to a pattern-cam, and a toothed segment and pinion-wheel for imparting an intermittent rotary motion to the feed-plate for the purpose of moving the same, as set forth.

2. The combination, substantially as hereinbefore set forth, of a cam attached to the driving-shaft, and a lever and spring for raising and depressing the spring W and imparting a horizontal reciprocating movement to the feed-plate.

3. The combination, substantially as hereinbefore set forth, of an eccentric attached to the driving-shaft, a pawl and ratchet for imparting an intermittent motion to a pattern-cam, a segment and pinion-wheel for imparting a rotary motion to the shaft carrying the feed-plate, and a cam, lever, and spring for raising and lowering a shaft for imparting a horizontal reciprocating movement to the feed, simultaneously with the intermittent rotary movement of the same, as specified.

4. The combination, with the driving-shaft B, of the eccentric D, pawl G, ratchet-wheel I, segment P, and pinion-wheel R, on the shaft T, for imparting an intermittent rotary movement to the feed-plate, substantially as described.

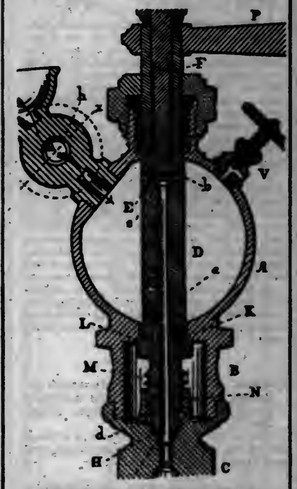
5. The combination, with the driving-shaft B, of a cam, D', lever C', spring G', and bevel-lever E', and spring-rod W, for imparting a horizontal movement to the feed-plate, substantially as described

6. The combination of a cam, D, pawl G, ratchet-wheel I, segment P, and pinion-wheel S, attached to the shaft T, the spring-bar W, carrying the feed-plate V, and the shaft E', spring G', lever A', and cam D', substantially as described, for imparting a combined rotary and reciprocating motion to the feed-plate, as set forth.

7. In combination with the mechanism, substantially as hereinbefore set forth, for imparting a rotary and horizontal reciprocating motion to the feed-plate, the cam D', lever A', and spring Z for imparting a vertical reciprocating motion to the feed-plate, as set forth.

165,799. POCKET-INHALERS. T. B. Daniels, Detroit, Mich. [Filed June 5, 1875.]

Brief.—The inhaler is made up of two concentric circular boxes. The inner box contains a pocket, into which the telescopic mouth-piece slides when not in use. Outside of the pocket, and within the inner box, the inhaling material is placed, and the vapor passes out through a piece of perforated paper, which is passed around the perforated edge of the inner box. The vapor passes from the space between the two boxes into the telescopic mouth-piece.



1. The inhaler, consisting of the case O D, the internal box A, provided with the perforations *c*, and the absorbent materials *d* and *e*, and the sliding tube or mouth B, constructed and operating substantially as shown.

2. A case or body for a pocket-inhaler, consisting of two circular flanged plates, O D, provided with an inlet-opening, *f*, and arranged to turn one within the other for the purpose of closing said opening.

3. In an inhaler the combination of a perforated box, A, an absorbent filling, *d*, and an inclining band, *c*, of porous material located in the air-passage, substantially as described.

165,800. LUBRICATORS. Samuel H. Davis, Jr., and Howard M. Du Bois, Philadelphia, Pa. [Filed Oct. 9, 1874.]

Brief.—The purifying solution or steam is kept at an elevated temperature.

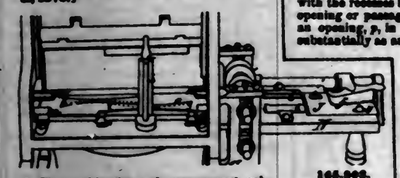
The valve-stem D, constructed to rotate, formed with a bore, *a*, and openings *b*, and extended above the shell A, in combination with the handle P, valvular stem F, and screw-collar M, substantially as and for the purpose set forth.

165,801. MANUFACTURE OF CHLORINE. H. Deacon, Widnes, England. [Filed July 1, 1875.]

The described improvement in the manufacture of chlorine by the Deacon process, which consists in effecting the separation of sulphuric acid from the hydrochloric-acid gas employed in said process, by submitting such impure hydrochloric-acid gas to the action of aqueous hydrochloric acid, or of chlorides, such as chloride of sodium, at an elevated temperature, in the manner hereinbefore described.

165,802. MANUFACTURE OF CHLORINE. H. Deacon, Appleton House, Widnes, England. [Filed June 26, 1875.]

Brief.—Improvement upon Patents Nos. 86,376, December 29, 1868; 116,369-12, August 22, 1871; and 141,333, July 29, 1873. Instead of the porous substances of these patents, use substances consisting mainly of sesquioxide of iron. Impregnate them with sulphate of copper or other of the "active chemical agents" specified in former patents. Also, adds to these a salt of magnesia.



1. The employment in the described process for the production of chlorine of such porous substances as consist mainly or essentially of sesquioxide of iron, in the manner and for the purpose herein before mentioned.

2. The employment in the described process for the production of chlorine of porous substances impregnated with salts or compounds of magnesia in conjunction with salts or compounds of copper, or with other described active chemical agents, in the manner and for the purpose herein before described.

3. The employment in the described process for the production of chlorine of natural magnesian minerals or products, the same being

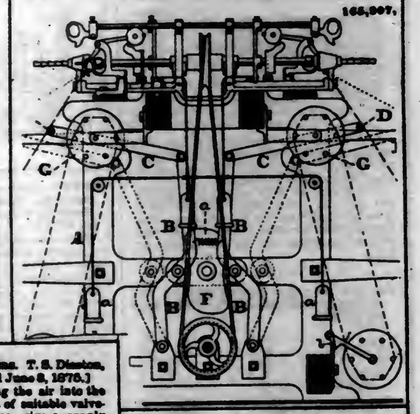
---

165,803. PAPER-COLLAR MACHINES. Chas. H. Dunham, New York, N. Y. [Filed Jan. 11, 1875.]

1. The combination and arrangement, substantially as before set forth, of the two collar-embossing dies, arranged to lap by each other longitudinally, the supporting-bed, the cutting mechanism, and the feed mechanism, located between the said dies and cutting mechanism, whereby the web is drawn past and from said dies, and advanced to the cutting mechanism, by which pieces are severed from the web by a combined longitudinal and transverse cut, having upon each piece two or more collars embossed.

2. The combination and arrangement, substantially as before set forth, of the two collar-embossing dies, arranged to lap by each other longitudinally, the supporting-bed, the button-hole cutter, the cutting mechanism, and the feed mechanism, arranged between the said dies and cutting mechanism, whereby the web is drawn past and from the said dies and button-hole cutters, advanced to the cutting mechanism, and pieces of paper severed from the web by a combined longitudinal and transverse cut, each piece having two or more collars embossed thereon and the button-holes cut.

165,804. METAL-BENDING MACHINES. H. Devine, Detroit, Mich., assignor to himself and M. McWilliams, same place. [Filed Apr. 17, 1875.]



Brief.—The forked lever D acts as a clamp for holding the metal against the former, and as a handle for turning the former.

1. The combination of the sheaves B B' and former C, with the bed-plate A, substantially as and for the purpose set forth.

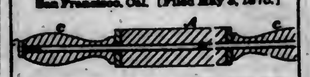
2. The forked lever D, in combination with the former C, substantially as and for the purpose set forth.

165,804.

165,807.

165,805. ROTARY BLOWERS. T. S. Dinston, Philadelphia, Pa. [Filed June 2, 1875.]

Brief.—The vanes, forcing the air into the segmental recesses and out of suitable valve-openings into the discharge, give a supply of compressed air. The disadvantages of a vacuum are prevented by the openings in the vanes and cylinder, as shown. The irregularities of the blast are modified by the air-chamber attached to the discharge-pipe.

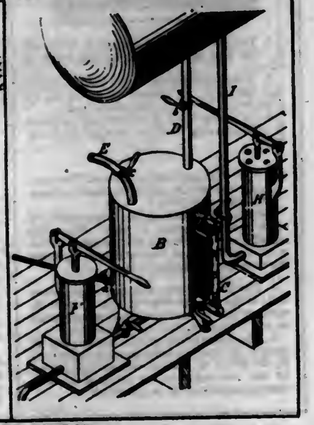


1. A rotary blower in which are combined the following elements, namely: two or more revolving vanes having curved sides, revolving segments *c c*, with concave recesses adapted to the said vanes, a chest-casing adapted to the vanes and segments, and a valve or valves operating in unison with both vanes and segments, for controlling the outlet of the blast, all substantially as set forth.

2. The combination, with the vanes and with the recesses between the segments, of an opening or passage through each vane, with an opening, *p*, in the casing of the blower, substantially as and for the purpose set forth.

165,805.

165,806. SHARPENING-RIPLES. S. P. Dodge, San Francisco, Cal. [Filed May 3, 1875.]



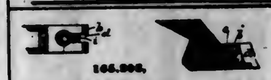
The stone or block A, having the hole *b* made longitudinally through it, in combination with the handles C C, rod D, and plates *a*, and tightening-nut *f*, all combined and arranged to operate substantially as and for the purpose described.

165,807. BOBBIN-WINDERS. John Dorman, Philadelphia, Pa. [Filed June 2, 1875.]

1. The combination, with the winding mechanism, of the sliding rods D, supporting-arms E, levers C, lever E, operating-cam F, and spring or weight *a*, all arranged as described, whereby the slack is taken up, and the yarn does not require to be passed over guides adjacent to said rods D, substantially as and for the purpose set forth.

2. The combination of the sliding rods D, upper barrels G, lever gravitating-barrels H, springs K, and separating-rods L, substantially as and for the purpose set forth.

165,807.



165,808. DENTAL FORCEPS. N. A. Durham, Hartford, Conn. [Filed May 21, 1875.]

Brief.—The socket for a removable beak of dental forceps is straight with a circular section, and the beak, with a corresponding shank, is entered from its inner side in a lateral direction, and held by a spring-pin.

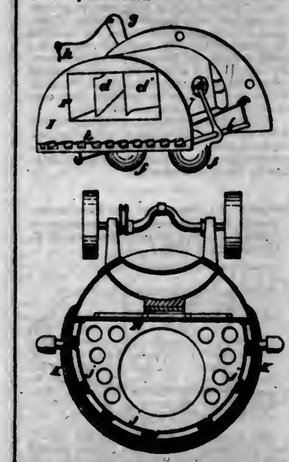
1. A forceps-handle, provided with a straight socket, having a circular cross-section, entering laterally from the inner side of said handle, and provided with a slot, *d*, combined with a beak constructed with a corresponding shank, as set forth.

2. A forceps-handle, A, constructed with the plane end *b* and the socket *c* parallel with said surface *b*, combined with the beak F, provided with the shank *f* fitted to said socket and groove, as set forth.

3. The pin-spring *i*, located in the middle of the socket *c*, combined with the shank *f*, constructed with the orifice A, for the purpose set forth.

165,808.

165,809. APPARATUS FOR SUPPLYING LIQUID HYDROCARBON TO GAS-MAKING RETORTS. Frederick H. Blakeman, Detroit, Mich., assignee of two-thirds his right to Wm. W. Horton, J. T. Salter, J. H. Sheldon, and Jas. Allen, Chicago, Ill. [Filed Jan. 13, 1875.]



Brief.—The liquid hydrocarbon is forced up into the retort by air-pressure from an independent air-reservoir. A gage is applied to the oil-supply tank, to measure the quantity fed.

165,809.

In an apparatus for supplying hydrocarbons to gas-distilling retorts, the combination of the reservoir B, provided with gage C, the air-chamber G, and a pump to exert an air-pressure in said chamber, all substantially as described.

165,810. BOILERS FOR PORTABLE ENGINES. Joseph Enright, San Jose, Cal. [Filed May 6, 1875.]

Brief.—By means of a frame inserted in the front of a furnace, and provided with swinging doors operated by weights and levers, straw or other fibrous material may be fed to the furnace. By the same means the doors may be kept opened and closed. A water-jacket is provided around the smoke-arch, the inner bottom of which is lined with staves for protection. The boiler-head is made in two or more sections, whereby easy access to the tubes is provided for.

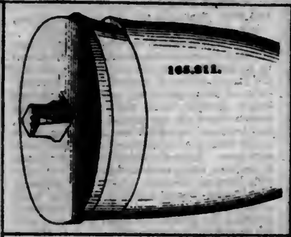
1. The improvement in the front boiler-head C, the same consisting in constructing it in two or more parts, substantially as and for the purpose described.

2. The thimble or short tube E, in combination with the circular flange *a* on the inside of the boiler-head C, and the projecting end of the main flue D, substantially as and for the purpose described.

3. The furnace-front G, with its inward-projecting tube F and doors *d d'*, in combination with the shield X, substantially as described, for the purpose specified.

4. The pivoted doors *d d'* and pipe F, in combination with the links 7, bent levers *e e*, pivoted on shafts 6 6, and bearing-weights *f f*, as set forth.

5. In combination with the hinged doors *d d'* and their weighted crank-shafts *e e*, the operating-lever *g*, rack *g'*, and pin *h*, substantially as and for the purpose specified.

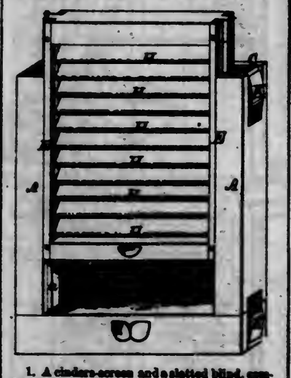


6. The combustion-chamber J, lined with the staves *j j*, substantially as and for the purpose described.

7. The combustion-chamber J, surrounded by the shell K, so as to provide a water-jacket between the shell and boiler, said space or jacket being connected with the water-space in the boiler by the pipes *i*, substantially as and for the purpose described.

165,811. CRUCIBLES. John Foix, San Francisco, Cal. [Filed July 7, 1875.]

Brief.—A crucible of ordinary construction is provided with a ring or annulus of the same material, to fit upon the mouth or top of the same, forming a continuation of said crucible, to hold the loose metal or bullion packed therein, thereby preventing the ingress of coals, or the loss of metal by shaking.

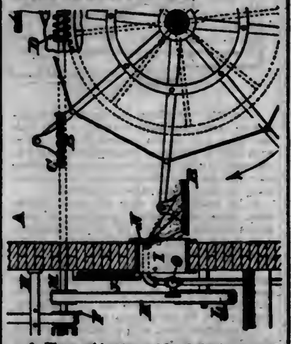


In combination with an ordinary crucible, a ring or annulus adapted to fit upon the mouth or top thereof and form a continuation of the same, substantially as and for the purpose herein described.

165,812.

165,813. CORNICES AND BLINDS AND SCREENS FOR RAILROAD-CARS. Wm. H. Fletcher, Washington, D. C. [Filed June 16, 1875.]

Brief.—A frame containing independent shutter-slats is detachably secured in grooves in a screen-frame. The screen-frame is also detachably secured in grooves in the window-opening. Both frames are provided with springs on their edges, to prevent rattling and to hold them at any desired height.



1. A cinders-screen and a slotted blind, combined together within a window-opening, and capable of an independent or a combined movement therein, substantially as and for the purpose specified.

2. In combination with the blind-frame, the springs K' and K', attached to the outer edge of the side rails B and B, and the springs K'' and K'', attached to the rails A and A, substantially as and for the purpose set forth.

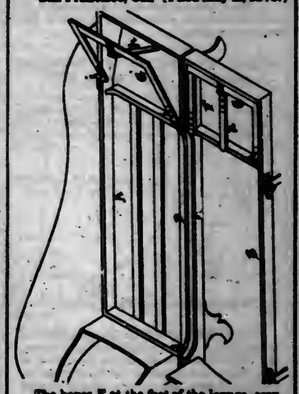
165,814. DEVICES FOR GLAZING CRACKERS. David Foerster, Cincinnati, Ohio. [Filed June 9, 1875.]

Brief.—A steam-jet can be thrown upon the crackers within the oven at will.

1. The combination, with a baker's oven, of a steam-jet pipe, N n, occupying a horizontal position within the oven, and controllable by a cock, O, in the manner set forth.

2. The combination of oven A I, rod B, controllable driving-gear D E F G H, and a steam-jet device, N n O, within the oven or oven-mouth, and under the control of the oven-man, substantially as set forth.

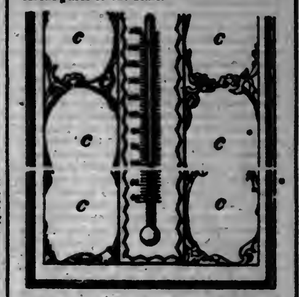
165,815. PIPE-STEMS. Henry C. Fritz, Chester, Pa. [Filed July 1, 1875.]



Brief.—The inside stem, through which the smoke is drawn, is of metal, and the exterior stem is of wood, and has side openings in it, to permit the metal stem to be exposed to the atmosphere to keep it cool.

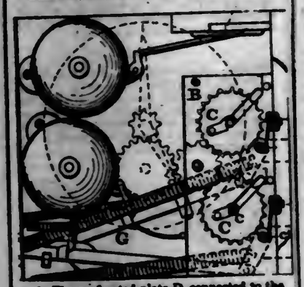
1. A double pipe-stem consisting of an exterior and interior stem, the former having a lateral air-passage, substantially for the purpose set forth.

2. The combination, with a pipe-bowl, A, and mouth-piece B, of the exterior stem C, slotted longitudinally, as described, and the interior stem D placed therein, substantially as and for the purposes herein set forth.



165,816. RED-LOUNGES. Wm. H. L. Gabbs, San Francisco, Cal. [Filed May 11, 1875.]

The bones F at the foot of the lounge, serving as braces, and having the frames or covers G, hinged at *i*, and provided with the adjusting-standards *k*, the covers serving as adjustable pillows, substantially as described.

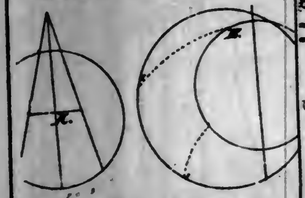


165,817. THERMOMETERS. Gammon Gano, Cincinnati, Ohio. [Filed Nov. 28, 1874.]

Brief.—Illustrated cards are fixed to the back plate, said cards representing scenes indicative of various temperatures, corresponding with indications of the mercury at different parts of the scale.

A thermometer-back consisting of a metallic plate, B, and pictorial card C, affixed, printed, or otherwise produced thereon.

165,917. TIRE-CHECKS. Henry Greene, Philadelphia, Pa. [Filed May 14, 1875.]



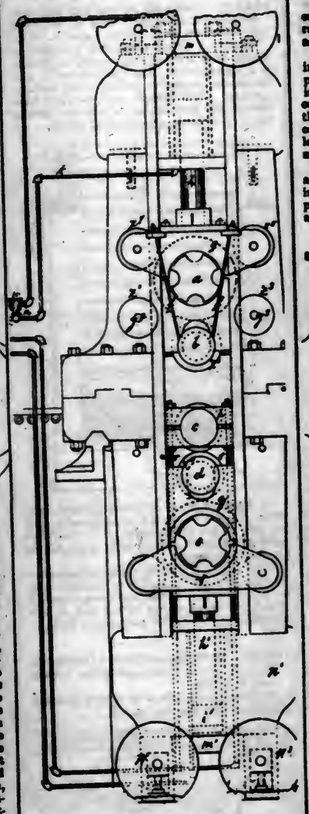
1. The perforated plate D, connected to the alarm-operating bar G, and swinging toward the register-drum B, substantially as and for the purpose set forth.

2. The guide-plate E, with indenting openings *d*, in combination with the swinging plate D and alarm-operating bar G, substantially as and for the purpose set forth.

3. The register-drum B, removably fitted to the frame c, and the confining-clamp C operating therewith, substantially as and for the purpose set forth.

4. The marker, constructed with a point, *f*, and shoulders *g h*, substantially as and for the purpose set forth.

165,918. CYCLOPEDES. R. C. Gwathmey, Louisville, Ky. [Filed May 10, 1873.]



[Ordered to issue by the Court.]

A combination of four bodies or systems of bodies, which will be called applying bodies, and which, in virtue of certain properties of size, shape, and position, will be effectual for holding objects, particularly objects formed with such surfaces as could be imparted by being turned in a lathe, and for other purposes. These properties are as to position, first, that the applying bodies shall be in relation each to an axis, which axis shall be perpendicular to the plane in which the bodies move; second, that these axes shall constitute two pairs; third, that the two constituent axes of each pair shall be fixed relatively to each other; fourth, that the distance between the axes of one pair shall be equal to the distance between the axes of the other pair; fifth, that one or both pairs of axes shall revolve around a point at a finite or infinite distance; sixth, that a radiant line from each point of revolution shall bisect at right angles a line connecting the middle point of a straight line, which connects the two of one pair with the middle point of a straight line which connects the two axes of the other pair, while at the same time the two straight lines connecting each pair shall be reciprocal if necessary, meet the aforesaid radiant line at the same point. The proportion as to size and shape are, first, that the four applying bodies shall have their centers that lie in the same plane perpendicular to their axes circular around their respective axes, and of the same diameter, at least, as to each of their surfaces as are applied to objects; second, any deviation from such size and shape to suit any particular purpose, such modification being available from the relation of the applying bodies to the above-described ones; and, third, that the objects to be held or acted upon by the applying bodies shall be formed in adaptation to the shape of the applying bodies when necessary, such applying bodies to be attached in any way to any machinery that will hold them in the required position, and communicate to them the required movement.

165,919. ROLLING-MILLS. Ignatius Hahn, Pittsburg, Pa. [Filed Feb. 24, 1876.]

Brief.—Five rolls in the same vertical plane, of which the outer two, adjusted and sustained by hydraulic power, are supporting-rolls, and the three interior, of small diameter, working-rolls, all driven positively,—the smaller by the larger through belts, and capable of two passes,—between the middle and upper one, and between the middle and lower one, of the small rolls, the series being readjusted after each pass. Rolls of unusual length, and made in sections, being contemplated, the two outer rolls have at intervals between the bearings anti-friction journal-bearings, of which those connected with the lower roll are adjusted and sustained by screws, and those connected with the upper roll by hydraulic power.

1. In mills for rolling metals, the combination of three small work-rolls, *b*, *c* and *d*, with one large roll, to the outside of and in line with each of the outer intermediate rolls *b d*, the central roll *c* being of equal or less diameter than its next adjoining ones *b d*, substantially as and for the purpose specified.

2. In combination with the outer bracc-rolls, three intermediate work-rolls of less diameter, one or more of the intermediate rolls being driven by belting, substantially as and for the purpose specified.

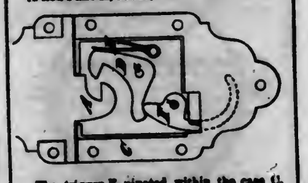
3. In combination with two rolls which move together, and the belting for driving the same, four or more fixed pulleys, and two or more pulleys moving with the rolls, substantially as and for the purpose specified.

4. In combination with a pulley secured to the shaft of a driven roll, four or more fixed pulleys and the belt for driving the roll, the belt being applied to the entire circumference of the pulley of the driven roll, substantially as and for the purpose specified.

5. The combination of the adjustable rolls *b*, *c*, and *d*, having suitable riders, with pistons working in cylinders formed in or secured to the housings, for raising and lowering the rolls, substantially as specified.

6. The combination of a fixed feed-table and three or more rolls, adjustable in relation to one another and to the table, substantially as and for the purpose specified.

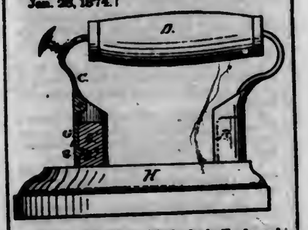
7. In combination with an adjustable roll, a hydraulic piston and cylinder, and a series of pipes for admitting fluid to both sides of the piston, so that the roll may be raised and lowered and held stationary by hydraulic power, substantially as and for the purpose specified.



8. In combination with the outer rolls *a c*, the supports D^2 D^2, operated by pistons working in cylinders, substantially as specified.

9. In combination with the fixed table, three or more rolls, *b c d*, and the mechanism for raising and lowering the rolls, substantially as and for the purpose specified.

10. The combination, substantially as herein described, with the several pistons, of four pairs of inlet and outlet valves, all mounted in a common axial line, each pair secured to a common shaft, and independent of the others, the outlet-valves of each two pairs communicating with a common outlet-pipe, and the inlet-valves of the two intermediate pairs communicating with a common inlet-pipe.

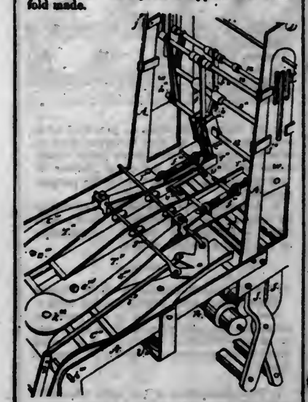


11. The check-valve *w*, in combination with a double line of pipes, one of said pipes leading to the side of the piston against which the pressure in rolling is exerted, substantially as and for the purpose specified.

165,920. FASTENINGS FOR TRUNKS, &c. Joseph Hall, Newark, N. J., assignor to himself and John Reebach, Geneseo, N. Y. [Filed June 11, 1876.]

The trigger F, pivoted within the case G, and constructed to move in a plane parallel with the front of the trunk, in connection with the elbow latch-lever D, pivoted to the pin *c*, the spring E, and the hook A, the whole being constructed and arranged to operate as and for the purpose described.

165,921. SAD-IRONS. Enoch M. Harris and Michael H. O'Neil, Richmond, Va. [Filed Jan. 28, 1874.]



The combination, with the body H of a sad-iron, constructed with lugs E E', the forward leg E' being provided with a notch, F', as described, of a bow or handle, C, having an arrangement F F', adapted to embrace the legs E E', and a curved lever, G, pivoted within its forward leg, formed with a catch, G', at its lower end, and operated by a button, G^2, and spring G^3, the whole being constructed and operating substantially as shown and described.

165,922. MODES OF TANNING LEATHER. G. W. Hatch, Lawrence, Kans. [Filed May 4, 1875.]

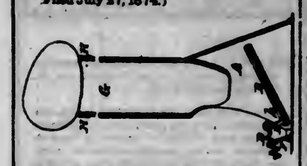
As an improvement in the art of tanning, the employment or use of the shrub or plant known as *Ephedra antisyphilitica*, substantially as set forth

165,922. PAPER-BAG MACHINES. James Hatfield, Cincinnati, Ohio. [Filed Aug. 25, 1874.]

Brief.—Paper tube is delivered through feed-rolls with end slightly open. The end is spread by descending spreaders, and held by sliding pins while paste is applied and final fold made.

1. Two swinging levers, *f'' f''*, combined with suitable operative mechanism to cause said levers to descend into and separate the end of the tube, substantially in the manner set forth.

2. The spreading-levers *f'' f''*, provided with adjusting-plates *h*, friction-rollers *e''*, lugs *f'*, combined and operating substantially as and for the purpose set forth.

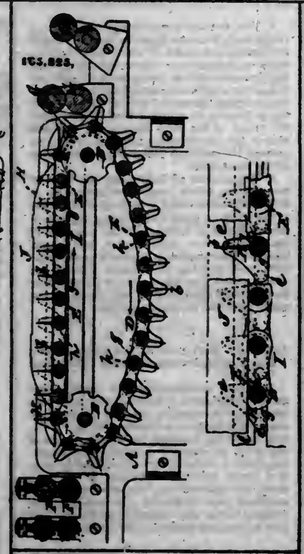


3. The reciprocating fingers *v'' v''*, arranged in pairs to approach each other from opposite sides without meeting, so as to leave uncovered the center line of the bag-bottom, and permit the central surfaces of the triangular side folds, and of the bottom, to be pasted together before the fingers are retracted, substantially as described.

4. The holders T^v T^v, adjustably mounted upon the vibrating frame J'', and combined with suitable spreading, pasting, and folding mechanism, for the purpose set forth.

5. Combined with the holders T^v T^v, the arms *r'' r''*, pivoted to said holders, and provided with the fingers *v'' v''*, and suitable mechanism, to transmit motion from their cam to said fingers, substantially as set forth.

6. Combined with the oscillating arms *r'' r''*, provided with the fingers *v'' v''* and adjusting-screws *f''' f'''*, the rods 1^{vv} and *g''*, with adjustable couplings *s''' s'''*, bell-crank *w''*, and cam-rod *t''*, substantially as set forth.



165,924. BED-TESTERS. William Henckler and Heinrich A. Troegeler, Kirkwood, Mo. [Filed July 27, 1874.]

The open-front case A, having adjustable reflector B, in combination with the vertical tubes G, substantially as set forth.

165,925. HEMP AND FLAX MACHINES. C. Herrschaft and James Lawrence, Brooklyn, N. Y. [Filed May 20, 1874.]

The toes H on the bars E, which carry the combing-pins, made with straight edges *g*, in combination with the rollers *b* and upper and lower guides I J, holding-rolls F F, and delivering-rolls G G, all constructed and operating substantially as and for the purpose herein set forth.

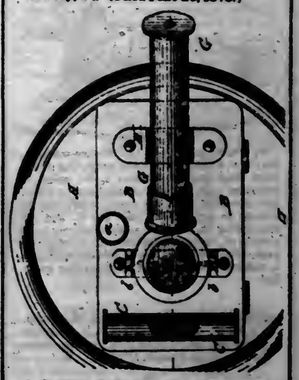
165,926. CAR-COUPLINGS. Phillip Hien and John Koch, Rock Island, Ill. [Filed June 2, 1875.]

Brief.—Each draw-head is provided with an open socket for the reception of a ball-link, the opposite end of which is secured in a socket in the opposite draw-head.

1. The draw-head constructed with the open socket *b*, in combination with the ball-link D, permanently confined at one end in socket *a*, substantially as and for the purpose specified.

2. The links D, constructed with the two balls and curved handle D', substantially as set forth.

3. The draw-head constructed with the double recesses *a* and *b*, and the recess *c*, and hole *d*, for coupling with either the link D or the ordinary coupling-link, substantially as set forth.



165,927. STOP-COCKS. Timothy Holland, New York, N. Y. [Filed July 1, 1875.]

Brief.—The valves are forced against their seats by means of two rollers acting against the surfaces of triangular wedges secured on opposite sides of the valve-casing.

The combination of the rollers J J, attached to the backs of the valves or valve-plate I I, the fixed inclines H H in the valve box or chamber, the valve seats or bearings *b b*, and the valve-operating screw-stem G, all substantially as shown and described.

165,928. TRANSITS. Simeon Holton, Middlebury, Vt. [Filed June 26, 1875.]

1. In a transit, the hinged plate B, supporting the telescope and reflector, and provided with the level C, and adjusted by means of the set-screw *a*, as and for the purposes set forth.

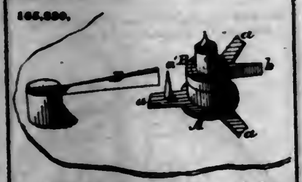
2. The combination, in a transit, of the hinged adjustable bed-plate B, rocking reflector D, and telescope G, as and for the purposes herein set forth.

3. The combination of the base A, hinged bed-plate B, with adjusting-screw *a*, level C, rocking reflector D, and telescope G, having one or more lines *i*, in focus of its eye-piece, all substantially as and for the purposes herein set forth.

165,929. FARE-REGISTERS. W. H. Hornum, New York, N. Y. [Filed Apr. 2, 1875.]

1. The combination of a casing, a bell, and a striking mechanism arranged therein, and a finger-wheel, the face of which is divided into ten sections bearing different colors and numbered from 0 to 9, substantially as described, whereby whenever the finger-wheel is turned its projections operate the striking mechanism and sound an alarm, as set forth.

2. The combination of the casing divided into two compartments, and having apertures in its back plate, the finger-wheel and alarm mechanism arranged in said casing, and a registering mechanism arranged in the rear compartments of the casing, substantially as described, whereby the single fares taken can be read through the face-plate, and the entire number of fares can be read through the back plate of the casing, as set forth.



3. The combination of a bright plate or disk with the hammer of the striking mechanism, with the finger-wheel, and with an opening in the face-plate of the case, substantially as described, whereby the motion of the hammer can be observed, even if the sound of the bell should not be heard.

4. The combination of a lever-clamp, constructed substantially as described, with the lid of a receptacle containing transfer-tickets for the purpose of facilitating the operation of tearing off said transfer-tickets, substantially as set forth.

165,930. ESCAPEMENTS FOR WATCHES. J. B. Hopkins, Washington, D. C., assignor of one-half his right to Wm. D. Colt, same place. [Filed July 14, 1875.]

Brief.—A stop mechanism, as set forth in the claim, is employed to prevent overbanking of the balance.

165,800.

In combination with the balance-wheel A, the pin *a'*, secured within and projecting downward from one of its arms *a*, the collar B, journaled upon the staff of said balance-wheel, and provided with the arm *b*, which may be caused to engage with said pin *a'*, and the stop-spring D, fixed to some relatively-fixed portion of the watch movement, so as to engage with and arrest the motion of said arm *a*, substantially as and for the purpose specified.

165,801. BARREL-ARBORS FOR WATCHES. J. R. Hopkins, Washington, D. C., assignor of one-half his right to Wm. D. Colt, same place. [Filed June 9, 1876.]

A going-barrel attached to or upon a staff which works in a hollow winding-arbor, and has its principal bearing in the same, substantially as and for the purpose specified.

165,802. FARE-REGISTERS. W. H. HOPKINS, New York, N. Y. [Filed May 26, 1876.]

Brief.—Sliding trigger attached to a swinging plate can be placed in position to act upon any one of the sets of register-wheels, registering fares of different amounts.

1. The sliding trigger B, moving in a guide-slot in the front plate of the case C, in combination with two or more levers, *g*, *g'*, and corresponding registering-wheels F F', substantially as shown.

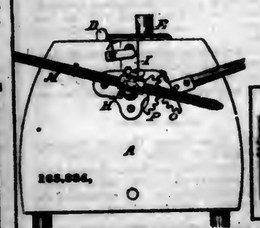
2. The sliding trigger E and hinged front plate D of the case C, in combination with the registering devices F F' F'', one or more, and with a bell and hammer or other alarm, substantially as set forth.

3. The sliding trigger E and hinged front plate D of the case C, in combination with the registering devices F F' F'', one or more, and with the general registering mechanism J K, substantially as and for the purpose shown and described.

165,803. METHODS OF IMPOSING AND PRINTING FROM NEWSPAPER FORMS. William D. Hughes, Philadelphia, Pa. [Filed Sept. 18, 1874.]

1. The method hereinbefore described of perfecting from one form at one impression two newspapers, each of which shall contain news or other matter not in the form when the first side of the two papers of each impression was printed, namely, by inserting before printing the second side of double sheets the later news or other matter in two opposite pages of the form from which the first side of the double sheets has been previously printed, the said form comprising all the pages of the newspaper.

2. The method of facilitating the issue of newspapers, which consists substantially as hereinbefore described, in putting all the pages of the paper to press and printing one side of double sheets in advance of the insertion of the latest news or other matter, then inserting such later matter in duplicate in the same form, and printing the second side of the double sheets, the latest news or other matter thus inserted appearing in both copies of the paper perfected at one impression.



165,804. BUTTER-WORKERS. Moses Hutchinson, Owatonna, Minn. [Filed June 7, 1876.]

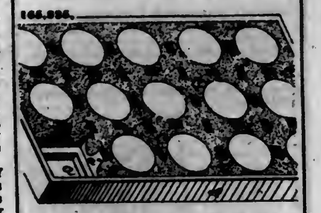
Brief.—A mounted shell or barrel, horizontally fixed, semi-cylindrical, the upper part narrowing in straight lines; a longitudinal axial shaft, carrying a dasher at its periphery, and vibrating between the angular parts of the shell; an external crank-shaft and gearing; also, a double lever hald adjustably within a sleeve removably attached to the main shaft for optional use, the top having descending pins to receive the impact of the forming butter, and wedged in by a blade, that also serves as a break for the current.

1. In the butter-worker, substantially as herein described, the chamber B, having a rounded bottom, *b*, inclined sides *b'* and *b''*, and cover C, attached as shown, and provided with pins *c* and ventilator E, the whole combined substantially as and for the purposes set forth.

2. The shaft F, constructed and carrying the paddle *g*, as described, and journaled or pivoted and combined with the plates H and I, wedge I', and arm K, substantially as and for the purposes set forth.

3. In the butter-worker, substantially as herein described, the shaft F, the detachable sleeve I, and double lever-arm M, arranged and combined with the paddle G *g*, so that a vibratory motion of the paddle may be easily produced, substantially in the manner and for the purposes set forth.

4. In combination with the mouth of the chamber B, formed by the beveled edges of the sides *b'* and walls A, the cover C, with beveled edges *c*, and wedge D, substantially as and for the purposes described.



5. The combination of arm N, segment-gears O P, and shaft F F' and paddle G, substantially as and for the purposes set forth.

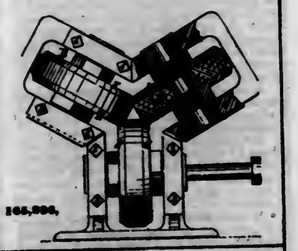
6. In a butter-worker, substantially as described, the combination of the rounded bottom *b*, sides *b'* *b''* and cover C *c c'*, wedge D, ventilator E, shaft F F' and paddle G *g*, whereby a free air-space is allowed over the cream, and all right-angled points are obviated, substantially as described.

165,805. ILLUMINATING-TILES. T. Hyatt. New York, N. Y. [Filed July 3, 1876.]

Brief.—An illuminating paving or roofing tile in which the cross-bars have the form of inverted arches, the abutments of said arches being flush with the upper surface of the tile, and in connection with a filling of cement and emery, and the illuminating-lenses form the wearing-surfaces.

165,806.

1. An illuminating-tile, A, provided with cross-bars *a'* and *a''*, that have the form of inverted arches, the abutments *a''* of which arches are flush with the upper surface of said tile, substantially as and for the purpose specified.



2. An illuminating-tile having a portion of its upper surface composed of emery combined with cohesive material, substantially as and for the purpose shown.

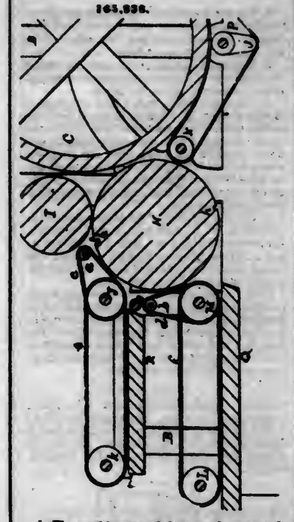
165,806. CANDY-SPINNING. S. B. Hymer, Terre Haute, Ind. [Filed Apr. 14, 1876.]

Brief.—The candy is fed to the space between the touching wheels. This space may be of any contour. Wheels have a central disk (which touches the candy) of wood or rubber.

1. The combination of the three wheels B, arranged to revolve together by frictional contact at or about one hundred and twenty degrees with respect to each other, substantially as and for the purpose described.

2. A wheel for spinning candy, having its face made of rubber, wood, or other non-conducting and non-adhesive material, substantially as and for the purpose described.

165,807.



165,807. APPARATUS FOR HYDRATING GASES. Barton H. Jenks, Philadelphia, Pa. [Filed June 10, 1875.]

In an apparatus for hydrating gases, the combination of a gas-generator, an absorber provided with a series of perforated separating-plates, having overflow-spaces on alternate sides or ends of the absorber, or both, a water-supply pipe leading into the top of the absorber, an exit-tube for the gas, having its exterior opening within the water-supply pan of the absorber, and a water-cooled pipe connecting the bottom of the absorber with a storage-tank, substantially as set forth.

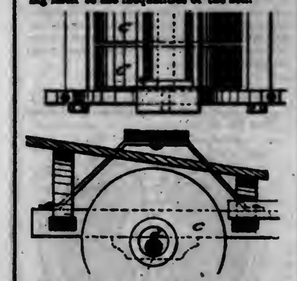
165,808. ROTARY PRINTING-PRESSES. C. Kahler, Chicago, Ill., assignor to himself, M. C. Rhines, W. L. Ogden, W. Bryerts, and Philipp Emrath, same place. [Filed Apr. 17, 1875.]

165,836.

1. The combination of the tapes I, supported upon the shafts N, O, and P, with the main cylinder C and the cutting-cylinders H I, for holding the paper against the main cylinder, giving uniform margins, and steadily delivering it to the discharge apparatus, substantially as specified.

2. The tapes *e*, in combination with the nipper-belts *c* and the cylinder H, substantially as and for the purpose described.

3. The combination of the tapes *d* with the nipper-belts *f*, cylinder H, and fly-board Q in a double-delivery press, elevated for taking the lower paper from the cylinder at the quarter turn from the center, substantially as set forth.

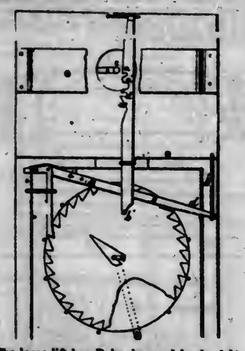


4. The combination of the tapes *e d* and nipper-belts *c f* with the cylinders H I, substantially as and for the purpose specified.

5. The steady-bearers *i* on the type-cylinder, between the curved stereotype-plates, to prevent the impression-cylinder from pressing into the spaces between the plates and spaces left for margins, and for preventing blurred printing, and giving a steady and uniform motion between the type-cylinder and impression-roller, substantially as specified

---

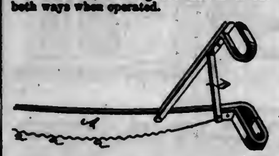
165,839. LAND-ROLLERS. Julius A. Kesler, Olatha, Kans. [Filed June 9, 1875.]



Brief.—The roller, as a whole, is made up of short sections mounted upon a shaft of much smaller diameter than the opening in the center of the roller, so that each section will act independently of all the others, thus adjusting itself to the inequalities of the soil.

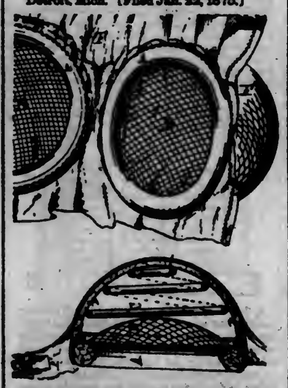
In a land-roller, a series of wheels or rollers, C, having enlarged central apertures *d d*, and revolving around a common axis, substantially as and for the purposes herein set forth.

165,840. CLOCK-CALENDARS. Lathe S. Kellogg, Leon, N. Y. [Filed May 22, 1875.]



Brief.—The lift-bar is carried up by the revolution of the hour-hand shaft, and actuated by its connecting devices, the ratchet-wheel carrying the calendar. The incline below the notches permits the bar to drop to its first position.

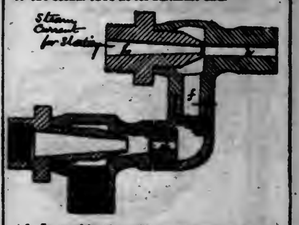
The loose lift-bar B, having end hooks *b b'*, and notches *a a' a''*, combined in a calendar-clock, with the hour-hand shaft and lever D, as and for the purpose described.



165,841. HAY-KNIVES. Russel Kellogg, Battle Creek, Mich., assignor to himself and James D. Kellogg, same place. [Filed June 18, 1875.]

Brief.—The claim sufficiently points out the invention—corrugating the edge to form rounded teeth, enabling the knives to cut both ways when operated.

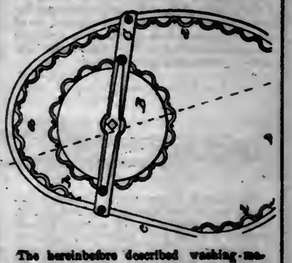
The hay-knife A, having its edge corrugated to form the rounded teeth *a a*, and sharpened its entire length, so that the knife will cut both ways, substantially as herein set forth.



165,842. BONGE-FORMS. Elizabeth Lesteh, Detroit, Mich. [Filed Jan. 22, 1875.]

A bosom-form, consisting of the upholstered ring A, straps B D E, and spiral spring C, constructed and arranged substantially as and for the purpose set forth.

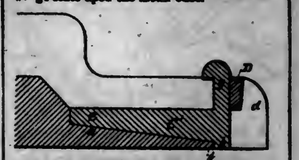
165,843. INJECTORS. Geo. H. Little, Peabody, Mass. [Filed Aug. 20, 1874.]



Brief.—Combines with an injector, an ejector, *f f' h*, constructed as shown, with the bore *h* of continuous larger diameter than the smaller end of the continuously-tapering bore *g*, the ejector being applied and arranged in relation to the injector, as shown and described.

1. In combination with an injector, an ejector, *f f' h*, constructed as shown, with the bore *h* of continuous larger diameter than the smaller end of the continuously-tapering bore *g*, the ejector being applied and arranged in relation to the injector, as shown and described.

2. In combination, the steam-tube for forcing water, the auxiliary tube for drawing water at starting, and the priming-chamber *c*, all substantially as shown, and for the purpose described.

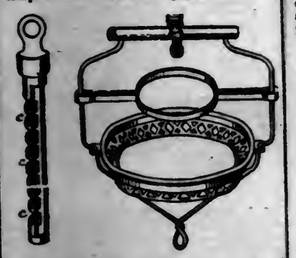


165,844. WASHING-MACHINES. M. Loughran, Allegheny, Pa. [Filed June 19, 1876.]

The hereinbefore described washing-machine, consisting of the tub A, of an oval or egg-shaped form, having a small end, *a*, and a larger end, *b*, and fattened side *c*, said tub being provided with a corrugated cylinder, B, pivoted in the smaller end *a*, substantially as and for the purpose set forth.

165,845. RAILROAD-RAIL CHAIRS. Richard C. Ludlow, St. Louis, Mo. [Filed June 30, 1875.]

Brief.—A rail-chair consisting of a metal seat, the upper outer edge of which hooks over the outer curve of the tread of the rail, and the inner base of which forms an inclined surface, upon which rests an adjustable clamp, having its upper portion made to hook over the inner upper edge of the base of the rail; said clamp-plate being tightened up to the rail by a wedge inserted between it and two wedge-seats upon the metal base.



1. The bed-plate having the flange C, recess *c*, under cut *b*, and hooks or wedge seats *d*, substantially as specified.

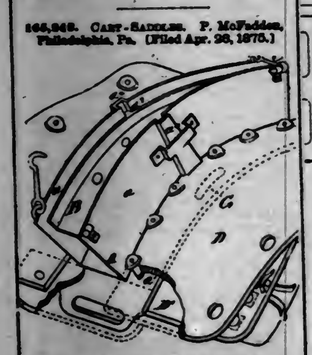
2. The lever-jaw C' having the tongue *e*, hook-flange *g*, and catch-flange *h*, substantially as specified.

3. The combination with the flanged and recessed bed-plate of the lower jaw C', having the tongue *e* and the key D, substantially as specified.

165,846. EXTENSION-FIXTURES FOR LAMPS AND CHANDELIERS. George R. Lyon, Chicago, Ill., assignor to R. G. Case, same place. [Filed Jan. 13, 1875.]

Brief.—The hook engages in the slots, and holds the lamp at different elevations. The spring insures the engagement of the hook by horizontal pressure, and aids to support the lamp when the hook is disengaged.

The combination, with a lamp or chandelier frame, of the rod B, having the hook *a*, and sleeve C, having slots *c*, the whole being inclosed in the spiral spring D, as and for the purpose set forth.



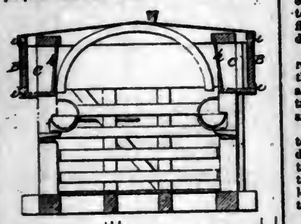
165,847. DOOR-CHECKS. James H. McClymonds, Winchester, Ky. [Filed June 9, 1875.]

Brief.—The claim sufficiently points out the invention. The beveled and notched tip of one bar catches into a spring-box arranged upon the other, to hold the door automatically against jarring or slight pressure.

The plate C, carrying the outwardly projecting box, or case D, having pivoted plate E, downward projection *h*, and spring *e*, in combination with the plate C, carrying catch-bar J, having notch *d*, and beveled end *c*, all substantially as and for the purpose herein set forth.

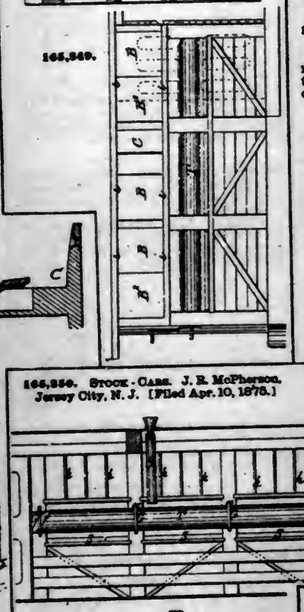
165,848. CART-SADDLES. P. McFadden, Philadelphia, Pa. [Filed Apr. 26, 1875.]

1. The cart or dray saddle-bridge A, having the lateral flanges *g* cast upon and forming a part thereof, for the attachment of the hames, substantially as described.



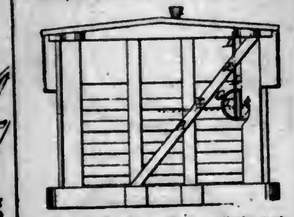
2. The yielding chain-support B, in combination with the saddle-bridge A, containing springs upon which said support rests, substantially as described.

3. The adjustable pad-shields D', in combination with the housings D, substantially as specified.



4. The improved pad G' for cart-saddles, having the internal divisions *g' g'*, substantially as and for the purpose described.

165,849. STOCK-CARS. J. R. McPherson, Jersey City, N. J. [Filed May 25, 1875.]



The combination, with a stock-car having a crib or feed-box, C, under the roof thereof, and built partially within and without the walls of the car, and occupying the wall-space above the water-troughs, of the sliding sectional doors B, the ways *i i* therefor, and the closed wall-sections B' between the wall-posts and the ways, substantially as and for the purpose herein set forth.

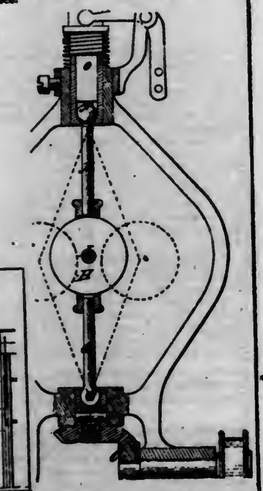
165,849.

165,850. STOCK-CARS. J. R. McPherson, Jersey City, N. J. [Filed Apr. 10, 1875.]

1. The combination, with the wall of a stock-car and the recessed studs thereof, of a trough rotatable within a circle to bring it partially within the space occupied by the wall-studs when in position for watering stock, and nearly wholly within the inner wall line when in position to discharge its contents into the sheds, whereby a trough without a side line of hinges is combined with the car-wall in a manner to leave the wall-posts in contact while occupying the least room within the car, substantially as herein set forth.

2. The combination of the water-trough to revolve about its own axis-line of fixed embracing guides C and the side walls of the car, substantially as set forth.

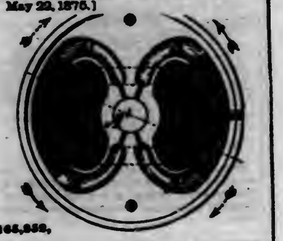
3. The combination of the axially-rotating water-trough with embracing guides and stay-loops *e*, substantially as set forth.



4. The combination, with a fixed water-shed, S, of a trough, T, rotatable about its own axis within a circle to bring it partially within the space occupied by the wall-studs when turned down to water the stock, and with its inner edge a carried by said rotation down to the water-shed flange *f*, whereby a projecting trough-flange is dispensed with, and the trough rendered much lighter.

5. The combination of water-trough made to revolve about its own axis, fixed guideways, the inner wall of the car, lever I, guide-bar A, and stops *c d*, whereby to turn and lock the trough in either its horizontal or vertical positions, substantially as set forth.

6. The combination of a water-trough made to revolve about its own axis, fixed guideways, directing-lever, stop-shoulders *b* in the wall of the car, against which the inner edge of the trough abuts, and a stop-pin, *c*, whereby to lock lever and trough into its horizontal position, substantially as set forth.

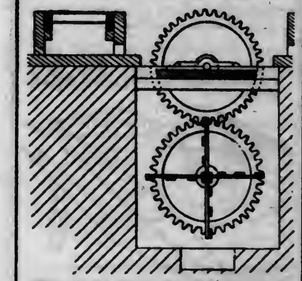


165,851. STEAM-GOVERNORS. Wm. Main, Stratford, England. [Filed July 18, 1874.]

Brief.—The center of gravity of the ball is not within the axis of rotation. The ball is thrown out more and more as the speed increases.

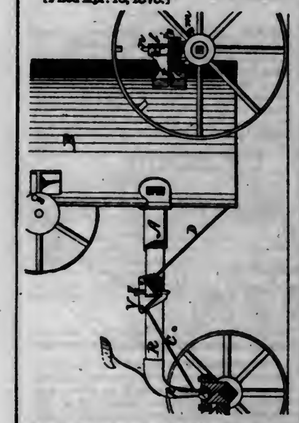
The combination, with the pivoted spindle G and the spindle M, connected with the valve-operating spindle O, of the single divided governor-ball H K, pivoted between the spindles, substantially as described, and the whole constructed to operate in the manner and for the purpose specified.

165,852. LOOMS PULLEYS FOR SHEDDING. Chas. H. Mellor, Philadelphia, Pa. [Filed May 20, 1875.]



165,852.

HELIOTYPE RELIEF PROCESS. JAMES R. OSGOOD & CO. BOSTON



The combination, in a loose pulley, of an oil-reservoir formed within or attached to the pulley and curved oil channels or guides leading from the outer portion of the oil-reservoir to the inner surface of the hub, substantially as set forth.

165,853. LIQUID-MIXERS. John B. Meyers, New Orleans, La. [Filed May 22, 1875.]

The combination, with a vat and rotary mixing-wheel, of a series of supply-boxes, B, having channel-ways leading into vat and discharging on the wheel, as and for the purpose described.

165,854. CARRIAGES FOR PORTABLE ENGINES. Cassius M. Miller, Phelps, N. Y. [Filed Apr. 16, 1875.]

1. In a carriage for portable engines, the combination of a socket upon the front axle, with the reach E having a bifurcated rear end and downwardly-bent front end terminating in a ball adapted to operate in connection with the axle-socket, substantially as and for the purpose set forth.

2. In a carriage for portable engines, the rods C D, combined with the boiler, the reach, and the block V, substantially as and for the purpose set forth.

3. In a carriage for portable engines, the combination of the forward axle and wheels, with the bent reach E and the screws *v v*, substantially as and for the purpose described.

4. In a carriage for portable engines, the tool-box A, combined with the boiler B and the reach E, and arranged between the bifurcated arms of the reach, substantially as described, for the purpose of strengthening the latter and forming the whole or a part of its connection to the boiler.

5. In a carriage for portable engines, the set-screws *m*, combined with the draft-wheels and axles, substantially as and for the purpose described.

6. In a carriage for portable engines, the combination of the clips *c*, rear axle, and clamping-screws *o w*, substantially as and for the purposes described.

7. In a carriage for portable engines, the brackets *b*, provided with the tubular arms *b'*, in combination with the pintles *a*, set-screws *f*, and carriage-springs, substantially as and for the purpose described.

8. In a carriage for portable engines, the combination of the carriage-springs, axle, and a locking device to lock the springs at will and prevent them from operating, substantially as described.

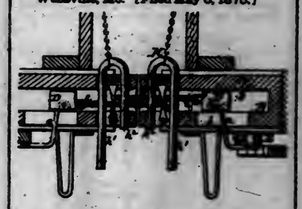
9. In a carriage for portable engines, the combination of the draft-wheels and axle with a locking device to lock the wheels to the axle, substantially as described.

10. In a carriage for portable engines, the combination of an arching reach, with the forward wheels adapted to swing under the reach, and with a locking device by which either forward wheel can be locked to the reach to support the latter and keep the wheels from moving, substantially as described.

165,855. OVENS FOR FIRING POTTERY. T. W. Minton, Stoke-upon-Trent, England. [Filed Feb. 6, 1874.]

Brief.—A drying-chamber is located above the burning-oven.

The combination of a series of fire-places, the vaulted oven, into which the products of combustion ascend from the fire-places, the oven-floor provided with openings, horizontal flues, upright flues in the walls of the oven, a second chamber or upper oven, into which the upright flues project, and its chimney, these members being constructed and operating substantially as set forth.



165,856. SASH-HOLDERS. Patrick Mullane, Davenport, Iowa. [Filed June 19, 1875.]

Brief.—A roller, held in a pivoting wire loop, is arranged to work in a notch with unequally inclined sides cut in the sash, and is locked by dropping into a suitable notch of the window-frame; there being also a groove and hole in the side bar of the sash, and an outwardly-extending cord and tassel, by which the device is operated.

1. The combination of the roller D, the pivoting wire loop E, and the cord F with the notch C, having unequally-inclined sides, the groove *c'*, and the hole *c''*, formed in the side bar of a window-sash, B, and with the casing A, substantially as herein shown and described.

165,857. CAR-COUPLINGS. L. R. Musick, Wellsville, Mo. [Filed May 6, 1875.]

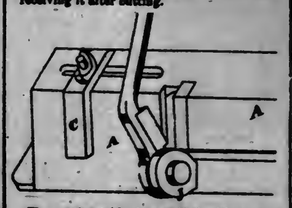
1. A draw-head, B, provided with projecting curved or beveled side flanges C C, substantially as and for the purposes herein set forth.

2. The combination, in a car-coupling, of the sliding block D, with the coupling-link *d* connected thereto, the rod *e*, lever E, bent rod *h*, and lifting-rod G, all substantially as and for the purposes herein set forth.

3. The self-acting gravitating-latch *h*, pivoted to the bottom of the draw-head, in combination with the U-shaped pin H, all substantially as set forth.

165,858. MILK-STRAINERS. Fred L. Oliver, Friendship, N. Y. [Filed May 17, 1875.]

Brief.—The cover is funnel-shaped and reversible. A flange upon its side fits the cylindrical vessel. The neck of the funnel is cylindrical, its mouth being a strainer. Within this neck is let down by its ball a short cylinder, having a coarser preliminary strainer on its upper end.

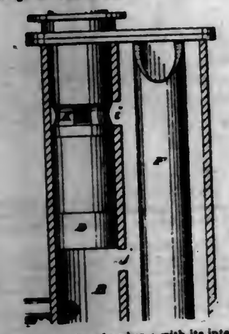


1. A funnel-shaped strainer, B C D, with an annular flange, E, attached to its under side, and tightly fitting the interior of the mouth of the can A, as and for the purpose set forth.

2. The removable preliminary strainer F G H, constructed as described, and inserted below the margin of the cylindrical neck C of the funnel, for the purposes set forth.

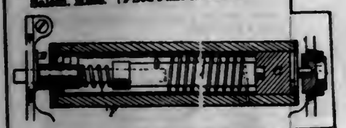
165,859. MACHINES FOR CUTTING PRINTERS' LEADS. John A. T. Overend, San Francisco, Cal. [Filed May 11, 1875.]

Brief.—The face of the cutting-table is inclined, and in two planes, the higher part supporting the lead before cutting, the lower part receiving it after cutting.



The cutting-table A, provided with an inclined face having two different levels, in combination with the longitudinal strip B and adjustable stop C, all constructed to operate substantially as and for the purpose set forth.

HELIOTYPE RELIEF PROCESS. JAMES R. OSGOOD & CO. BOSTON



165,860. HEATERS AND FEED-PUMPS FOR BOILERS. John A. T. Overend, San Francisco, Cal. [Filed June 9, 1875.]

Brief.—The water is heated in the side vessel by steam. It passes into the pump-cylinder through two openings. The upper opening connects with the bottom of the cylinder through the hollow plunger. The plunger descends, closes the two openings, and ejects the water through the bottom exit.

The condensing-chamber *c*, with its interior pipe F, in combination with the pump-chamber B, having the two passages *i* and *j*, and the chambered plunger D, with its passage K, substantially as and for the purpose herein described.

165,861. CURTAIN-ROLLERS. P. W. Phillips, Salem, Mass. [Filed June 11, 1875.]

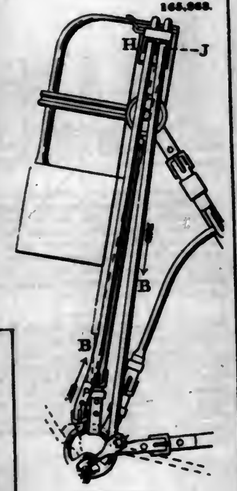
In combination with the shade-roller and shaft, the spring F and sleeve D, provided with a lug, *d*, said sleeve fitting over the end of the shaft, and extending through the cap E, which is provided with a ratchet or stops, *a*, with which the lug or pin *d* is automatically engaged and disengaged, as described, for the purpose of locking or unlocking the shade-roller upon its shaft, substantially as described.

165,862. CARBURETERS. John A. Pierce, Philadelphia, Pa. [Filed June 9, 1875.]

Brief.—The air-reservoir, stationary and open-bottomed, is placed within a tank of water. A back-pressure pipe, having a stop-cock, extends from the top of the carburetor to the top of the air-reservoir.

1. The combination of a condensing air-pump communicating with a stationary open-bottomed air-reservoir, a water-tank surrounding the air-reservoir, a connecting air-pipe, and a hydrocarbon chamber, substantially as set forth.

2. The combination of a stationary open-bottomed air-reservoir surrounded by a water-tank, an air-pipe connecting the air-reservoir with the lower portion of a hydrocarbon-chamber, and an independent back-pressure pipe and valve connecting the upper portions of the air-reservoir and hydrocarbon-chamber, substantially as set forth.

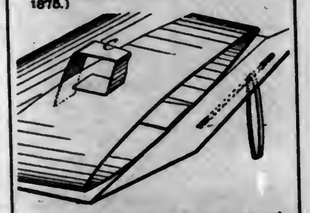


165,863. BRIDLE-BITS. Wm. A. Pierson, Valley Forge, Pa. [Filed June 12, 1875.]

1. The straps B, each connected to one side of the bit, extended over the headstall, and passed through a pulley-block on the other side of the bit, substantially as and for the purpose set forth.

2. The combination, with the extended straps B B, of the two chains G, substantially as and for the purpose set forth.

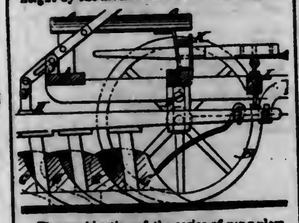
3. The combination, with the extended straps B B, of the boxes H, and bearings J, substantially as and for the purpose set forth.



165,863.

165,864. SAFETY ATTACHMENTS FOR POCKET-BOOKS. Thaddeus Potter, Jackson, Miss. [Filed May 22, 1875.]

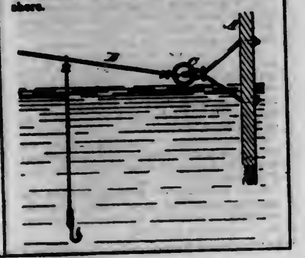
The combination, with head E and plate A, having rolled-up edges B, of the spring-slide C, having hooks D pivoted in the lower end of slide, and projecting through edges B, as and for the purpose specified.



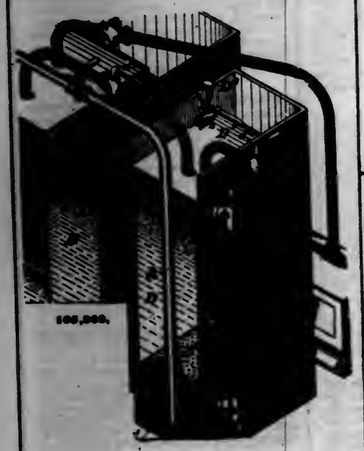
165,865. DOCUMENT-ENVELOPES. John Pritchard, Maysville, Mo. [Filed May 22, 1875.]

A document envelope or holder, composed of interior fold or pocket, open at the sides and closed at the ends, being attached to the inclosing-wrapper firmly at one side and by an adjustable connecting-band at the other, to expand and contract with the thickness of the papers, substantially as and for the purpose set forth.

165,866. GANG-PLOWS. Eugene P. Pulliam, Palmyra, Mo. [Filed Feb. 20, 1875.]

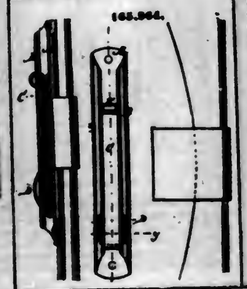


Brief.—The several plow-beams are rigid upon a rear cross-bar operated by a lever. In front they move vertically in curved and slotted hangers, having a cross-bar or yoke hinged to them, which is itself hinged to a lever, by which the plows are held up at any height by the inverted teeth of a ratchet-post.

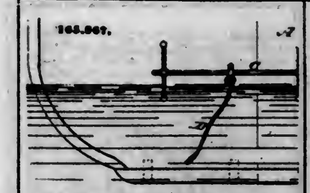


The combination of the series of gang-plow beams F, rigid rear bar H, pivoted front bar L, and slotted socket-arms E, as shown and described, to enable the altitude of all the beams to be simultaneously regulated, in the manner set forth.

165,867. FISHING AND SIMILAR FLOATS. Wm. T. Quinn, Paterson, N. J., assignor of two-thirds his right to Will Hague and J. Hague, same place. [Filed June 5, 1875.]



Brief.—A board loaded below, to sit upright in the water, is hung to a line, so as to be quartering, or at an angle with the line, for the current to carry it across a river or away from shore.



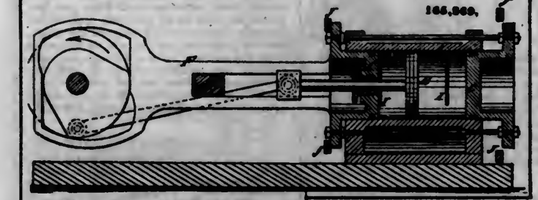
165,868.

165,864.

165,867.

The combination of a draft-line, D, and an attaching-rod, C, with a float, A, when constructed and arranged substantially in the manner described.

165,868. CUTTER-HEADS. S. P. Randolph, Tehama, Cal. [Filed Mar. 20, 1875.]



Brief.—The cutter is provided with side lips on its cutting-edge.

The end-tongued matching and flooring cutter A, having on end side lips and angular edge, as shown and described, for the purpose specified.

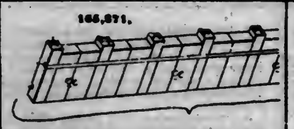
165,869. STEAM-ENGINES. Wm. Read, St. Cloud, Minn. [Filed Nov. 14, 1874.]

165,869.

1. The movable cylinder heads C C and mechanism, substantially as herein described, for causing the same to follow the piston and stop when they reach the steam-ports, in combination with the cylinder and piston of a steam-engine, for the object stated.

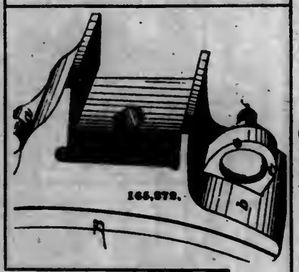
2. The combination of stops J with the movable cylinder-heads, arranged to fall behind them when steam enters the cylinder, and hold them against the back pressure of the steam, substantially as specified.

165,870. STEREOSCOPIC-PICTURE HOLDERS. James D. Rice, Philadelphia, Pa. [Filed May 31, 1875.]



A pivoted stereoscopic-picture holder, reversible upon its axis, to expose the opposite sides, respectively, of the card to the same point of view, substantially as described.

165,871. NUMBERING PRINTING-PLATES. Thos. Richards, Sidney, Australia. [Filed May 25, 1875.]

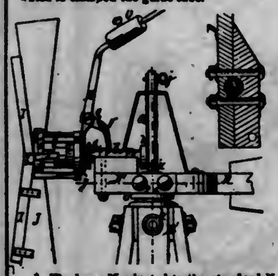


Brief.—A number of ordinary printing-types are arranged at a proper distance apart, and the spaces between them filled with blocks. The types and blocks are grooved and bound together by a rod or wire, thereby converting the types and blocks into a continuous bar. Several of these bars, having the proper figures, are bound together, and may be used in an ordinary printing-press.

165,871.

A printing-plate for numbering coupons, &c., consisting of one or more bars, B, each composed of types A and blocks *a*, arranged alternately, and secured together by means of longitudinal rods *b*, adapted to recesses formed in the sides of said types and blocks, as herein set forth.

165,872.



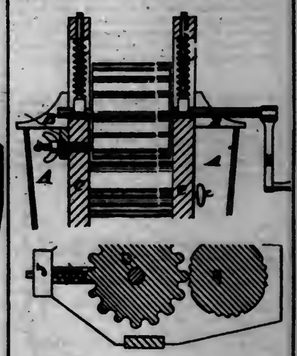
165,872. BRAKE-SHOES. Wm. Robinson, Jr., Wilmington, Del., assignor to himself and Saml. Harris, same place. [Filed Apr. 24, 1875.]

A brake-shoe having recess *a* at the upper end and slot *b* at the lower, in combination with sole B, having top hook *d* and ear *e*, as and for the purpose specified.

165,873. WEIRSHELLS. Robt. N. Rockwell, Glenwood, Iowa. [Filed Feb. 12, 1875.]

Brief.—The sails are hinged to arms projecting from the hub, and held at the required angle through the means of an adjustable weight and a sleeve connected to said sails. The turn-table is made in two parts, between which is clamped the guide-tube.

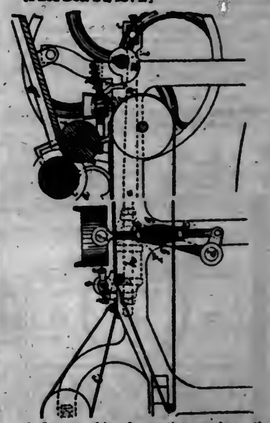
1. The lever M, pivoted to the standard N, and provided with the adjustable weight O, the sleeve L on the shaft G, the disk, bars *f*, and arms *e*, in combination with the sails J, hinged to the shaft-arms I, for governing the positions or angles of said sails, substantially as described.



2. The annular-grooved bearing B, provided with the quadrangular pendent flange B′, to each face of which the top of a tower-strut, A, is secured by a bolt, *b*, substantially as described.

3. The wear-plate C, provided with the annular bead *a*′, in combination with the bearing B, having an annular groove, *a*, substantially as described.

4. The guide-tube F, secured to the turn-table by clamping it between its parts D and D′, substantially as described.

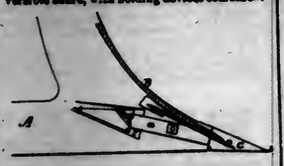


165,874. WASHING-MACHINES. Orville V. Roe, Chico, Cal. [Filed May 17, 1875.]

Brief.—The lower cylinder is held in a fixed position by a set-screw at one end. The upper roller is adjusted by side plates and set-screws.

The tub A and cylindrical surface D, provided with the set-screw *c*, in combination with the frame B, provided with head-pieces C, adjustable roller G, plate *l*, and screw *e*, all constructed and combined to operate substantially as and for the purpose set forth.

165,875. CRACKER-MACHINES. James W. Roger and Augustus Roger, Buffalo, N. Y. [Filed Dec. 24, 1874.]

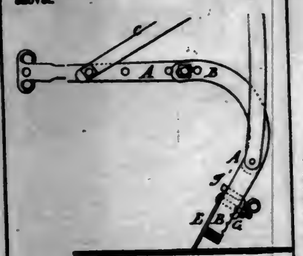


1. In a machine for cutting crackers, the combination of the elastic attachment of the connecting-rod *e*, the crank-shaft *d*, adjustable strap F, and cutting-frame E, all substantially as and for the object specified.

2. In a machine for cutting crackers, the feeding-hopper O, having the lug *f*, in combination with the cam *n*, shaft *i*, and springs *k*, substantially as and for the purpose described.

3. In a cracker-cutting machine, in combination with the fingers *p p p*, the swinging bar *s*, for raising and lowering said fingers simultaneously, as and for the purpose specified.

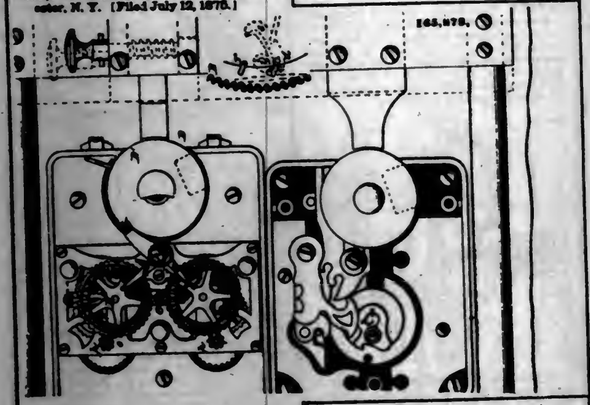
165,876. PLOWS. Jacob B. Sample, Liberty, Mo. [Filed May 14, 1875.]



Brief.—Reversible point and triangular reversible share, with holding devices combined.

The point C, having symmetrical wedge-shaped extremities with lateral grooves, in combination with the land-side A, having depression F, the reversible triangular share D, the grooved wedge E, and the mold-board, substantially as and for the purpose specified.

165,877. PLOWS. Oliver P. Sanford, Dadeville, Ala., assignor to himself and Jacob Henry, same place. [Filed May 28, 1875.]

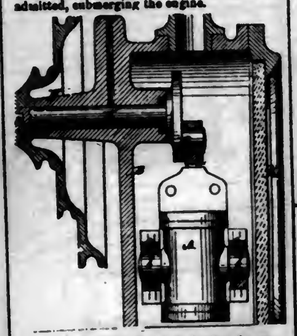


Brief.—The curved beam passes between the members of the double standard, the curve of both being equal. Device for securing the shovel.

1. The combination of the beam A, having its rear end curved downward, the U-shaped adjustable standard B, and the adjustable handles C, with each other, substantially as herein shown and described.

2. The combination of the washer G, provided with a tongue and cross head, *f*, with the notched U-shaped standard B, the plow-plate E, and its bolt F, substantially as herein shown and described.

165,878. TIME-LOCKS. Jas Sargent, Rochester, N. Y. [Filed July 12, 1875.]



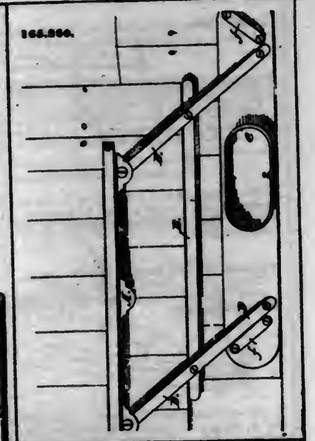
1. The bolt D of a time-lock, constructed in two parts, D' D², each having an independent turning movement, and connected together by a spring, *f*, substantially as described, whereby the time-movement may be set while the door-bolt is held in the unlocked position.

2. The combination, with the mainspring-arbor, of the dial-wheel connected with said arbor directly by means of the pinion *p*, or by intermediate gearing, whereby the time mechanism of a time-lock is wound by the turning back or setting of the dial-wheel, substantially as described.

3. The combination, with the dial-wheel H and pallet *s*, of the stop pins *r u*, for stopping the movement of the time mechanism when the lock is unlocked, substantially as described.

165,879. HYDRAULIC MOTORS. A. Schmid, Zurich, Switzerland. [Filed May 4, 1875.]

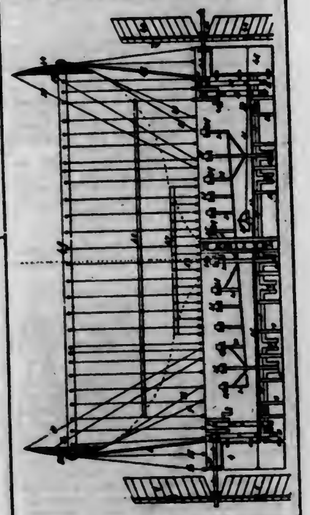
Brief.—The engine is inclosed in an air and water tight case, to which the water is freely admitted, submerging the engine.



The oscillating cylinder A, having the convex slide-face I, provided with ports or passages *g g*, in combination with the closed box or casing B, constructed with the inlet and outlet passages G and H, and the internal concave face *f f*, through which the outlet-passage H passes, and communicates with the oscillating cylinder by the ports *g*, substantially as shown and described.

165,880. SHINGLING-GAGES. C. Schneider, Charles City, Iowa, assignor of one-half his right to John F. Spaulding, same place. [Filed Sept. 15, 1874.]

Brief.—Three courses of shingles can be laid at each passage of the operator over the roof of a building by means of three horizontal and adjustable bars, one of which is provided with a nail-holder and angular rests at either end, in connection with two cross-bars having swiveled joints at their intersections.

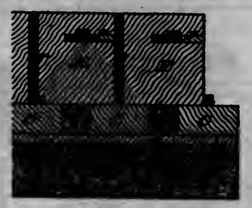


The herein-described shingling-gage, consisting of the bar C, provided with the nail-holder *e*, and adjustable rests *f f*, bars A and B, and cross-bars D D, constructed and operating as shown, and for the purpose specified.

165,880.

165,881. STEERABLE AIR-SHIPS. Frederick W. Schroeder, Baltimore, Md., assignor to himself and George W. Gail, same place. [Filed July 1, 1875.]

Brief.—A ship made of woven wire or wicker-work, provided with front and rear propellers, and front and rear rudders for steering, together with side oscillating wings, the said propellers and wings being connected with and operated by a revolving shaft actuated by any suitable power. To this ship is attached a balloon secured by end caps, a girdle, and steel bands, so as to form a part of the ship, and afford the elevating power.



1. The combination of the girdle 49, rings 47 and 48, and the ship constructed of woven wire, covered by canvas, and attached by ropes to the balloon through the said connections, substantially as described.

2. The combination, with the ship, of the end caps 50 64, and the supporting-rods 5 46, held in place by stay-ropes, as and for the purpose described.

3. The combination, with the main shaft 15, provided with cranks and couplings 14 34, of the propellers 1 44, and the side wings having ribs 28, and the extension 61 connecting with the cranks of the main shaft, as and for the purpose set forth.

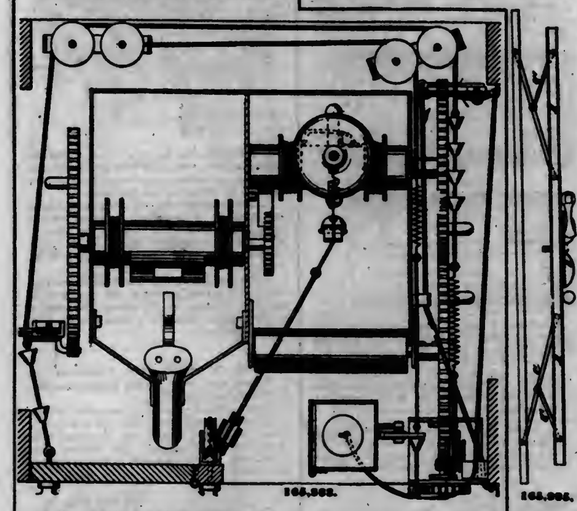
HELIOTYPE RELIEF PROCESS. JAMES R. OSGOOD & Co BOSTON

165,882. WOOD PAVEMENTS. Joseph J. Schroyer, Springfield, Ill., assignor of one-half his right to Charles A. Helms, same place. [Filed June 26, 1875.]

A wooden pavement composed of several layers of blocks superimposed upon each other, the upper tier of blocks being provided with recesses near their upper faces, into which petroleum and wet salt are introduced, and confined by a plug, substantially as described.

165,883. BOOKKEEPERS' HAND-RESTS. W. D. Sloan, New York, N. Y. [Filed Feb. 2, 1875.]

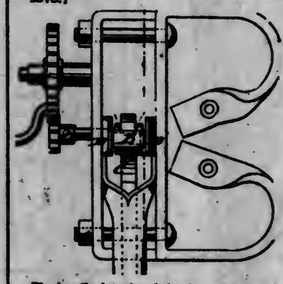
Brief.—The rest is clamped to one cover of a book, and is adjustable to any thickness by a lazy-tongs worked by rack-and-pinion movement.



1. An adjustable accountant's rest, constructed with a clamp or hold-fast, whereby it may be fixedly attached to the cover of a ledger or like volume, substantially as herein set forth.

2. In an adjustable accountant's rest, the base-plate A, constructed with the rabbet *a*, the circumferentially-grooved eccentric A', spring *c*, and thumb-piece *b*, the whole arranged for operation, in the attachment of the apparatus to a suitable volume, substantially as and for the purpose set forth.

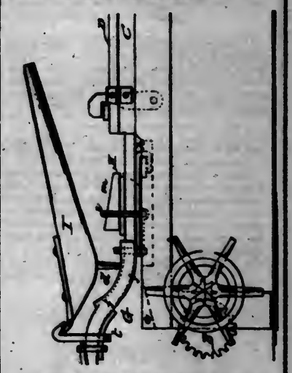
3. The links C, supplemental link or links C', spur-pinion F, ratchet-wheel G, and pawl *f*, in combination with the base-plate A and shelf or top plate D, the whole arranged for operation in the adjustment of the shelf or top plate, substantially as and for the purpose set forth.



165,884. BORING-ATTACHMENT. H. Seawright, Pottsville, Ohio. [Filed Mar. 20, 1875.]

A bench-plane, provided with the adjustable hinged part L, substantially as and for the purpose specified.

165,885.

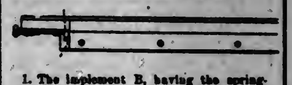


165,886. PEG-CUTTING MACHINES. J. F. Smith, Keokuk, Iowa. [Filed June 6, 1875.]

The bar C, slotted at *b*, having one pivoted straight and one unpivoted curved arm, combined with cam *a* and guide-case D, as shown and described, to enable both a peg and heel cutter to be simultaneously operated, as set forth.

165,887. MACHINES FOR BENDING CARRIAGE-POLES. Andrew G. Snyder, Ashtabula, Ohio. [Filed June 9, 1875.]

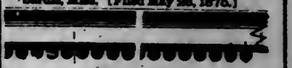
Brief.—The former has a double curve, and is connected with devices which give it a partial rotation in opposite directions.



1. The combination of the box C with bit D, screw E, former G with its attachments, ring *n*, chain *p*, and windlass B, all constructed substantially as and for the purposes herein set forth.

2. The combination of the box C with bit D, screw E, former G with its attachments, hook *i*, and lever L, all constructed substantially as and for the purposes herein set forth.

165,888. ATTACHING T-SQUARES TO DRAWING-BOARDS. William B. Stevenson, Philadelphia, Pa. [Filed Nov. 26, 1874.]



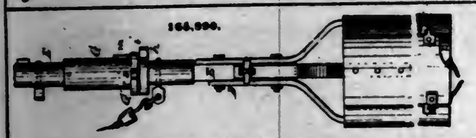
Brief.—The drawing-board is provided with a groove on two or more sides, in which is placed the slide attached to the T-square by a spring pressing the head of the T-square against the side of the drawing-board.

1. The implement B, having the spring-plate E, substantially as and for the purpose set forth.

2. The implement B, having the spring-plate E, combined with the drawing-board formed with the way or ways C, substantially as and for the purpose set forth.

165,889. LIST-ROOM FLOORS. J. M. Sale, Sardis, Miss. [Filed May 28, 1875.]

A list-room floor made of round elastic poles, attached at slight intervals to round joists, as and for the purpose specified.

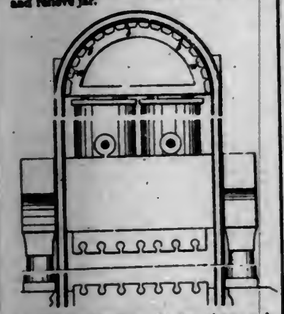


165,890. HARPY-APPARATUS. Cornelius Taylor, De Witt, Mo. [Filed May 21, 1875.]

Brief.—The bucket is made in three sections, two of which carry the cutting-bits, and are adjustably secured to the shaft by bolts and nuts. The third section is removable, and is secured to the shaft by a staple and key, and to the other sections by nuts. The shaft-coupling is a slotted flanged sleeve secured to the upper shaft-section, into which the lower section enters, said section having a bracket, which projects through the slot of the sleeve. A wedge-shaped ring surrounds the sleeve, and, when turned, condemn both sections together by bearing between the flange of the sleeve and the projection of the shaft.

1. In an earth-auger bucket consisting of two sections, A A, carrying the bits U C, and one removable section, B, I claim one or both of the sections A made adjustable up and down on the shaft, for the purposes herein set forth.

HELIOTYPE RELIEF PROCESS. JAMES R. OSGOOD & Co BOSTON.

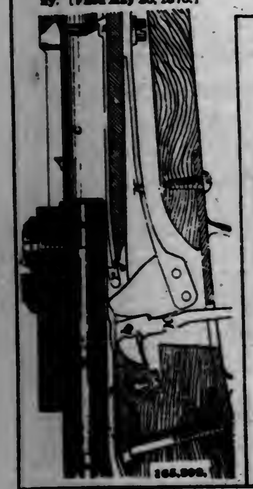


165,890.

2. The combination, with the auger-shaft sections E E', of the slotted sleeve G, having flange A, with slotted projection i, the loose collar G', with slotted projection i' and inclined upper edge, and the lug m, all substantially as and for the purpose herein set forth.

165,891. HYDRAULIC PRESSES. J. F. Taylor, Charleston, S. C. (Filed May 13, 1875.)

Brief.—The frame carrying the cross-head and lower platen consists of wrought-metal bands encompassing the same lengthwise of them. Wedges of wood are interposed between the bands and the bearing-surfaces of the cross-head and platen, to cushion the same and relieve jar.



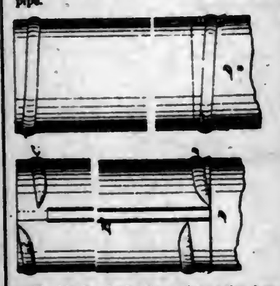
1. The combination, with the platen and cross-head, of continuous links of wrought metal, which encompass the said platen and cross-head lengthwise, and constitute of themselves the frame, and receive all the strain, of the press, substantially as described.

2. An elastic filling, in combination with the links and platen or cross-head, as and for the purpose set forth.

3. The wooden keys W, in combination with the links A A, and the cross-head or platen, having transverse ribs or tongues b as, and for the purpose specified.

165,892. BURNER-LOADING FIRE-ARMS. August F. W. Timmer, Cobleneo, Germany. (Filed May 28, 1870.)

165,893.



1. The button N, having square edges k, in combination with the breech block, and the breech having the counter-stops r, constructed to operate substantially as described.

2. The button N, having square edges k and notches l, in combination with the spring-catch o, breech block, and the breech having the counter-stops r, constructed to operate substantially as described.

3. The ejector R, having the hook p and projection r, in combination with the breech A, and with the breech-block B, having the channels s and the oblique channel t, substantially as described.

165,893. STOVE-PIPE JOINTS. George D. Umland, Osceola Mills, Wis. (Filed Mar. 29, 1875.)

Brief.—The lock of the longitudinal joint extends only to the lower end of the groove at one end of the section of the completed pipe.

The blank A for forming a pipe section, having corrugations B C, locking-strips E E, and notches N' F', as shown and described.

165,894. VESSELS FOR REMOVING FOUL WATER FROM DOCKS, &c. H. H. Vogeding, Baltimore, Md. (Filed June 28, 1875.)

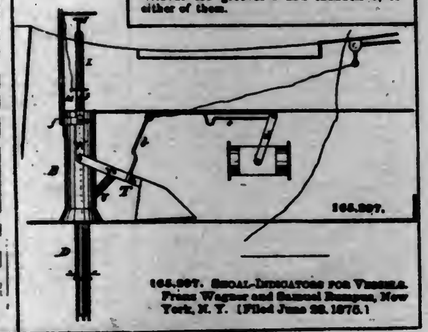
A vessel for removing foul water from docks and basins, having an open-ended flow and a gate at the stern, all constructed and operating substantially as specified.

165,895. SPOKE-TENONING MACHINES. W. H. Von Behren, Logansport, Ind. (Filed June 14, 1875.)

Brief.—The spoke is held between centers upon a reciprocating table, and carried between rotating cutters, which form the tenon.

1. The circle-bar K, to or upon which the center is fixed, combined with the double cutter-heads, to operate substantially in the manner and for the purposes set forth.

2. The movable table of a tenoning-machine, substantially as described, provided with a circle-bar at one end, having a center attached to it, and an adjustable center at the other end, combined to operate substantially as described.



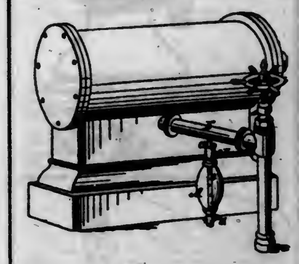
3. The combination of a movable table, provided with a fixed center at one end and an adjustable center at the other, with double cutter-heads, substantially as and for the purpose described.

165,896. PAVING-BLOCKS. Frederick Von Vorsen and John Bickel, Baltimore, Md. (Filed June 24, 1875.)

Brief.—Twenty-five parts protoxide of iron, fifty parts ferruginous silica, and twenty-five parts pulverized quartz are tempered with water, and then molded into blocks. The blocks are burned in a kiln until the surface is vitrified.

A paving block or tile composed of the ingredients herein before stated, and burned until a vitreous surface is produced, with or without the grooves a and channels b, or either of them.

165,897. SIGNAL-INDICATORS FOR VESSELS. Peter Wagner and Samuel Rampen, New York, N. Y. (Filed June 28, 1875.)

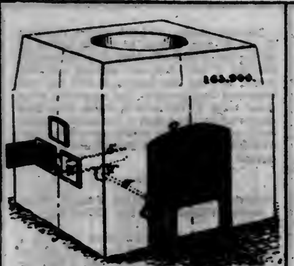


1. The pendent rod D, with or without its extension C, in combination with the shaft C, so supported that it can be vibrated and be drawn down when the rod D is inclined by a rock or cleat, substantially as described.

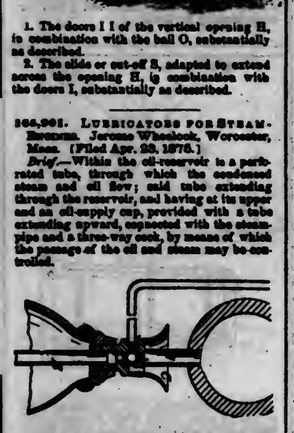
2. The combination, with a vessel provided with a well, B, of the pendent rod D, the shaft C, and the disk E, arranged on the rod D, at its junction with the shaft C, substantially as and for the purposes described.

3. The combination of the pendent rod D and shaft C and weighted lever T, to which they are connected, with the reversing-lever of the engine of the vessel A, substantially as described.

165,898. STOVE-POLISHES. J. M. Watson, Sharon, Mass. (Filed Apr. 8, 1875.)



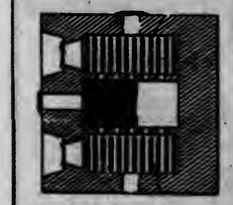
The said composition or stove-dressing, composed of plumbago and silicate of soda alone, or of each and a quantity of soap, all being substantially as specified.



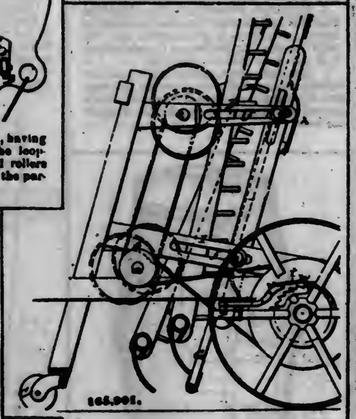
165,899. BAKING-STANDS. J. A. Watson, Lexington, Miss. (Filed June 12, 1875.)

The combination of baking-stand A, having perforated peripheral projections, the loop-rods F, the swiveled bearings C, and rollers B, all arranged to operate as and for the purpose specified.

165,900.



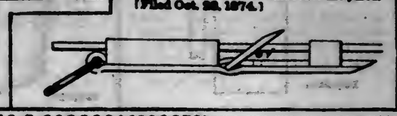
1. In a steam-engine lubricator, the combination of an oil-reservoir, a perforated tube within and extending through the reservoir, an oil-cup, a three-way cock for controlling the flow of the oil and water, and a cock for withdrawing the water from the reservoir, substantially as described.



2. The tube g, in combination with the oil-cup, the perforated tube, and the reservoir, substantially as and for the purpose described.

165,901. LUBRICATORS FOR STEAM-ENGINES. Jerome Wheelock, Worcester, Mass. (Filed Apr. 23, 1875.)

Brief.—Within the oil-reservoir is a perforated tube, through which the condensed steam and oil flow; said tube extending through the reservoir, and having at its upper end an oil-supply cup, provided with a tube extending upward, connected with the steam-pipe and a three-way cock, by means of which the passage of the oil and steam may be controlled.

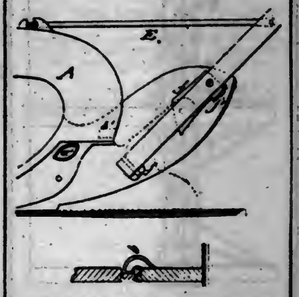


165,902.

165,903. LUMBERING. Abner B. Weeks, Rockland, Me. (Filed Nov. 12, 1874.)

Brief.—The cut-off may be used to obstruct the flow of the contents, in combination with the doors, which may be partially open when a restricted delivery is desired.

165,904. HAY-LOADERS. Edwin R. Whitney, Mason, Canada, assignor to Geo. M. Morton and Frank E. Morton, Chicopee, Mass. (Filed Dec. 29, 1874.)



Brief.—Devices for adjusting or shifting the flexible bars form the rake or lifting bars, which carry up the hay. Lower end of flexible bars made yielding, to keep the hay from clogging between the ends.

1. The combination of the slotted arms I I, slotted side bars H H, having the flexible bars G G connected to them, and the tightening-screws A A, substantially as and for the purposes herein set forth.

2. The combination of the flexible bars G G, and the rope i, or its equivalent, attached to and connecting the lower ends of said bars, substantially as and for the purposes herein set forth.

165,905. PLOWS. George Wiard and Thos. Wiard, East Avon, N. Y., assignors to Geo. Wiard and Chas. W. Hough, same place. (Filed June 12, 1875.)

Brief.—Land-side secured by socket, hooked leg, and a single bolt. Devices for securing and bracing the handles.

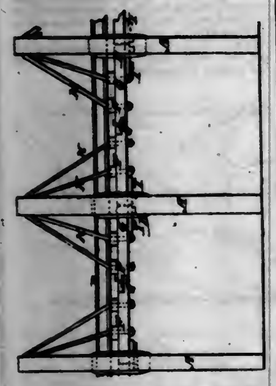
1. The land side B, constructed with the offset c and projecting semicircular hook b, where it joins the rear edge of the beam, and the projecting elliptical leg a near its upper forward edge, in combination with the beam A, constructed with the locking-leg b' and recess c', and fastening-bolt e, as described.

2. A mold-board handle fastened by two adjacent supports, f f', one side support, f'', and two bolts placed at right angles to each other, as and for the purpose specified.

3. The one-piece handle-brace E, flattened at the bend, and combined with a socket having undercut lip b', as and for the purpose specified.

165,906. EYE-GLASSES FOR WATCHMAKERS. Myron W. Wiard, Waukegan, Ill., assignor to himself and Charles F. Wiard, same place. (Filed June 20, 1875.)

1. The combination, substantially as before set forth, of the eye-tube and the expanding-rim thereof.

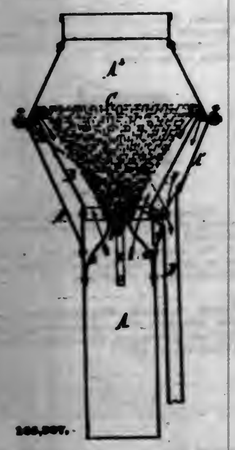


2. The combination, substantially as before set forth, of the lens, the eye-tube, and the expanding rim of said tube.

165,907. BUCKLES. Wm. Henry Williamson, Ashtabula, Ohio, assignor of one-half his right to Samuel C. Talcott, same place. (Filed Oct. 28, 1874.)

A buckle consisting of the frame E and rigid tongue F, the latter attached to the front bar of the frame, and having its base flush or nearly so with the adjacent parts of the frame, and curved downwardly in such manner that the swell of the curve may be opposed to the draft of the strap, substantially as specified.

165,866. ELEVATED RAILWAYS. James G. Wilson, Millerton, N. Y. (Filed July 10, 1875.)

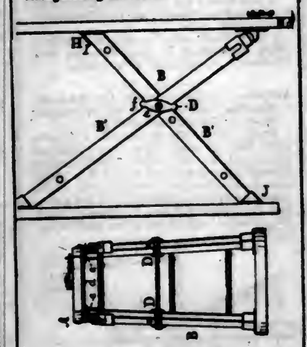


Brief.—The rail-supporting beams are suspended from posts, which extend above the level of the roadway, by tension-bars extending from the tops of the posts diagonally to the ties and stringers outside the rails. The stringers are independently supported from each side, and are connected in the middle by a lap-joint only, allowing for expansion and contraction.

1. The combination of posts A, beams C, cushion D, and suspenders E, substantially as specified.

2. The combination of posts A, stringers G, independently supported by the tension-rods E, and connected by an expanding lap-joint, as described.

165,867. SPARK-ARRESTERS. David Wiser and Henry Schneideau, Fort Wayne, Ind. (Filed Apr. 6, 1875.)



165,867.

The combination, with the stack A, deflector B, top A^1, and bonnet A^2, of the screen C, having its upper part curved over and around the top of said deflector, secured and supported between the flanges of said top and bonnet at their junction, and supported at its lower point by the cone b, which is in turn supported by the braces c, the inclined annulus d, and pipe D, the several parts being constructed and arranged substantially as described and shown.

165,868. IRONING-TABLES. John N. Wimderlich, Philadelphia, Pa. (Filed July 27, 1874.)

Brief.—The table has crossed legs and a platform, with sockets and braces, for holding the legs and feet in position, and plates for strengthening the table.

1. The combination, with the ironing-table A, folding legs B', and hinge C, constructed with butts a, and socket-butts c, of the bow d, extending transversely on the under side of the table, and uniting the butts c, substantially as and for the purpose specified.

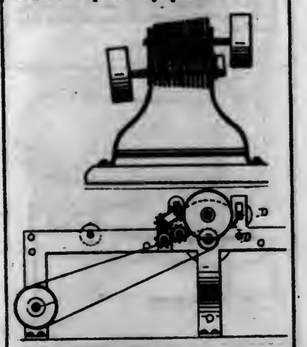
2. The combination, with the metal frames D, of the metal plate G, secured to the legs B' B'', whereby the frames will bear against said plates, substantially as and for the purpose set forth.

3. The combination, with the ironing-table, of the metallic shoes, constructed of the depending flanges H' and the diagonal flanges H'', projecting laterally therefrom, as set forth.

4. The shoes, consisting of the depending flanges H' and diagonal flanges H'', projecting laterally therefrom, in combination with the plate H connecting the flanges H', substantially as and for the purpose set forth.

5. The combination, with the table A, of the metallic shoes I for the upper ends of the legs, and the metallic shoes J for the lower ends thereof, substantially as and for the purpose set forth.

165,868.



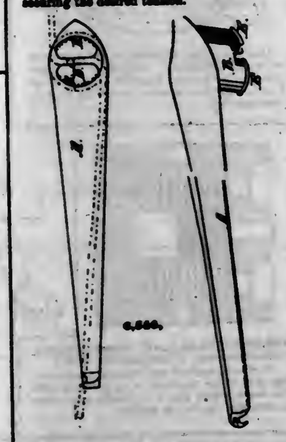
165,900. SHEET-IRON BARRELS. Charles M. Wyrell, Scottsville, N. Y. (Filed Apr. 10, 1875.)

Brief.—The parts are joined together by the overlapping extensions and external hoop, held together by the clasps.

A barrel formed in two parts, having their adjacent edges notched to each other, and secured by the hoops C and the locking-strips D, substantially as herein shown and described.

165,910. MACHINES FOR SAWING HOOPS. Edward Young, Sarnia, Canada. (Filed Jan. 22, 1875.)

Brief.—Two saw-arbors, each carrying a series of circular saws, are placed at such an angle to each other as to give the hoops as sawed from a plank the proper bevel.



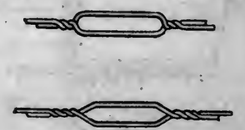
1. A hoop-sawing machine having two gangs of saws, one above the other, and inclined in intersecting planes, substantially as described.

2. The standying-collars f and shafts D, in combination with two gangs of saws whose arbors are inclined in their supporting-frame, substantially as described.

REISSUES.

6,566. DEVICES FOR TIGHTENING WIRE FENCES. Peter S. Crawford, Union, Ill. Patent No. 54,110, dated Apr. 24, 1866. (Filed June 21, 1875.)

Brief.—The wire to be tightened is placed in the slot in the drum. The lever is then turned, and the slack in the wire wound around the drum, after which the hooked end of the lever is adjusted upon the wire, thus securing the desired tension.

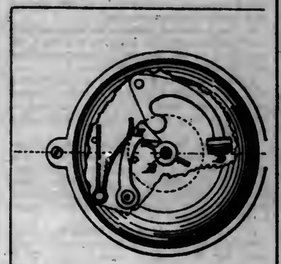


6,566.

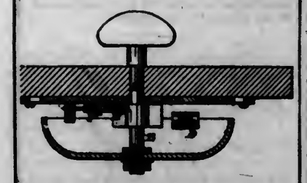
1. The lever A, provided with a slotted spool or drum and with a hook, substantially as and for the purpose specified.

2. The lever A, provided at one end with the slotted spool or drum B, with the rims E, and at the other end with the hook D, substantially as and for the purpose specified.

6,567. WIRE HEDDLES FOR LOOMS. D. C. Brown, Lowell, Mass. Patent No. 64,044, dated May 21, 1867. (Filed July 12, 1875.)



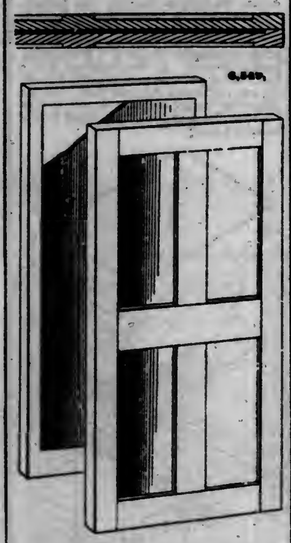
Brief.—To prevent the warp-thread from catching and breaking, a rigid close twist is given the wires at the ends of the eye, and the ends are so shaped as to form an open path for the thread.



1. In a wire heddle for loom-harnesses a warp-eye having at each or either end the rigidly-compressed twist as herein described, for the purposes set forth.

2. A wire heddle for loom-harnesses, having the free bed and path, and the rigidly-compressed twist, herein described, at each or either end of said warp-eye, as and for the purposes shown and stated.

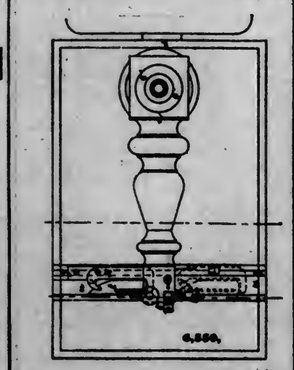
6,568. DOOR-BELLS. HENRY A. DIEHL, New York, N. Y. Patent No. 157,602, dated Dec. 15, 1874. (Filed July 10, 1875.)



1. In the mechanism for striking or sounding bells, a loosely suspended or pivoted hammer, D, arranged to be operated upon by a spring-follower, E, and in connection therewith, substantially as specified.

2. The mode of hanging bells herein shown and described, consisting in securing the said bell rigidly to the end of a central revolving spindle, E, so that the bell may be solely supported thereby and revolve therewith.

6,569. DOORS. William G. Hurd, Watertown, Conn. Patent No. 161,966, dated Apr. 13, 1875. (Filed June 21, 1875.)



6,569.

A wooden door containing, between the exterior surfaces of the casing, a sheet of chilled iron or other suitable metal, substantially as and for the purpose specified.

6,570. SEWING-MACHINES. Albert F. Johnson, Boston, Mass., assignor, by mesne assignments, to S. T. Thomas, same place. Patent No. 42,202, dated Apr. 12, 1864. (Filed Aug. 12, 1875.)

Brief.—The machine is so constructed that the thread is drawn through the material, and a shuttle then passed through its loop. The driving-shaft is arranged beneath the cloth-plate, and operates the shuttle and the hook-needle, the latter of which devices is set eccentric to the axis of the needle-bar, having a semi-rotary motion. On the rear end of this driving-shaft is a crank, which, through a suitable connection, imparts a rocking motion to a second shaft, situated above the work-plate in the gooseneck of the machine, and operates the awl, the looper, and the take-up. The awl-bar is provided with a longitudinal groove in its side, in which is pivoted a bar carrying in its lower end the awl, and having an incline on its side, that impinges against a screw in a projecting arm when said bar descends, causing the awl to swing with its supporting-lever, and feed the work to the needle.

1. The combination of an awl or other device for puncturing the fabric, an open-eyed or hooked needle for raising and pulling the thread through the fabric, and a shuttle for interlocking one thread with another, the whole operating together substantially as described.

2. The combination of an awl or perforating device, open-eye or hook needle, shuttle, and the take-up mechanism, as and for the purpose herein set forth and described.

3. In combination with the rocker-shaft I and vibrating arm, the guide-pulley e and pulley a, the whole forming a take-up, substantially as described.

4. In combination with the awl-bar, provided with a swinging arm for holding the awl, the adjusting-screws n n and their supporting-arm, as and for the purpose herein set forth and described.

5. In combination with a rocker-shaft above the work-plate, the awl-bar and thread-guide, as and for the purpose set forth.

6. A shaft arranged above the work-plate for the operation of the awl, in combination with a shaft below the table for the operation of the needle, and suitable connecting mechanism, as and for the purpose set forth.

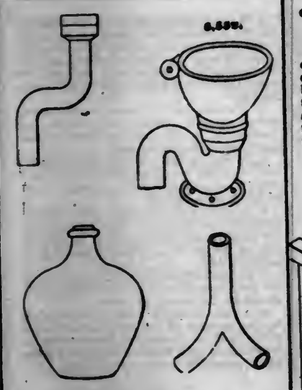
6,571. PAPER BARRELS AND CYLINDRICAL BOXES. Benjamin Rhodes, Bow, England, assignor, by mesne assignments, to N. B. Fogtt, Washington, D. C. Patent No. 41,261, dated Jan. 19, 1864. (Filed Mar. 26, 1875.)

Brief.—A sheet of paper wound into a cylindrical form, with uniting cement interposed between the layers.

1. As a new article of manufacture, a barrel made of paper and an adhesive substance, and provided with suitable hoops.

2. Barrels and boxes made of paper and an adhesive substance, compacted by pressure, and provided with suitable hoops.

3. Wound paper barrels and boxes, the layers of which are united by an adhesive substance, and compacted by pressure.



4. Barrels, the walls of which are built up with layers of paper and compacted by pressure while the layers are in a condition to adhere firmly together after being compressed.

5. Bilged barrels or casks provided with hoops, and having their walls composed of adhesive layers of paper compacted together.

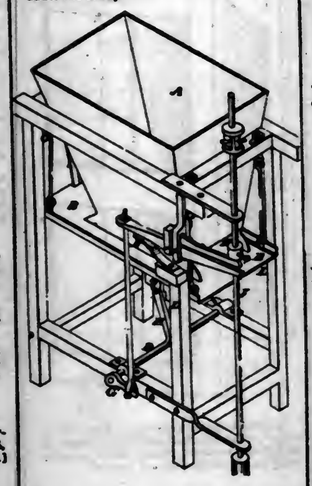
6. The process of forming hollow articles of paper and an adhesive substance by means of a mandrel that will contract to permit their removal when formed.

6,572. MANUFACTURE OF BEMUSLAN-SHAPED VESSELS. Benjamin Rhodes, Bow, England, assignor, by mesne assignments, to N. B. Fogtt, Washington, D. C. Patent No. 41,261, dated Jan. 19, 1864. (Filed Mar. 26, 1875.)

6,859.

1. Irregular-shaped vessels, consisting of alternate layers of fibrous or textile fabrics built up in bitumen or bituminous mastics or compositions, substantially as described.

2. The process of forming irregular-shaped vessels by drawing over a core or pattern of the required shape several layers of an elastic or looped fabric and dipping the pattern, after each layer is applied, into a bath of bitumen or bituminous mastic or composition, substantially as described.



6,860. CHILDREN'S CARRIAGES. W. Stewart, Hartford, Conn. Patent No. 160,064, dated May 10, 1874. (Filed July 2, 1875.)

The combination of the rigid reaches, lever-springs d e, lying in the same line of direction with the reaches, and the body of the carriage, all substantially as shown and described.

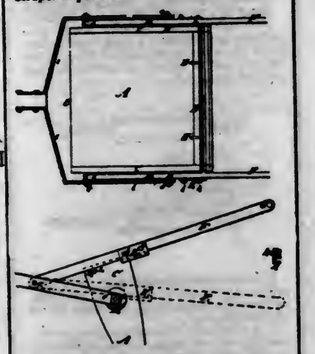
6,864. ORE-STAMP FEEDER. Jos. Tullock, Jamestown, Cal. Patent No. 144,714, dated Nov. 18, 1873. (Filed May 28, 1875.)

Brief.—Ore is fed into a hopper, whose lower orifice is closed by means of a horizontally-oscillating plate. As the stamp-rod falls, a backward motion is given to this plate through the action of levers and a crank-shaft. The rear side of the hopper acts as a scraper to force the ore forward on table, from which it falls under the stamp.

1. In a machine for feeding ore to crushing-mills, the stationary hopper A, in combination with a longitudinally-vibrating tray or shoe, B, substantially as and for the purpose described.

2. In combination with a longitudinally-vibrating shoe or tray, B, a stationary scraper, S, substantially as and for the purpose described.

3. The spring M, arranged to press the tray B forward after each backward movement, substantially as above described.



4. The oscillating tray B, supported by the links C, and operated by the shaft D, with its rocker-arm E and crank G, together with the lever I, the whole operated from the stem J by means of the adjustable collar K, substantially as and for the purpose described.

5. In combination with the oscillating tray B, as herein shown, the post or bar L for giving a concussive or abrupt step to the tray, substantially as and for the purpose described.

In witness whereof I hereunto set my hand and seal.

6,868. ROTARY ROAD-SCRAPERS. J. W. Wilson, Somerford, Ohio. Patent No. 68,086, dated Apr. 6, 1869. (Filed June 10, 1875.)

Brief.—The handles of the scraper are pivoted to the draft-pieces in advance of the pivots of the scraper, so as to connect and disconnect with the scraper automatically through the eccentricity of the movement of the handles when raised. Pins on the scraper engage with pins on the handles, to hold the scraper in position.

1. The combination, in a revolving scraper, of handles pivoted to the tongue-pieces or yoke in advance of the pivots of the scraper, and connecting devices on the scraper, and the handles arranged to disconnect and connect automatically, substantially as specified.

2. The peculiar arrangement and combination of the scraper A, standards E E, tongue-pieces I I, and handles F F, the several parts being arranged substantially in the manner and for the purpose specified.

3. The L-shaped irons K K, when used in combination with the handles F F and the pins L L on the scraper A, substantially as and for the purpose specified.

4. The pins M M, when used in combination with the handles F F, pivoted to the tongue-pieces I I and pins L L, and the scraper A, substantially as and for the purpose herein specified.

5. The peculiar arrangement and combination of the scraper A, with the standards E E and pins L L, the tongue-pieces I I, and handles F F, with pins M M and L-shaped irons K K, the several parts being arranged substantially in the manner and for the purpose herein specified.

6. The rotary road-scraper herein described, composed essentially of the scraper A, with standards E E, pins L L, and spikes H H screwed thereto, the tongue-pieces I I, with tongue J, the pivot-bolts *c c*, with separating washers *b b*, handles F F, with pins M M and L-shaped irons K K, and cross-bar O, with braces *f f*, the several parts being constructed and arranged substantially in the manner and for the purpose herein specified.

HELIOTYPE RELIEF PROCESS. JAMES R. OSGOOD & Co. BOSTON

OFFICIAL GAZETTE

OF THE

United States Patent Office.

VOL. 8.—NO. 4. TUESDAY, JULY 27, 1875. PRICE { $5,00 per year—single. $4,00 per year in clubs.

The OFFICIAL GAZETTE is published on Tuesday of each week, from the United States Patent Office. The subscription price for 1875 is six dollars per year for single subscribers; five dollars per year to clubs of not less than five sent at one time, and which will be mailed free of postage to separate addresses if desired. Subscriptions will commence and terminate with the year. All orders should be addressed to the Commissioner of Patents, Washington, D. C.

COMMISSIONER'S DECISIONS.

WILLIAM H. GOLDING.—*References.*

[*In the matter of the application of Wm. H. Golding, for an* "IMPROVEMENT IN THE MANUFACTURE OF TAGS," *filed June* 15, 1875. *Decided July* 30, 1875.]

Section 4894 of the Revised Statutes, (sec. 32, patent act of 1870:) *Held*, to comprehend the abandonment of applications only. It does not apply to the same class of cases, does not contain the same limitation, and has not the same effect as sec. 35 of the act of 1870.

Where an applicant has abandoned an application for a patent by failure to prosecute it within two years after an action thereon, of which he was duly notified, he is not by that fact alone debarred from prosecuting a new application for patent for the same invention.

The abandonment of an *application* for a patent, as provided for by sec. 4894 of the Revised Statutes, is a different thing from the abandonment of an *invention* to the public.

When an *invention* becomes abandoned to the public it is no longer patentable. But an *application* for a patent being a legal proceeding to secure an alleged right, the abandonment of that proceeding does not necessarily amount to a surrender of the alleged right.

Although long neglect to file or prosecute an application may be a link in a chain of evidence going to prove abandonment of an invention, it is not sufficient for that purpose unless accompanied by proof of express acts of dedication, or by a clear acquiescence in the acts of others amounting to the same thing.

The actual intention indicated by an applicant to sever the two proceedings, where he has abandoned one application and filed another in its stead, is to be regarded, and notice will be taken only of his last application.

Where, intermediate the two applications, another party has filed an application for patent for the same invention, the proper practice is to institute an interference between the second application and that of such other party.

The case of *ex parte* Mills commented on.

THACHER, *Commissioner:*

This is a question of practice involving the construction to be placed upon section 4894 of the Revised Statutes.

The facts in the case are briefly as follows: November 19, 1872, Wm. H. Golding filed an application for an improvement in the manufacture of tags. It was rejected by the Examiner in view of certain references and the general state of the art. February 8, 1873, the case was amended, and February 18 it was again rejected for the same reasons as before. No further steps were taken by Golding in the matter until June 15, 1875, when he filed the present new application for a patent for the same invention. Thus more than two years had elapsed from the date of the last official action on his first application before the filing of his second application.

In the meantime, March 16, 1874, T. Van Kannel filed an application showing and claiming the same subject-matter that Golding had applied for, and he was accordingly refused a patent for substantially the same reasons as was Golding. May 13, 1875, Van Kannel appealed from the decision of the Examiner to the Board of Examiners-in-Chief. The Board reversed the Examiner, and decided that the subject-matter was patentable. The Examiner then suspended further action on Van Kannel's application, in order that inquiry might be made as to whether the invention had gone into public use for more than two years prior to the filing of the latter's application, in accordance with the practice established in the case of *Rouse* and *Stoddard*, 7 OFFICIAL GAZETTE, 169.

In pursuance with this practice a letter was addressed to Golding informing him of the fact that an application was pending before the Office, and requesting him to furnish affidavits in regard to the public use of his invention, if there had been any. Golding furnished no information on that point, but instead thereof filed a second application at the time above mentioned.

In reply to another inquiry as to whether he wished

the Office to consider his second application as a renewal of the first, or as an entirely separate proceeding, Golding replied that it was his purpose to rely upon the last application without reference to the old one. The question now to be determined is, what effect shall the first application have upon the second.

Sec. 4894 of the present law, which is precisely the same in its requirements as sec. 32 of the act of 1870, is as follows:

All applications for patents shall be completed and prepared for examination within two years after the filing of the application, and in default thereof, or upon failure of the applicant to prosecute the same within two years after any action thereon, of which notice shall have been given to the applicant, they shall be regarded as abandoned by the parties thereto, unless it be shown to the satisfaction of the Commissioner of Patents that such delay was unavoidable.

Unless this section be construed to cover the *invention* as well as the *application*, I see nothing in its provisions to prevent an applicant from filing a second and independent application for the same invention, and nothing prohibiting the Office from entertaining such application without regard to the one first filed. For when applied to the application alone, the language of the section has plain reference to the same proceeding throughout. It is the failure of applicants to complete and prepare the applications originally filed, or their failure to prosecute those applications for more than two years after notice has been given of any action thereon, which subjects *such applications* to the charge of abandonment. No reference in words or by implication is had to any other applications than those filed in the first instance, and the question of unavoidable delay to be considered by the Commissioner is in reference alone to those applications.

I had occasion lately to hold (*ex parte Mills*, 7 OFFICIAL GAZETTE, 963) that the filing of an application for a patent is analogous to a proceeding at law to establish one's rights, and that in that particular case the right to recommence such an action, after a certain time, was barred by a proviso in section 35 of the act of 1870. That proviso related to applications filed *prior* to July 8, 1870. But the 32d section of that act, the one now under consideration, relates to applications filed *subsequently* thereto, and there is no provision anywhere in the law of 1870, or the present one, prohibiting or restricting the renewal of applications made since that date, however long they may have remained dormant, or the filing of new ones, except that if the applicant has delayed the prosecution of his original application a certain time, then, in order that the *renewal* may have the advantages of proceeding upon the old fee and under the old date, he shall show to the Commissioner that such delay has been unavoidable; but as to the right to file a new application the statute is silent.

In regard to abandonment of the invention, I have already indirectly held, in the *Rouse* and *Stoddard* case, that the rejection or withdrawal of an application cannot amount to such an abandonment. The decision in that case was based upon the doctrine laid down by the United States Supreme Court in the case of *Brown* vs. *Guild*, 6 OFFICIAL GAZETTE, 392. The court therein held that, after an inventor had embodied his discovery in a machine which was subsequently thrown aside, it amounted to no more than an unsuccessful experiment, and the filing of an application for a patent thereafter for the same invention, which application was rejected and never renewed, did not remove the case from the category of abandoned experiments, and was no bar to a further patent.

An abandonment of the invention by the first applicant would, of course, operate as a bar to all subsequent applicants, and if the provision of the law under consideration applied to the *invention* as well as to the *application*, the court would have erred in the decision referred to, as the statute would have already concluded the matter to the contrary; and if a statutory bar had been thus established, the inquiry required to be made in the *Rouse* and *Stoddard* case as to abandonment to the public by rejected applicants would be clearly uncalled for.

But I am not aware of any decision of the courts in which it has been held that after an application for a patent has been once filed, the neglect to prosecute or renew the same is in itself sufficient evidence of the abandonment of the invention to the public. Section 12 of the act of March 2, 1861, contained the same provision as to the abandonment of the application, unless unavoidable delay was shown, as the section of the statute under consideration, with the single exception of requiring the application to be prosecuted within two years after action thereon, and that section was construed by Judge McKennan, in the case of *McMillin* vs. *Barclay*, 5 Fish., 189. There McMillin applied for a patent July 23, 1855; after various proceedings he was finally rejected August 25, 1856, on appeal to the Commissioner. He did nothing more until the early part of 1867, when the specification was amended, and the patent was granted April 16, 1867. It will be seen that the state of the facts in this case brought it within the exception now provided for, but the court held that, conceding the case was within the scope of the act of 1861, the section referred to could not be invoked to invalidate the patent. The questions of *abandonment of the application* and *abandonment of the invention* were there treated as entirely separate and distinct, and it was not even hinted that the latter question was included in that provision of the statute. On the contrary, whether the delay to prosecute an application was unavoidable or not, was regarded as a question resting entirely with the Commissioner, and the court refused to consider the proof on that point; but as to the abandonment of the invention, the learned judge quoted Mr. Justice Grier to show that the filing of the application was conclusive evidence that the inventor did not intend to abandon his invention, and that where gross laches could not be imputed to the inventor, the delay interposed by the action of officers or courts could not affect his rights.

The courts, although regarding a long neglect to file an application, or to complete or renew one already filed, a link in the chain of evidence going to prove abandonment of an invention, yet do not hold the evidence complete unless such neglect is accompanied by actual proof of express acts of dedication, or by a clear acquiescence in the acts of others amounting to the same thing. Abandonment being regarded as in the nature of a forfeiture of a right, is not favored in law. (*Jones* vs. *Sewall*, 6 Fish., 343.)

In conclusion, Golding having manifested to the Office his actual intention to abandon his first *application*, but not his *invention*, the rule adopted by Judge Emmons in regard to a patent issued upon the last of two applications filed, will be applied here:

If, intermediate the first and second application, the patentee manifests an actual intention to abandon the first, his patent will have relation to the last one only. His actual intention severs the proceeding. The law deems the first application terminated, and as bearing no relation to the patent, which rests solely on the last one. (*Felton & Taylor* vs. *Waters et al*, 7 OFFICIAL GAZETTE, 425.)

Under the construction of the statute which I have given above, to the effect that section 4894 relates only to the application, and does not include the invention, and in view of the citation immediately above, Golding's actual intention must be regarded as a purpose to sever the two proceedings in this case, and notice will be taken only of his last application.

If the Examiner is still of opinion that Golding's and Van Kannel's applications cover the same subject-matter, he will, of course, declare an interference. If evidence of abandonment on the part of Golding is then adduced, proper weight can be given it to better advantage, probably, than if brought out by an *ex parte* inquiry.

This case is returned to the Examiner for his further action, in accordance with the above views.

VIDVARD & SHEEHAN.—*Appeal.*—*Trade-Mark.*

[*Appeal from the Examiner of Trade-Marks in the matter of the application of Messrs. Vidvard and Sheehan, of Utica, New York, for the issue of corrected certificates upon Trade-Marks for Whisky, Nos. 180 and 226, of the year 1871.—Decided June 29, 1875.*]

PRACTICE IN TRADE-MARK CASES.

The requirement of the statute that an applicant for the registration of a trade-mark shall make oath "*to the effect*" that he and no other has the right to use it, "either in the identical form *or having such near resemblance thereto as might be calculated to deceive*," is properly complied with by a declaration under oath that no other has a right to the use of said trade-mark, "*or of one substantially the same.*"

The statute does not require that the oath shall be in the exact words of the section, but only "*to the effect*," &c.

When an error in the form of a certificate of registration occurs, solely on the part of the Office, it will be corrected without expense to the registrants.

THACHER, *Commissioner:*

The applicants, Messrs. Vidvard and Sheehan, of Utica, New York, forward to the Office two trade-marks for whisky, registered in February and April, 1871, numbered, respectively, 180 and 226, and ask that the certificates appended thereto be corrected, "and legal certificates be issued in their stead." To this the Examiner of Trade-Marks returns, in each case, the following reply:

The above-mentioned application has been considered. It is found, upon examination, that the declaration filed in 1871 does not fully meet the requirements of the statute. In the present condition of the application papers, the Office would not be justified in re-registering the case with a certificate such as is essential, according to Judge Blatchford's ruling, to make the registration valid.

Before registration can be made, it will be necessary to present an entirely new application, and accompany the same with a fee of $25.

Whereupon the applicants take their present appeal, contending that the declaration was in strict compliance with the statute and the form prescribed by the Commissioner of Patents.

The petition and declaration in the case, which are the same in form in both cases, are as follows:

Your petitioners, Peter Vidvard and John H. Sheehan, partners, under the firm-name of Vidvard & Sheehan, residing in Utica, Oneida county, New York, and engaged in the rectification and sale of whiskies at said Utica, represent that they have used for over one year last past, are now using, and have the right to use, a trade-mark for whisky, of which the design represented in the annexed drawing is a true copy. This trade-mark consists of a representation of a medal having stars on its face, accompanied by the words "Gold Medal Kentucky Malt Bourbon," the words "Gold Medal" being arranged in an arch over the medal, and the three words "Kentucky Malt Bourbon" being arranged in as many straight lines thereunder. Said trade-mark has been stenciled on the heads of the barrels containing the whisky, the medal having been in gold, and the words in black.

Your petitioners further represent that no other person, firm, or corporation has a right to the use of said trade-mark, or of one substantially the same.

They, therefore, pray that said trade-mark may be registered and recorded in the Patent Office according to law, they having paid into the Treasury of the United States the sum of twenty-five dollars, and otherwise complied with the regulations in such case made and provided.

Then follows their oath in due form.

This petition complied strictly with six of the seven requirements set forth in the act of 1870. The names of the parties, their residence and place of business, the class of merchandise, and the particular description of goods comprised in such class by which the trade-mark had been or was intended to be appropriated, the description of the trade-mark itself, with *fac-similes* thereof, and the mode in which it had been or was intended to be applied and used, the length of time it had been used, the payment of the fee of twenty-five dollars, and a compliance with such regulations as had been prescribed by the Commissioner of Patents, and which were in force at the date of their petition and registration, were all given and performed.

The seventh requirement of the statute is—

The filing of a declaration, under the oath of the person, or of some member of the firm or officer of the corporation, to the effect that the party claiming protection for the trade-mark has a right to the use of the same, and that no other person, firm, or corporation has the right to such use, either in the identical form, or having such near resemblance thereto as might be calculated to deceive, and that the description and *fac-similes* presented for record are true copies of the trade-mark sought to be protected.

Upon inspection of the declarations filed in these cases, it is found that they also comply with this last requirement. To be sure, the exact language of the section is not adopted in reference to the right of others to use the identical trade-mark in question, the words of the statute being—

That no other person, firm, or corporation has the right to such use, either in the identical form, or having such near resemblance thereto as might be calculated to deceive.

And the words of the declaration of applicants being—

That no other person, firm, or corporation has a right to the use of said trade-mark, *or of one substantially the same.*

The statute does not require that the applicant's oath shall be in the exact words of the section, but that it shall be "*to the effect*," &c.

Now, the essential value of a trade-mark consists in the peculiar appearance it presents to the eye; and when one trade-mark is made of such near resemblance to another as would "*be calculated to deceive*," it is "*substantially the same*" to all intents and purposes.

It is the practice of skillful draftsmen of legal instruments to adopt the exact language of a statute, when applicable; but, when other words are used, no court would hold the instrument invalid if its language was "*in effect*" the same as that of the statute.

It appears, then, that applicants complied with all the requirements of the law and the regulations of the Patent Office in their petition and declaration. They, were, therefore, entitled to registration and a certificate in due form at the time their original applications were made. The only error was on the part of the Office in giving a certificate which has since been declared informal. As the error was on the part of the Patent Office alone, I believe it ought to be corrected by the Commissioner by the issue of new certificates in due form, without additional expense to applicants.

The decision of the Examiner of Trade-Marks is overruled.

VOLTA BELT COMPANY.—*Appeal.—Trade-Mark.*

[*Appeal from the Examiner of Trade-Marks in the matter of the application of The Volta Belt Company, of Cincinnati, for registration of trade-mark, filed April* 23, 1875.—*Decided June* 26, 1875.]

A clear, full, and accurate description of a trade-mark, which distinguishes between essentials and non-essentials in the mark, is necessary before a trade-mark can properly be registered.

THACHER, *Commissioner:*

Applicants apply for the registration of a trade-mark which they allege in their petition is "described in their annexed specification or statement and the accompanying *fac-simile*."

The specification sets forth that the trade-mark they have adopted is for electro-voltaic bands or other analogous goods, and is—

A symbol consisting of the words "electricity is life," placed beneath clouds from which lightning-flashes proceed, the whole arranged generally as shown in the *fac-simile*.

In addition to these features, the *fac-simile* shows the figure of a globe, which the clouds surround. No allusion is made in the description to this feature, and it is, therefore, impossible to tell whether the applicants regard it as an essential or non-essential part of their trade-mark. The presumption is, from the absence of such description, that they regard it as a non-essential part of the symbol; but the description ought not to be left open to presumptions when a few words can make the matter perfectly clear.

This is just what the Examiner insists upon. He does not attempt to "emasculate" their symbol, as applicants allege, but asks them to distinguish definitely between the essentials and non-essentials of the trade-mark.

They having described the words they use as "placed beneath clouds from which lightning-flashes proceed," I cannot agree with the examiner that it is not plain whether the latter feature constitutes one of the essentials; but the description, as I have already remarked, makes no allusion to the figure of a globe; and the expression "arranged generally as shown," in reference to the position of the clouds, does not supply this omission, nor is it *descriptive* of anything whatever.

The law is as imperative in requiring a *description* of the trade-mark as in requiring a *fac-simile* thereof, and one will not supply the omissions of the other.

With the exception mentioned, the decision of the Examiner is affirmed.

CHRISTOPHER C. TRACY.—*Interlocutory appeal.*

[*Appeal from the Principal Examiner in the matter of the application of Christopher C. Tracy, for Letters Patent for the* "MANUFACTURE OF CAMES OF LEAD."—*Decided June* 5, 1875.]

That part which constitutes the improvement on a former machine must be shown by model and drawing; but an applicant for a patent need not furnish model and drawing of the whole of the machine which he claims to have improved, provided the machine is well known to the public, or a description of it readily accessible.

SPEAR, *Acting Commissioner:*

This case is brought up by appeal from the requirement of the Examiner that applicant should furnish drawing and model with his application.

I cannot quite agree with the Examiner that it would not be proper for a patentee to refer the public to the invention of another for a knowledge of the machine on which the patentee had made an improvement. Such reference would, in my judgment, be proper, provided the machine improved and referred to had been patented or otherwise made known to the public. In the case of *Brooks* and *Morris* vs. *Bicknell* and *Jenkins*, 3 McLean, p. 261, it was said—

In describing the improvement of a machine in use and well known, it is not necessary to state in detail the construction of the entire and improved machine. It is only necessary to describe the improvement by showing the parts of which it consists, and the effects which it produces.

What is here expressed is, as I understand, the established practice of the office in such cases. I am of the opinion, therefore, that it is unnecessary and not lawful to require applicant to file a model or drawing of the machine which he claims to have improved. I, however, agree with the examiner to this extent, that it is the practice of the office to require that the improvement described, (if it be a machine,) whether made the basis of a claim for an improvement in the art, or directly claimed as an improvement in the machine, should be shown in drawing and model; but that part which constitutes the improvement and illustrates its connection with the machine improved need be shown, and no more.

The machine on which applicant has, as is alleged in this instance, made the improvement, is a well known machine, all the information relating to which is accessible to the public, and those skilled in the art to which the construction of such machines appertains can, undoubtedly, make it without any other instruction, except that which can be obtained from the patent itself, or from sources well known to the artisan.

With the limitation stated above, the decision of the Examiner is affirmed.

DECISIONS OF THE COURTS.

U. S. CIRCUIT COURT, SOUTHERN DISTRICT OF NEW YORK.

GILBERT AND BARKER MANUFACTURING COMPANY *vs.* ABRAHAM BUSSING.

[*In equity.—Before* WOODRUFF, *Cir. J.—January*, 1875.]

A mere interlocutory decree for gains, profits, and damages against the manufacturer of infringing machines cannot operate as any defense in behalf of the purchaser of one of such machines.

A patentee cannot take compensation for an infringement, including manufacture, sale, and use, and thereafter enjoin that use for which he has taken compensation.

When a patentee claims and recovers, not only the actual gains and profits of the manufacture and sale of the infringing machine, but all the damages which he has sustained therefrom, it is at least to be presumed that such recovery embraces all the profit which the patentee would have received had he made and sold the machine with the incidental and consequential right to use it.

Where the complainants had obtained an interlocutory degree for an accounting of gains, profits, and damages against the manufacturer of the infringing machines, an unqualified injunction *pendente lite* against the purchaser and user of one of the machines was refused. The defendant, however, was put under bonds.

On final hearing the complainants might become entitled to a perpetual injunction against such defendant, as they cannot be compelled, against their will, to permit the defendant to use their invention.

[*E. W. Stoughton* and *W. Stanley*, for complainants.
Edmund Wetmore, for defendants.]

[This was a suit under letters patent granted to C. N. Gilbert and J. F. Barker, August 3, 1869, for an "Improved apparatus for carbureting air." The patent had been sustained at final hearing in a suit against Oakes Tirrell, decided by Judge Woodruff in July, 1874, and the complainants had obtained an interlocutory decree for an accounting as to gains, profits, and damages. Tirrell was a manufacturer of the infringing machines, and the defendant in the present suit had purchased one of the machines so manufactured by Tirrell, and was using it to light his own residence.]

WOODRUFF, *Circuit J.:*

The complainants heretofore filed their bill in this court against Oakes Tirrell, in which they charge him with infringing their patent by the manufacture and sale of gas-machines, the exclusive right to the manufacture and sale of which they claim under their patent. The decision in that case sustained the complainants' patent, and held Oakes Tirrell an infringer. Thereupon an interlocutory decree was entered, requiring the said Oakes Tirrell to account to the complainants for all gains and profits made by him by the manufacture and sale of such infringing machines, and for all damages sustained by the complainants from the infringement of their patent by the said Tirrell. That interlocutory decree is in full legal force, and may be carried into execution so that the complainants may have a final decree for such gains, profits, and damages.

I am inclined to think that if that final degree were made, and the amount which should thereby be awarded to the complainants should be paid, it could be held an indirect affirmance of all sales made and accounted for, or a satisfaction of the damages resulting from such sale, so that as to the particular machines so made and sold there would result to the purchaser a right to hold and take the benefit of his purchase.

Possibly the question, whether demanding and receiving from Tirrell the mere profits of the manufacture and sale, would include the profits of the use of the machine might arise; but, in general, the sale of a machine to a purchaser for use carries with it the right to use it, the presumption being that whatever license fee or compensation for the use is due to the vendor is included in the price. So when a patentee claims and recovers, not only the actual gains and profits of the manufacture and sale, but all the damages which he has sustained therefrom, it is at least to be presumed that such recovery embraces all the profit which the patentee would have received had he made and sold the machine to such purchasers with the like incidental or consequential right to use it. I do not, however, mean to affirm that a patentee may not have a decree against him who manufactures and sells an infringing machine, and also a decree against the purchaser thereof, enjoining such manufacture and sale and also enjoining the future use of the infringing machine, but only that the patentee cannot take compensation for the infringement, including manufacture, sale, and use, and thereafter enjoin that use for which he has taken compensation.

The patentee in such last supposed case would stand very much in the condition of one who sues in trover for the value of his property wrongfully converted, and recovers and receives such value and compensation for his damages. He thereby so far affirms the conversion that his title to the property is gone. But to effect this something more than the bringing of the action and more than a verdict assessing damages is necessary. There must be satisfaction.

An analogous rule, I think, applies to this case. The complainants brought their suit and have established their title as against Oakes Tirrell to full compensation. But they have not received such compensation; *non constat* they ever will. On the contrary, the proof on this motion is that he is insolvent, and, if so, a final decree against him may be of no value. Such interlocutory decree ought not, therefore, to be regarded as any defense to the purchaser from Tirrell. Upon the case made by the bill both Tirrell and the defendant were *tort feasors*. Nothing has occurred by reason of which the defendant is enabled to say that he has acquired a right to use the infringing machine. Until the complainants have received some compensation or satisfaction which will operate to vest such right in the defendant, he stands undefended, assuming, of course, the validity of the patent.

On the other hand, I think the complainants can be fully protected without an unqualified injunction *pendente lite*. The defendant is not engaged in manufacturing and selling, and does not, therefore, interfere with the business of the complainants by competition or otherwise. He is not injuring their business or impairing the present value or profits which they derive from their monopoly. He has a single machine, connected with and used for lighting his private residence. It would be a great inconvenience to him, and, so far as I can perceive, of no legitimate advantage to the complainants, to compel him to discontinue that use while this suit is pending, especially as the decree which the complainants may, if they so elect, have against Tirrell may be fully paid and satisfied in such wise that it might operate as satisfaction of the entire wrong, in which both Tirrell and the defendant are participators. The complainants may be secured ample indemnity, and so the order of the court will work no hardship.

I do not mean to intimate that on the final hearing the complainants may not be entitled to a perpetual injunction against the defendant. The complainants cannot be compelled, against their will, to permit the defendant to use their invention.

All that I mean to hold now is that the complainants

can be fully indemnified for that use pending this suit, and that I am of opinion that such indemnity will protect them, without subjecting the defendant to needless inconvenience and expense, until his rights can be considered and decided on a final hearing.

Neither the moving papers nor those read in opposition to the motion give much information as to the amount of security which should be required, and if the complainants deem the amount which I suggest an insufficient protection, I will hear the parties on the settlement of the order, which will be that an injunction issue, unless the defendant, within twenty days after service of the order on his solicitor, files a bond to the complainants, with two sufficient sureties in the sum of fifteen hundred dollars, conditional for the payment of whatever decree may be rendered against him in this suit.

U. S. CIRCUIT COURT, SOUTHERN DISTRICT OF NEW YORK.

FREDERIC A. KURSHEEDT *vs.* ROBERT WERNER.

[*In equity.—Before* BLATCHFORD, *J.; June*, 1875.]

The claim in the patent of George E. King, issued February 26, 1867, and reissued June 23, 1868, for an improvement in fluting-machines, which is for "the guide E, constructed with one or more curved or arched portions, *a'*, in combination with suitable fluting-rollers, substantially as herein set forth, for the purpose specified," construed to cover a machine in which the guide consists simply of an arched projection rising up in front of the plain part between the two fluted parts of the fluting-rollers, by which arched projection an extra width of the fabric passing over it is taken up laterally, to be afterward crinkled as it is passed in between the plain parts of the fluting-rolls.

Although the specification speaks of the guide as composed of two pieces of metal, one over the other, between which the fabric passes—and although those parts of the fabrics which are to be fluted and those which are to be flattened, as well as those which are to be crinkled and puffed, are described as passing between the two pieces of metal of the guide, and although the patentee calls the whole instrument in front of the rollers a guide—yet the only material part of it is the arched or curved portion. The raising of the fabric, or the deflection from the general plane of the fabric, or from the general course of the fabric, of that part of the fabric which is to be crinkled by an interposed deflector, is the essence of King's invention.

The expression in the claim "the guide constructed with a curved or arched portion" is the same thing as saying "the curved or arched portion of the guide."

[*F. H. Betts*, for complainant.
A. V. Briesen, for defendant.]

[The case came up on motion for preliminary injunction.]

BLATCHFORD, *J.*:

The letters patent sued on herein are reissue No. 3,000, granted to George E. King, June 23, 1868, the original letters patent having been granted to him, as inventor, February 26, 1867.

The patent is for "an improvement in fluting-machines." The specification of the reissue says:

This invention is designed for making puffing applicable to shirt-bosoms, trimming, or other purposes of dress, in which the article, as it issues from the machine, is (without having recourse to laundering) delivered in a complete form, either single or in two or more series or rows, composed of flattened borders, with flutes running along their inner edges, and puffed or crinkled surfaces between the flutes. The invention consists in a guide, constructed with one or more curved or arched portions, in combination with one or more suitable fluting-rollers, whereby the material, in passing through the machine, is fluted and contracted laterally, as it were, or drawn up between the flutes to produce the required crinkled surface or surfaces in the puffing.

The main feature of the machine is the arched guide, in combination with two rollers, one above the other, and opposite and near to the guide. The rollers are so formed that the strip of material, after being acted on by the guide, passes between the two rollers. The rollers are so formed that the strip of material, after being acted on by the guide, passes between the two rollers. The rollers have such configuration externally on their surfaces as to produce a finished fabric which has a longitudinal strip that is puffed or crinkled in such manner as to possess an irregular wavy surface, and on each side of such crinkled strip a longitudinal strip that is fluted, and on each side of, and outside of, each of such fluted strips a longitudinal flattened strip, through which stitching may be made longitudinally, to render permanent the conformation of the puffing. The portions of the rollers from between which the crinkled part of the finished fabric issues are plain, and so are the portions from between which the flattened parts of the finished fabric issue, while the portions of the rollers from between which the fluted parts of the finished fabric issue are grooved, so as to make grooves and flutes on each roller—a groove alternating with a flute, and the flute on one roller taking into the groove on the other. Each part of each roller is of the same width as that portion of the finished fabric which it is designed to shape. The parts of the rollers from between which the crinkled part of the finished fabric issues are of such diameter that, when the rollers are in proper position, the face of that part of one roller is situated at such distance from the face of that part of the other roller that no considerable pressure is exerted upon the fabric in passing between them. It is the action of the guide, in connection with the grooved and fluted parts of the rollers and the plain parts of each roller that lies between the two grooved and fluted parts of each roller, that produces the crinkled part of the finished fabric.

The specification describes the guide as "the inclined guide E," and as being composed of two pieces of sheet metal, secured one over the other at such a distance apart as to permit the passage of the cloth or fabric between them. It also states that those parts of this guide E which are in front of the plain cylindrical portions of the rollers "are curved upward, or arched transversely, as shown at *a'*," in such manner that the width of the fabric passed between each pair of the plain portions of the rollers will be greater, if stretched out to its full extent, than the width of such plain portions of the rollers, so that the fabric, by means of such excess of width, will be crinkled or puffed in passing between such plain portions of the rollers; that the end of the strip of fabric is passed between the two pieces of metal of which the guide is formed, and between the rollers, which rotate, so as to draw the fabric lengthwise between them; that the grooves and flutes of the rollers flute the parts which they press; that the parts outside of the fluted parts of the fabric are pressed flat; that the parts of the fabric that are drawn through the curved or arched parts *a'* of the guide E, being (if stretched to their full extent) of a width greater than the width of the plain portions of the rollers opposite such curved or arched parts of the guide, and being also gathered by the fluting formed at their sides or edges, are caused to assume a crinkled or puffed form as they are passed between such plain portions of the rollers, the distance between the faces of such plain portions being such that no pressure is exerted upon the fabric passing between them beyond that required to simply press the convex surface thereof downward to a sufficient degree to insure the shaping thereof into such puffed condition; and that the extent to which the material will be thus contracted laterally or drawn up between the flutes will be governed by the excess of the width of the arched portions *a'* of the guide over the length of a straight line or lines connecting such arched portions at their base.

The description in the specification is of a structure capable of making several strips of finished fabric at once, which may be cut apart longitudinally in the flattened portions. Each of the strips so cut off will present a crinkled portion, two fluted portions, and two flattened portions. But the specification also speaks of making but one of such strips at a time with a guide which has only one curved or arched portion, and rollers which are capable of making at one time but one strip of finished fabric having the features before mentioned.

The claim of the reissue is in these words:

The guide E, constructed with one or more curved or arched portions, *a'*, in combination with suitable fluting-rollers, substantially as herein set forth, for the purpose specified.

The specification speaks of the guide as being composed of two pieces of metal, one over the other, at such a distance apart as to permit the passage of the fabric between them. At the arched part of the guide both pieces of metal are arched. The part of the fabric which passes between the arched parts is only that part of the fabric which is to be crinkled. But the other parts of the fabric, namely, those parts of the fabric which are not to be crinkled, but are to be fluted and flattened, pass on their way to the rollers between the two pieces of metal of the guide, although not between the arched portions. The language of the specification and claim shows, however, that the fact that the part of the fabric which is not to be crinkled passes between two pieces of metal on its way to the rollers is immaterial to the invention claimed, and that the fact that the part of the fabric which is to be crinkled has, at the time it passes over the arched part of the guide, a correspondingly-arched piece of metal over it, is immaterial to the invention claimed. Both of the pieces of metal on each side of the arched part of the guide, as well as the piece of metal above the arched part of the guide, may be cut away or removed without affecting the operation of the machine in the particular aimed at by the invention of the patentee, as described and claimed in the specification, and without removing anything which is of the essence of his invention, or is necessary to its completeness, as claimed. The language of the specification throughout shows that the arched portion of the lower piece of metal is what is alone effective, in combination with the rollers, in producing the result of which the specification speaks. Thus, the specification states that it is the arched portion of the guide, in combination with the rollers, which is the invention, in that thereby the material, in passing through the machine, is drawn up between the flutes to produce the required crinkled surface. It also states that it is the curving upward or arching of the part of the guide which is in front of the plain portions of the rollers which causes the width of the fabric which is passed between such plain portions to be greater, if stretched out to its full extent, than the width of such plain portions of the rollers, so that the fabric, by means of its increased width, will be crinkled or puffed in passing between such plain portions. It further states that the effect of the curved or arched parts of the guide upon those parts of the fabric which they affect is, that such parts of the fabric are, if stretched to their full extent, of a width greater than that of the plain portions of the rollers, and that this fact, with the gathering of such parts of the fabric by the fluting that goes on in the adjacent parts, causes the crinkling. It further states that this lateral contraction of the part that is to be crinkled will depend upon the degree of arching in the arched part of the guide. Now, it is the raising up of the fabric, or the deflection from the general plane of the fabric, or from the general course of the fabric, of that part of the fabric which is to be crinkled by an interposed deflector, which is the essence of the patentee's invention. Such is his claim. The claim designates as the invention the curved or arched portion of the guide, in combination with suitable fluting-rollers, substantially as set forth in the specification, for the purpose therein specified. The patentee calls the whole instrument in front of the rollers a guide; but the only material part of it is the curved or arched portion. The expression in the claim "the guide, constructed with a curved or arched portion," is the same thing as saying "the curved or arched portion of the guide."

This has been the construction heretofore given to this patent. In *King* vs. *Maudelbaum*, (8 Blatchf., C. C. R., 468,) the defendant's machine had two rollers, which did not have plain portions, to form, in connection with an arched guide exterior to the rollers, the crinkled part of the puffing; but the defendant had transferred the arched guide to one of the rollers, by placing thereon, on the portion between the fluting instrumentalities on that roller, knobs or buttons, which formed a series circumferentially around the roller, and had between each two of them a depression. The exterior surfaces of these knobs or buttons performed the same office as the arched portions of the patentee's guide, and caused a greater width of fabric to be taken up and passed through over the knobs or buttons than the width of the base of the knob or button in a straight line between the two adjacent fluted portions of the roller. The material was contracted laterally or drawn up between the flutes in proportion to the excess in length of the arched exterior transverse surface of the knob or button over a straight line, connecting such arched surface at the base of the knob. There were on the other roller depressions matching the knobs. On these facts it was said, in the decision in that case:

The plaintiff claims, in substance, a curved or arched guide, in combination with suitable fluting-rollers, to contract the material or draw it up laterally between the flutes, so that there shall be in the finished fabric a greater width of material than the width on the roller in a straight line between the two fluted portions of the roller, in a line parallel to the axis of the roller, and so that such greater width of material shall thereby have given to it a crinkled or puffed or wavy conformation. The defendant has the arched guide in combination with the fluting-rollers. He has merely changed the position of such guide. It operates in the same way as the plaintiff's arched guide to produce, in combination with the rollers, the same result that the plaintiff produces.

The same patent was again before this court in the case of *King* vs. *Werner*, (decided August 13, 1874.) In

that case the defendant used, in connection with the fluting-rollers, a detent or finger, by which a portion of the fabric was held back, and thereby formed into V-shaped, but more or less irregular, lateral waves and crinkles. He had plain zones between the fluted portions of his fluting-rollers. The free end of the detent bore against a platform midway of the plain zones. The fabric, in its passage to the rollers, passed over the platform and under the detent, which was a spring, and which so pressed the fabric against the platform, while the rollers were drawing the fabric forward, as to detain or hold back that portion of the fabric which was so pressed by the detent, and cause it to be crinkled in the space between the inner edges of the flutes. This result was attained, because the same thing was done as in the King machine—that is, the width of the fabric passed between the pair of plain zones was greater than the width of such zones, and, as the fluting gathered the fabric, the portion of it which passed between the pair of plain zones was crinkled. In the decision in that case, it was said:

The main feature of the plaintiff's machine is the device for pulling away the fabric before the fluting-rollers grasp it too firmly, so as to get the increased width of fabric opposite the pair of plain zones. The plaintiff shows how this is to be done by an arched guide. This arch raises up the fabric. The fabric rides over it, and so is pulled away from the fluted parts of the rollers. The obstacle interposed by the arched guide pushes up the fabric to an apex. There would be no difference in mode of operation if the fabric were pushed down to a given point by an arched guide. The defendant interposes an obstacle which pulls back the fabric from the fluted parts of the rollers. The mode of operation is the same as in the plaintiff's machine, and the result is the same. The only difference is, that in one the center of the extra width moves upward as the pull is made, and in the other it does not; but in each the detaining instrument diverts the fabric from what would otherwise be its course, so as thereby to pull out extra width. I think the variation is merely mechanical, and not substantial, and that the defendant's machine is an infringement.

In the testimony in that case, evidence was given as to the use prior to King's invention of a guide called the Muller guide No. 5, which had an arched projection raised in front of two rollers, and over which arched projection the material passed on its way to the rollers; but the evidence showed that such arched projection had been used, not in combination with fluting-rollers which had plain parts or zones opposite the arched projection, but always in combination with rollers on which, opposite the arched projection, were diamond embossing-rings, which made a diamond figure on the material and occupied all the space on the rollers that was not occupied by the fluting parts of the rollers. It was held that this did not present the combination set forth in the claim of the patent, for the purpose therein specified.

The defendant in the suit last referred to is the defendant in this suit. He has altered his machine by taking off the detent or finger and putting in place of it an arched projection, raised up in front of the plain parts of the rollers, and like the arched projection in the said Muller guide No. 5; but he dispenses with the Muller embossing-rings, and uses instead rollers like King's, which have plain parts between the fluting parts and opposite the arched projection. He has removed from the King machine those parts before spoken of as immaterial to King's invention, namely, the upper piece of metal in King's guide, and the metal each side of the arched projection. He retains all that there is essential in King's guide—that is, its curved or arched portion opposite the plain parts of the rollers, which are between the fluted parts of the rollers—and he uses such curved or arched portion in connection with rollers which have parts suitable for fluting each side of plain parts, in a machine which operates by means of such fluting parts and such plain parts of the rollers, and such curved or arched piece in front of such plain parts, to produce the crinkled or puffed conformation in the fabric in connection with the fluted parts of it. The mode of operation of the parts is the same as in King's machine, in all features that are essential to King's invention, as described and claimed, and the result in the finished fabric is the same. The defendant takes up an extra width of material by causing the material to ride over and to be raised by the arched or curved projection, and this extra width is crinkled as and because the adjacent parts are fluted.

The plaintiff is entitled to an injunction, as prayed for.

DISCLAIMERS FILED.

86,306.—Improved Metallic Lathing.—ISAAC V. HOLMES, New York, N. Y. Patented January 26, 1869; reissue No. 3,661, dated October 5, 1869. Disclaimer filed July 6, 1875. Disclaims:

"That part of the claim, in said Letters Patent, which is in the following words, to wit:

"1. A metallic stud or support, when formed with suitable projections and recesses or stilts, for holding metallic lathing, substantially as herein described and set forth."

48,366.—Tremolo Attachment.—RILEY W. CARPENTER, New York, N. Y. Patented June 27, 1865; reissue No. 3,444 dated May 18, 1869; reissue No. 3,665, dated October 5, 1869. Disclaimer filed June 19, 1875. Disclaims:

"Your petitioners hereby enter their disclaimer to those parts of the claims of said reissue No. 3,665, if any which cover, or which may be construed to cover, the application to the instrument of any valve or tremolo, producing mechanisms arranged as shown in the drawings or model, or original specification of the Letters Patent granted Lafayette Louis, dated November 18, 1856, No. 16,094, and limit their claims to and cause said claims to include only—

"'1. The application to a musical instrument of a fan vane, or beater, located externally to the wind-chest and air-passages of the instrument, and behind or above the key-board and the place usually occupied by the swell of the instrument, and operated by a treadle or other suitable means of operation, substantially as shown.

"'2. The arrangement of such fan or agitator in the instrument, so located and operated at right angles to the keys and parallel to the line of reeds or pipe mouths, at any convenient distance from them, as described.'"

DESIGNS PATENTED DURING THE WEEK.

8,534.—Oil-Cloth.—CHARLES T. MEYER and VICTOR E. MEYER, Bergen, N. J., assignors to EDWARD C. SAMPSON, New York city. Application filed July 16, 1875. Term of patent 3½ years.

8,535 to 8,545, inclusive.—Carpets.—ELMER J. NEY, Dracut, Mass., assignor to HARTFORD CARPET COMPANY, Hartford, Conn. Applications filed July 17, 1875. Term of patents 3½ years.

8,546 to 8,549, inclusive.—Carpets.—JOHN H. SMITH, Enfield, assignor to HARTFORD CARPET COMPANY, Hartford, Conn. Applications filed July 17, 1875. Term of patents 3½ years.

8,550 to 8,553, inclusive.—Fabrics for Clothing.—EDWARD C. CLARK, Rockville, Conn.—Cases A, B, C, and D. Applications filed July 19, 1875. Term of patents 3½ years.

TRADE-MARKS REGISTERED DURING THE WEEK.

[Each certificate bearing date July 27, 1875.]

2,785.—Beer.—BENJAMIN BATES, Baltimore, Md. (Re-registration.) Application filed February 7, 1871.

"a ring, stripe, or band of a different color from that of the bottle, running entirely around the girth of the bottle, with my name or signature, Dr. BENJAMIN BATES, cut or affixed upon the bottle just above said colored ring or band."

2,786.—Beer.—BENJAMIN BATES, Baltimore, Md. (Re-registration.) Application filed April 21, 1871.

"a ring, stripe, or band of a color different from that of the bottle, running round the bottle."

2,787.—Tonic Beer.—BENJAMIN BATES, Baltimore, Md. (Re-registration.) Application filed September 26, 1872.

"word 'National' in connection with the words 'Tonic-Beer.'"

2,788.—Medicine.—HENRY H. HAY, Portland, Me. (Re-registration.) Application filed January 3, 1871.

"letters 'L. F.'"

2,789.—Mail-Bags.—JOHN BOYLE, of Brooklyn, N. Y., assignor to MARSHALL JEWELL, Postmaster-General of the United States, on behalf of the United States. Application filed June 30, 1875.

"thirteen parallel stripes, in blue or other suitable color."

2,790.—Condensed and Fresh Milk.—SAMUEL W. CANFIELD, Piermont, N. Y. Application filed June 19, 1875.

"word 'SALICTLIC.'"

2,791.—Broom and Tool Holders.—HIRAM CARSLEY, Lynn, Mass. Application filed June 30, 1875.

"a female figure, represented as holding a broom and emerging from a doorway."

2,792.—Cigars.—LICHTENSTEIN BROTHERS & Co., New York, N. Y.—Case A. Application filed June 17, 1875.

"phrase 'M. Blem.'"

2,793.—Cigars.—RICHTENSTEIN BROTHERS & Co., New York, N. Y.—Case B. Application filed June 17, 1875.

"word 'CONSTELLATION.'"

2,794.—Cigars and Tobacco.—LICHTENSTEIN BROTHERS & Co., New York, N. Y. Application filed July 17, 1875.

"words 'AMERICAN TEAM.'"

2,795.—Soap.—ROBINSON BROS. & Co., Boston, Mass.—Case A. Application filed July 6, 1875.

"words, or compound word, 'Almond Meal.'"

LABELS REGISTERED DURING THE WEEK.

[Each certificate bearing date July 27, 1875.]

287.—Title: "**Livingston's Indelible Carmine Ink.**"—FRANK L. JOY, Chicago, Ill. Application filed June 28, 1875.

288.—Title: "**Anti-Corrosive Cylinder-Oil.**"—E. H. KELLOGG, New York, N. Y. Application filed July 15, 1875.

289.—Title: "**Pennsylvania Cellar Co., Phila.**"—RESTEIN BROS., Philadelphia, Pa. Application filed July 17, 1875.

290.—Title: "**Adam H. Riebeling, Buffalo.**"—ADAM H. Riebeling, Buffalo, N. Y. Application filed July 12, 1875.

INDEX OF INVENTIONS PATENTED JULY 27, 1875.

	Class No.	No. of Patent.
Air brake and car starter, H. Moschowitz	122	166 098
Alarm, burglar, C. H. Williams	24	165 967
Ant destroying apparatus, W. Grafton	53	166,092
Auger, earth, J. E. Hall	51	165,964
Bag, traveling, W. Roemer	102	165,950
Bale tie, H. Estes	7	166,085
Bale tie, hook, W. Greer	7	165,906
Bales, applying sample patches to cotton, S. Sullivan	7	166,156
Barrel heads, machine for making, W. W. Trevor	40	166,041
Base ball, J. Giblin	143	165 964
Basket for newspapers, De Barry and Lundqvist	146	166,073
Battery, galvanic, J. Kidder	50	166 012
Bayonet scabbard, T. W. Rounds	55	165,953
Bayonet scabbards, apparatus for the manufacture of, T. W. Rounds	55	165,958
Bee hive, W. Vanwider	9	166 163
Bell, alarm, I. H. Abell	24	166,036
Boiler, Rotary bleaching, H. Loring	11	166,117
Boiler, steam, C. E. Emery	148	165,900
Boneblack, &c., apparatus for burning and revivifying, J. Gandolfo	155	165,902
Boots and shoes, burnishing and finishing tool for, J. W. Carver	16	165,917
Bottles, machine for applying wire caps to, A. De Mestre	1	166 077
Bridge, metallic truss, J. Valleley	21	166,042
Broom machine, corn, Blood and Topping	29	166,065
Brush, rotary hair, Nutsford and Glasgow	29	166,027
Buckle, harness, I. L. Landis	23	165,936
Button, C. H. Goodwin	23	166,091
Button for wearing apparel, H. C. Griggs	23	166,097
Calculator, A. C. Wellman	42	165,964
Car coupling, J. H. Acton	122	165,971
Car coupling, M. Sullivan	122	166,157
Car spring, railway, J. E. Wootten	122	166,178
Car spring, railway, J. E. Wootten	122	166,179
Cars, motor for railway, G. E. Oliver	122	166,070
Carbureters, air supply attachment for, J. M. Cayce	27	166,089
Carding machine, J. F. Foss	28	166,089
Carriage, child's, R. W. Caldwell	31	166,088
Carriage curtain fixture, Knight and Ripple	31	166,114
Chair, folding rocking, G. McAleer	62	166,123
Chair, nursery, J. F. Downing	62	166,079
Chairs, foot rest for, T. A. Johnsen	62	165,932
Chairs, &c., spring bottom for, T. Noonan	62	166,133
Charcoal and boneblack heater and cooler, J. Gandolfo	155	165,903
Churn, reciprocating, D. Rowland	45	165,954
Cigar box, S. Heineman	109	166,100
Cigar machine, R. Appleby	100	165,911
Cigar mold, S. Simonson	100	166,154
Cistern cover, S. Haffter	51	165,907
Clasp for uniting webs of cloth for japanning, B. Atha	23	166,059
Clock, tower, C. Fasoldt	36	165,901
Cloth for japanning, clasp for uniting webs of, B. Atha	23	166,059
Clothes drier, H. Winter	91	166,053
Clothes pin, U. D. Mihills	91	166,082
Clothes pin, G. Topping	91	166,160
Clothes wringer, Bunnell and Ronan	91	166 067
Coal vase, W. S. Potwin	154	165,947
Cocoanut meats, machine for paring, Smith and Maltby	88	165,959
Condenser and heater, Newman and Van Orsdale	150	166,132
Cooler, milk, O. H. Willard	45	166,051
Corer and slicer, apple, C. E. Kimball	88	166,013
Corn cutter, green, T. Witmer	88	165,968
Corn sheller, C. D. and E. D. Read	88	166,142
Corn stalk cutter, J. N. Hill	59	166,096
Cot, folding, O. E. Lord	62	165,939
Cotton cleaner, J. Wright	41	166,054
Cotton for spinning, preparing, R. Handy	142	166,001
Cotton jack, M. J. Walsh, (reissue)	79	6,559
Crank motion, C. E. Whipple	67	166,047
Cultivator, W. Weaver	43	166,044
Cultivator, G. Wilkinson	43	166,050
Curtain cord fastener, L. Knudson	62	166,115
Dental plugger, A. J. Polk	46	166,139
Dish, covered, W. E. Hawkins	88	165,926
Dish washing machine, H. H. Hall	86	166,098
Disinfecting sick room slop jars, C. F. Parker	98	166,135
Doll heads, &c., manufacture of, E. S. Judge	143	166,111
Egg beater, W. Redheffer	88	166,143
Elevator, grain, C. W. Mills	79	166,023
Explosive compound, C. A. and L. S. Browne, (reissue)	32	6,564
Faucet, Newman and Kneal	167	165 944
Feed cutter, A. C. Stewart	59	165,963
Fence, farm, Rush and Yarbrough	52	166,149
Fire arm, breech loading, J. P. Pieri	18	166,138
Fire arm, revolving, R. White	123	166,173
Fires, apparatus for extinguishing, E. Harris	118	166,003
Floor, fire proof, L. P. Rogers	4	166,148
Fork, horse hay, T. M. Edwards	77	165,949
Fork, spiral hay, A. Shellenberger	77	166,152
Fountain and lawn sprinkler, portable, R. Brusie, (reissue)	167	6,560
Fruit drier, portable, J. W. Faulkner	48	166,088

	Class No.	No. of Patent.
Fruit jar, Stevens and Lumley	58	165,902
Fruit loosener, dried, H. J. White	88	166,171
Fruit press, I. W. Heysinger	19	166,103
Furnace, cupola, J. Blakeney	85	165,980
Furnace grate, G. R. Moore	154	165,943
Furnace, hot air, T. Langstrath	154	166,015
Gage, bias, J. A. Hamilton	38	165,999
Gas from petroleum, making illuminating, Wren and Barker, (reissue)	66	6,568
Gas, heating retort for the manufacture of illuminating, W. H. Spencer	66	166,037
Gas, manufacture of illuminating, W. H. Spencer	66	166,036
Gas retorts, mouth piece for, P. Munzinger	66	166,131
Gas stove, pocket, T. W. Houchin	65	166,008
Glucose, manufacture of, W. Garton	155	166,090
Gold from sand, &c., apparatus for separating, T. W. Irwin	99	166,009
Grate, J. E. Baum	154	165,974
Halls, preventing reverberations in public, W. B. Carlock	4	165,976
Halters, clamp for, F. F. Drinkhouse	144	166,082
Handkerchief holder, H. G. Mackinney	86	165,940
Harrow, J. S. Beazell	73	166,061
Harrow, L. Study	73	166,156
Harrow, rotary, W. G. Reed	73	165,948
Harrow, sulky, D. F. Shaw	73	166,031
Harvester, J. P. Manny	74	166,017
Harvester, J. P. Manny	74	166,018
Heater and cooler, charcoal and boneblack, J. Gandolfo	155	165,993
Heel stiffener, W. F. Spinney	16	165,961
Hinge, C. Sholl	24	165,957
Hook, snap, E. Kempshall	23	165,933
Horse power, portable, C. Roberts	159	166,147
Hose coupling, A. J. Morse	81	166,130
Hose coupling, A. Work	81	166,177
Iron into steel, converting, A. E. Carpenter, (reissue)	85	6,562
Jewelry pin, I. B. Abrahams	86	166,057
Journal bearings, composition for, Lathrop and Weber	87	165,977
Kiln, calcining, W. J. Taylor	99	166,159
Knife and tape line combined, G. S. Hastings	44	166,089
Knob shanks, manufacture of metal, J. P. Adams	24	165,972
Lace machine, E. Malhére	89	165,941
Lamp chimney, W. H. Barnard	90	165,912
Lamp stove, E. H. Huch	65	166,106
Lantern for trapping insects, B. F. McQueen	63	166,124
Lap board, H. G. Stepp	38	166,038
Latch, reversible, J. Moore	94	165,972
Letter box, De Barry and Lundqvist	146	166,074
Lock, H. S. Shepardson	93	166,034
Lock for doors, A. Goldfinger	93	165,995
Lock, hasp, J. Lachier	93	166,014
Lock, seal, J. S. Brown	93	165,915
Locomotive smoke stack, N. Irving	94	165,930
Log turner, C. P. McWane	130	166,021
Looms, shuttle box mechanism for, H. Wyman, (reissue)	95	6,567
Mangle, J. Johnson	91	166,108
Marking wheel, F. M. Trueworthy	146	166,162
Medical purposes, mask for, H. M. Bowley	156	165,955
Meridian, apparatus for finding true, H. C. Pearsons	157	166,137
Metal timber haugers, device for bending, J. Flynn	125	166,088
Metals, apparatus for introducing refining materials into molten, E. P. Hudson	85	165,929
Millstone dressing machine, C. A. Smith	57	165,958
Millstones and spindles, device for adjusting, S. Whitaker	57	166,174
Miter box, P. and N. H. Johnson	29	166,010
Mop wringer, M. Regan	22	165,949
Mowing machine, J. P. Manny	74	166,019
Nails, socket for attaching ornamental heads to, T. C. Richards	103	166,145
Needle blanks, machine for swaging, P. M. Beers	104	165,976
Needles, machine for polishing the eyes of, P. M. Beers	104	165,977
Needles, machine for stamping, P. M. Beers	104	165,975
Nut lock, J. M. Kent	14	166,113
Oiler, G. F. Dutton	87	165,987
Ore and stone crusher, J. E. Blake	3	166,064
Pan, frying, A. Malin	154	166,120
Paper bag, W. Oesterlein	109	166,028
Paper, machine for water marking, M. Mathews	108	166,123
Photographic prints, machine for washing, O. Dubois	111	165,986
Pin pools, marking board for, G. H. Decker	143	165,985
Pins, machine for assorting, J. D. Shelton	104	166,153
Pitman, J. F. Thomas	67	166,039
Planing and molding machines, cutter head for, G. J. Shimer	173	166,035
Plow, J. Middleditch	114	166,127
Plow, gang, E. A. Beers	114	166,063
Plow, sulky, B. Slusser, (reissue)	114	6,563
Plows, composition metal for casting, G. K. Smith, (reissue)	33	6,558
Pot, boiling, Hennaman and Shaw	154	166,102
Press, cotton, Mackey and Green	7	166,119
Press for packing putty, L. Boucher	107	166,066
Press, fruit, I. W. Heysinger	19	166,103
Pulley block, J. Weir	79	166,167
Pump, J. Graybowski	118	165,925
Pump bucket, chain, J. S. Beazell	118	166,062
Pump for tubular wells, J. T. Whipple	118	166,048
Pump, wood, A. Breed	118	165,914
Punching machine, C. Norton	119	166,134
Punching machines, feeding device for, F. Deming	119	166,078
Railway signal, R. H. Moore	120	166,094
Rake, horse hay, Lufkin and Allen	77	166,118
Rake, horse hay, Wood and Taylor	77	166,176
Rake, revolving horse, J. H. Randolph	77	166,030
Refrigerator for pails, &c., removable, J. C. Jones	58	166,110
Registering machine, C. M. Cady	42	165,981
Regulator, feed water, I. Dreyfus	148	166,081
Regulator, feed water, G. Henry	148	165,928
Ribbon runner, C. Young	38	165,970
Rock, &c., wedge for splitting, T. Cosbey	153	165,984
Roll for rolling round iron bars, J. H. Helm	125	165,927
Ruffles, machine for making, J. A. Pipo, (reissue)	134	6,565
Sack holder, J. L. Millhiser	57	166,128
Sack holder, adjustable, H. W. Clark	57	165,982
Saddle, riding and pack, G. E. Albee	72	165,973
Safe, fire proof, T. Hyatt	128	166,107
Sash holder, W. H. Plympton	24	165,945
Saw mill, circular, D. Rawson	130	166,170
Saw mill head block, L. W. Pond	130	165,946
Sawing machine, scroll, G. Mercer	130	166,126
Scales, weighing, H. M. Weaver	132	166,046
Scraper, road, J. W. Wilson	51	166,052
Screw machine, metal, J. F. Webster	171	166,166
Screws, machine for threading wood, B. A. Mason	171	166,121
Separator, grain, J. W. Johnson	150	165,931
Sewer trap, C. Lewis	8	166,116
Sewing machine, L. J. Crecelius	134	166,071
Sewing machine, R. Whitehill	134	166,172
Sewing machine caster, A. C. West	134	165,965
Sewing machine for making band ruffling, T. Robjohn, (reissue)	134	6,566
Sewing machine guide, J. H. Trowbridge	134	166,161
Shade roller, sheet metal, A. H. Knapp	62	165,935
Sheet metal rollers, forming, A. H. Knapp	62	165,934
Sheet metal shade roller, A. H. Knapp	62	165,935
Shirt bosom, F. C. Goodwin	38	166,092
Shoe fastener, G. P. Reeves	16	166,031
Sleeve protector, O. H. Dunn	38	165,921
Sleigh, A. A. Abbott	31	166,055
Spark arrester for locomotives, W. McK. Thornton	94	166,040
Spooling machine, S. D. Learned	17	166,016
Sprinkler, rose, W. T. Voce	167	166,164
Stereoscope, A. Quirolo, (reissue)	157	6,557
Stool, kneeling, W. Cahill, (reissue)	62	6,561
Store counter, W. Volkland	63	166,043
Stove cover lifter, Edgar and Bardell	154	166,084
Stove grate, J. W. Collins	154	165,983
Stove, heating, W. Wickkiser	154	166,049
Stove, lamp, E. H. Huch	65	166,106
Stove, magazine heating, M. A. Cushing	154	166,072
Stove, parlor cook, W. Doyle	154	165,919
Stove, parlor cook, W. Doyle	154	165,920
Stove pipe elbows, machine for making, J. F. Piehl	136	166,029
Stove, pocket gas, T. W. Houchin	65	166,008
Stoves, magazine for coal, J. P. Richardson	154	166,144
Stoves, oven door for, J. C. Barnes	154	165,913
Straw board, manufacture of lined, B. F. Field	108	166,087
Sugar mold, M. L. Senderling	155	166,150
Table, folding, J. E. Root	62	165,951
Telegraph, automatic, Wheatstone and Stroh	50	166,168
Telegraph for transmitting musical tones, electric, E. Gray	50	166,095
Telegraph for transmitting musical tones, electric, E. Gray	50	166,096
Telegraphs, magnet for electric, Wheatstone and Stroh	50	166,169
Telegraphs, receiver for electro-harmonic, E. Gray	50	166,094
Telegraphs, signal box for fire alarm, M. G. Crane	50	165,918
Telegraphic fire alarm repeater, Gamewell, Crane, and Rogers	50	165,923
Thill coupling clamp, L. B. Prindle	31	166,141
Tile making and laying machine, R. Hoffhein	114	166,104
Tire tightener, Horton and Hayes	31	166,105
Tobacco, compound for flavoring and preserving, G. E. Sterry	160	166,155
Toilet glass frame, J. Hollely	161	166,007
Toy, G. F. Morse	143	166 025
Toy torpedoes, machine for making, T. H. Spear	143	165,960
Truck, hand, B. L. Pratt	31	166,140
Truck, hook and ladder, Kiey and Higgins	31	166,112
Trunk strap, G. E. Albee	102	166 038
Valve, gate, E. Russell	152	166,032
Valve, steam, J. Hare	158	166,002
Valve, stop, G. W. Eddy	167	165,988
Valve, stop, G. W. Eddy	167	166 083
Vegetable washer, P. P. Roberts	88	166,146
Vehicle spring, C. Bauer	31	166,060
Vehicle spring, J. D. Sarven	31	165 956
Vehicle top, H. W. Warner	31	166,165
Vehicle wheel, J. C. Garretson	31	165,924
Vehicle wheel, E. Shaw	31	166,151
Wagon, dumping, W. H. Henkel	31	166,101
Wagon, dumping, M. C. and H. L. Meigs	31	166,125
Wall paper exhibitor, W. H. Hazzard	54	166,005
Wash bowl, H. M. Weaver	8	166,045
Washing machine, C. C. Bishop	91	165,979
Washing machine, E. A. Jones	91	166,109
Washing machine, N. Longley	91	165,938
Washing machine, A. B. Wroth	91	165,969
Water, apparatus for ejecting, I. Dreyfus	118	166,080

	Class No.	No. of Patent.
Water meter, H. M. Wilcox	167	165,966
Water meter, Winzer and Bland	167	166,175
Water wheel, H. W. Hawley	168	166 004
Waxing compound, L. R. Mears	26	165,942
Weather strip, F. Fleury	30	165,922
Well, driven or bored, M. T. and M. C. Chapman, (reissue)	51	6,559
Well tubing, W. Patterson	51	166,136
Windmill, T. Kellogg	118	166 011
Wire caps, machine for finishing, A. De Mestre	163	166,076
Wire caps, machine for making, A. De Mestre	163	166,075
Wire caps to bottles, machine for applying, A. De Mestre	1	166 077
Woods, making imitation, G. V. Hann	54	166,000
Wrench, McCormick and Baker	100	166 020
Yarn, machine for balling, L. C. Billings	89	165,978

INDEX OF PATENTEES TO WHOM PATENTS WERE GRANTED JULY 27, 1875.

	Patent No.
Abbott, A. A., Sleigh	166,055
Abell, I. H., Alarm bell	166,056
Abrahams, I. B., Jewelry pin	166,057
Acton, J. H., Car coupling	165,971
Adams, J. P., Manufacture of metal knob shanks	165,972
Albee, G. E., Riding and pack saddle	165,973
Albee, G. E., Trunk strap	166,058
Allen and Lufkin	166,118
Appleby, R., Cigar machine	165,911
Andrews, I. R., assignee	165,965
Atha, B., Clasp for uniting webs of cloth for japanning	166,059
Atkeson, G. A., assignee	165 969
Babcock Manufacturing Company, assignee	166,112
Baker and McCormick	166,020

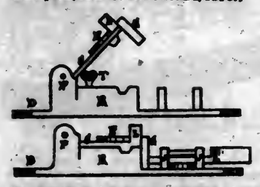
TITLES, DRAWINGS, AND CLAIMS

OF

PATENTS GRANTED JULY 27, 1875.

165,911. CIGAR-MACHINE. R. Appleby, New York, N. Y. [Filed Oct. 17, 1874.]

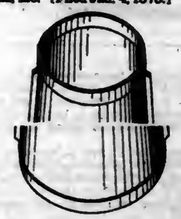
Brief.—The body of the cigar is laid between three rolls, which rotate it, while its point rests between a set of short rolls, that are arranged to surround the same, to give it the finished form. Over these short rolls, and upon the upper main roll, is an adjustable conical sleeve, that can be brought over the short rolls, to co-operate therewith in forming the point.



The combination, with the rollers A B C, of the adjustable thimble Q and the rolling sleeve N, mounted on spindles projecting from the grooved head L, and arranged in the arc of a circle, all as shown and described.

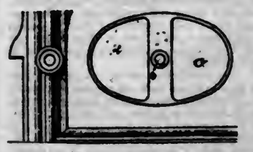
165,912. [illegible]

In a metal-lined wood pump made in two sections, A and B, suitably secured together, the lining C, made to enter a groove in the section B, and inclose the clack-valve upon the upper face of said section, substantially as and for the purpose described.



165,913. SEAL-LOCKS. John S. Brown, Indianapolis, Ind. [Filed Feb. 24, 1875.]

The combination of the lock D R, hinged key-hole cover C, having the opening M, with the L-shaped seal E, having the opening P, notched bolt H, and bar K, constructed and operated substantially as described.



165,914. LAMP-CHIMNEYS. W. H. Barnard, Sedalia, Mo. [Filed Jan. 4, 1875.]

A lamp-chimney constructed of two sections, each of which is provided with laterally-projecting flanges, substantially as described, whereby, when the sections are placed together, a longitudinal projection is formed and a perfect joint secured, as set forth.

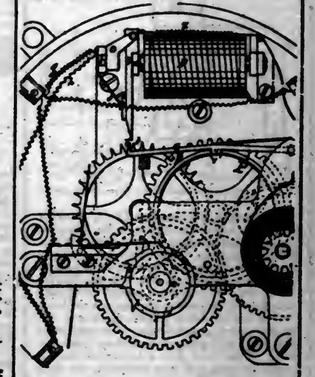
165,915. OVEN-DOORS FOR STOVES. Jos. C. Barnes, Albany, N. Y., assignor to Van Wormer & McGarvey, same place. [Filed May 20, 1875.]

Brief.—The name-plate is held in the recess by the bolt passing through the bar.

The combination of the removable name-plate a and the opening or recess c, formed in the stove-door for the reception of the plate, secured and held in place by means of nuts and bolts, substantially as shown and described.

165,916. WOOD PUMPS. Amos Breed, La Harpe, Ill. [Filed Mar. 27, 1875.]

Brief.—The pump-stock is made in two sections, the lower receiving in a groove in its upper face the metal cylinder-lining projecting from the lower end of the upper section. The lining so received incloses the clack-valve placed on the lower section. The working parts of the pump may then be displaced without disturbing the tubing.

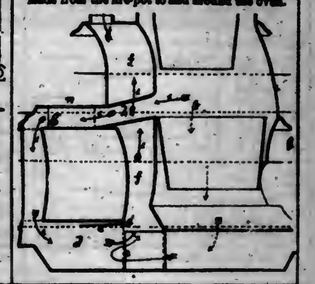


165,917. BURNISHERS AND FINISHING TOOLS FOR BOOTS AND SHOES. Jas. W. Carver, Lynn, assignor to himself and George H. Morrison, East Boston, Mass. [Filed June 20, 1875.]

The burnishing-iron *a*, provided at each end with a marking-wheel, *c*, and gage *d*, substantially as shown, and for the purpose specified.

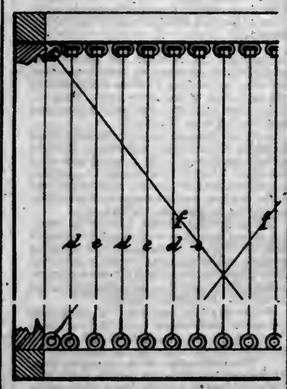
165,918. SIGNAL-BOXES FOR FIRE-ALARM TELEGRAPHS. Moses G. Crane, Newton, Mass. [Filed July 9, 1875.]

Brief.—Boxes in normally-closed circuit. On the breaking of the circuit, the armature-levers are withdrawn by a spring. On taking against the fingers, closes a short circuit outside of magnet and circuit-breaking wheel, thus preventing a signal being given by any except the box first operated. In such box the mechanism is released by raising a lever having a lug in recess of the wheel, a tooth taking against a lever and locking it, to prevent the formation of the short circuit in such box.



1. In a fire-alarm signal-box the lever G, with its lug V and hook *t*, the flange *p* and its notches V', the lever *b*, insulated plate *c*, and magnet D, all combined and operating as and for the purpose specified.

2. The combination of the lever H, the lever G, and the wheel F, whereby the said wheel is liberated and allowed to revolve under the stress of the motor Q, as and for the purpose specified.

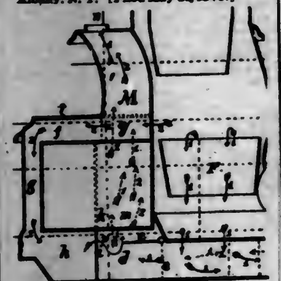


165,919. PARLOR COOK-STOVES. W. Doyle, Albany, N. Y. [Filed May 31, 1875.]

Brief.—The draft in the ascending flue is quickened by heat from the "blast-flue," which leads from the fire-pot to and around the oven.

The method of preventing echo, &c., by interposing a barrier of wire strands between the echoing or reflecting surfaces and the point or points from which the sounds emanate.

165,920. MEANS FOR PREVENTING REVERBERATIONS IN PUBLIC HALLS. William B. Carlock, Bloomington, Ill. [Filed Jan. 21, 1874.]



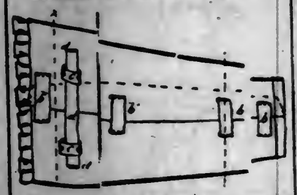
1. A heating-stove having an ash-pit at its rear, and the base-flues *b*, *b'*, and *c*, bottom horizontal flue with dampers *c c* between it and the said base-flues, and an ascending flue between the oven and the stove proper, combined to operate substantially as and for the purpose set forth.

2. The combination, with the ascending flue *f*, of the blast-flue *h* leading from the combustion-chamber to the horizontal flue or chamber *g*, and through the said ascending flue, whereby the hot gases passing through the said blast-flue may reheat the gases of reduced temperature in the said ascending flue, and stimulate the draft of the same, substantially as and for the purpose set forth.

3. The combination, with the stove proper, of the blast-flue *h*, horizontal flue or chamber *g*, direct return-flues *m m*, and ascending flue *f*, substantially as and for the purpose set forth.

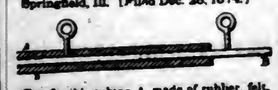
4. The combination, with the blast-flues *h* and *h h*, one or more return-flues, *m m*, and horizontal top flue *g*, of the ring *s*, carrying the damper-plates *s' s'*, substantially as and for the purpose set forth.

166,920. PARLOR COOK-STOVES. W. Doyle, Albany, N. Y. [Filed May 31, 1875.]



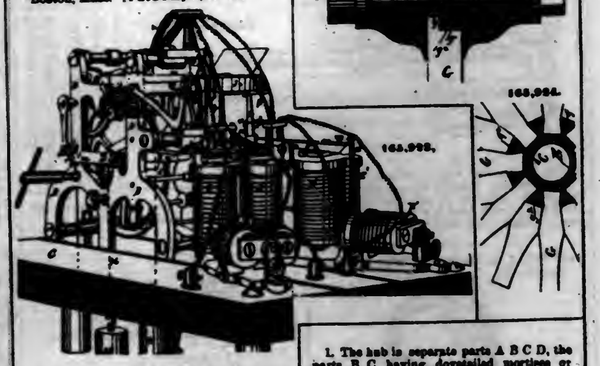
1. A heating-stove proper having flues for a reversible draft into and from the base, and an oven located at the rear, a top flue, *g*, horizontal flue *f*, descending flues *g f'*, horizontal flues *h* and *d*, separated by a flue-strip, ascending flues *m* and M, damper *c*, and ring-damper *s v* at the opening *m'*, combined to operate substantially as and for the purpose set forth.

2. A heating-stove proper, top flue *g*, flue or chamber *f*, descending flue M leading from the flue *f*, descending flues leading down the sides of the oven into a horizontal flue beneath the oven, and to an ascending flue leading to the flue M and damper to open or close the opening *m'* to the flue M, combined to operate substantially as and for the purpose set forth.



3. A heating-stove proper having descending and base flues for a reversible draft into the lower portion of the said stove, top flue *g*, chamber or flue *f*, having an opening to the ascending flue M, chamber or flue *d*, communicating with the flue *c* in the base of the stove proper, ascending flue *m*, base-damper *c*, and damper to variously open or close the opening *m'* to the ascending flue M, combined to operate substantially as and for the purpose set forth.

166,921. SLEEVE-PROTECTORS. O. H. Dunn, Boston, Mass. [Filed June 26, 1875.]



In combination with the protector *a*, provided with the flap *a'*, the elastic bands *b b'*, loops *c*, and elastic encircling band *d*, as and for the purposes herein specified.

166,922. WEATHER-STRIPS. Frank Fleury, Springfield, Ill. [Filed Dec. 26, 1874.]

The flexible tubing A, made of rubber, felt, or other like materials, in combination with the metal rod B and the metal fastenings C, for the purpose specified, substantially as shown and described.

166,923. TELEGRAPHIC FIRE-ALARM REPEATERS. Jno. N. Gamewell, Hackensack, N. J., M. G. Crane, Newton, and E. Rogers, Boston, Mass. [Filed July 9, 1875.]

1. The combination, with the break-circuit wheel of a telegraph-repeater, upon which the lines of two or more circuits converge, of a governor, whereby, when a signal is being given over any one of the circuits, and repeated over the other circuits, the armatures of the magnets in such other circuits are locked in position, thereby preventing interference between the several circuits, as and for the purpose specified.

2. The auxiliary escapement-movement, in combination with the governor J and the break-circuit wheel, whereby the reverse movement of the governor is not permitted to take place during several successive revolutions of the said wheel, as and for the purpose specified.

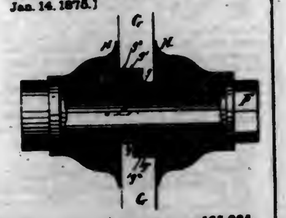
3. The auxiliary escapement-movement, the circuit-wheel and its shaft, and the lever 26, combined and operating as described, whereby, after the winding up of the escapement by the revolution of the circuit-wheel shaft, the reverse motion of the said lever is prolonged and graduated, as specified.

4. The combination, in an electro-telegraphic repeater, of two electro-magnets in the same circuit, one of which has a larger core than the other, whereby there results an appreciable difference in the periods required for them to be charged and discharged, respectively, as and for the purpose specified.

5. The device described, whereby the breaking of any one of several circuits connected with the repeater for the purpose of signaling occasions the break-circuit wheel to be cut out from that circuit by closing the same over auxiliary fingers *n n'*, all combined and operating as and for the purpose specified.

6. The auxiliary magnets F F', with their armatures and hooked lever M, in combination with the armature-lever H and swinging lever D, as and for the purpose specified.

7. The combination of the swinging lever D, with its two stop-pins, and the arm *i*, with its two fingers *s s'* upon the break-circuit-wheel shaft, as and for the purpose specified.



8. The combination of the cam 23, levers 22 and 25, and sliding bar 18, as and for the purpose specified.

9. The combination of the governor J, bar 18, lever 25, and latch 37, as and for the purpose specified.

10. The lever I, with its short arm 10, the armature-lever H, and lever D, and the governor J, combined and operating as and for the purpose specified.

11. The auxiliary escapement *y y'*, with its train 31 32, in an electro-telegraph repeater, employed to graduate the movement of the mechanism by which said train is actuated relatively to the movement of another telegraphic repeating mechanism.

166,924. WHEELS FOR VEHICLES. Jacob C. Garretson, Marchland Village, N. Y. [Filed Jan. 14, 1875.]

1. The hub in separate parts A B C D, the parts B C having dovetailed mortises or notches *g* for the reception of the spokes, and the whole held firmly together by means of the box or thimble E and nut F, as set forth.

2. The spoke G, with a dovetailed tenon, *g'*, and a square shoulder, *g''*, for the purpose of assembling the spoke with the hub, and holding it firmly fixed thereon at a fixed distance from the axis of the hub, as set forth.

166,925. PUMPS. Julian Grzybowski, Detroit, Mich. [Filed Apr. 22, 1875.]

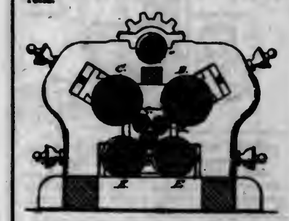
Brief.—The pistons are connected to the piston-rods by cross-heads and sliding keys, by which either pump may be disconnected, leaving the other to work, the cross-head of the disconnected pump sliding freely on the elongated rod.

1. The combination of the two pumps, mounted on opposite ends of a common frame, the crank-shaft O, mounted midway between the two pumps, and the pitmen H, having their inner ends mounted on the crank, and their outer ends connected to the elongated piston-rods by means of the cross-heads M and keys S, as shown, so that either pitman may be disconnected and permitted to slide freely on the rod.

2. The combination of the two pumps, having their pistons both detachably connected to a common driving-shaft by mechanism substantially such as shown, and each pump being provided with two discharge-openings, *n* and *v*, the latter being united by a pipe, V, having cocks R, to a single pipe, N, as shown and described.

166,926.

166,926.

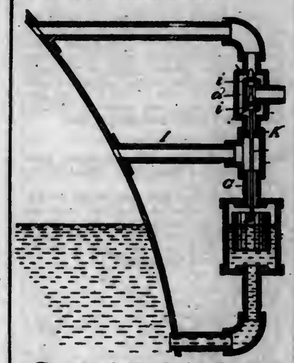


166,926. COVERED DRAINS. W. R. Hawkins, Wallingford, Conn., assignor to Simpson, Hall, Miller & Co., same place. [Filed May 11, 1875.]

1. The disk A, provided with studs *a* upon opposite sides, and the cover B, provided with slotted vertical arms *d*, substantially as described, so as to be turned and suspended beneath the disk, substantially as set forth.

2. The combination of the stationary disk and slotted cams with the cover provided with studs extending into the slots of said cams, and guides, substantially such as described, to govern the movement of the cover as it is turned to and from the disk, substantially as specified.

166,927. ROLLS FOR ROLLING ROUND IRON BARS. J. H. Heim, Allegheny, Pa. [Filed Dec. 8, 1874.]

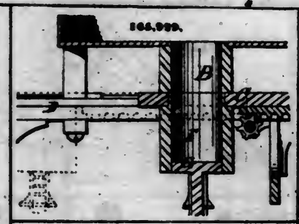


Brief.—Three small rolls, the axis of each of which is inclined spirally to the axis of the bar, so that said bar receives not only a rotary, but also a longitudinal, motion while being rolled. The small rolls are, when the bar (parallel to their axis) is inserted, forced against it by the driving-rolls and the re-enforcing rolls.

The interior rolls *a*, *d*, and *e*, the driving-rolls C and D, and friction-rollers E K, as combined, arranged, and for the purpose specified.

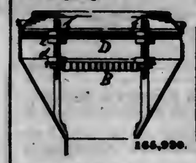
166,928. FEED-WATER REGULATORS. Geo. Henry, Leonorville, Canada. [Filed July 2, 1875.]

Brief.—Steam is admitted through an intermediate pipe, to balance the float.



The water-chamber D, float R, stem *a*, valves *c c*, valve-chamber F, having steam-passage *d*, pipe G, valve-seats *i i*, and branch *g*, in combination with pipe I and plug K, substantially as and for the purposes described.

166,929. APPARATUS FOR INTRODUCING REFINING MATERIALS INTO MOLTEN METALS. Edward P. Hudson, New York, N. Y., assignor of one-half his right to N. Huggins, same place. [Filed Dec. 12, 1874.]

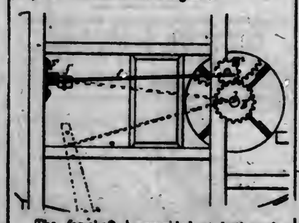


An apparatus substantially as herein described, consisting essentially of a stationary charging-tube, B, attached to a furnace or melting-pot, a closing plate, C, moving beneath the same in suitable ways D D, a movable charging tube or shell, E, and a piston or follower, G, arranged and operating substantially as set forth, for introducing materials into molten metals below the surface thereof, for refining and treating the same, substantially as herein specified.

166,930.

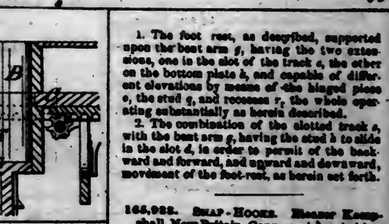
166,930. LOCOMOTIVE SMOKE-STACKS. N. Irving, Susquehanna Depot, Pa. [Filed Apr. 21, 1875.]

Brief.—The taper collar is adjustable attached, to facilitate its removal for repairing the diaphragm.



1. In a smoke-stack, the combination of the grate B, diaphragm or netting D, taper collar C, and fixed collar E, arranged relatively to each other as shown, and for the purpose specified.

2. The taper collar C and fixed collar E, in combination with the diaphragm or netting D, substantially as described and set forth.

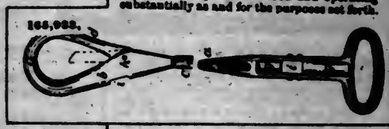


166,931. GRAIN-SEPARATORS. John W. Johnson, Towanda, Pa., assignor of two-thirds his right to C. M. Manville & H. B. Buffington, same place. [Filed Apr. 23, 1875.]

Brief.—Means for varying the actual and relative movement and throw of the upper and lower shoes of a fanning-mill.

The fan-shaft *b*, provided at both ends with crank-pinions B B', the latter driving a smaller crank-pinion, B'', in combination with the transferable connecting-rods *g*, elbow-lever *r* on the removable bracket F, and removable crank-arm D on the rocking shaft D', as and for the purpose set forth.

166,932.



1. The foot rest, as described, supported upon the bent arm *g*, having the two extensions, one in the slot of the track *d*, the other on the bottom plate *h*, and capable of different elevations by means of the hinged plate *o*, the stud *q*, and recesses *r*, the whole operating substantially as herein described.

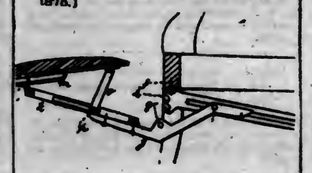
2. The combination of the slotted track *d*, with the bent arm *g*, having the stud *h* to slide in the slot *d*, in order to permit of the backward and forward, and upward and downward, movement of the foot-rest, as herein set forth.

166,932. SNAP-HOOKS. Eleazer Kempshall, New Britain, Conn., neighbor to himself and William Nash, same place. [Filed July 7, 1875.]

The hook *a* and the body *b*, having orifice *f* through the beak, and recess *g*, in which is fitted the spring *f*, and between the cheeks of which is pivoted the latch *d*, having the cam *e*, the several parts combined and operating substantially as and for the purposes set forth.

166,933.

166,934. MODES OF FORMING SHEET-METAL ROLLERS. A. Haydn Knapp, Boston, Mass. [Filed June 12, 1874.]



The method or process of forming cylindrical sheet-metal rollers by first bending the metallic sheet upon an elliptical mandrel, and afterward placing and clamping it around a cylindrical mandrel, whereon the edges are soldered together, substantially as and for the purposes herein specified.

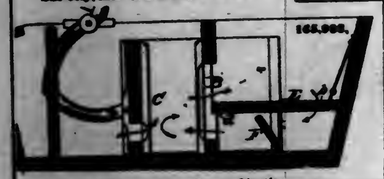
166,935. SHEET-METAL SHADE-ROLLERS. A. Haydn Knapp, Newton, Mass. [Filed Apr. 1, 1875.]

1. An extension coupling-tube, *a*, of a sheet-metal shade-roller, A B, having the edges of the metallic sheet composing it soldered together for a portion of its length, and the remaining portion thereof unsoldered, substantially as and for the purposes herein specified.

2. The longitudinal groove *h* in the side of the extension-tube *a*, formed where the edges of the sheet metal composing the tube lap by each other, and embracing both edges, substantially as and for the purposes herein specified.

166,936. FOOT-RESTS FOR CHAIRS. T. A. Johnson, Portland, Me. [Filed June 15, 1875.]

166,936. BUCKLES FOR HARNESS. Israel L. Landis, Lancaster, Pa. [Filed Aug. 18, 1874.]



In combination with the crank-shaft C and tongue D, the frame A A, having the depending central legs B and strap-rail A'', as described.

165,937. COMPOSITIONS FOR JOURNAL-BEARINGS. Lebbeus W. Lathrop and T. A. Weber, New York, N. Y. [Filed June 26, 1875.]

The compound or composition consisting of copal, sulphur, and graphite, in the proportions substantially as stated, for making journal-box linings or machinery-bearings, substantially as described.

165,938. WASHING-MACHINES. E. Longly, Sac City, Mo. [Filed May 3, 1875.]

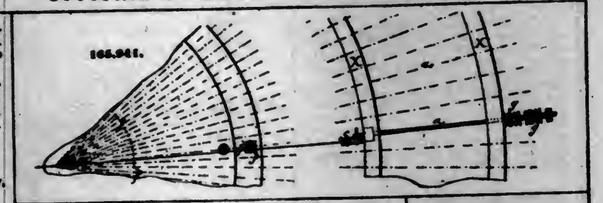
1. In a washing-machine, the combination of a sliding head, a valve operated thereby, a grating to support the clothes against the impact of the head, and a perforated shelf or guide-board, arranged in the manner described, to form a current of water under the clothes on the back stroke of the plunger, and thereby turn them over, substantially as shown and described.

2. The combination of the body A, fixed grating B, sliding head C, perforated shelf E, arranged behind the grating, and the valve F, operated by the head in such manner as to drive a current of water forward through the feet of the grating as the head recedes therefrom.

165,939. FOLDING COTS. Orrin R. Lord, Baldwinsville, Vt., assignor to T. Stowe, same place. [Filed June 8, 1875.]

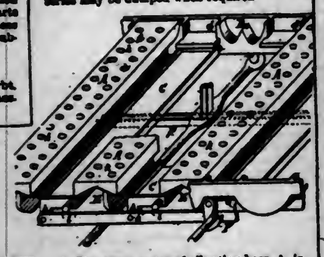
1. In a folding cot, the combination of the side rails *a*, cross-bars *b*, legs *c*, braces *d*, head-boards *g*, and rods *h*, substantially as described.

2. In a folding bed or cot, the combination of the braces *d* and boards *g*, the two parts being connected together so as to form braces alone, or braces and head or foot boards, substantially as shown.



165,940. HANDKERCHIEF-HOLDERS. Hervi O. Mackinney, North Attleborough, Mass. [Filed June 10, 1875.]

The handkerchief-holder composed of the spoon B, provided at one end with the jaws C D D, and at the other with a loop, in combination with the trumpet-shaped slide A, all constructed and arranged substantially as shown and described.



165,941. LACE-MACHINES. E. Malherbe, Paris, France. [Filed Sept. 8, 1873.]

Brief.—The loop is formed by a series of rotating disks placed side by side, and carrying bobbin-carriages, which are alternately shifted, by the double bent levers, from one disk to another, for the purpose of crossing the threads, and rubbed with the disks to twist the crossings. In shifting, they slide on the T-pieces of the disks, and the rotation of the latter is imparted by the gearing on the sleeves attached to the axes of the disks, which gearing is connected by cords to a Jacquard mechanism.

165,942. FURNACE-GRATES. Geo. R. Moore, Philadelphia, Pa. [Filed Feb. 9, 1875.]

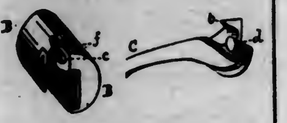
Brief.—Two series of grates are arranged one above the other, so that when the upper one is shaken the lower one receives the here-tofore waste particles of coal. The lower series may be dumped when required.

1. The upper series of vibrating bars A, in combination with the lower series of swinging bars C, as and for the purpose herein set forth.

2. The bed-plates E, having each central bearing D provided with side flanges *d*, as and for the purpose specified.

3. The swinging bar C, in combination with an upper series of bars, as and for the purpose herein set forth.

4. The latch F, in combination with the bar C, as and for the purpose herein set forth.

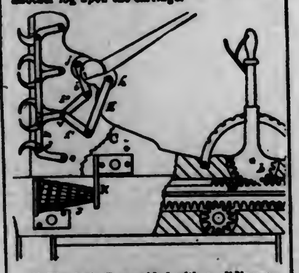


5. In combination, the bars A, hangers *c*, and lever *e*, as and for the purpose herein set forth.

165,943. FAUCETS. Thomas Newman and Wm. H. Kneal, Cleveland, Ohio. [Filed June 17, 1875.]

The tube D, in combination with the tip C, head A, and jacket B, in the manner substantially as described, and for the purpose set forth.

165,944. SASH-HOLDERS. W. H. Plympton, Providence, R. I. [Filed Dec. 26, 1874.]

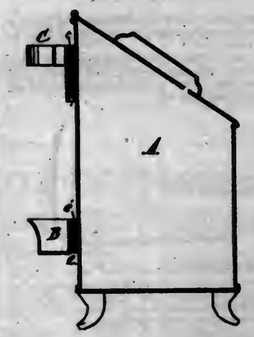


Brief.—Peculiar construction and adaptation of parts, actuated by an interposed U-shaped spring, which is placed vertically within the stile of the sash.

The improved sash-supporter herein described, consisting of the bolt A, the cylindrical case B, the bent lever C journaled in the opening *c*, and provided with the operating leg *d* and the U-shaped spring D interposed between the working parts, and placed vertically within the stile of the sash, all constructed, arranged, and operating substantially as and for the purpose specified.

165,945. SAW-MILL HEAD-BLOCKS. Levi W. Pond, Eau Claire, Wis. [Filed Apr. 6, 1875.]

Brief.—The rack-bars upon which the setting-jacks are adjusted are placed below the tops of the head-blocks, and a coiled spring is so placed as to assist in starting the setting-jacks when they are drawn back to receive another log upon the carriage.



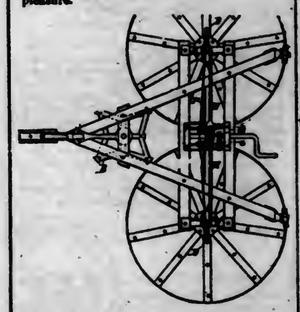
1. The jack C, provided with a sliding or movable bar, operating below the tops of the head-block and permitting the movement of each jack independently of the others, in combination with the head-block B, substantially as specified.

2. The independent spring J in combination with the head-block B and jack C, provided with an arm or stop, K, all arranged and operating substantially as specified.

3. The frames or bars *m n*, each having dogs *e e'* pivoted thereto, and also to the jack, in combination with the dogs *f f*, with rearward extensions *f f'*, arms *g i*, and lever I, substantially as and for the purposes specified.

4. The wheel L, provided with projections *r*, in combination with the set-shaft D, ratchet-wheel R, and brake P, substantially as specified.

165,947. COAL-VASES. William S. Potwin, Chicago, Ill. [Filed June 16, 1875.]

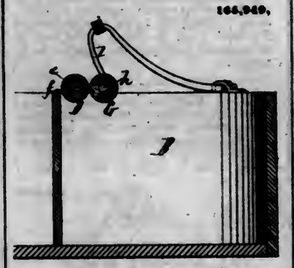


1. The rest or trough B, provided with the tongues *c c'*, in combination with a coal-vase having in its rear face the loops or eyes *s s*, substantially as and for the purposes specified.

2. The coal-vase A, having eyes, loops, or recesses in its rear face, in combination with the rest B and arms C C, each provided with tongues to enter the said eyes, substantially as and for the purposes specified.

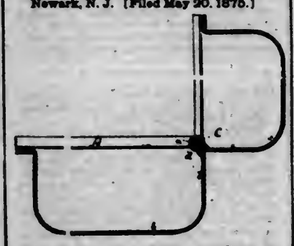
165,948. ROTARY HARROWS. W. G. Reed, Colusa, Cal. [Filed June 1, 1875.]

Brief.—The harrows are formed with a hub and radial arms, into which the teeth are inserted. A band of iron encircles the outer ends of the arms. Both hubs are hinged to a frame-work, and so arranged with brace-rods and windlass that the harrows can be changed from a horizontal to a vertical position at pleasure.



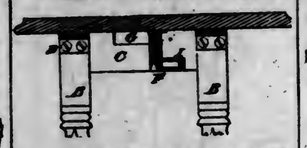
1. The jointed rods or toggles H H, arranged and combined with the rotary wheel-harrow-supporting levers D D and the windlass or shaft G, all being as and for the purpose as set forth.

2. The eccentric *e*, arranged and combined with the windlass or shaft G, and with the toggles H H applied to the levers D D, and having a joint-pin or projection to rest on the eccentric, as explained.



165,949. MOP-WRINGERS. Michael Regan Connecton, N. Y. [Filed Dec. 1, 1874.]

Brief.—The tub over which the wringer-rolls are held has a partition, so that one side thereof can hold the clean water, while the dirty water, as it is wrung from the mop, enters the other side.

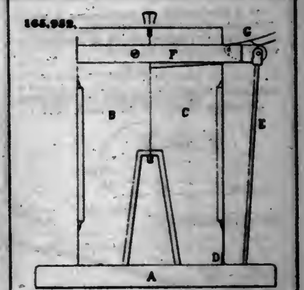


In a mop-wringer, the combination, with a tub, T, having two compartments, A B, and provided with a roller, D, arranged over the compartment B, and revolving in journals *c c*, fixed to sides of said compartment, of the arms K K, pivoted at one end to the sides of the chamber B, and at the opposite end provided with springs I, formed with journals *k* at their lower ends, for supporting the roller G, the whole being constructed and operating substantially as and for the purpose described.

165,950. TRAVELING-BAGS. Wm. Roemer, Newark, N. J. [Filed May 20, 1875.]

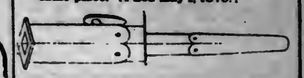
The combination of the bag-lining *b c* and strip *a* with the hinge-wire C of a bag-frame, all arranged so that the seam which joins the parts *a b c* will be below the wire, substantially as herein shown and described.

165,951. FOLDING TABLES. J. B. Root, Westfield, N. Y. [Filed Sept. 20, 1874.]



1. In a folding table, the combination of the locking-bar F, hinged to the under side of the table and having its ends flush throughout their whole extent with the hinged legs and their cross-rails C C, the latter having a partial mortise or recess, G, corresponding in width to the width of the brace or locking-bar and inclined sufficiently to allow the rails to freely pass over the ends of the same, and fold flatly against it, as shown and described.

2. The folding table herein described, consisting of the hinged locking-bar F, hinged legs E, with their cross-rails C C, having inclined mortises or recesses G G, one of said rails being provided with a stop, I, for the purpose specified, and the cleats E E, and table top A, the whole constructed and arranged as specified.

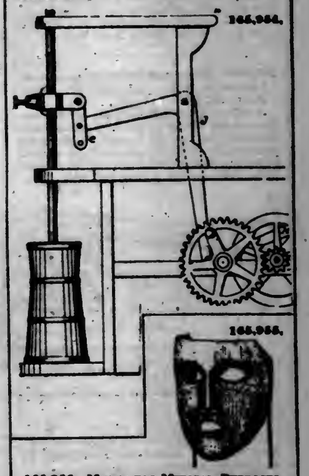


165,952. APPARATUS FOR THE MANUFACTURE OF BAYONET-SCABBARDS. Thomas W. Rounds, Providence, R. I., assignor of one-half his right to John B. Humphreys, same place. [Filed May 1, 1875.

165,953. BAYONET-SCABBARDS. Thomas W. Rounds, Providence, R. I., assignor of one-half his right to John B. Humphreys, same place. [Filed May 1, 1875.]

1. The combination of the jaws B and C with the recess H, the plunger J, and the compressing screws F and G, substantially as and for the purposes specified.

2. In combination with the grooved jaws B and C, the metallic-faced plate H, having a toothed, serrated, or roughened surface, for seizing the scabbard on the outside, and holding it securely while being formed on the inside, substantially as and for the purposes set forth.

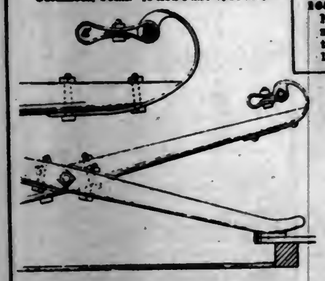


1. The quadrangular scabbard herein described, having its seam at one corner, substantially as and for the purpose specified.

2. A quadrangular scabbard with mitered edges, united by a chamfered corner seam, substantially as set forth.

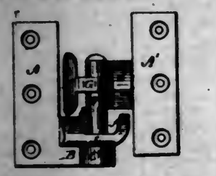
165,954. RECIPROCATING CHURNS. David Rowland, Pittsburg, Pa. [Filed Mar. 2, 1875.]

Brief.—The dasher-rod is connected to the gearing by a gib and thumb-screw, and a short drop-link.



The cross-head *f*, gib F, and binding-screw S, in combination with the short drop-link *e* and L-shaped lever J, as and for the purposes set forth.

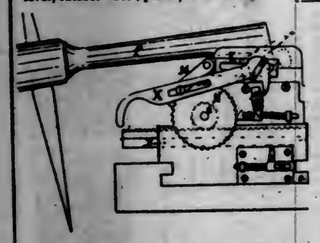
165,955. MASKS FOR MEDICAL PURPOSES. Helen M. Rowley, Van Wert, Ohio. [Filed Apr. 9, 1874.]



As a new article of manufacture, a mask made throughout of flexible india-rubber, for the purpose of being applied to the face, as and for the purposes specified.

165,856. VEHICLE-SPRINGS. J. D. Serven, Columbia, Tenn. [Filed June 7, 1875.]

1. In a carriage-spring, C-shaped springs, when combined with X-springs, so as to allow the ends of the X-springs greater freedom of motion, substantially as described.
2. In a carriage-spring, connectors F F, in combination with C-springs and X-springs, substantially as and for the purposes specified.
3. In combination with X-springs and C-springs, an elastic bearing between the carriage-body and C-springs, substantially as and for the purposes set forth.



165,857. HINGE. Christian Sholl, Mount Joy, Pa. [Filed Dec. 7, 1874.]

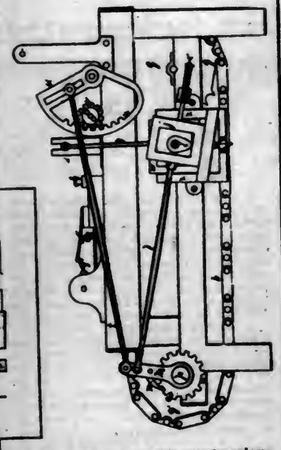
The combination of the leaf A, having projection B, cylinder C, pin D, offset *b*, beveled ovolls *d d* forming flange *c*, and wedge-shaped projection *f*, with the leaf A', having projection F, double inclined ovolls *d'*, tube *b'*, collar G, and lip H, with curved and straight sides *i h*, all substantially as set forth.

165,858. MILLSTONE-DRESSING MACHINE. Charles A. Smith, Lebanon, Mo. [Filed July 1, 1875.]

Brief.—A graduated bed-plate and two carriages, each sliding on and at right angles to the other, have on top a shaft, on which the pick-handle partially rotates in a vertical plane, receiving forward motion by a pawl-lever, ratchet-wheel, pinion, and rack.

1. The combination of the ratchet-wheel N, lever K, dog M, slotted bar L, and shaft H, all operating together, as described.
2. The pick-handle F, provided with lugs *f*, the shaft H, and thumb-screw G, all combined and operating together, as described.

3. The combination of the spring-dog P, lever S, lever K, provided with lug R, thumb-screw *o*, slotted bar L, dog M, ratchet-wheel N, shafts I and H, pinion *e*, and rack E, all combined and operating together, as described.



165,859. MACHINES FOR PARING COCOA-NUT MEATS. Edward Smith and E. Chapman Maltby, Northford, Conn., assignors to E. Chapman Maltby. [Filed July 6, 1875.]

1. The combination of the concave and convex cylinders and the correspondingly concavo-convex cutter R, arranged relatively to each other, substantially as and for the purpose specified.
2. The combination of the concave and convex cylinders, the endless band H bearing upon the surface of the convex cylinder, and the correspondingly concavo-convex cutter, substantially as and for the purpose set forth.

165,860. MACHINES FOR MAKING TOY TORPEDOES. Theddeus H. Spear, Gardiner, Me. [Filed Dec. 31, 1874.]

Brief.—An endless intermittently-moving carrier moves the bed-plates into a position to receive the paper wrappers as they drop from the cutters, by which they are cut into suitable size. The bed-plates are then moved under the vertically-moving rammers, by which the wrappers are rammed down into the holes in the bed-plates, to form pockets to receive the fulminate, which is deposited therein by a series of spoons, by which it is taken from the hoppers. Afterward the gravel is deposited in the wrappers by similar devices, when the bed-plates are moved forward, taken from the machine, and the paper wrappers twisted, to complete the torpedoes.

1. In a machine for making toy torpedoes, the combination of the shaft *a*, cam *i*, frame *j*, rod *l*, lever *m*, belt *k*, with its notched wheels, substantially as and for the purposes described.

2. The combination of the shaft *a*, cam *i*, frame *j*, rod *l*, lever *m*, rod *t*, gear *v*, gear *v'*, and the feed-roll *d*, as and for the purposes described.
3. The combination of the horizontal plate *g* and the vertical cutter, operating substantially as described.
4. The combination of the spoons *h* with the hoppers, for the purpose of supplying the papers with the powder and gravel, substantially as herein described, the same operating as set forth.

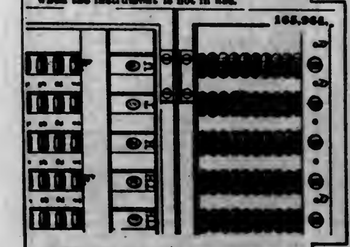
165,861. HEEL-STIFFENERS. William F. Spinney, Chelsea, Mass. [Filed June 14, 1875.]

Brief.—The internal layer consists of waste rubber, steamed, ground, and mixed with trimmings from other stiffeners, flour of sulphur, and palm-oil.

A heel-stiffener composed of an internal layer formed of the materials compounded as herein described, and of external layers of muslin or closely-woven cotton fabric, all united substantially as described.

165,862. FRUIT-JARS. David H. Stevens and R. F. Lumley, Newark, Ohio, assignors to David H. Stevens. [Filed June 30, 1875.]

The combination of jar A B C, formed with slight inwardly-projecting portions or indentations *b b*, and cap or cover D, stamped or formed from a single piece of material, with a flaring downwardly-projecting rim, *d*, laterally and upwardly-projecting double inclined curved portions *d' d'*, and handle *d''*, all constructed and arranged as and for the purposes described.



165,863. FEED-CUTTERS. A. C. Stewart, Walton, N. Y. [File . Dec. 30, 1874.]

The angular knife D, supported in the frame F, and cutting upward against the stationary knife D', at the end of the inclined feed-box A, in combination with the hinged rod C, pitman *h*, and fork H, as shown and described, and for the purpose specified.

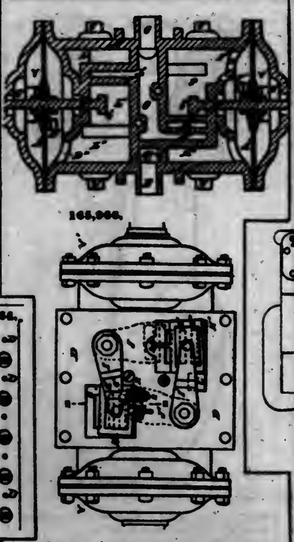
165,864. CALCULATORS. Alfred C. Wellman, Walla Walla County, Wash., assignor of one-half his right to E. W. Griffin, same place. [Filed Feb. 16, 1875.]

1. The box, composed of two halves or leaves, O O', one, O, containing the mechanism for calculating, and the other, O', the statement-box, containing the mechanism for registering or stating the different amounts as they are developed by the calculating mechanism, the parts O O' hinged together and adapted to fold together with the mechanism in the interior when the instrument is not in use.

2. The combination of the numeral-balls F, thumb-pins D, spiral spring E, substantially as and for the purpose hereinbefore set forth.
3. In combination with the series of endless chains G and numerical balls F secured thereto, the index-rollers I and their transmitting-gears *i*, *i'*, &c., constructed and arranged as and for the purposes described.

165,865. REVERSE-MACHINE CASTERS. A. G. West, Chicago, Ill., assignor to Isaac R. Anderson and D. P. Jones. [Filed Nov. 29, 1874.]

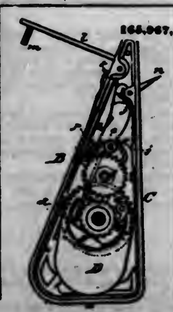
Brief.—The outside and inside bars working upon each other through inclined slots, to raise or lower the casters in position.



The combination of the bars O O, fastened by means of clamps D D to a sewing-machine stand, and provided with headed pins *a a*, the movable bars E E, provided with inclined slots *b b*, and casters G G, the shaft H, cams I I, and lever J, all constructed, arranged, and operating substantially as and for the purposes herein set forth.

165,866. WATER-METERS. E. M. Wilcox, Chicago, Ill., assignor of three-fifths his right to J. J. Dobelcor, E. W. Crafton, and J. A. Ballock, same place. [Filed Apr. 6, 1875.]

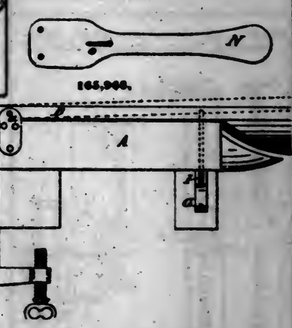
Brief.—The water-channels are so combined with settling-chambers that the sediment is deposited where it can easily be removed, and the necessity of packing the spindles is avoided. Counter-weighted pawls of unequal lengths attached to the slide-valve engage with a ratchet bar or wheel, and actuate the registering mechanism.



1. The combination of the pair of double-concave measuring-chambers V V', flexible diaphragms A' A'', spindles B' B'', arms J J', arms I I', arched slide-valves H H', and ports *e e' e''* and *e f e''*, all arranged and operating together in connection with each other and the passages or water-channels of a water-meter, substantially as shown and described, and for the purposes set forth.

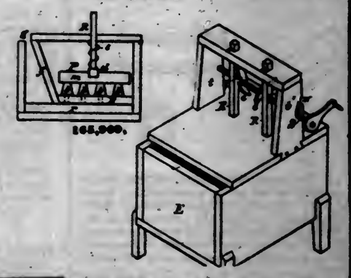
2. The settling-chambers having removable plugs therein, and arranged in the bottom of the meter, in combination with the pair of double-concave measuring-chambers V V' and the water-channels of a water-meter, for the purpose of thereby keeping the said chambers and channels clean by collecting the sediment carried in by the water, and admitting of its discharge by removing the plugs for that purpose, substantially as described.
3. The independent counterweighted dogs or pawls *k k*, of unequal length, pivoted to the valve-actuating mechanism of a water-meter, substantially as and for the purposes specified.

165,867. BURGLAR-ALARMS. C. H. Williams, Chicago, Ill. [Filed May 22, 1875.]



Brief.—The operating arm or lever and the pointed teeth have extensions or lugs on their pivoted ends, which engage with each other, so that the teeth is thrown out in the act of raising the lever. The pin on the upper end of the lever is wedge-shaped, and forces a spring-stop out of contact with the escapement of the clock mechanism, and allows an alarm to be given.

1. The folding teeth n and spring *j*, substantially as and for the purposes described.
2. The combination of the lever I, provided with the lip *k*, with the teeth n, provided with a projection for starting or opening the teeth, substantially as set forth.
3. The folding teeth n and spring *j*, in combination with the lever I, and inclined pin *o*, and the cams A B C, substantially as and for the purpose specified.

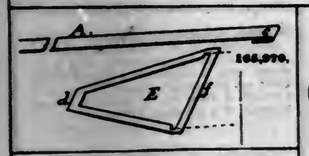


165,868. GERMS-CORN CUTTERS. T. Wilmer, Buffalo, N. Y. [Filed Oct. 20, 1874.]

Brief.—A trough-like cutter, with a V-shaped edge, is secured to a hinged frame, which can be vertically adjusted to the end of a trough, in which the ear is moved forward by means of a spiked ear-holder.

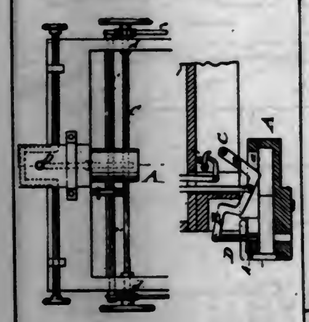
1. The top pieces D D', in combination with the knife F, when attached directly thereto, for the purposes set forth.
2. The trough-like shaped stationary gage-board or body A, in combination with the knife F, substantially as described, and for the purposes set forth.
3. The knife F, top pieces D D', when hinged to the body or gage-board A by hinges *a a'* or their equivalents, all constructed and arranged substantially as and for the purposes described.
4. The ear-holder N, when constructed substantially as described, and for the purposes set forth.
5. The wedge G, in combination with the pins I I' and the top pieces D D', for the purposes set forth.

165,869. WASHING-MACHINES. Alfred B. Wroth, Winterset, Iowa, assignee of one-half his right to Geo. A. Atherton. [Filed Mar. 24, 1875.]



The plungers P P, constructed of two pieces, *n n*, attached to the cross-pieces *d d*, and provided with the beaters *b b*, and having the vertical shafts E E, in combination with the perforated bottom B, resting on the cleats *r r*, the pins *p p*, and crank-shaft S, provided with the cams *o o*, all constructed to operate substantially as and for the purpose set forth.

165,870. BUSHING-BOXINGS. C. Young, New York, N. Y. [Filed June 28, 1875.]



Brief.—The ribbon to be run in a tank or other opening in a garment has one end attached to the head end *f* of the triangle. The guide-bar is inserted in the tank, and its hooked end engaged with the small end of the triangle, so as to draw the triangle and ribbon through the tank.

A ribbon-runner composed of guide-bar A, in combination with the triangle E, substantially as described, and for the purpose specified.

165,970.

165,971. CAR-COUPLINGS. John H. Acton, Jackson Ct. H., Ohio. [Filed Mar. 20, 1875.]

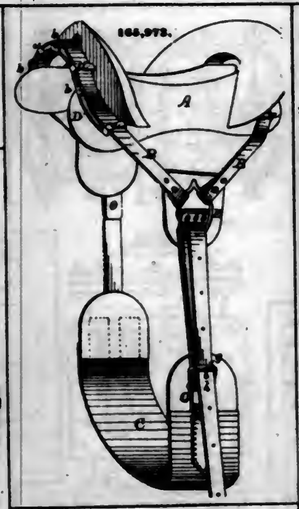
The combination of the crooked bar B, coupling-pin D, transverse shaft C, ratchet-and-pawl mechanism *d e*, lifting-rod *f*, and pawl-unlocking rod *F* with the draw-head A, as and for the purpose set forth.

165,972. MANUFACTURE OF METAL KNOB-SHANKS. John Popkin Adams, Brooklyn, assignor of one-half his right to James A. Rathbone, New York, N. Y. [Filed Apr. 7, 1875.]

Brief.—Relates to the manufacture of the shanks of knobs, such as was patented to H. B. Tuthill, May 4, 1869, No. 89,769. The inner square tube is made from a piece of metal in which a depression or angular recess has been stamped.

1. The improvement substantially as before set forth in the art of manufacturing knob-shanks consisting of the following three operations, viz, first, the production of the recessed angular tube of sheet metal; second, the fitting of the said tube with a core; and, third, the casting of melted metal upon said tube.

2. The recessed angular tube of indented and bent sheet metal substantially as before set forth, the same being a new article of manufacture.

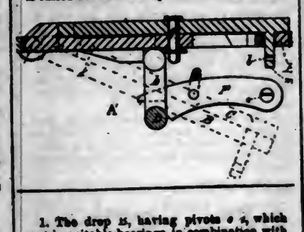


165,973. REINS AND FACE SADDLES. Geo. H. Allen, Minneapolis, Minn. [Filed July 20, 1875.]

1. The combination of the saddle-tree A and sliding straps B B with a girt, C, substantially as described.

2. The arched sideway D, provided with two or more loops, *a*, or their equivalents, in combination with a saddle-tree, substantially as and for the purpose specified.

3. The arched sideway D, provided with one or more rollers, *b*, substantially as and for the purpose specified.

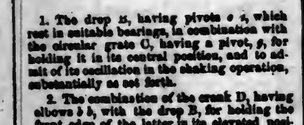


4. The ring E, provided with the cross-bar *c*, in combination with the sliding-strap F and buckle G, substantially as and for the purpose specified.

165,973.

165,974. GRATES. John H. Beam, Frostland, Pa. [Filed July 6, 1875.]

Brief.—The supporting-frame of the grate is raised and lowered by means of the crank.

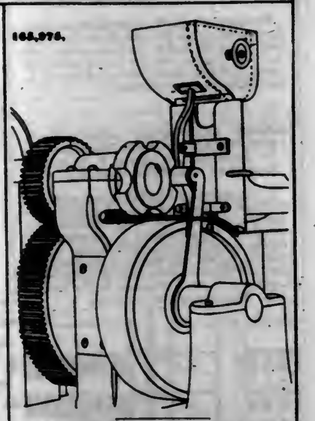


1. The drop E, having pivots *c c*, which rest in suitable bearings, in combination with the circular grate C, having a pivot, *p*, for holding it in its central position, and to admit of its oscillation in the shaking operation, substantially as set forth.

2. The combination of the crank D, having elbows *b b*, with the drop B, for holding the front edge of the latter in its elevated position, and lowering and raising the same, substantially as set forth.

3. The combination of the locking-bar F, crank D, and drop B, whereby to hold the latter in its elevated position, substantially as set forth.

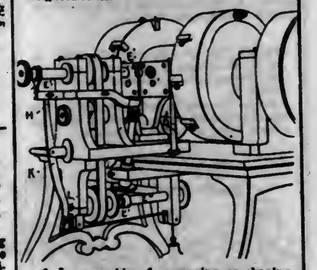
165,975. MACHINES FOR STAMPING NUMBERS. Philo M. Beers, Bridgeport, Conn. [Filed Dec. 3, 1874.]



Brief.—A fixed die on a spring-arm; a carrying, holding, or compressing cylinder, for carrying the needles under the die; a guide for properly presenting the needle between the cylinder and die; and a hopper and chute, provided with mechanism for admitting of the passage of but one needle at a time to be operated upon.

1. The hopper K, its feeding slide and operating mechanism, as described, in combination with the carrying and holding or compressing cylinder and fixed die, substantially as set forth.

2. In combination with a carrying and holding or compressing cylinder and stationary die, the guide O for carrying the blank and holding it parallel with the axis of the cylinder, as described.



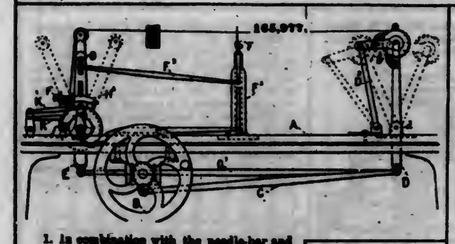
3. In combination with the carrying and holding or compressing cylinder and die, the spring-arm for supporting the die, substantially as and for the purpose specified.

165,976.

165,976. MACHINES FOR SWAGING NEEDLE-BLANKS. P. M. Beers, Bridgeport, Conn. [Filed Dec. 3, 1874.]

Brief.—Two movable dies, operated by tappets contained in a double tappet-wheel, with mechanism in front of them for feeding up the blank, consisting of a rotating mandrel, thrown up by a cam operating on a sliding bar; said bar having an adjustable cam on one of its sides, to operate in conjunction with a similar cam on a pivoted lever, carrying at its end the bearing of a screw; said cams causing said screw to be thrown into and out of connection with a worm-wheel on the cam-shaft. The mandrel is thrown back by a weighted lever.

1. In a machine for swaging or shaping needle-blanks, &c., the combination of a double tappet-cylinder operating two opposing dies and an automatic guide, substantially as described.



2. The combination of the rotating mandrel F, the sliding bar G with its connecting-yoke, the cam F, lever K, and cord and weight for moving said bar, substantially as described.

3. The combination of the mandrel with the lever H, bar G, lever K, gear mechanism and cam F, substantially as described.

4. The combination of the vibrating-lever H with the sliding bar G, the cam F, the worm and screw, and an adjustable guide, H', between the lever H and bar G, by which the blank is held between the dies the required length of time to complete the operation of shaping the article desired, substantially as described.

165,977. MACHINES FOR POLISHING THE EYES OF NEEDLES. P. M. Beers, Bridgeport, Conn. [Filed Dec. 3, 1874.]

Brief.—Two frames to carry the polishing-thread, automatically and simultaneously vibrated—one carrying a cylinder, intermittingly rotated by suitable mechanism, to wind up a portion of the thread at each vibration, thus presenting a new part to the needle, the other having mechanism for automatically connecting it at certain times to the needle-bar, causing the needle-bar to vibrate with it while so connected. Also, mechanism for automatically, gradually, and regularly raising and lowering the needle-bar.

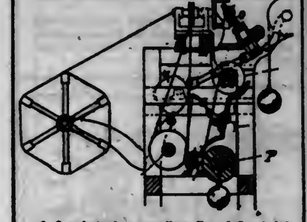
165,977.

1. In combination with the needle-bar and automatic vibrating mechanism for holding the polishing-thread or wire, automatic mechanism consisting of the connecting-rod F', reciprocating lever G, pawl E', vibrating arm E', and ratchet-plate H, for controlling the motions of the needle-bar, substantially as described.

2. In combination with the automatic vibrating frames or arms D and E, the winding-cylinder D' and its pawls, whereby the polishing-thread is shifted at every vibration, substantially as described.

3. In combination with the frame E, ratchet-plate H, and arm G, the double cam-wheel, and double-ended pawl E', for controlling the vibratory movements of the needle-bar, substantially as described.

4. The combination of the vertical frame for carrying the needle-bar with the tappet-wheel on the cam-shaft, so that the bar will be raised and let down at regular intervals and gradually, as and for the purposes set forth.

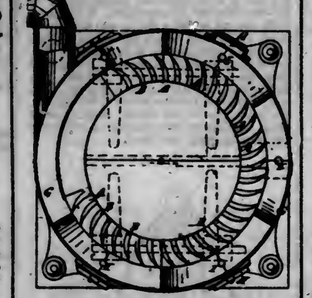


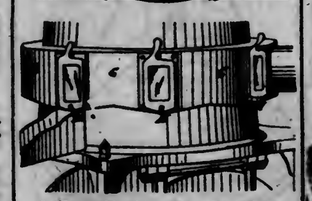
165,981.

165,979.

165,979. MACHINES FOR BALLING YARN. Louis C. Billings, Milford, N. H. [Filed May 27, 1875.]

Brief.—Balls of yarn are wound in such a manner that enough of the exterior layer is made compact to furnish a hard surface, while the interior layers are wound with sufficient space between them to preserve the elasticity of the yarn. To accomplish this the speed of the spindle on which the ball is wound is increased toward the finish by running the belt which transmits the motion over cone-pulleys. The size of the ball is regulated by an automatic stop mechanism.



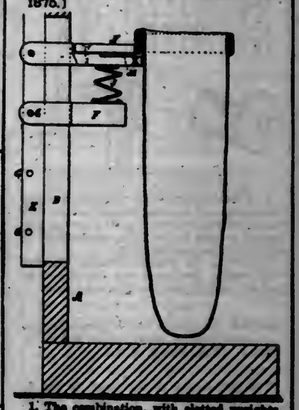


1. The belted cone-pulleys P and Q, of different layers, as described, in combination with the spindle O, whereby the intervals between the threads are varied in the different layers, substantially as and for the purpose specified.

2. The combination of the shipping and winding mechanisms, constructed as described, whereby, when the proper amount of twine or yarn is wound upon the ball, the shipping-lever is tripped, and the machine automatically stopped, as set forth.

165,980. CUPOLA-FURNACES. J. Mahoney, Springfield, Ohio. [Filed June 6, 1875.]

Brief.—The air enters through the blast-pipe into the air-chamber surrounding the cupola, from which it enters the latter through passages formed by curved plates, which are built into the cupola-wall within the air-chamber, so as to form a second air-chamber concentric with the first. The bottom of the air-chamber has hollows with fusible plugs in them.



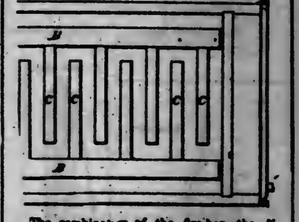
1. The combination, with cupola, of flat circular plate A, having curved inclined chutes B, plate D, and pipe F, as and for the purpose described.

2. The combination, with tuyere, of the cone G, having irregular hollows H in bottom, and openings I, as and for the purpose specified.

165,981. REGISTERING-MACHINES. Collins M. Cady, Peninsula, Ohio. [Filed Jan. 11, 1875.]

In a tallying-machine, the combination of the swinging lever B, connecting-bar F, pawls E F', ratchet-wheels *g* I, forked pivoted plate H, eccentric J, and arbor K, all constructed and relatively arranged as herein set forth.

165,982. ADJUSTABLE SACK-HOLDERS. H. W. Clark, Red Bluff, Cal. [Filed Mar. 18, 1875.]



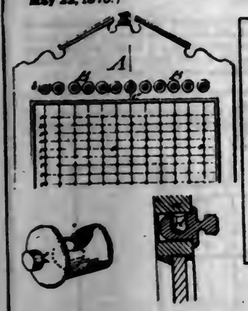
1. The combination, with slotted uprights A D and severally-holed cleat E, of the spring-separated arms F K, made adjustable as and for the purpose specified.

2. The combination, with bag-holder L and arm K, of the bag-pinch M, as shown and described.

165,983. STOVE-GRATES. John W. Cotton, Chicago, Ill. [Filed Nov. 14, 1874.]

Brief.—The interlocking arms projecting from the main bars rise and fall together.

The combination of the fire-box, the diversely-rotary bars B B, each arranged horizontally along opposite sides or ends of the box, and the horizontal and interlacing bars C C having spaces between them and projecting from the bars B B, all operating together substantially as and for the purpose specified.

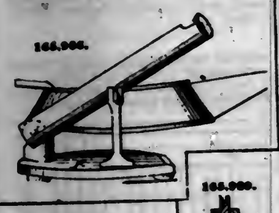


165,984. WEDGES FOR SPLITTING ROCK, &c. Thos. Cosbey, Mormon Mills, Tex. [Filed Apr. 24, 1875.]

Brief.—The wedge is made partially hollow, which makes it lighter, and enables the operator to grasp and extract it from the cleft.

As an improved article of manufacture, a hollow or skeleton metal wedge, substantially as herein described.

166,965. MARKING-BOARDS FOR PIN-POOLS. George H. Decker, Belleville, N. J. (Filed May 22, 1875.)

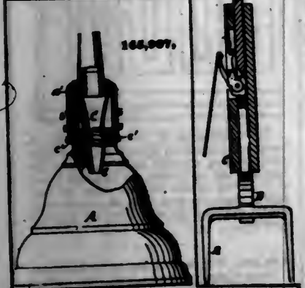


1. A marking-board for pin-pool, provided with a series of recesses, in combination with countersunk plugs fitting therein, having cup-shaped cavities for the balls, substantially as and for the purpose set forth.

2. A plug for marking-boards, provided with button, face-flange, and cup-shaped recess for the ball, substantially as set forth.

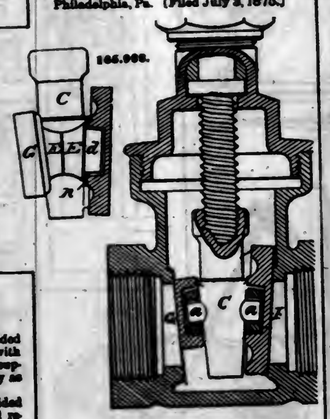
166,966. MACHINERY FOR WASHING PHOTOGRAPHIC PRINTS. Otto Dubois, Fall River, Mass. (Filed May 6, 1875.)

The combination of the vessel or pan A, tube C, provided with the movable weight, weighted foot D, and lip or spout E, substantially as and for the purpose hereinbefore set forth.



166,967. CISTERN. Geo. F. Dutton, Farmington Falls, Me., assignor to Elias C. Dutton, same place. (Filed Apr. 17, 1875.)

Brief.—The outlet of the reservoir is a glass tube screwed thereon, for the purpose of indicating when it is full. It is protected by an enlargement of the nozzle at the bottom screwed onto the outside of the reservoir.



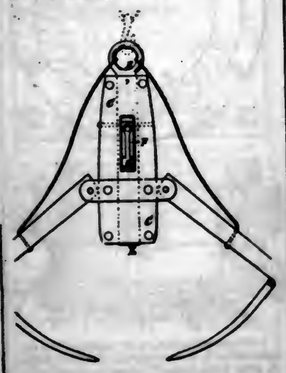
1. The combination of the tube C with the reservoir A and discharge-nozzle B, having the enlarged air chamber-ed portion b', substantially as shown and described.

2. The combination of the packing c' and collar c with the funnel-shaped glass tube C, the reservoir A and projecting lower end nozzle B, as shown and described for the purpose specified.

166,967.

166,968. STOP-VALVE. George W. Eddy, Waterford, N. Y., assignor to L. K. Eddy, Philadelphia, Pa. (Filed July 3, 1875.)

166,968.

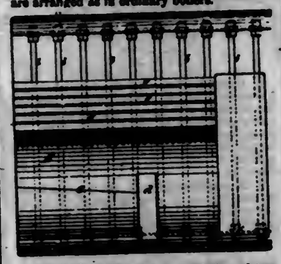


1. The combination, in a stop-valve, of a valve-plate, fitted to cover the opening on one side, with a bar or plate, G, which, while it does not close the opening, will bear against the sides or face thereof, and thus afford a means of guiding the valve-plate to its seat, substantially as shown and described.

2. The stem E, in combination with the sleeve C, provided with the studs c, and the collars B, all constructed to operate as set forth, as a means of operating the plates I and G.

3. The washer a, in combination with the valve-plate I and its sleeve or support, to compensate for wear of the parts, as set forth.

166,969. HORSE HAY-FORKS. Thomas M. Edwards, East Hampton, N. Y. (Filed Apr. 24, 1875.)



Brief.—Fork-arms pivoted to a sliding bolster stock, and connected by cords to the upper end of a recessed bar sliding within it, by which the fork is suspended. A swinging block pivoted within a slot in one side of the stock, and pressed inward by a spring, carries a swinging pawl pivoted to it, engaging with the recessed bar by the pressure of said spring when the teeth are in grasping position. The pawl, when its outer end is depressed by a cord, bears with its inclined lower face against the lower edge of the recess, pushing itself out of engagement with the bar, and allowing the teeth to dump their load.

The combination of the swinging block F, pawl G, and spring H with the slotted hollow stock G, and with the slotted or notched sliding bar E, substantially as herein shown and described.

166,970. STEAM-BOILERS. Chas. B. Emery, Brooklyn, N. Y. (Filed Apr. 9, 1874.)

Brief.—The boilers are constructed with the minimum amount of small stays or braces, and in each form as to occupy less room for a given power. The cross-section of the boiler is made to consist of a number of segments of a circle, with, in some cases, inclosed spaces. In the spaces between the main braces and shells, the furnaces, tubes, and steam-spaces are arranged as in ordinary boilers.

1. A boiler with section, consisting of two or more segments braced by connections to the ends of the arcs, and provided with direct and return passages for the products of combustion in each portion of the shell, substantially as and for the purposes specified.

2. A boiler-shell with sectional outline of the sides, top, and bottom, composed of a series of connected circular arcs, with cross-braces at junctions, whereby a rectangular or other desired section may be approximated, substantially as and for the purposes specified.

3. A boiler-shell with cross-section formed of connected circular arcs, with braces at junctions, combined with furnaces or furnace-tubes, wholly or partly of circular section, arranged singly or in pairs between the cross-braces, and within the said shell, to secure, with few small braces, strength and adaptability to location, substantially as and for the purposes specified.

4. Two or more furnace-arches, with sections formed in part of circular arcs, connected together by struts at the ends of the arcs, and thus dispensing with the necessity of brazing corresponding portions of connecting arches to other parts of the boiler, substantially as and for the purposes specified.

5. A trough-shaped plate, combined with the ends of the arcs and the braces supporting the same, substantially as and for the purposes specified.

166,970

166,971.

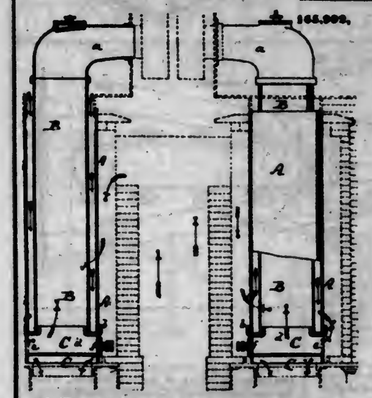
166,971. TOWER-CLOCKS. Chas. Franklin, Albany, N. Y. (Filed Apr. 17, 1875.)

Brief.—In a tower-clock, the driving mechanism of the hands arranged separately from the clock-train, the connection of the parts being such that any irregularities in the movement of the hands will not affect the operation of the train.

1. In tower and other clocks, the clock-train and hand-driving mechanism, operated by separate retaining power, working independently of each other, substantially as and for the purposes set forth.

2. In tower and other clocks, the combination of an unlocking-wheel of the main arbor of the clock-train, controlled by swinging fork and guard-lever, with the planetary-motion device, actuated by the hand-driving arbor, substantially as shown and described.

3. The combination of the swinging lever, having projecting guard-rests, with the spring-arm of the planetary motion, so as to be arrested by the guard-plate at one end, and transferred to and liberated by the guard-plate at the other end, of the lever, substantially as set forth.



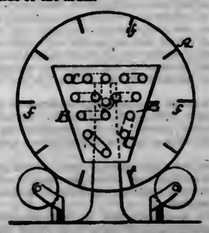
4. The planetary motion, for arresting and liberating the working of the separate hand-actuating weight, composed of larger fixed gear-wheel around hand-arbor, and of revolving frame, with circumferentially-traveling pinion and spring-arm, substantially as shown and specified.

5. The combination of hand-actuating arbor with one or more power-transmitting shafts, suspended by revolving carriage and platform to support weight of the same, in the manner and for the purpose substantially as described.

166,972. APPARATUS FOR BURNING AND REVIVIFYING BONE-BLACK, &c. Joseph Gandolfo, Brooklyn, N. Y. (Filed July 6, 1875.)

Brief.—The retort has a central flue, and is set vertically into a socket, open at top and bottom, but provided with a passage from the outside to the central flue, for the products of combustion to pass to the chimney.

166,972.



1. The socket C, open on top and bottom, to constitute a support for and a continuation of the retort A, and provided with the hollow bridge d, which is open on top, and supports the flue B, and is closed at the bottom, and with the aperture or smoke-passage a that leads into the hollow bridge, substantially as herein shown and described.

2. The combination of the retort A and pipe B with the socket C, which has the hollow bridge or partition d, substantially as herein shown and described.

166,973. CHARCOAL AND BONE-BLACK HEATERS AND COOLERS. Joseph Gandolfo, Brooklyn, assignor to himself and Jno. W. Jarboe, Green Point, N. Y. (Filed July 2, 1875.)

Brief.—The drum, in an inclined position, rests and revolves upon friction-rollers. The inclined stationary open-bottomed vessel, containing the labyrinth of pipes, for conveying the heating or cooling liquid, is open at top and bottom, and is supported on standards outside of the drum.

The combination of the rotary inclined drum A, which is provided with the inwardly-projecting blades f, with the stationary inclined vessel B, containing the pipes or hollow shelves C, substantially as herein shown and described, and for the purpose specified.

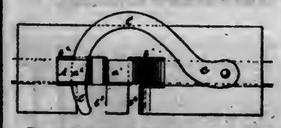
166,974. BASE-BALLS. John Giblin, Boston, Mass. (Filed June 26, 1875.)

Brief.—A core of palm-leaf thread has a covering of woolen yarn, cotton next outside, and one or two layers of rubber over all, which is then vulcanized.

1. As a new article of manufacture, a water-proof base or cricket ball, composed essentially of a heart, A, of palm-leaf or other suitable material, a mass, B, of woolen yarn wound thereon to the requisite thickness, and an external water-proof cover, D, of two or more pieces of india-rubber compressed thereon and into close contact at their edges, and into shape and size by a mold, and vulcanized, all substantially as set forth.

2. In combination with the ball-body, having its outer layer composed of woolen yarn, and its external cover of vulcanized rubber, applied, as described, the protective or interposed covering C of cotton or cotton yarn, all arranged as specified.

166,974.



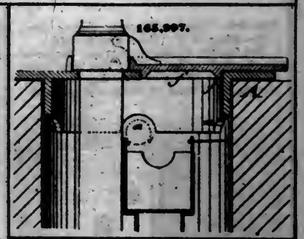
166,975.

166,975. LOCKS FOR DOORS. A. Goldfinger, Newark, N. J. (Filed June 24, 1875.)

In a lock constructed as hereinbefore described, the combination of the plate A, having a flange, C, lugs a, spring e, and feet f and g, with the bolt D, having grooves b, spring e, and feet h and i, all arranged to operate substantially as and for the purpose described.

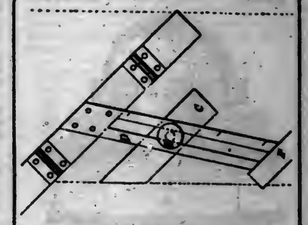
166,976. HOOK BALE-TIES. William Groet, Mooreville, Ala. (Filed Mar. 20, 1875.)

The combination of the plate B, provided with the recesses b' b' and the slots b' b', and the hook C with each other, to adapt the tie to be used with a bale-band, A, substantially as herein shown and described.



166,977. CISTERN-COVERS. Sebastian Haffner, Highland, Ill. (Filed May 28, 1875.)

Brief.—The flanged cover has two openings, one for the pump-stock, and one covered by the spout shown. There is also provided a filter-box, adjusted as described.



1. A cover for wells or cisterns, fitting by cylindrical and flanged part on the top of the cistern, and having recess for pump-stock and entrance-opening covered by hinged lid, substantially in the manner and for the purpose set forth.

2. The combination of the cistern cover or platform, having oblong recess and fastening-lug, with the pump-stock or pump-chain tube, and the supporting standards or casing attached thereto, substantially as set forth.

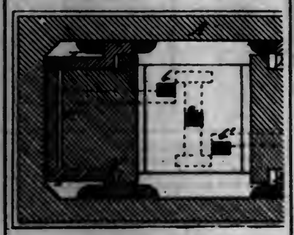
166,977.

166,978. BIAS-GAGES. John A. Hamilton, Chippewa Falls, Wis. (Filed Jan. 20, 1875.)

As an article of manufacture, a bias-trimming gage consisting of double-jointed piece A, end-bevled piece C G, slotted piece D, clamp E, and block F, all constructed and arranged as shown and described.

166,979. PROCESSES OF MAKING IMITATION WOODS. Geo. V. Hess, New York, N. Y. (Filed Feb. 6, 1875.)

The process of making imitation woods by first graining a surface with a mixture of acetic acid, logwood, and iron oxide, and then staining with a mixture of aloëine, alcohol, logwood, and red sanders, all substantially as specified.

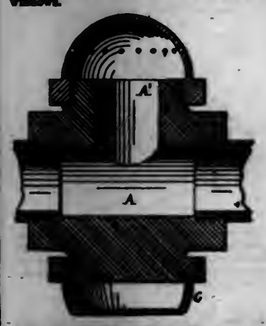


166,980. ART OF PREPARING COTTON FOR SPINNING. Russel Handy, Manville, R. I. (Filed Oct. 24, 1874.)

Brief.—The product of several carding-machines, being united upon the railway-belt, is divided at the end thereof into as many slivers as is desired, and each sliver is passed through a separate evener, so that its size and bulk may be made uniform throughout its entire length, and is then passed directly through a stubbing-frame, dispensing with the employment of one or more drawing-frames.

The improvement in the art of preparing cotton for spinning, the same consisting in the division of the product of two or more cards into slivers at the end of the railway, the passage of each sliver directly through an evener, and from this to the stubbing-frame, substantially as and for the purpose herein described.

166,000. STEAM-VALVES. James Have, Brooklyn, N. Y. [Filed May 6, 1875.]



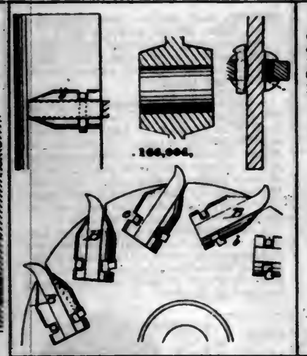
Brief.—The valve-cylinders are supported on the ends of the valve. The large valve contains the ports for operating it, and carries the small valve by which it is operated.

The combination, substantially as hereinbefore set forth, of a main sliding valve, having piston-formed ends, which support the cylinders, in which they are to be reciprocated by steam or other fluid, and a secondary valve, which admits and releases the steam into and from said cylinders, also supported by the main valve, and mounted at right angles to the axis of the cylinders, arranged to operate in the manner and for the purpose set forth.

166,002. APPARATUS FOR EXTINGUISHING FIRES. Elisha Mowry, Providence, R. I. [Filed Feb. 6, 1875.]

Brief.—Perforated and non-perforated caps are attachable at pleasure to the couplings—the former as sprinklers, and the latter to permit the system of pipes to be cleared by letting on the water, the terminal sections of pipe being extended to deliver out of the windows.

1. In combination with coupling A, having port A', perforated cap B, and non-perforated cap C, both removable, substantially as and for the purpose specified.



2. The apparatus for extinguishing fire, consisting of combined of piping connected by couplings, as herein described, and forming a series of pipes, as shown in Fig. 5, so arranged, with reference to the windows or other convenient outlet, that the same may be tested and cleared by removing the perforated caps from the said couplings and closing the outlets in the same, all in the manner substantially as described.

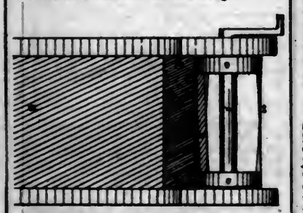
166,004. WATER-WHEELS. E. W. Hawley, Walton, N. Y. [Filed June 26, 1875.]

Brief.—The invention consists of a water-wheel with central web, and solid or detachable buckets extending to equal distance and suitable angles therefrom.

1. A water-wheel made of a central solid web, and buckets extending at equal width to both sides of the same, substantially as specified.

2. The combination, with the recessed web of a detachable bucket, cut by side wedges in plaitions, and locked by lateral wedge-keys, substantially as specified.

166,004.



1. The combination of the shafts and pulleys B C, the endless belts E, the bearing-blocks F, the shafts and pulleys G H, the endless cord I, and the guide-pulleys J with each other and with the frame A, substantially as herein shown and described.

2. The combination of the rollers K, the slotted bars L, and the clamping-screws M with the frame A of the device, substantially as herein shown and described.

3. The combination of the pivoted brake-levers P and the spring Q with the shafts G, and with the frame A of the machine, substantially as herein shown and described.

166,005. CORN-STALK CUTTERS. John N. Hill, Concord, N. H., assignor of his right to Chas. G. Pressey, same place. [Filed Oct. 26, 1874.]

Brief.—Cutting-blades are horizontally extended between cylinder heads or disks, upon a shaft at right angles to the feed-trough. Bars with outer fingers alternate with these blades, the fingers passing through slots in the end of the floor of the feed-trough.

The combination of the slotted plate a with the series of knives i and the knife s, substantially as and for the purpose herein set forth.

166,007. TOILET-GLASS FRAMES. Joseph Holley, Brooklyn, N. Y. [Filed May 1, 1875.]

A toilet-glass frame composed of a strip, A, of sheet metal, molded into proper shape, in combination with a surrounding-piece, B, by which its ends are united around the glass, substantially in the manner and for the purpose herein specified.

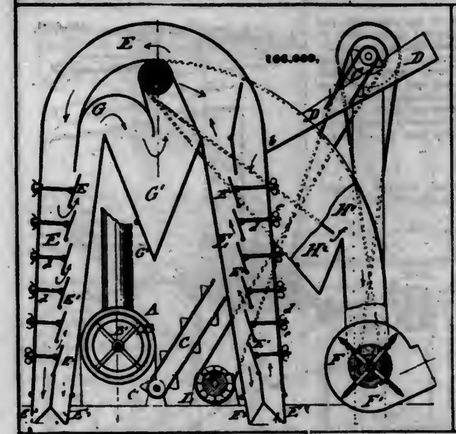
166,008. POCKET GAS-STOVES. Thos. W. Houchin, New York, N. Y. [Filed Apr. 28, 1875.]

166,008.

The pocket gas-stove herein before described, the same consisting of the combination, with the gas-thimble B, of the metallic chamber A, covered with wire-gauze or perforated metal G, and provided with gauze-covered openings a, and with suitable devices for supporting cooking utensils, all constructed, arranged, and operating as and for the purposes specified.

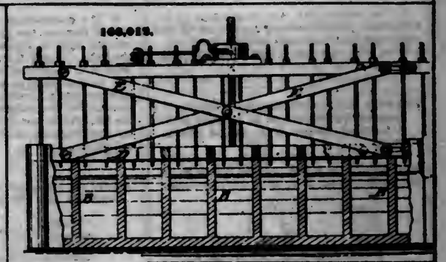
166,009. APPARATUS FOR SEPARATING GOLD FROM SAND, &c. Thos. W. Irvin, Bucuka, Cal., assignor of one-half his right to Alex. Gilmore, A. Dolan, H. Brown, and M. F. Mulcahy. [Filed Sept. 10, 1874.]

Brief.—The gold-bearing sand is introduced into the inner revolving cylinder, which is also a stove, and retains the gravel to be separately discharged, while the fine sand and gold passes on to the elevator, and is dried meanwhile by the fire. The elevator carries it to the upright separators, into which it falls, and is met by an ascending current of air produced by the fan. The heavy particles settle in the various pockets, and the lighter pass off through the fan.



1. The apparatus for separating gold from gold-bearing sands and other substances, composed of a revolving drier and separator, an elevator, an upright main separator, with adjustable valves and segmental side condensers, and a suction-fan, all being combined and operated by suitable motive power, substantially in the manner and for the purpose set forth.

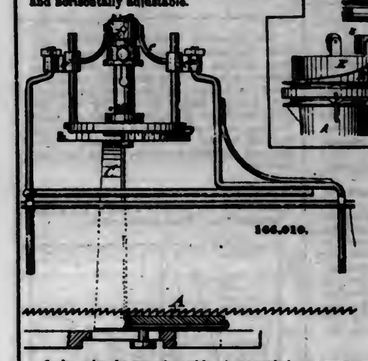
2. The main separator B, consisting of upright parts, with pivoted adjustable valves B' and bottom valves B' B', connected by a rounded-off top part, substantially as specified.



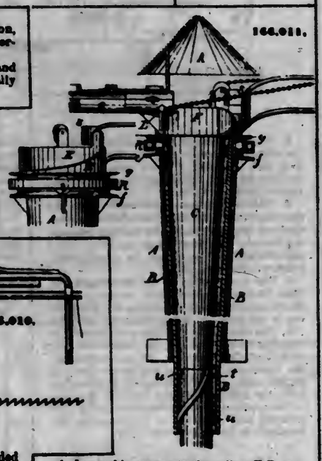
3. The inner semicircular diaphragm C and angular receptacle C' below the same, in combination with condensing-channels H, as shown and described.

4. The main separator B, in combination with segmental condensers B', by upper side extending channels H, as described.

5. The segmental condensers B', provided with triangular receptacle F' and adjustable partition, for the purpose of collecting a still finer mixture of gold and sand for amalgamation, as described.



166,009.



166,012.

166,010. MITER-BOXES. Peter Johnson, Wauconda, and N. H. Johnson, Blackberry, Ill. [Filed Apr. 3, 1875.]

Brief.—The saw-guides clasp the sides and back of the saw, and are made both vertically and horizontally adjustable.

166,010.

166,011.

1. In miter-boxes, the table A provided with supporting-arms A' folding under the table, as and for the purpose described.

2. A saw-frame, F, having a side sleeve, a, in combination with a spiral spring having pin d and secured in post, for the purpose set forth.

166,011. WINDMILLS. Timothy Kellogg, McGregor, Iowa. [Filed June 1, 1875.]

Brief.—When the wind blows with greater force than necessary to do the work, it turns the face of the wind-wheel nearer to a line parallel with the vane, and, turning the frustum on the spiral threads within the concentric cylinders, raises the same, compensating the greater force by the greater resistance, and preventing injury to the machinery, and rendering stoppage in high winds unnecessary.

1. In combination, the concentric cylindrical parts at the lower ends of the two frustums of cones B and C, with spirals fitting and working together, substantially as and for the purpose set forth.

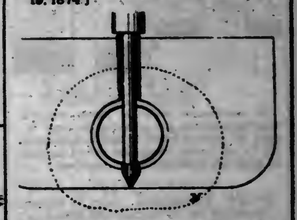
2. The combination of the cylindrical collars E F on the two conic frustums B C, each collar having a portion of one side cut away on an incline, in the manner and for the purpose described.

3. The combination of the two concentric frustums B C, inverted within a third external frustum, A, which serves as a jacket to inclose them, and of a frame for the attachment of the machine to the lower parts of the mill, all constructed and operating in the manner specified.

4. In combination with the collars E F, constructed as described, the vane V, arm L, shaft D, chain H, and pulleys P P', all arranged and operating in the manner and for the purpose set forth.

5. In combination with the vane V, the spring S, operating as described, to counteract the forces drawing the vane and shaft out of line, and thus assist in regulating the action of the main shaft.

166,012. GALVANIC BATTERIES. J. Kidder, New York, N. Y. [Filed Apr. 24, 1875.]

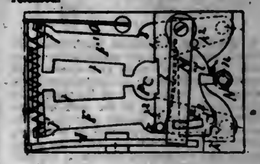


1. A cell-casing for galvanic batteries having interior cell forming partition-walls, made at less height than outer walls, for enabling rapid filling and emptying of cells substantially as and for the purpose specified.

2. A cell-casing for galvanic batteries provided with outer walls of greater height than the interior partition-walls, and having a supply-reservoir with flanged gutter and spout for the more rapid emptying and filling of the cells with the fluid, substantially as and for the purpose set forth.

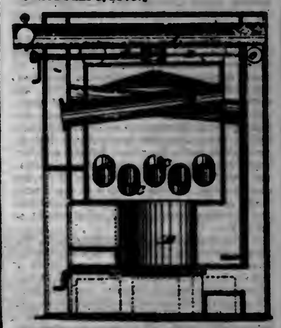
3. The subdivided guide-frame seated in main cell-case, and connected with vertically-moving element carrying top plate, as shown and described, then admitting of the lateral removal of cells and insuring the insertion of each element in its proper cell when depressed, substantially as set forth.

4. The diagonal pivoted straps B B, to command the parallel immersion of the elements into the solution of the cells, substantially as and for the purpose specified.



166,013. APPLE CORERS AND SLICERS. C. B. Kimball, New York, N. Y. [Filed Dec. 19, 1874.]

The combination, with the notched radiating quartering-blades, of the coring-cutters B and the spindle D, substantially as specified.

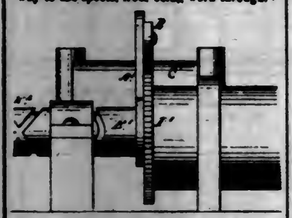


166,014. HASP-LOCKS. John Lechler, Erie, Pa. [Filed June 16, 1875.]

Brief.—Two pivoted spring-bolts serve to hold the hasp in a locked position. A sliding plate is so connected to the said bolts that by moving it in one direction the bolts will be moved in opposite directions, and the hasp released.

The combination, in a door-lock, substantially as described, of bolts F and F', or their equivalent, plate E, lever L, spring M, lever l, stop-plate H, and spring O, and spring D.

166,015. HOT-AIR FURNACES. Thos. Longstreth, Germantown, Philadelphia, Pa. [Filed June 5, 1875.]



1. The combination of rod R, which actuates damper C of the indirect draft-flue, with tubular valve-rod S, which moves the damper T of the direct draft-flue, as shown and described.

2. The combination, with smoke-pipe H, of horizontal pipe I, receiving the former at its middle, open at both ends, and provided with a valve, M, at one end, as and for the purpose set forth.

166,016. SPOOLING-MACHINES. Stephen D. Learned, Pawtucket, R. I., assignor to A. C. Learned, Bergen, N. J. (Filed Nov. 9, 1874.)

Brief.—To prevent the cloth covering of the friction-roll, over which the yarn passes on its way to the spools, from being worn through.

In combination with the friction-roll of a spooling-machine, the wave-bar D', lever A', pawl B', ratchet-wheel F', and rotary-screw E', for producing rotary and lateral motions of cloth roll, substantially as described.

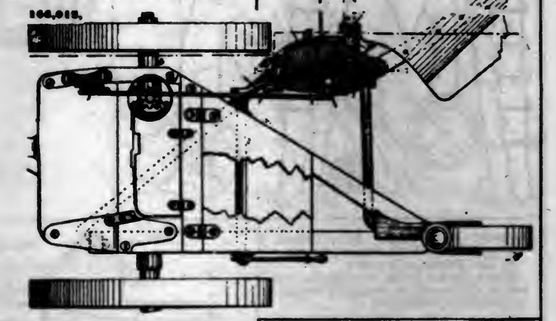
166,017. HARVESTERS. John P. Manny, Rockford, Ill. (Filed Nov. 26, 1874.)

Brief.—Combinations by which the cutters and rake may simultaneously be thrown into or out of gear, or their speed changed.

1. The clutch mechanism, hereinbefore described, consisting of the combination of the main axle, the two main gear-wheels H K mounted loosely thereon, and constructed with recesses for the reception of the clutch, the cup-shaped hub fast on the main axle, between the gears H K, the grooved clutch-sleeve or collar F', constructed as described, with spurs to enter the recesses in the gears, turning with but moving endwise on the hub, and the oscillating shipping-yoke F—all constructed as and for the purposes set forth.

2. The combination of the main axle, the spurred sliding clutch-collar F' thereon, the loose recessed main gear H, the bevel-wheel f thereon, the stud-axle on the pipe-bar, and the bevel-gear thereon for driving an automatic rake, these members being constructed and operating substantially as set forth.

3. The combination of the main axle, the sliding clutch thereon, the double gear-wheel K, the counter-shaft, the spur-pinion j thereon, gearing with the gear-wheel K, the pinion h fast on the counter-shaft, the main gear H loose on the axle, the bevel-wheel f thereon, and the bevel rake-gear on the stud-axle g, all these members being constructed and operating in combination, substantially as set forth, to drive the rake at an increased speed.



4. The combination of the main axle, the sliding clutch thereon, the spur-wheel H loose on the main axle, the spur-pinion h fast on the counter-shaft, the pinion j on the counter-shaft, the pinion I L loose on the main axle, the spur-pinion m and bevel-wheel M on the counter-shaft, and the pinion e on the crank-shaft, all these members being constructed and operating in combination, substantially as set forth.

5. The combination of the main axle, the main gear-wheels H K loose thereon, the intervening sliding clutch, the bevel-gears f and G, the counter-shaft, the gears h j fast thereon, the gears I L loose on the main axle, the gears m M loose on the counter-shaft, and the gear on the crank-shaft, these members being constructed and operating in combination, substantially as hereinbefore set forth, whereby the speed both of the rake and of the cutters simultaneously may be varied.

6. The combination of the main axle, the hub B' thereon, the sparred notch-sleeve F' moving endwise thereon, its shipping-yoke, the latch J hinged thereto, and the notched plate with which said lever engages to hold the mechanism into and out of gear, these members being constructed and operating substantially as hereinbefore set forth, whereby the latch forms part of the lever which moves the shipping-yoke, and is then turned down to lock it.

166,018. HARVESTERS. John P. Manny, Rockford, Ill. (Filed Nov. 26, 1874.)

166,018.

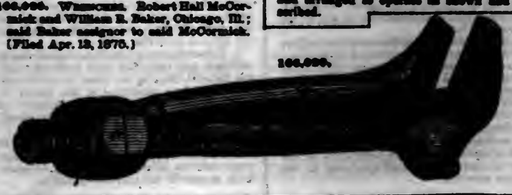
1. The combination of the coupling-frame, the shoe, the bracket thereon, the adjustable loop, and the lever I, these members being constructed and operating in combination, substantially as set forth.

2. The combination of the main frame, the coupling-frame, the shoe, the adjustable loop, the post, the hand-lever, and the link connecting the post and lever, these members being constructed and operating in combination, substantially as set forth.

3. The combination of the coupling-frame, shoe, finger-beam, post, and swinging latch, these members being constructed and operating in combination, substantially as set forth.

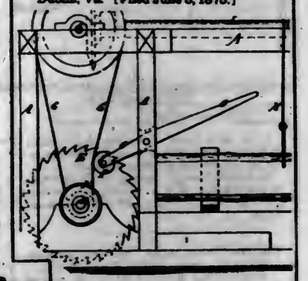
4. The combination of the main frame, the coupling-frame, the shoe, the finger-beam, the rock-shaft, its crank-arm, the link connecting the crank-arm and shoe, the grain-wheel, its hinged arm, and the lifting-cord extending from the grain-wheel arm through the shoe to the crank-arm, these members being constructed and operating in combination, substantially as hereinbefore set forth.

166,019. MOWING-MACHINES. John P. Manny, Rockford, Ill. (Filed Nov. 26, 1874.)



The combination, substantially as set forth, of the divider, the track-cleaner, the stud-bracket, to which the grass-wheel arm is hinged, and the single through-belt which secures the above-named parts together.

166,019.



166,020. WRENCHES. Robert Hall McCormick and William R. Baker, Chicago, Ill.; said Baker assignor to said McCormick. (Filed Apr. 12, 1875.)

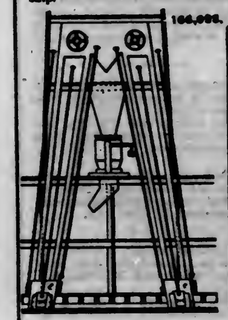
166,020.

The improved wrench hereinbefore set forth, consisting of the combination of the main portion, provided with a jaw, guide-flanges, a longitudinal guide-groove, and a screw; a movable portion, provided with a jaw, grooved flanges interlocking with the guide-flanges on the main jaw, and a tongue working in the guide-groove, and a screw-nut working on the screw of the main portion and over the sliding portion, for the purposes specified.

166,021. LOG-TURNERS. Chas. F. McWane, Dublin, Va. (Filed June 5, 1875.)

The rope-winding shaft I, placed parallel to the ways of the log-carriage, the saw-shaft J at right angles thereto, the gear K, pinion J, pulleys H F, stock-band G, and pivoted lever O, carrying friction-roller P, all constructed and arranged to operate as shown and described.

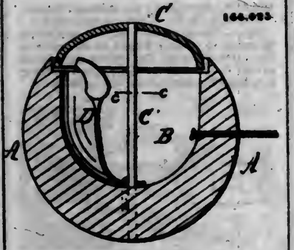
166,022. CLOTHES-PINS. Uriah D. Mihills, Fond du Lac, Wis. (Filed June 26, 1875.)



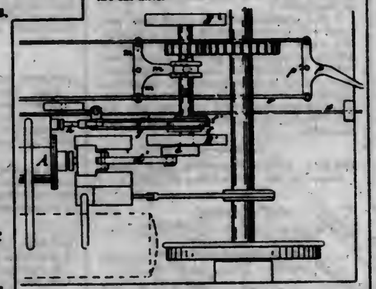
An improved clothes-pin, formed by the combination of a notched and slotted block, A, and the tapering key B, provided with a head upon each end, substantially as herein shown and described.

166,023. GRAIN-ELEVATORS. C. W. Mills, Mont Clair, N. J. (Filed Jan. 19, 1875.)

Brief.—Endless belts in water-tight wells, with slides for admission of grain, and others on the floor for the admission of water, in order that the same means may pump the ship.

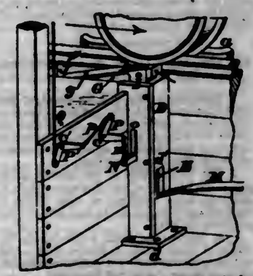


166,023.



166,024. AIR-BRAKES AND CAR-STARTERS. Herman Moschowitz, New York, N. Y. (Filed Feb. 8, 1875.)

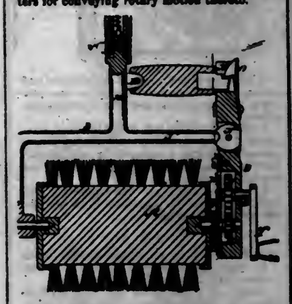
Brief.—The one lever, by a longitudinal movement, reverses the engine, and by a lateral movement throws it out of or in gear with the car-axle.



166,024.

The water-tight well fitted into a vessel and extending below the floor of the grain-bins, in combination with the elevating-buckets and two slides, one to admit grain from the bin and the other to admit water below the bin, substantially as set forth.

166,025. RAILROAD-SIGNALS. R. H. Moore, Greenbeck, Ohio. (Filed June 4, 1875.)



The combination, substantially as herein described, of housing D d', vertically-acting shaft E c, tappet F G g l, spring l, retractor H, and arm N, together with the connexion P [" p Q R T, or their equivalents, for sounding an alarm upon a bell or gong, V, so as to give intimation of an approaching train, substantially as set forth.

166,026. TOPS. Geo. F. Morse, New York, N. Y., assignor to himself and J. P. Tobin, same place. (Filed May 22, 1875.)

A toy chime-ball consisting of a recessed ball having a bell mounted thereon, which completes the spherical shape of the ball, and a ball-ringing device, combined and arranged substantially in the manner and for the purpose specified.

166,027. ROTARY HAIR-BRUSHES. Wm. O. Nutsford and Wm. Glasgow, Chicago, Ill. (Filed Apr. 17, 1875.)

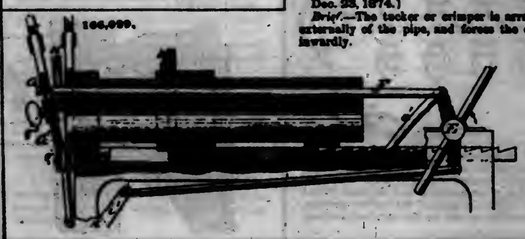
Brief.—The rotary brush is so held in the frame that it can be readily removed and replaced by another. The end of the brush carries two flanges, between which a pin enters for conveying rotary motion thereto.

1. The spright D, snap-fastening H O, and joint N', gear-wheels E and F, crank T, and pivot-pin O', in combination with a rotary hand hair-brush, the pivoted handle E, and frame B, for the purposes described.

2. The pin I and flanges J J, in combination with the brush A, having pivot O', for the purposes described.

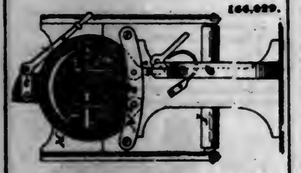
166,028. PAPER BAGS. William Osterlein, Cincinnati, Ohio. (Filed May 20, 1875.)

166,028.



1. The method of making a "satchel-bottom" paper bag by cutting or punching the paper to shape shown in Fig. 1.

2. Folding the irregular-shaped side of the paper lengthwise, inwardly, Fig. 2, and pasting the paper and folding it twice in a right angle to the first fold, Fig. 4, as herein set forth, and folding the bottom corners of the bag inwardly, Fig. 5, as in the manner described.



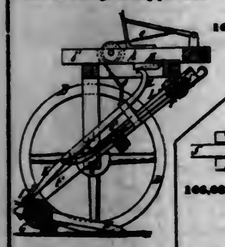
166,029. MACHINES FOR MAKING STOVE-PIPE ELBOWS. John F. Field, Richmond, Ind., assignor of part of his right to John H. McIntyre and J. B. Taylor, same place, and Geo. Erick, Philadelphia, Pa. (Filed Dec. 23, 1874.)

Brief.—The tucker or crimper is arranged externally of the pipe, and forces the crimp inwardly.

166,029.

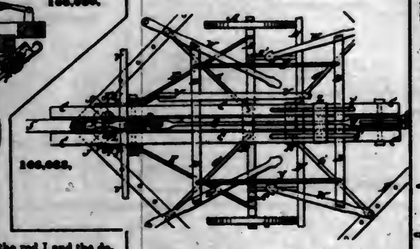
166,029.

1. The beater or crimper H, constructed and adapted to form an interior tuck by one operation, substantially as and for the purpose described.



2. The expansible and adjustable rest, composed of the sections G G', with studs g' g' and eccentric, forming a support for making the interior crimp, substantially as and for the purpose described.

3. The combination of the expansible rest and the crimper H, substantially as and for the purpose described.

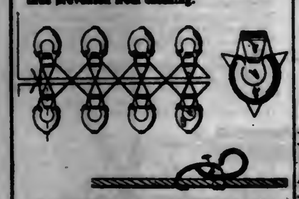


166,030. REVOLVING HORSE-RAKES. John H. Randolph, Jr., Bayou Goula, La. [Filed Mar. 1, 1875.]

Brief.—The release of the rake-head to dump the gathered hay is effected at will by the depression of a foot-board hinged to the main frame, tilting thereby the tripping-lever mounted in adjustable bearings in the rake-frame, and held by a spring in engagement with the stop on the rake-head. Said stop is formed of two or more pieces, removable, to alter the angle of inclination of the rake-teeth in their gathering position.

166,030.

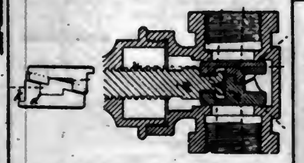
166,032.



1. The combination of the rod I and the detachable stop-blocks J with the roller G of the rake-head, to receive the end of the holding-lever K, substantially as herein shown and described.

2. The combination of foot-board M, hinged to the main frame A, the lever K, the adjustable slotted bar L, secured to the rake-frame F, and the spring *b'*, for holding and tripping the rake-head, substantially as herein shown and described.

166,031. SHOE-FASTENERS. George P. Reeves, Hebron, Mass., assignor to himself and Charles Rumley, same place. [Filed Mar. 29, 1875.]



Brief.—A sheet-metal fastening has a horseshoe-shaped ridge or projection, between the open end of which the hook that receives the lace fills. The dress and other objects are thus prevented from catching.

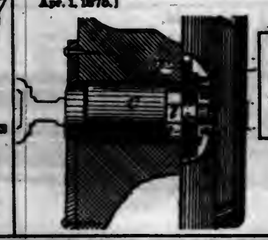
The shoe-fastening A provided with suitable prongs for securing it to the shoe, and having the central concavity b, the surrounding ridge or projection a, and the hook d bent to fall within the ends of the curved portion, substantially as and for the purpose specified.

166,032. GATE-VALVES. Edmund Russell, Brooklyn, N. Y. [Filed June 21, 1875.]

Brief.—The gates have inclined backs, and by means of wedges formed in the walls of the valve-chamber the valves are forced against their seats, the wedging action being in a direction transverse to the valve-seats.

1. In a gate-valve, the combination of a gate composed of two pieces, respectively, having oppositely inclined backs, with wedge-guides upon the side walls of the gate-chamber, for the purpose of imparting transverse motion, in opposite directions, to the two gate-pieces as the gate is depressed, substantially as described.

2. The combination of a screw-stem, provided with a collar upon its lower extremity, and a gate composed of two parts obliquely halved, or tongued and grooved together, and vertical wedge-guides for imparting transverse motion to the two parts of the gate in opposite directions, with annular seats surrounding the water-way openings into the gate-chamber, substantially as shown and described.



166,033. SULEY-HARROWS. D. F. Shaw, Hamilton, Mo. [Filed May 28, 1875.]

1. The combination of the perforated plates J, the arms K and G, the blocks L H, and bar I with each other, and with the bars F of the harrow-frame, to enable said harrow-frame to be adjusted, substantially as herein shown and described.

2. The combination of the blocks N, the pivoted connecting links or bars O, the pivoted bent levers P, the pivoted connecting-bars Q R, and the sliding tongue S with the parallel bars C of the carriage, and with the bar I, with which the harrow-frame is connected, substantially as herein shown and described.

3. The combination of the lock-catch T and the lever U with the parallel bars C of the carriage, and with the sliding tongue S, substantially as herein shown and described.

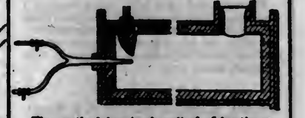
166,034. LOCKS. Henry S. Shepardson, Shelburne Falls, Mass., assignor to the Winn Lock Company, same place. [Filed Apr. 1, 1875.]

The nut e and plate F, provided with the recesses or notches *e*, in combination with the cylinder C, provided with the lugs *c*, said parts being provided with a screw-thread or grooves for adjusting and locking them together, substantially as described.

166,035. CUTTER-HEADS FOR PLANING AND MOLDING MACHINES. George J. Skinner, Milton, Pa. [Filed Dec. 30, 1874.]

Brief.—The bit is formed of a circular plate or disk, sufficiently thick to form the required cutting-edge, thin in the central part or web, and transversely notched to form a cutting lip.

A bit formed of a circular plate or disk sufficiently thick to form the required cutting-edge, and thin in the central part or web, and transversely notched, all as herein shown and described.



166,036. MANUFACTURE OF ILLUMINATING-GAS. Wm. H. Spencer, Brooklyn, N. Y. [Filed Dec. 26, 1874.]

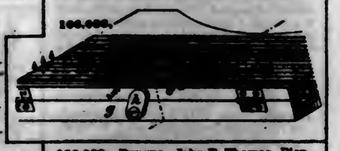
Brief.—The retort is lined with lime. The hydrocarbon enters the retort just above the jet of oxyhydrogen flame.

The method herein specified of decomposing hydrocarbons and aqueous vapors by the direct application of an oxyhydrogen flame within a retort, substantially as set forth.

166,037. HEATING-RETORTS FOR THE MANUFACTURE OF ILLUMINATING-GAS. Wm. H. Spencer, Brooklyn, N. Y. [Filed Dec. 26, 1874.]

Brief.—The gas-retort is heated by the vapors of zinc, whereby a definite and uniform temperature is maintained.

The method herein described of heating a retort for the manufacture of illuminating-gas by the vapors generated in the distillation of zinc or other metal, as set forth.

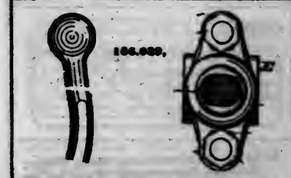


166,038. LAP-BOARDS. Henrietta G. Stapp, Somerville, Mass. [Filed Dec. 18, 1874.]

1. The combination, in a lap-board, of parallel guide-grooves *b b* for guiding scissors or hand-shears, and a clamp, *c*, for holding the goods while strips are being cut therefrom by means of the scissors or shears, substantially as herein shown and described.

2. The combination of the parallel guide-grooves *b b*, clamp *c*, and measuring-scale *d*, the latter being arranged at right angles to the guide-grooves, as herein specified, for the purposes set forth.

3. In combination with a lap-board, the clamp or cloth-holder *c*, elastic strip *i*, and button *h*, constructed and arranged substantially as herein shown and described.

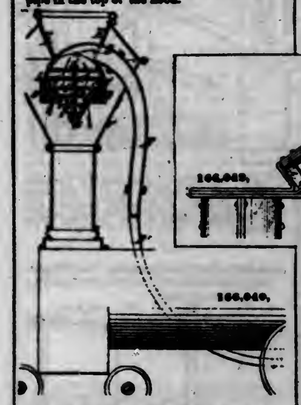


166,039.

166,040. PUMPS. John F. Thomas, Rion, N. Y. [Filed May 28, 1875.]

Brief.—The parts are so constructed that a slight lateral play is given to the rod to allow it to adjust itself, and prevent binding, and also enable the wear of the joint to be taken up.

166,039.



The combination, in a pitman-head, of the yoke B, spherical head J, ring C, with the box E, shoe I, and staple D, all constructed and arranged to operate substantially as set forth

---

166,040. SPARK-ARRESTERS FOR LOCOMOTIVES. William McK. Thornton, St. Louis, Mo. [Filed Dec. 30, 1874.]

Brief.—An inverted cone made of annular adjustable sections suspended on a pendent screw-rod, which is inclosed within a hood. An annular section of wire netting surrounds the lower part of said hood, whereby the sparks are trapped and carried off through a pipe in the top of the hood.

166,039.

166,040.

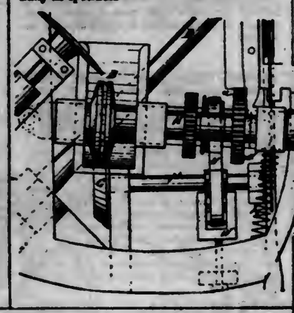
1. The inverted conical spark-catcher, consisting of the head *a*, pipe E, and a downwardly-tapering portion formed of annular sections *b*, which are of varying diameters, and are fastened upon a pendent rod, substantially as and for the purpose described.

2. The annular sections *b*, of varying diameters, and tapered on their inner circumference, and fitted (by means of a screw-thread formed on each of them, and a screw-thread formed on the pendent rod) to be adjusted nearer together or farther apart, in combination with the head *a* and pipe E, substantially as and for the purpose described.

3. The inverted conical spark-catcher, consisting of the head *a*, pipe E, and annular sections *b b* of varying diameter, and fastened upon a pendent rod, *d*, in combination with the notching D open at its lower end, and suspended from the spark-catcher and conductor, substantially as described.

4. The inverted cone portion of the spark-catcher and conductor, formed of annular rings of varying diameters, which are tapered on their inner circumferences and cylindrical on their outer surfaces, substantially as described.

166,041. MACHINES FOR MAKING BARREL-HEADS. Wm. W. Trevor, Lockport, N. Y., assignor to himself and Francis M. Trevor, same place. [Filed June 10, 1875.]



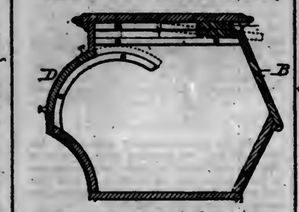
Brief.—The material is held between revolving chucks, and the desired form given to the head by means of a concave circular saw, in contact with which it is brought while revolving with the chucks.

1. The combination of a tripping-wheel, *c*, with the clamp-shaft and the trip-catch, the said wheel having clearer motion than the clamp-shaft, substantially as specified.

2. The combination of the pinion *b*, and tripping-wheel *c*, with the driving-shaft T, and the clamp-shaft, substantially as specified.

3. The swinging rod P, combined with and jointed to the swinging clamp-shaft H, substantially as specified.

4. The swinging rod P, having lengthwise motion in its support, and the spring N, in combination with the clamp-shaft, substantially as specified.



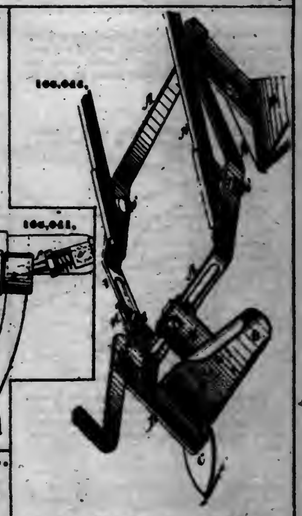
166,042. METALLIC TRUSS-BRIDGES. Jas. Valleley, Canton, Ohio. [Filed Apr. 24, 1875.]

Brief.—The bridge-arch is composed of top and bottom plates, connected by diagonal stay or brace pieces, arranged transversely and lengthwise alternately.

In an iron bridge, the arch A, composed of the top and bottom plates H H and connecting stay or brace plates F of the form shown, and arranged transversely and lengthwise of the arch, as set forth.

166,043. STORE-COUNTERS. W. Volkland, Fond du Lac, Wis. [Filed Mar. 29, 1875.]

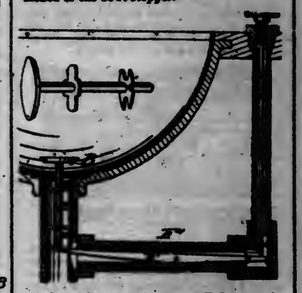
A store-counter composed of one or more compartments, with the top A, the curved sliding lid D, and the hinged sliding lid B, both opening upon opposite sides into the same compartment, the whole being constructed to operate substantially as described.



166,044. CULTIVATORS. William Weaver, Greenwich, N. Y. [Filed May 15, 1875.]

Brief.—An angular-shaped cultivator with alternate devices, to adapt it for use as a cultivator, hiller, or potato-digger.

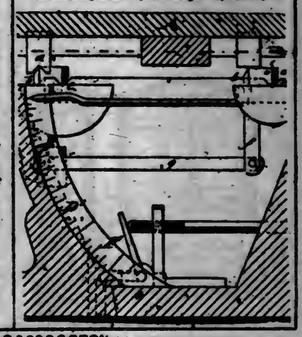
1. The angular bars A A, slotted in their front sections, in combination with the angular draft-bar B and standard D, forming a cultivator of angly diamond shape, and adapted to receive alternate cultivating devices, as shown and described.



2. The combination of angular slotted frame A A, draft-bar B, slotted handle-sockets O, standards D F E, and plows C G E, all arranged substantially as and for the purpose specified.

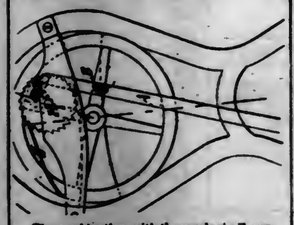
166,045.

166,046. WASH-BOWLS. E. M. Weaver, Mansfield, Ohio. [Filed May 22, 1875.]



Brief.—On the stem, below the valve-ring, there are sieves or strainers. The valve mechanism is operated by a lever, as shown, thus dispensing with the chain usually attached to the bevil-stopper.

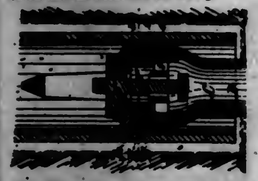
1. The valve-operating device F G, inclosed in tight tube F G', as and for the purpose described.



2. The detachable valve-ring, having top-ring and sieves or strainers attached of stem below the same, substantially as and for the purpose set forth.

166,047. WHEELBARROW-SECTION. E. M. Weaver, Mansfield, Ohio. [Filed Apr. 17, 1875.]

The combination, with knife-edges, of a balance-weight and an auxiliary weight, connected by rigid arms *f f* and pivoted rod *g*, the weights oscillating in same plane, as and for the purpose specified.

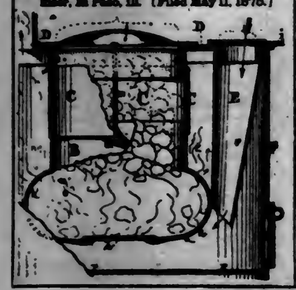


166,047. CRANK-MOTIONS. C. B. Whipple, North Charlestown, N. H. [Filed May 1, 1875.]

The combination, with the crank-pin E, connecting-rod A, and the secondary crank D, pivoted concentrically to the axis, of an idle-wheel, B, or another crank, substantially as specified.

166,048. PUMPS FOR TUBULAR WELLS. J. T. Whipple, Oak Park, Ill. [Filed June 10, 1875.]

Brief.—The coupling is provided with a flaring elastic packing, between which and the upper edge of the coupling applies a vertical flange depending from the valve-seat, by which means the packing is compressed against the tubing. Between the flange and the body of the valve-seat is a groove, provided with elastic packing, against which the upper edge of the coupling impinges, the two packings thus forming an air and water tight joint between the valve-seat and the tubing.

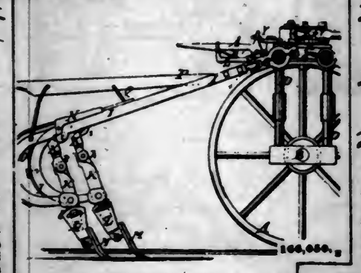


1. The valve-seat F provided with the depending flange E, adapted to pass between the coupling and packing, whereby the latter is compressed between the flange and inner surface of the tube, as specified.

2. The valve-seat F provided with the vertical groove G, adapted to receive the upper end of the coupling, in combination with packing J, as specified.

3. In combination with the valve-seat, coupling, and main tube, the packings E and J, arranged for joint operation to secure an air and water tight joint below the valve at the junction of the valve-seat with the coupling, as specified.

166,049. HEATING-STOVES. William Wickhiser, El Paso, Ill. [Filed May 11, 1875.]

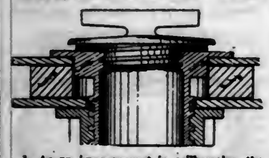


1. The combination, with the stove-case D F provided with air-passage E, with its cover *i*, furnace-cover *f*, and smoke-passage *g*, of the bowed furnace-bars *h* on cylinder B, with lugs *a a* and rods *m m*, connected by cylinder C to the rim *e* of the cover D, and supported by said rods *m m*, as described.

2. The combination of the bowed furnace-bars *h*, cylinders B C, cover D, and casing F, having the water-tight door S, and a food caldron or boiler, as and for the purposes described.

166,050. CULTIVATORS. Gershom Wilkinson, Quincy, Ohio. [Filed Apr. 17, 1875.]

Brief.—Spring-bars instead of a break-pin and slotted plates, to regulate the pitch of the teeth. Adjustable hooks for holding up the drag-bars.



1. The combination of the pivoted and jointed standards K, the elbow-levers N, and the springs O, with the curved rear parts of the plow-beams I, substantially as herein shown and described.

2. The combination of the pivoted and slotted plates L with the standards K and the plows M, substantially as herein shown and described.

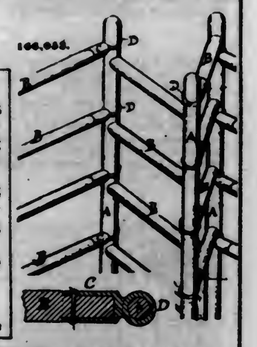
3. The combination of the levers or arms T and the adjustable hook-plates U *u*, with the outer adjusting-bars R, substantially as herein shown and described.

166,051. MILK-COOLERS. O. H. Willard, Randolph, N. Y. [Filed July 10, 1875.]

1. As an improvement in milk-cooler, the milk pan and vat provided with bottoms of diagonal inclination or pitch from one corner to the opposite one, for drawing off both milk and water at the lowest points, substantially as and for the purpose set forth.

2. The combination of milk pan and vat with a milk-outlet or faucet made of a flanged and threaded tube with screw-plug, a rubber ring interposed between pan and vat, and fitted to collar of tube, and of a bottom fastening-nut for connecting or detaching the parts, substantially as specified.

166,052. ROAD-SCRAPERS. Jacob W. Wilson, Hammerfort, assignor to himself and Addison Shanklin, London, Ohio. [Filed July 3, 1875.]



Brief.—In a revolving scraper manipulated by the handles, which are connected to the draft-yoke eccentrically, so that the scraper is detached by swinging the handles upward, and connected by swinging them downward. A guard-hook is arranged on the sides of the scraper, to prevent disconnection except when the handles are raised.

The combination of the guard-hook J with the pin G of the revolving scraper and the rods I H of the handle, substantially as specified.

166,053.

166,053. CLOTHES-DRYERS. Henry Winter, Cincinnati, Ohio, assignor of one-half his right to Wm. F. Kurtz, same place. [Filed Nov. 27, 1874.]

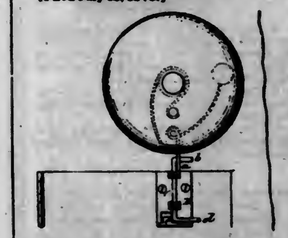
166,053.

In an articulated clothes-drier of the character stated, the socket-clasp C D, composed of a single piece of malleable cast-iron, and applied substantially as and for the purpose specified.

166,054. COTTON-CLEANERS. Jas. Wright, Mountain Mills, Ala. [Filed Nov. 7, 1874.]

166,054.

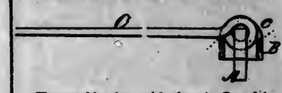
The improved cotton willow or cleaner, consisting of the frame A, containing the following elements: The frusto-conical chamber C, having removable top B and wire-screen bottom C', the beating-shaft, provided with curved radial and spirally-arranged beaters, breaking-joints with pins E, the beaters F above opening F, the bar G located under the screen C', and having the laterally-projecting spout and the dampers H H on opposite sides



---

166,055. GRINDERS. Arthur A. Abbott, Chicago, Ill. [Filed Apr. 27, 1875.]

A sleigh-knee consisting of a standard provided with the socket E to receive the runner, the outward projection *a* to support the runner, the inward projection *c* to support the body of the sleigh, and the intermediate upright projection *d*, all cast in one piece, and having substantially the form and construction herein described and shown.



166,056. ALARM-BELLS. Irvin H. Abell, East Hampton, Conn., assignor to the East Hampton Bell Company, same place. [Filed July 13, 1875.]

1. In combination with an alarm-bell, the shaft C, provided with arms *b d* in different planes, one arm serving as a trip for the bell, and the other as a stop to hold the said trip in either of the two positions of sounding the alarm when the door is open or closed, substantially as described.

2. The herein-described trip for alarm-bells, consisting of the shaft provided with the two arms *b d* in different planes, arranged in bearings on a plate, D, and with the stop *c* on said plate arranged to form a bearing to support the arm *b* at one incline for actuating the bell, and also to hold the said arm *b* in its position of disengagement, substantially as set forth.

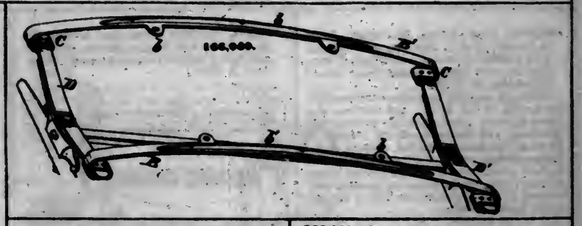
166,057. JEWELRY-PINS. I. B. Abrahamson, New York, N. Y. [Filed Dec. 19, 1874.]

The combination, with the pin C and inclosed post A hinged together, of the slotted shell B inclosing said post, substantially as specified.

166,058. TRUNK-STRAPS. Geo. R. Alter, Minneapolis, Minn. [Filed May 22, 1875.]

1. A trunk-strap, consisting of a buckle, F, and loops D and H, connected to the long strap E, substantially as described, and for the purpose specified.

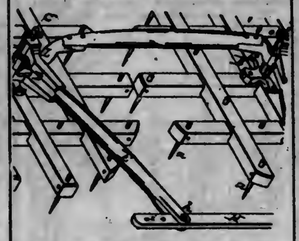
2. The long strap B, provided with a buckle, F, and loop D, in combination with loop E, strap C, and adjusting-buckle G, substantially as and for the purpose described.



166,059. CLASPS FOR UNITING WIRE OR CLOTH FOR JAPANNERS. Benjamin Atha, Newark, N. J. [Filed Feb. 20, 1875.]

The bar A, having margins B B and undertarned ends C C, of the key or rigid wedge D, all constructed and applied as and for the purpose specified.

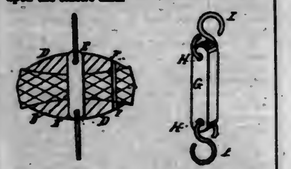
166,060. VEHICLE-SPRINGS. C. Bauer, Cincinnati, Ohio. [Filed June 21, 1875.]



The vehicle-spring B B', having lugs *b b*, connecting-pieces *b' b'*, and coiled extremities C C, in combination with the semi-elliptic springs D D', as set forth.

166,060.

166,061. HARROWS. John S. Bonsall, Chillicothe, Mo. [Filed Feb. 1, 1875.]

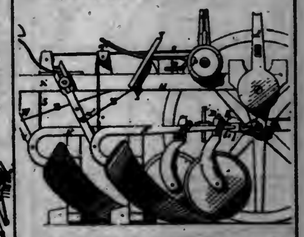


Brief.—Each section of the harrow is provided with a spindle rising from a center-plate, which is bolted to the center of the frame. The lower part of the spindle is of uniform diameter for about two-thirds of its length; then a tapering seat is formed for a ring, the upper end of the spindle being straight. The upper arm of the drag-bar rests upon the upper edge of the ring, and the coupling-bar rests upon the lower arm of the drag-bar, and that in turn is supported by the upper arm, thus relieving the base plate from friction.

In a revolving harrow, the post C, constructed as shown, and provided with the washers M, in combination with the forked shoes D and bearings L, substantially as and for the uses and purposes set forth.

166,062. CHAIN-PUMP BUCKETS. John S. Bonsall, Chillicothe, Mo. [Filed Feb. 22, 1875.]

Brief.—An elastic disk having concave faces, a central rectangular opening, and a smaller leak-passage near its edge. Upon each face of the disk is placed a convexo-convex metallic disk, having openings to correspond with those in the elastic disk. The disks are held together by a rectangular eyebolt, of such length that the links can only be inserted in the eyes by compressing the metallic disks upon the elastic disk.



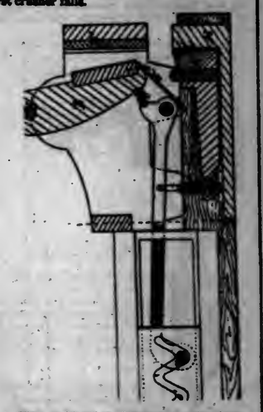
1. In a pump-bucket for chain-pumps, an elastic central disk and metallic outer disks secured together by a rectangular eyebolt, having an eye in each end for the reception of a link, and of such length that the links can only be inserted into the eyes of said eyebolt by compressing the disks together, and causing the ends of the eyebolt to project from the bucket, substantially as and for the purposes set forth.

2. In combination, the elastic disk A, having openings B and C, metallic disks D D, having openings E and F, and the rectangular eyebolt G, having eyes H H and links I I, substantially as and for the purposes set forth.

3. The rectangular eyebolt G, having eyes H H and links I I, as described, for the uses set forth.

166,063. GANG-PLOWS. Edwin A. Beers, De Kalb Centre, Ill. [Filed June 17, 1875.]

Brief.—Devices for holding down and regulating the plows, and loose couplings for connecting the beams.

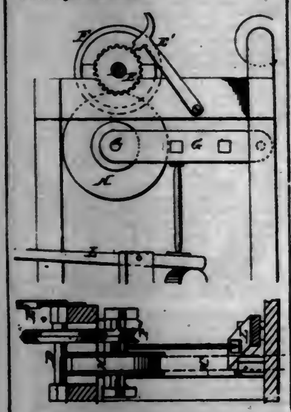


1. In combination with the jointed bars W and W, the shaft Y, provided with the arms *y* and *y*, and foot-lever *y'*, and connected to or with said bars by means of the rods Z and Z, substantially as and for the purpose specified.

2. In combination with the plow-beams N and N, the bars A' and A', secured to or upon said beams, and provided at their inner ends with the interlocking loops *a'* and *a'*, substantially as and for the purpose shown.

166,064. ORE AND STONE CRUSHERS. John R. Blake, Sewickley, Pa. [Filed June 17, 1875.]

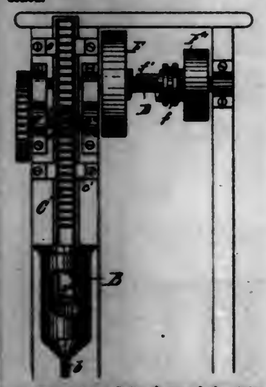
Brief.—The movable jaw of a stone-crusher is actuated by a pivoted lever, which is caused to rise and fall by means of a sliding cam. Attached to the under side of the lever is another sliding cam, which causes lateral motion in the movable jaw of another crusher, into which the partially-pulverized ore from the first crusher falls.



1. The combination of two converging jaws, actuated by means of a pivoted lever and sliding cam, substantially as and for the purpose specified.

2. In combination with a crusher having converging jaws, and a pivoted lever for operating them, a pulverizer operated from the pivoted lever by means of sliding cam, substantially as and for the purpose specified.

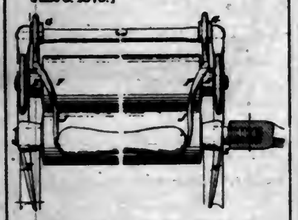
166,666. CORN-HUSKER MACHINES. John D. Blood and Geo. Topping, Amsterdam, M. Y., assignors to John D. Blood, Henry Herrick, and Geo. Topping, same place. [Filed May 19, 1876.]



Brief.—A mounted hollow mandrel receives the handle of the broom, and revolves the broom opposite a floating-pulley intermediate between it and the tension-drum. Motion is given to the mandrel by the contact of its friction-pulley with a friction-pulley on the shaft of a hand-wheel, held in a pivoted frame beneath; said pivoted frame being raised and lowered by the action of the foot of the operator upon a treadle.

In a broom-winding machine, the combination, with the hollow mandrel D and ratchet-wheel E, with its dog F', of the friction-wheels F and F', hand-wheel H, vibrating frame G, treadle L, and rod M, substantially as and for the purposes set forth.

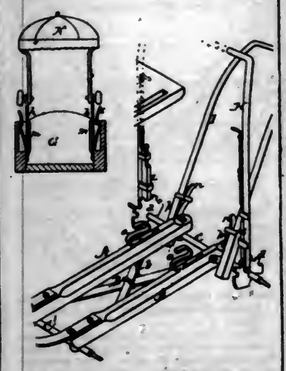
166,666. PRESSES FOR PACKING PUTTY. L. Boucher, St. Louis, Mo. [Filed Mar. 4, 1876.]



Brief.—The rack-bar, having the piston thereon, is connected with corresponding gearing and double-clutch mechanism, by means of which the piston is brought into or out of action.

1. The rack-bar C, its plunger *c'*, the piston *c*, gear-wheel E, pinion d, power-shaft D, in combination with a cylinder, B, to operate as and for the purpose set forth.

2. The clutch *f*, pulleys F F', power-shaft D, pinion d, gear-wheel E, pinion *e*, rack-bar C, its plunger *c'*, in combination with the cylinder B, to operate as and for the purpose set forth.



166,667. CLOTHES-WRINGERS. William T. Bunnell and A. G. Ronan, Ottawa, Canada; said Ronan assignor to said Bunnell. [Filed June 3, 1876.]

1. The combination of rock-shaft F, having end eccentrics G G, the coiled pressers F F, and the friction-rolls H H with the upper roll of a wringer, as and for the purposes described.

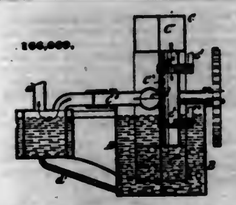
2. The guide-roll I, suspended from the pressers F F of a wringer, as described, thus serving as a handle for the convenient manipulation of said pressers.

166,668. CHILDREN'S CARRIAGES. Robert W. Caldwell, Zanesville, Ohio. [Filed Feb. 4, 1875.]

1. The combination, in a child's carriage, of the frame A B, secured upon the axles C C', the G-shaped springs D D, and bed E, upon which the carriage-body is fastened, substantially as and for the purposes set forth.

2. The combination of the frame A B, springs D I., bed E, adjustable body G, springs *e e*, and elastic band *b*, all substantially as and for the purposes set forth.

3. The pivoted foot-piece J and pins *f f*, in combination with the bed E, springs D D, and adjustable carriage-body G, as and for the purposes set forth.



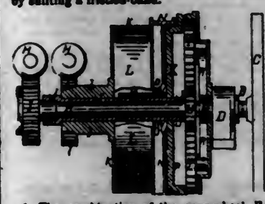
4. The combination, with a child's carriage, of the pivoted adjustable handle H, with spring-pawls *e e*, and the segmental racks *d d*, substantially as and for the purposes set forth.

5. The combination, with a child's carriage, of the handle I, having spring-catches *a a*, and the sockets *p p*, as and for the purposes set forth

166,669. AIR-SUPPLY ATTACHMENTS FOR CARBURETTERS. John M. Cayce, Franklin, Tenn. [Filed Feb. 20, 1876.]

Brief.—In a water-reservoir revolve one or more hollow wheels or annular chambers, having on their outer peripheries inlet-ports, and on their inner peripheries outlets through radial tubes opening into the central tube, on which they revolve. The radial tubes are provided with valves or cocks operated by trippers attached to the sides of the reservoir. As the inlet-ports are immersed in the water, the air in the chamber above is discharged through the central tube into the air-reservoir. Any water that may be carried along with it is delivered again from the air-reservoir to the water-reservoir through a connecting-pipe.

166,669.



1. The combination, with air and water reservoirs B D and pipe C', of the hollow wheel C, having chambers C', and provided with inlet and outlet *c c'* and valved pipe *c'*, operated as and for the purpose described.

2. The combination, with valves having arms *c' c'*, of the trippers *b' b'*, as and for the purpose set forth.

3. The combination, with reservoirs B D, of the connecting-pipe *c'*, as and for the purpose specified.

166,670. MOTORS FOR RAILWAY-CARS. G. B. Oliver, Philadelphia, Pa., assignor to himself and Robert Eastman, same place. [Filed May 27, 1876.]

Brief.—Revolution of hand-wheel winds spring in drum; recoil propels car. Connection between drum and wheel made or broken by shifting a friction-band.

1. The combination of the spur-wheel E, pinion F, shaft G, screw H, worm-wheel I, case K, sleeve J, and the spring L, as shown and described.

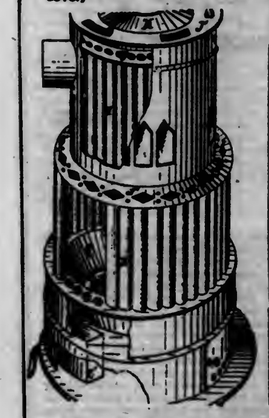
2. The combination of the sleeve J, case K, spring L, feather M, transmitting-wheel N, spring O, and the annular wheel P, as shown and described.

3. The combination of the lever V, shifting-cloth W, transmitting-wheel N, sleeve J, feather M, spring O, and the wheel P, as shown and described.

4. The combination of the wheel P, spider R, gear-wheels T U, shaft B, and the sleeve J, as shown and described.

166,671. SEWING-MACHINES. L. J. Crenshaw, St. Louis, Mo. [Filed May 24, 1876.]

Brief.—Improvement on the Wardwell machines. The hook which takes the loop from the needle is pivoted to the edge of the spool-case holder, and is held out against the needle by a spring, so that the removal of the stitch from the needle is insured. A notch is formed in the spool-case stay, through which projects the retaining-arm on the spool-case, to prevent such parts from wearing the thread.



1. The combination, with a revolving spool-case holder, of a movable or vibratory hook projecting beyond the edge of said holder, and operated by spring-power, whereby the said hook is always brought in line with the path of the needle, substantially as and for the purpose described.

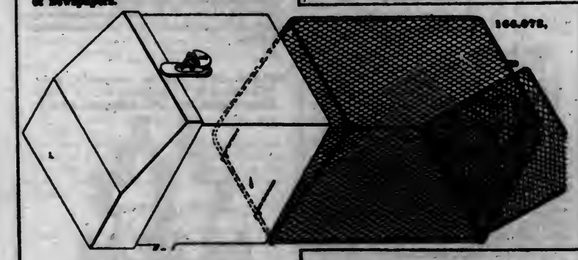
2. The combination, with the spool-case holder, of the spring A, point B, needle-guard C, and pivot D, as and for the purposes set forth.

3. The combination, with the spool-case stay F, provided with the escape-notch G, of the spool-case finger E, the several parts being constructed and relatively arranged as shown and described.

166,672. MAGAZINE HEATING-STOVES. M. A. Cushing, Aurora, Ill. [Filed Mar. 29, 1876.]

1. In a magazine heating-stove, the magazines inclined in and built up of contiguous tubes, open at their upper ends to the surrounding air, and at their lower ends to the combustion-chamber, substantially as described.

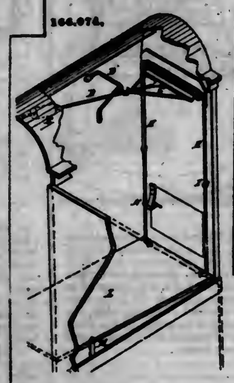
2. In a heating-stove, a magazine built up of pendent tubes, combined with an annular air-register at the top, substantially as described.



3. In a heating-stove, a tubulous magazine, pendent from and in combination with an annular air-chamber, provided with an air-register, substantially as described.

4. In a heating-stove, a tubulous magazine, built up of alternate long and short tubes, combined and arranged substantially as and for the purpose set forth.

5. In a heating-stove, a fire-pot, built up of and entirely surrounded by contiguous tubes, open at their top to the surrounding air, and at their bottom to an air-flue extending through the ash-pit and base-plate, said tubes and air-flue combined and arranged substantially as described.

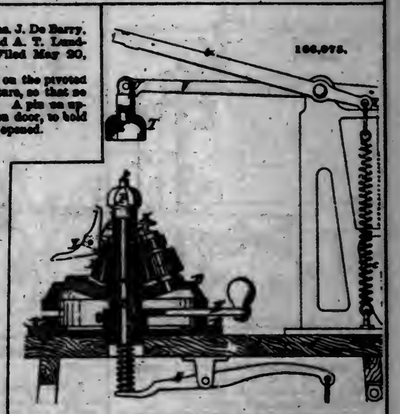


166,673. BASKETS FOR NEWSPAPERS. Jas. J. De Barry, Thorvald J. Lundqvist, and A. T. Lundqvist, Brooklyn, N. Y. [Filed May 30, 1876.]

Brief.—The basket is intended to hang under a lamp-post letter-box, for the reception of newspapers.

A mail-box composed of woven wire or ferruginous metal, having a door at the bottom, and an open inclined top, and adapted to be secured below an ordinary street letter-box, as described.

166,674.



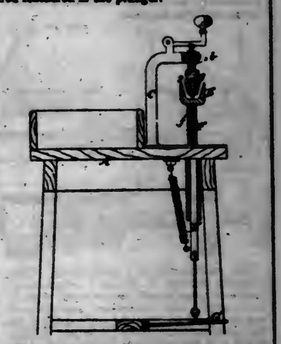
1. A letter-box in which is combined a table, I, pivoted near one end, vertical rods H, connected at their lower ends to the pivoted table, a shield-plate attached to the vertical arms, and a rod, D, connected with the shield-plate, and provided with an adjustable weight, H, all substantially as and for the purpose described.

2. In combination with the reciprocating frame, the pin and spring-fastening attached to the door of the box for securing the frame when dropped, and preventing the plate from being pushed away from the mail-opening, substantially as described.

166,675. MACHINES FOR MAKING WIRE CAPS. Adrn. de Mestre, Bordeaux, France. [Filed May 7, 1875.]

Brief.—A flat wire cap is pressed over a conical former by a cup-shaped die, and the long loose end of the wire is passed alternately through the loops of the wire and over hooks which are journaled in a horizontally-revolving head, and geared to a central pinion loosely revolved on the shaft supporting the former by an arm extending through a slot in the head, the end being finally twisted with the short end of the wire over a pivoted spring-pressed hook. The journaled hooks revolving, the loops half open them are twisted, after which the former is forced upward to stretch the cap; and, with the pivoted hook, releases the cap from the machine.

166,675.



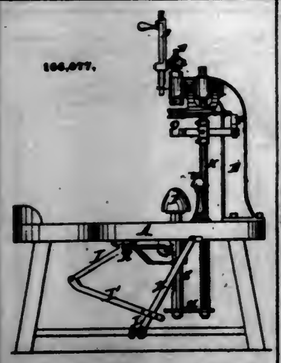
1. The combination of the revolving head D, the pinion I, journaled in and carried by the same, and provided with the hooks K, the central pinion G, arranged between the pinions of the hooks, the lever R, connected with the central pinion for partially revolving the same, and the forming-die P, arranged on the shaft G, passing through the central pinion, all substantially as described.

2. The combination of a cup, T, and head-lever b with the forming-die P and the twisting-hooks K, substantially as set forth.

3. The combination, with the revolving hooks K, their pinions I, and the central pinion G, arranged between the same, of the pivoted hook K', having a thumb piece, L, and a spring to throw it away from the hooks K, substantially as and for the purpose described.

166,676. MACHINES FOR PRESSING WIRE CAPS. Adrn. de Mestre, Bordeaux, France. [Filed May 7, 1875.]

Brief.—The wire cap, placed in a swiveled cup-shaped die and its branches adjusted in notches in the die, is pressed upward against a swiveled conical plunger, and retained between it and the die, while the loose ends of the wire are passed through the loops of the cap, which is drawn to shape over the projecting edge of the plunger. The die is then depressed, and the finished cap is forced off the plunger by a pivoted lever acting on a headed rod fastened in the plunger.



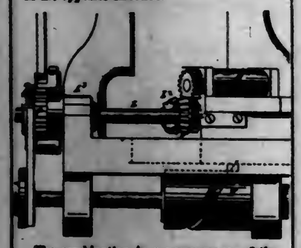
The cup-shaped die E, swiveled upon the spring-impelled bar F, and having notches *d*, for receiving the wires to form the cap, in combination with the swiveled plunger D, having a projecting edge for bringing the loops of the wire cap into the proper position, substantially as described, and for the purpose specified.

166,677. MACHINES FOR APPLYING WIRE CAPS TO BOTTLES. Adrien de Mestre, Bordeaux, France. [Filed May 7, 1875.]

Brief.—A bottle-supporting slide operated by a foot-lever; a retaining-clamp opened and shut by moving over an incline, and a die for depressing the wire caps on the cork-stoppers, so that the caps can be readily fastened. Combined with said parts is a cutter for removing ends of projecting wires, and a hand-stamp for applying lead seals to the caps, and for stamping thereon required designs, &c.

166,077.

1. The combination of the bench A, upright B, die C, rod D, sliding rod, E, jaws C, and fastener P, all constructed and operating substantially as shown and described.

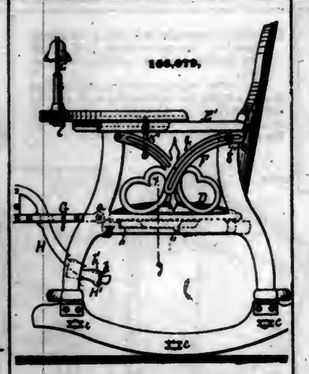


2. The combination of the treadle I, cog-wheel G, slide E, and bottle-supporting block F with the sliding rod E, die C, jaws C, and fastener P, substantially as set forth.

3. The combination of cutting-jaws m, with the rod D, die C, sliding rod E, jaws C, fastener P, and bottle-supporting block F, substantially as shown and described.

4. The combination of ρ tool for impressing designs on a lead disk with the apparatus for applying wire caps to bottles, substantially as set forth.

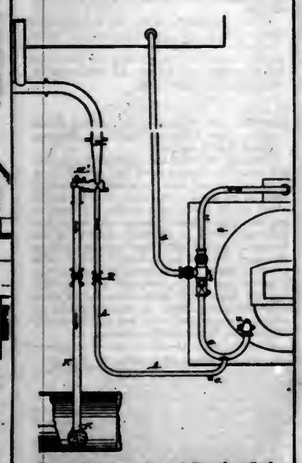
166,078. FERRULE DEVICES FOR PUNCHING-MACHINES. Ferdinand Deming, Waterbury, Conn. [Filed Apr. 20, 1875.]



Brief.—During the reciprocation of the carriage the shoe is raised and held up by a cam, so that the pawl ceases to operate the feed-rollers; but at the extremes of the movement the shoe is permitted to fall, and allow the pawl to engage with the ratchet on the shaft of the feed-roller, the shoe being again raised the moment the carriage commences to move in the opposite direction.

The combination, in a power-press, of the diagonal carriage G, having a reciprocating movement parallel with the press, the shaft L, in connection with the feeding mechanism of the said carriage, the pawl and ratchet P P', for imparting a revolution to the said shaft L, the shoe R, and the cam S, for interrupting the action of the pawl P', move at the two extreme movements of the carriage, substantially as specified.

166,079. NURSERY-CHAIRS. J. F. Downing, Erie, Pa. [Filed Mar. 10, 1875.]

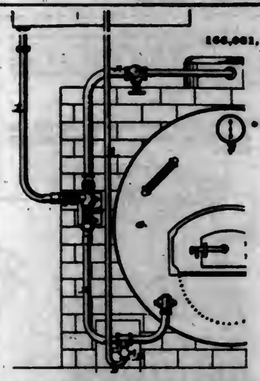


1. The leg-rest G, secured by pivot-bearings to the frame of the chair, foot-rest G' pivoted to said leg-rest, and having arms H H rigidly attached thereto, the latter being provided with ratchet-teeth h h, and adapted to slide in the stirrup-bearings H' H', in combination with a seat and swinging back, the whole being arranged to permit of the parts being adjusted and fastened in the manner and for the purpose set forth.

2. The leg-rest G secured by pivot-bearings to the frame of the chair, foot-rest G' pivoted to said leg-rest, and having arms H H rigidly attached thereto, the latter being provided with ratchet-teeth h h, and adapted to slide in the stirrup-bearings H' H', in combination with a seat and swinging back, the whole being arranged to permit of the parts being adjusted and fastened in the manner and for the purpose set forth.

166,080. APPARATUS FOR RAISING WATER. Isidore Dreyfus, New York, N. Y., assignor to Nathan & Dreyfus, same place. [Filed July 1, 1875.]

Brief.—A return-pipe from the boiler-feed is connected to an injector for raising water.



The combination, substantially as described, with a boiler-feeding apparatus, of an ejecting or forcing apparatus, and a return or diverting pipe, which communicates with the feed-delivery pipe at a point between the feeder and the boiler, and is adapted to conduct from said feed-delivery pipe an impelled column of water that becomes, in the ejecting or forcing apparatus, the ejecting or forcing agent, substantially as set forth.

166,081. FEED-WATER REGULATORS. Isidore Dreyfus, New York, N. Y., assignor to Nathan & Dreyfus, same place. [Filed July 1, 1875.]

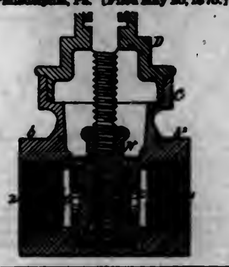
Brief.—The over-feed of the injector escapes through a return-pipe, provided with a valve, to the supply-tank.

166,081.

1. The described combination of the feed-water-forcing apparatus, the boiler, the feed-delivery pipe, and the return or diverting pipe, which communicates with the feed-delivery pipe at a point between the feeder and the boiler, and through which, when open, and to the extent to which it is open, water from the feed-delivery pipe is driven under the combined pressure of the boiler and the boiler-feeder, substantially as set forth.

2. The combination, with a constantly-working injector, of the feed-delivery pipe, the boiler, and the return-pipe, communicating with the feed-delivery pipe at a point between the boiler and the injector, said parts being constructed and arranged for joint operation, in the manner and for the purposes substantially as shown and described.

3. The combination of the boiler, the injector or other feeder, the water-tank, the delivery-pipe, and the return-pipe, provided with a regulating valve or cock, and connected at one end with the tank, and at the other end with the delivery-pipe at a point between the injector or other feeder and the boiler, substantially as set forth.



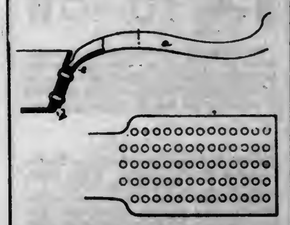
166,082. CLAMPS FOR HALTERS. Frank P. Drinkhouse, Phillipsburg, N. J. [Filed June 26, 1875.]

Brief.—The clamp is formed of two pieces, which fit about the rope, and are drawn tight by the screw, the head of which forms the eye for the snap-hook.

The combination, with a rope halter, A, of a bisected clamp, B C, ring D, and screw b, substantially as and for the purposes herein set forth.

166,083. STOP-VALVES. George W. Eddy, Waterford, N. Y., assignor to L. K. Eddy, Philadelphia, Pa. [Filed May 26, 1875.]

1. In a stop-valve the gate or gates G thereof, provided with a convex central projecting bearing, *a*, and combined for operation with the wedging sleeve-nut N, to equalize the bearing of the gates upon their seats *e*, without fixed or jointed connections, substantially as herein set forth.

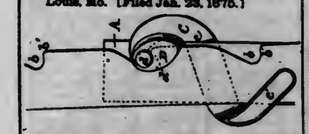


2. The gates provided with the annular grooves *g*, and combined for operation with projections *h* upon the wedging sleeve-nut N, whereby the gates are suspended and allowed to turn in either direction upon their points of suspension, substantially as herein set forth.

3. The combination, with the wedging nut or sleeve N, provided with the side projections *h h*, of the gate-grooves *g* of larger cross-section throughout their circle than the projections, whereby the gates may turn and the nut have a limited movement within any part of the circular grooves of said gates, independent thereof, for the purpose stated.

4. The circumferential annular-rim bearings of the gates, combined with the flat surfaces *i i* at the top of the wedging-sleeve N, whereby the said gates are free to turn, and the nut held from turning, as described.

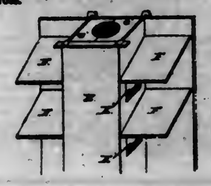
166,084. STOVE-COVER LIFTERS. James Edgar and Alfred Bardell, New York, N. Y. (Filed June 30, 1875.)



Brief.—A sheet-metal lifter with a ventilated handle, arched shank, and re-enforced tip.

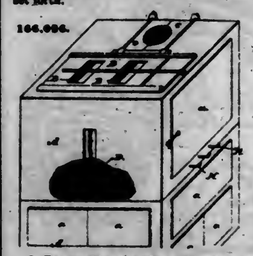
1. A sheet-metal handle, constructed with the imperforate shank *a* and perforated head *b*, substantially as herein shown and described.

2. In combination with a sheet-metal handle, constructed with a perforated head, *b*, imperforate shank *a*, and the lip *c* of the re-enforcing-plate *d*, substantially as and for the purpose described.



166,085. BALE-TIES. Henderson Estes, St. Louis, Mo. [Filed Jan. 23, 1875.]

The combination of the band and A with the serpentine tie or lock piece C, provided with finger *c'* and head D, the latter having recess *d'* and projection or shoulder *d²*, and secured by rivet or stud *d*, all substantially as set forth.



166,086. PORTABLE FRUIT-DRIERS. James W. Faulkner, Auburn, Cal. (Filed Apr. 13, 1875.)

Brief.—The door in the rear of the case and the cut-away valves are opened to admit the stove-pipe when the case is placed over the stove. Both the trays and the cases are reversible.

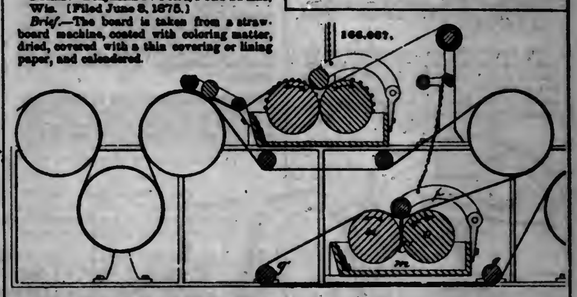
1. The combination of the drying-chamber A, having in its rear the chamber E, with door *e*, and in its lower part the valves H, with the adjustable and removable jacket A', adapted for any ordinary domestic heater or cooking-stove, substantially as and for the purpose set forth.

166,086.

2. The combination of case A', constructed as described, with chamber A, having ventilating-openings B and valve B', doors *e*, and removable and reversible drying-shelves, substantially as described.

3. The combination of chamber E, with its doors *e e'* and apertures E', with the chamber A' and case A, substantially in the manner set forth.

4. The wire-gauze shelf or slide G, with its front rail or lip *g*, adapted to and combined with the drying apartment or case, substantially as and for the purposes set forth.



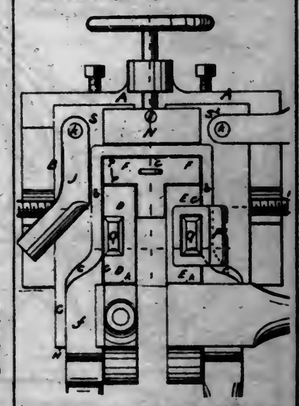
5. The chamber A, having drying-shelves or case G, and vertical chambers E *e e'*, and valves H and wire-gauze or perforated diaphragm D, combined with the folding and adjustable jacket A, substantially as and for the purposes described.

6. The combination of the drying-chamber A, having openings B and valves B', the shelves or trays G *g*, valves or registers H, and suitable doors *a*, and chamber E E', with its doors and registers, substantially in the manner and for the purposes set forth.

166,087. MANUFACTURE OF LINED STRAW-BOARD. Benjamin F. Field, Fond du Lac, Wis. [Filed June 8, 1875.]

Brief.—The board is taken from a straw-board machine, coated with coloring matter, dried, covered with a thin covering or lining paper, and calendered.

166,087.



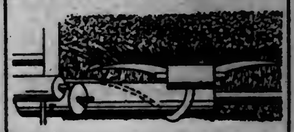
1. The mode or process of finishing straw-board, and other coarse dark paper-boards, by coating or dyeing one or both surfaces with coloring material, and afterward lining such colored surface with thin lining-paper, substantially as and for the purposes set forth.

2. As an article of manufacture, straw-board, or other dark heavy paper or board, lined with thin paper, and having a coating or wash of coloring material, or coloring and smoothing material, applied between the lining and the board, substantially as described.

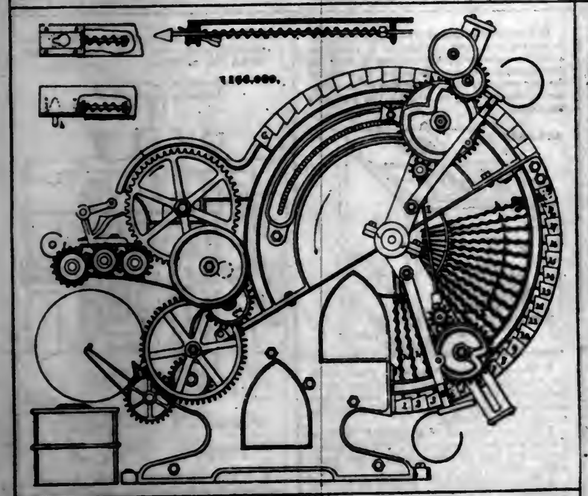
3. The combination of a straw-board machine with an apparatus for applying lining-paper, and an apparatus for coloring or sizing the surface of the board preparatory to the application of the lining-paper, substantially as described.

4. The combination of a straw-board machine, driers for partially drying the straw-board, a coloring apparatus for coloring the surface of the board, additional driers for drying in or hardening the coloring material, a lining apparatus, and, finally, other driers to dry the lining-paste, all operating in the order and for the purposes set forth.

166,088. DEVICES FOR BENDING METAL TIMBER-HANGERS. Jas. Flynn, Boston, Mass. (Filed Feb. 5, 1875.)



1. A form for making timber-hangers, substantially such as herein described, constructed with faces or walls D, E, F, G, H, and I, which are arranged relatively to each other, substantially as described, of a series of bending-levers, which are applied to and about said form for being operated substantially as described, for the purpose specified.



2. The combination, with a form made in two parts, S S', and otherwise constructed with walls and levers substantially as herein described, of the right and left adjusting screw-shaft U, arranged to enter the parts S S' of the form, and, when turned, to move them substantially as and for the purpose specified.

166,089. CARDING-MACHINES. John F. Foss, Lowell, Mass., assignor of one-half his right to John M. Pevey, same place. (Filed Oct. 24, 1874.)

Brief.—In order to maintain the under flats in position against the lower side of the main cylinder, they are each attached to a guide-rod, which is surrounded by a spiral spring, and is capable of sliding radially.

In a carding-machine, under-flats 1 2 3 in combination with guide-rods and springs *h h h*, substantially as herein specified.

No. 166,090.

166,090. MANUFACTURE OF GLUCOSE. W. Garton, Southampton, England. [Filed June 30, 1875.]

Brief.—Treats cane-sugar solutions with acid. Cane-sugar is added to the solution, whose acid is still capable of inverting the sugar.

The process of manufacturing glucose from starch and cane-sugar by heating saccharose or starchy substances with acid in the ordinary manner, and adding to the mixture cane or beet sugar before neutralizing the acid, substantially as described.

166,091. BUTTON. Charles H. Goodwin, Waterbury, Conn., assignor to the Waterbury Button Company, same place. [Filed May 31, 1875.]

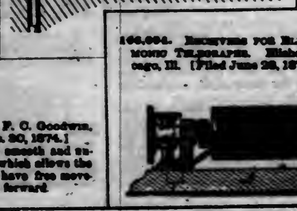
The herein-described improvement in the manufacture of buttons, consisting of the button-eye formed from wire, bent to bring the two ends into a plane, substantially at right angles to the plane of the eye proper, and substantially as set forth.

No. 166,091.

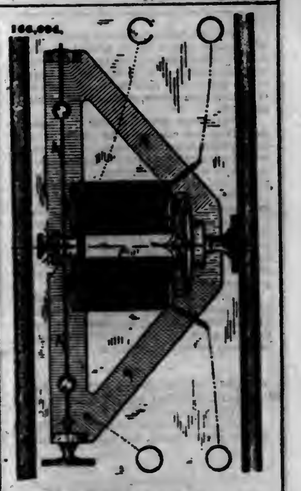
No. 166,092.

166,092. SHIRT-BOSOM. F. C. Goodwin, Boston, Mass. [Filed Dec. 30, 1874.]

Brief.—The bosom is kept smooth and crumpled by the folded gore, which allows the lower end of the bosom to have free movement when the wearer bends forward.



1. A shirt-bosom connected at its lower end to the shirt by a flexible or bellows-like gore, substantially as described, and for the purpose specified.

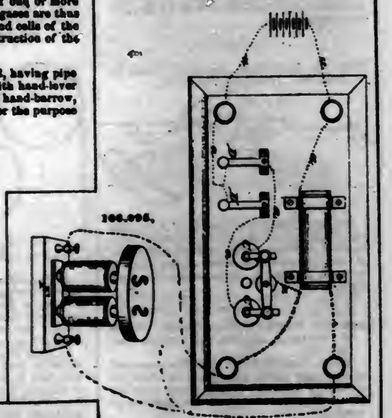


2. In combination with a shirt and shirt-bosom the gore B, having the folded sides C and bottom D, formed substantially as described, and for the purpose set forth.

166,093. ANT-DESTROYING APPARATUS. Wm. Grafton, Clinton, Tex. [Filed Mar. 20, 1875.]

Brief.—A closed retort is used for the combustion of materials for generating poisonous gases. A pipe is inserted into the ant-hill, so as to connect with the main chamber, and coupled to the neck of the retort. Combustion is maintained by means of one or more air-pumps, and the generated gases are thus forced through the chambers and cells of the ant-hills, resulting in the destruction of the insects.

The combination of furnace B, having pipe C and air-pumps D, provided with hand-lever E and pipe I, all arranged on hand-barrow, with the earth-tube H, as and for the purpose specified.



No. 166,093.

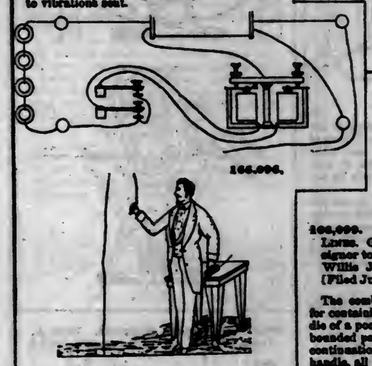
No. 166,094.

The combination, substantially as herein-before set forth, of the vibrating receiving-spring, the elbow-lever circuit-interrupter, and mechanism, substantially such as described, for adjusting the rate of vibration of said lever.

166,095. ELECTRIC TELEGRAPHS FOR TRANSMITTING MUSICAL TONES. Elisha Gray, Chicago, Ill. [Filed Jan. 19, 1875.]

Brief.—Depends primarily on fact that the core of a magnet expands and contracts, causing vibrations as it is made and unmade. Currents corresponding in number to the vibrations necessary to produce any particular note are transmitted, causing corresponding vibrations in core of magnet, which are transferred to a sounding-box placed in the magnet.

No. 166,095.



The combination of a telegraphic circuit, a series of circuit-breakers capable of producing musical tones of different pitch, a series of keys for simultaneously or successively throwing said circuit-breakers into or out of operation, and an electro-magnet receiver, which is thrown into operation by the transmitters, whereby tones of different pitch may be reproduced at the receiving end of the line by the employment of a single circuit.

166,096. RECEIVERS FOR ELECTRO-HARMONIC TELEGRAPHS. Elisha Gray, Chicago, Ill. [Filed June 28, 1875.]

No. 166,096.

166,096. ELECTRIC TELEGRAPHS FOR TRANSMITTING MUSICAL TONES. Elisha Gray, Chicago, Ill., assignor of one-half his right to Saml. S. White, Philadelphia, Pa. [Filed Jan. 19, 1875.]

Brief.—Uses induced current. By any suitable circuit-breakers, pulsations are sent upon the line, corresponding in number to the vibrations necessary to produce any given note or sound. At receiving-station operator is placed in circuit, and in electrical connection with a vibrating resonant-plate, also in the circuit. The transmission, then, of these vibrations through the living tissue to the resonant substance causes an audible note, corresponding to vibrations sent.

No. 166,096.

1. The herein-before-described art of transmitting musical impressions or sounds telegraphically, by producing musical impressions or sounds at the transmitting end of a telegraphic circuit by causing interruptions in the electric current of uniform frequency to produce musical tones, transmitting said tones through an electric circuit composed in part of animal tissue, and reproducing them at the receiving end of the line by means of a resonant body, which is also a conductor of electricity, substantially as set forth.

2. The electro-harmonic telegraph apparatus, herein before set forth, consisting of the combination of a telegraph-circuit, composed in part of animal tissue, a circuit-breaker capable of producing a musical tone, and a resonant conductor of electricity capable of reproducing that tone at the receiving end of the circuit.

3. The combination, substantially as herein-before set forth, of a telegraphic circuit composed in part of animal tissue, a resonant receiver, which is also a conductor of electricity, a series of circuit-breakers capable of producing musical tones of different pitch, and a corresponding series of keys for throwing the circuit-breakers into or out of operation, whereby several tones simultaneously may be transmitted through a single wire

---

166,097. BUTTONS FOR WEARING APPAREL. Henry C. Grigas, Waterbury, Conn. [Filed May 4, 1875.]

Brief.—The back or filling is paper-board covered with fabric, so as to dispense with japanning, or the use of an extra metal disk.

No. 166,097.

As an article of manufacture, the herein-described button, consisting of the metal front A and the fabric-surfaced paper back, substantially as set forth.

166,098. DISH-WASHING MACHINES. H. H. Hall, Tioga, Pa. [Filed Nov 21, 1874.]

The combination, with the dasher-wheel B, of the removable rack D, having pins *p* arranged in an inclined position, and in a vertical plane oblique to its longer axis, substantially as and for the purpose set forth.

No. 166,098.

No. 166,099.

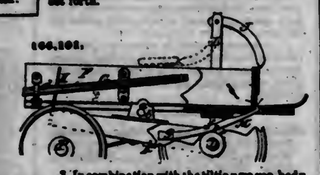
166,099. COMBINED KNIVES AND TAPE-LINES. Glover S. Hastings, Unionville, assignor to himself, Frank S. Johnson, and Willis J. Hemingway, Plainville, Conn. [Filed June 8, 1875.]

The combination described, of a chamber for containing a tape-measure, with the handle of a pocket-knife, the said chamber being bounded partly by the ring *a*, and partly by continuations *b* of the said cheek-pieces of the handle, all substantially as set forth.

166,100. CIGAR-BOXES. Saml. Heineman, Baltimore, Md. [Filed June 17, 1875.]

Brief.—The stamping-surface is of wood, and is held in an indentition in the tin box by side strips of tin.

No. 166,100.



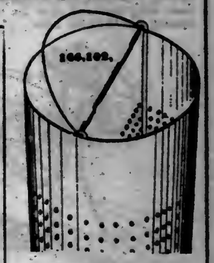
A sheet-metal cigar-box having a cavity or recess stamped in one of its walls for receiving a branding material, and metallic strips secured at the edges of the said recess for overlapping the branding-surface and confining in place, substantially as described.

166,101. DUMPING-WAGONS. W. H. Henkel, Morton, Ind. [Filed May 4, 1875.]

Brief.—Owing to the peculiar running-gear, the wagon may dump between the hind wheels.

1. The combination of the end gate I, curved arms J, pivot-rod K, and standards L, and the wagon-body, substantially as described.

2. A tilting wagon-box having an apron or chute, H, with an upwardly-turned flange, O, as an extension of the wagon bottom, substantially as herein described, for the purpose set forth.

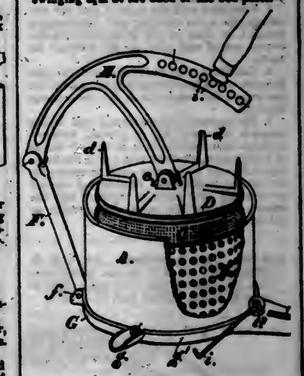


No. 166,101.

3. In combination with the tilting wagon-body and trunk-frame, the check relieving spring Q and chain R, substantially as herein described.

4. The tail-board L hinged to be turned over frontward upon the wagon-body to form a seat for the driver when the wagon is empty, as described.

166,102. BOILING-POTS. Wm. H. Heineman and W. F. Shaw, Jr., Baltimore, Md. [Filed June 24, 1875.]



Brief.—The hinged cover closes one side while the other is being emptied.

No. 166,102.

A boiling-pot provided with a sectional cover hinged to the top of a vertical partition, as and for the purpose specified.

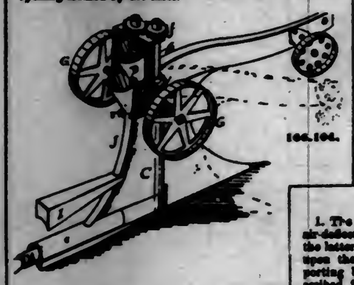
166,103. FRUIT-PEELERS. Isaac W. Heysinger, Philadelphia, Pa., assignor of one-half his right to Stewart & Matthews, same place. [Filed June 30, 1875.]

Brief.—Two concentric perforated cylinders rest within an imperforated one, with a space between, all lying in a spanned pan or bed-plate. The prosser within the innermost cylinder has centrally pivoted to its top an arm, rigidly attached to and descending from a lever carving to the front, and pivoted to a swinging arm at the back of the bed-plate.

No. 166,103.

1. The combination of the bed-plate G, having the vertical rim *f* flared out gradually from its bottom to its top on its inner side, and the removable cylinder A, so that cylinder A, when forced within it, will be held there without other fastening, substantially as and for the purpose described.

2. The curved lever E, having the right-angle arms, and connected at its outer end with the inner plate G by means of the link F, and having the traveling or shifting joint with lever F at *e*, substantially as and for the purpose described.



3. The plunger D, having the vertical finger *d*, and jointed to the arm *a* of *c*, and adapted to perpendicular motion, with a perforated pulp-cylinder in combination therewith, substantially as and for the purpose set forth.

4. The combination of the removable cylinder C, having the inner ledge *c*, the fixed cylinder B, cylinder A, and bed-plate G, substantially as and for the purpose described.

5. The combination of the link *i*, connected by a hook and eye at *f* to the base-plate G with the rear nail perforated end of lever F, substantially as and for the purpose described.

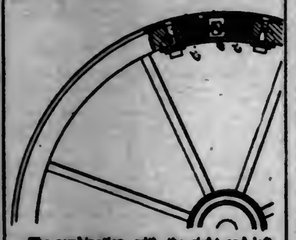
166,105. TILE MAKING AND LAYING MACHINES. Reuben Hoffheim, York, Pa. [Filed May 20, 1875.]

Brief.—A mole-plow with attached devices for folding the material, and shaping and forming a tile-drain at one operation, the cement being plastered upon the walls of the opening formed by the mole.

1. Combined with the mole C, substantially as described, a mixing and feeding device, whereby concrete or cement may be mixed, fed, and discharged into the trench at the rear of the mole.

2. Combined with the mole C the hopper D and screw E, driven by gearing *e f g* A, substantially by the rotation of the wheels G.

3. The mole C and the device for mixing, feeding, and discharging the cement or concrete, the hollow cast piece or former, either cylindrical or horseshoe shaped, combined with a core, for the purposes set forth.



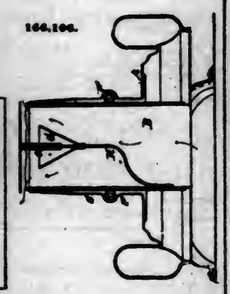
4. Combined with the discharge or end piece and its former or core the loosely-attached drag A, slightly larger than said core, for the purposes set forth.

5. Combined with the mole C and the discharge-pipe *c*, the covering and compressing weight *f*, to shape in the earth over the discharge end of said pipe, for the purposes set forth.

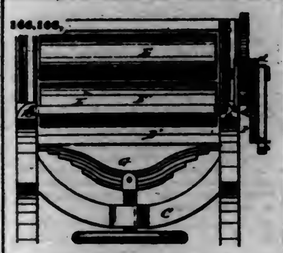
6. Combined with the mole C and the pipe through which the cement is to be passed into the trench, the water-pipe J, for the purposes set forth.

7. The process of constructing and laying concrete or cement tile in ground, substantially as described—that is to say, by means of a mole-plow, provided with a tube discharging at the rear of the mole—and an apparatus for mixing, feeding, and discharging cement or concrete over cores or formers into the trench made by said mole, substantially as set forth.

166,106. TIME-TELEPHONES. Henry A. B. Horton and Amos P. Hayes, McKinney, Tex., assignees of one-half their right to John H. Owen. [Filed Apr. 17, 1875.]



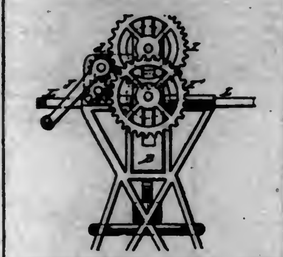
The combination, with the right and left screw D, of a fire, having tongue J and notch I, the mole C, rigidly attached to the ends of the fire, and the follies, having wedge-shaped ends provided with metallic thimbles, which fit into corresponding recesses in the mole, as shown and described.



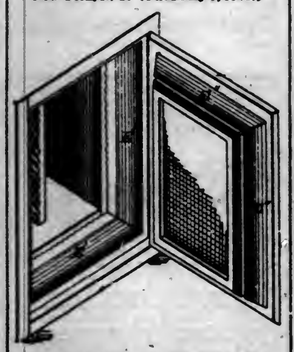
166,107. STOVE-LAMPS. R. H. Heath, Brunswick, Germany. [Filed July 9, 1875.]

Brief.—The flame and air deflectors *a c* each relatively adjustable.

166,108.



166,109.



1. The combination, in a stove-lamp, of the air-deflector G, and flame-deflector I, both of the latter being adjustable toward each other upon the bracket, with the bracket H supporting both deflectors, substantially as described, for the object specified.

2. In combination with the tube B, and the encircling tube E carrying the wick-raising wheels F F, the fixed bracket H, and the air and the flame-deflectors, which are adjustable toward and from each other, and supported by the bracket, substantially as described.

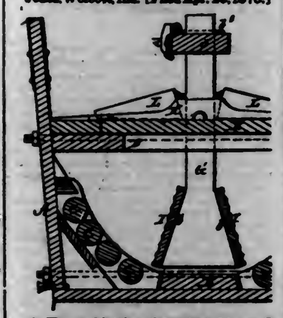
166,110.

166,107. FIRE-PROOF SAFES. Theo. Hyatt, New York, N. Y. [Filed July 3, 1875.]

1. A fire-proof safe in which the hollow walls contain a filling of glass, the molecular structure of which has been changed so as to render it tough and a non-conductor of heat, substantially as and for the purpose specified.

2. In combination with a filling of toughened glass for the walls of a safe, asbestos, or other heat non-conducting minerals or earths, substantially as and for the purpose shown.

3. In combination with a filling of toughened glass for the walls of a safe, heat non-conducting earths or minerals and chemical salts containing water of crystallization, substantially as and for the purpose set forth.



4. A fire-proof safe in which the book-case, partitions, and shelves are constructed of or from toughened glass, substantially as and for the purpose shown and described.

5. A fire-proof safe in which the jambs of the door-frame and door and inner face of same are composed wholly or in part of toughened glass, substantially as and for the purpose specified.

166,108. MANGLES. James Johnson, New York, N. Y., assignor to Metropolitan Washing-Machine Company, Middlefield, Conn. [Filed July 1, 1875.]

A clothes-mangle, consisting of rollers E F, standards A B, with their horizontal grooves *h h*, and vertical grooves *a a*, tables I, bars O D D', springs G, pinions *f f*, and cog-wheels I F, all constructed and arranged to operate as set forth.

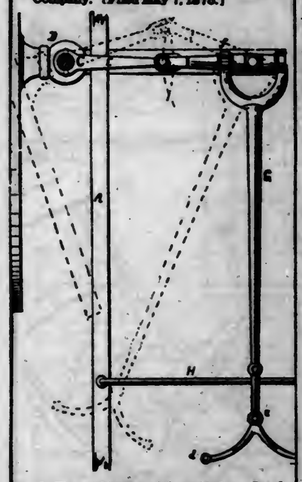
166,109. WASHING-MACHINES. Evan A. Jones, Wolcott, Ind. [Filed Apr. 26, 1875.]

1. The combination of the pivoted levers G G, carrying the wash-boards I I, the cross-bar J, pins *b b*, and bottom *d d*, substantially as and for the purposes herein set forth.

2. The combination of the box A, frame D, having slots *a* and cleats H, the levers G pivoted above said slots and passing through them, and the slides L connected to the levers, and having their inner ends beveled and hollowed out at *n*, all substantially as and for the purposes herein set forth.

166,110. REMOVABLE REPRESENTATIONS FOR FAIRS, &c. James G. Jones, New York, N. Y. [Filed June 28, 1875.]

Brief.—Bills or wings may extend from the ice-trough. The metal bottom may be on the refrigerator or attached to the pail.



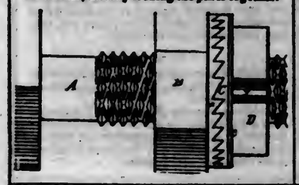
The removable open-screwed lining B, provided with the ice-chamber C, having its ends closed by attachment to said lining, and furnished with the central waste-pipe *d*, as herein shown and described.

166,111. MANUFACTURE OF DOLL-HEADS, &c. Edward S. Judge, Philadelphia, Pa. [Filed June 16, 1875.]

1. The process of treating paper with paste, and beating, wrinkling, and folding while so crushing it to render it uniformly supple and pliable for molding it into sections of doll-heads, and other like structures, substantially as set forth.

2. As a new article of manufacture, a doll-head made of sheets or layers of paper laid one upon another, manipulated and treated as herein described, connected, pressed and molded into form, in sections, such sections being united to form the completed head, substantially as described.

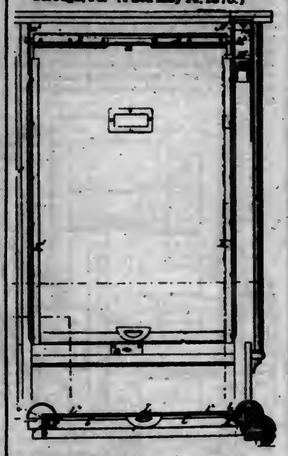
166,112. HOOK-AND-LADDER TRUCKS. Jno. A. Kloy and Van H. Higgins, Chicago, Ill., assignors to the Babcock Manufacturing Company. [Filed May 7, 1875.]



1. The combination of the guide-lever G and cross-head F with the levers E and the shafts D, substantially as specified.

2. The combination of the springs M N with the bars K L, cross-bar P, and frame A, substantially as described.

3. The pivoted steady-rods I, in combination with the bars K and cross-bar O, for holding the upper ends of the shafts D in position and allowing them to sway, substantially as set forth.



166,113. NUT-LOCKS. James M. Kent, Curtis, N. Y. [Filed June 10, 1875.]

Brief.—The washer and nut are moved, respectively, on right-and-left-head screws, with a roughened ring between, fitting over an angular projection on the inner face of the nut, to lock it thereto, and provided with an elastic packing between the ring and nut, which seats the teeth of the ring into the adjacent face of the washer, thereby locking the parts together.

The nut-lock described, having double threaded bolt A, ring C, washer *c*, and nuts B and D, the latter of which is provided with grooves *y*, for the purposes specified.

166,114. CARRIAGE-CURTAIN FIXTURES. D. R. Knight and John M. Ripple, Waynesborough, Pa. [Filed May 14, 1875.]

1. The curtain-roll A, recessed at *a*, as and for the purpose described.

2. The drive-shaft C and sleeve E, connected by a pin, D, in combination with curtain-roll A, having one end in open bearing, and the other receiving finally said drive-shaft, as and for the purposes specified.

3. A carriage-curtain having thin bars I, with end hooks *i*, that slide in grooved plates K, as and for the purposes described.

4. The combination of end bent plate N, having notches *n n*, and the straight plate N', having projections *n' n'*, with short post J, as and for the purposes set forth.

5. The combination of wheel, having spoke *f*, to one side of rim, the cone H, having hole *h'*, and the pin *h*, as and for the purpose specified.

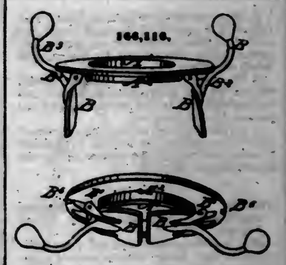
6. The combination of key G, having opposite slots *o o*, the shaft C, and the pin P, as and for the purposes described.

7. A curtain stretched longitudinally between a spring-held roll at top, and a spring-catch, Q, at bottom, and laterally between guides K K', as and for the purposes set forth.

8. The combination with curtain of the bottom stripe R R, arranged substantially as and for the purposes specified.

166,115. CURTAIN-CORD FASTENERS. Lewis Knudson, San Francisco, Cal. [Filed Oct. 12, 1874.]

Brief.—The pulley-block slides in a grooved holding-plate, and is provided with a set-screw, that fixes said block in any desired position.

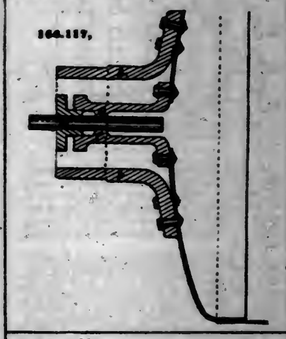


The block D, provided with the cord-pulley F at its upper end, and clamping-screw G at its lower end, in combination with the holder A, having grooves B B, whereby the block can be adjusted in any desired position, and at the same time all action of the pulley-cord on the clamping-screw is prevented, substantially as described, and for the purposes set forth.

166,116. SEWER-TRAPS. Christphr. Lewis, Columbus, Ohio. [Filed June 17, 1875.]

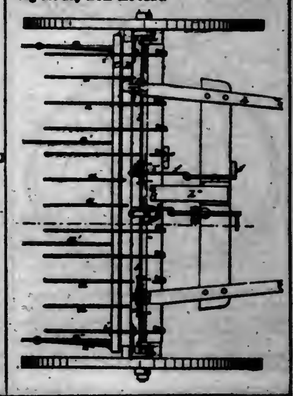
Brief.—When sufficient weight has accumulated, the double-weighted doors fly back, allowing a discharge; then the doors return to place.

166,116.



In a sewer-trap, the frame A, provided with a suitable opening, A', and downwardly-projecting flange A' *c* of the hinged flaps or doors B, having attached thereto weighted balls B', all constructed and operating as shown and described.

166,117. ROTARY BLEACHING-BOILERS. H. Loring, Boston, Mass. [Filed Oct. 7, 1875.]

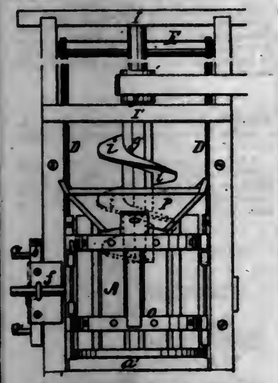


A hollow cylindrical gudgeon, with flanges, attached to the head of a rotary bleaching-boiler so as to surround the induction-pipe and be separated therefrom, substantially as described.

166,117.

166,118. HORSE HAY-RAKES. Charles M. Loftin and Charles G. Allen, Barre, Mass. [Filed Jan. 29, 1875.]

Brief.—The stripper-bar slides freely upon the end teeth of the rake, and acts as a support to the teeth, as well as an aid in discharging the hay from the rake.

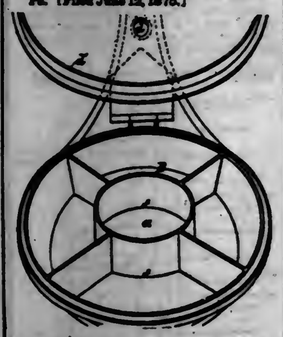


1. The combination of the lever *f*, rod *f'* with the rod *h*, and pawl *k* with its lugs 1 and 2, and ratchet *n*, when constructed and arranged to operate in the manner and for the purpose herein described.

3. The stripper-bar C, in combination with the end teeth *a a*, stripper-rods *a''*, and connecting-rods *a'''*, in the manner and for the purpose herein described.

3. The combination of the stripper-rods *a''* with the connecting-rod *a'''* and stripper-bar C, and cross-bar B, in the manner and for the purpose herein set forth.

166,119. COTTON-PRESSES. Robt. Mackey and Matthew Green, Nevada, Mo. [Filed Feb. 20, 1875.]

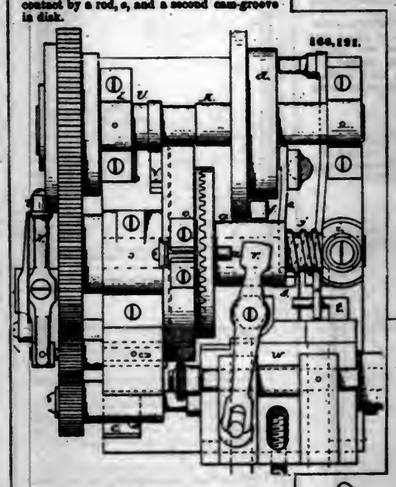


Brief.—Horse-power shaft and press vertical in the same frame; belting rotating a central press-shaft, with a screw-blade thereon, while the box is gradually raised by ropes and a drum.

1. In a cotton-press, the cylindrical press-box A, vertically movable in guides, by means of ropes D, roller E, and winding-drum F, in combination with the friction-shoe *d*, set-screw G, and wheel *h*, on the end of winding-drum F, substantially as and for the purpose set forth.

2. In a cotton-press, the press-box A, vertically movable in guides, as set forth; friction-shoe *d*, set-screw G, and wheel *h* on the end of winding-drum F, in combination with the shaft H, having flange *i*, pulleys *k j*, endless belt J, shaft K, and lever M, substantially as and for the purpose set forth.

166,120. FRYING-PANS. Asa Mills, Derby, Pa. [Filed June 12, 1875.]



1. As a new article of manufacture, a frying-pan divided into compartments, and having a grease-fountain communicating laterally with said compartments, substantially as set forth.

2. In combination with a frying-pan, A, a grease-well or fountain, *a*, substantially as shown and described.

166,121. MACHINES FOR THREADING WOOD-SCREWS. Benjamin A. Mason, New York, N. Y. [Filed July 12, 1875.]

Brief.—The vertically-revolving blank-carrier has notches in its periphery, into which the blanks are fed from a spout, and these blanks are successively caught and rotated by a revolving driver in front of the milling-cutters. The cutter-carriage *w* rests on—and by means of screw *o* is adjustable to—a second carriage, *m*, that is reciprocated by a cam-groove in disk *d*, through rod *l*; and this carriage *m* rests on a third carriage, that has a movement perpendicular to that of carriage *m* by a revolving screw-shaft underneath, with which a half-nut is intermittingly brought in contact by a rod, *o*, and a second cam-groove in disk.

166,121.

1. The cam on the face of the wheel I, in combination with the rotating sliding turn-screw and lever, substantially as described, and for the purpose set forth.

2. The cylindrical blank holder and carrier, with clutch-teeth on its face, ratchet-teeth on its rear, and the hollow journal, substantially as described, and for the purpose set forth.

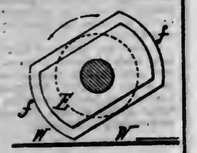
3. The combination of the sliding clutch-disk *g* and the roller *f*, by which it is operated, the shaft and bearings upon which it moves, and the feather *a* upon the exterior of the barrel for operating the lever *r*, substantially as described, and for the purpose set forth.

4. The cam U on the shaft E, in combination with the vibrating lever V, mounted on stud-pin F, substantially as described, and for the purpose set forth.

5. The cam-disk *d*, having the wedge *c*, and the cam-grooves *b* and *a*, substantially as described, and for the purpose set forth.

6. The sliding bar I and the sliding bar *o* and their connection, in combination with the cam-disk *d*, the half-nut slide, and tool-carriage, substantially as described, and for the purpose set forth.

7. The automatic sliding-tool-carriage, operating as herein described, in combination with the rotating milling-tools and the blank holder or carrier, substantially as described, and for the purpose set forth.

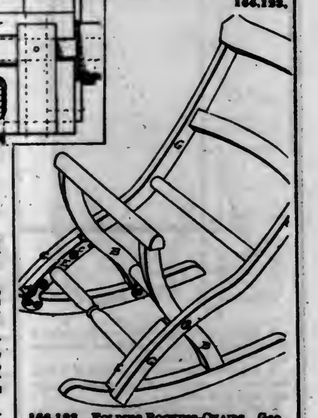


8. The combination of the cam-groove disk *d*, tool-carriage *m*, bar *l*, and adjusting-screw *n*, as and for the purpose set forth.

9. The combination of the intermittingly-rotating screw-blank carrier and holder, the rotating screw-driver for revolving the screw-blank, one or more revolving milling-tools for cutting the thread on the blank, and mechanism to impart to said tool or tools the proper feed movement toward the axis, and also longitudinally of the blank, the combination being and operating substantially as described.

166,122. MACHINES FOR WATER-MARKING PAPER. Mathew Mathews, Saggart, Ireland. [Filed Feb. 22, 1874.]

Brief.—The removable plates admit of applying different water-marks by the same cylinder.



The segments E on the skeleton-roll, and having rounded portions *f* on line with the marking-plates *e*, in combination with the wire-cloth W, whereby the said plates *e* are caused to move at exactly the same surface-speed as the said wire-cloth during the formation of the water-mark.

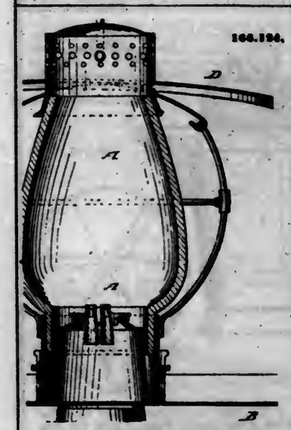
166,122.

166,123.

166,123. FOLDING ROCKING-CHAIRS. Geo. McAleer, Worcester, Mass. [Filed May 8, 1875.]

Brief.—When the chair is unbided for use, the front legs support the rear legs in proper position, and relieve the pivots of strain. The lever side extensions of the back panel are pivoted to the front and rear legs, and strengthen the structure at the points where the front legs abut the rear legs and rockers.

1. The combination, with the rocker and pivoted folding rear leg B, of the front leg E, between the rocker and rear leg, and abutting at its ends against the same, substantially as specified.



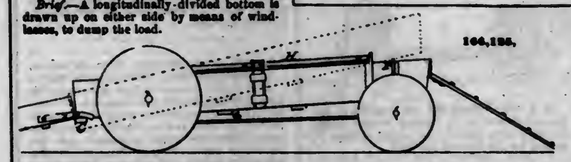
2. The combination, with the folding front and rear legs and rockers, of the back-panel extensions G, pivoted to both front and rear legs, substantially as specified.

166,124. LANTERNS FOR TRAPPING INSECTS. Benj. F. McQueen, Monroe, Ala. [Filed June 9, 1875.]

Brief.—A common glass lantern is provided with a large basin for containing liquid below the burner, and above the burner is a horizontal circular reflector, allowing light to radiate in all directions horizontally.

HELIOTYPE RELIEF PROCESS. JAMES R. OSGOOD & CO. BOSTON

166,124.

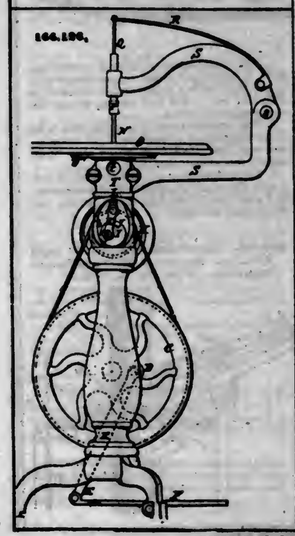


In combination with the lantern A and pan B, the reflector D, placed at the top of the lantern, as and for the purposes herein set forth.

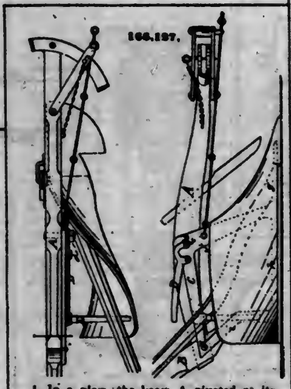
166,125. DUMPING-WAGONS. M. C. Meigs and Henry L. Meigs, Romney, Ind. [Filed June 7, 1875.]

Brief.—A longitudinally-divided bottom is drawn up on either side by means of windlasses, to dump the load.

166,125.



1. The combination, with a wagon-body, of a skid placed at each end, as and for the purpose described.

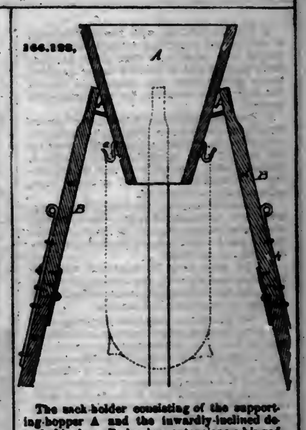


2. The bars E E, angle-notched at top, and pivoted to the front bolster, as and for the purpose set forth.

3. The combination of bottom sections F F, flexible connections I, and rolls H H, arranged as and for the purpose specified.

166,126.

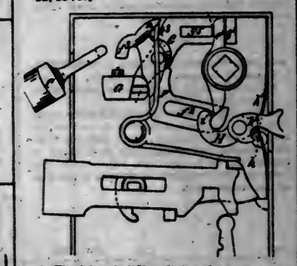
166,127.



1. In a plow, the beam A pivoted at its rear end to a frame, C, and made rigid with the handle B in combination with the adjusting-lever D, set-nut, and said frame, substantially as shown and described.

2. The cross-frame E, composed of two vertical and two or more horizontal bars, and having a socket to receive the handle B', substantially as specified.

3. In a plow, the combination of the frame E, constructed as described, the removable handle B', and mold-board, substantially as specified.

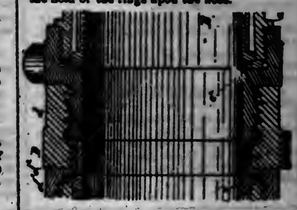


166,128. SACK-HOLDERS. John L. Millhiser, Marshalltown, Iowa, assignor of two-thirds his right to Joel S. Edwards and Randolph F. Marshall, same place. [Filed Aug. 17, 1875.]

166,128.

The sack-holder consisting of the supporting-hopper A and the inwardly-inclined detachable legs B, having extensions *s* hinged to fold inward, and stiffening-belts *h*, substantially as specified.

166,129. REVERSIBLE LATCHES. John Moore, Brooklyn, E. D., N. Y. [Filed July 12, 1875.]



1. The jointed sliding link or horseshoe, in combination with the tail-piece of a detachable latch and the horns of a knob-shaft hub, substantially as shown and described.

2. The combination of the pivoted joint F of the horseshoe with the lever H, projecting through the shell of the lock, substantially as and for the purposes set forth.

3. The combination of the pivoted joint F, provided with the slot *f''*, and the movable guide-pin *f'*, affixed to the inner end of the lever H, with the notch *h'*, and a screw passing through the lock, for the purpose of maintaining the pin *f'* in suitable position to act as a guide for the horseshoe in its reciprocating movement, substantially as shown and described.

166,130. HOSE-COUPLINGS. A. J. Morse, Boston, Mass. [Filed Dec. 22, 1874.]

Brief.—Secures the hose to the coupling by clamping the end between outer and inner rings, by expansion of the latter or contraction of the former, the two being united together at the end next the coupling-section, and secured thereto by screw-threads, and readily removable therefrom without breaking the hold of the rings upon the hose.

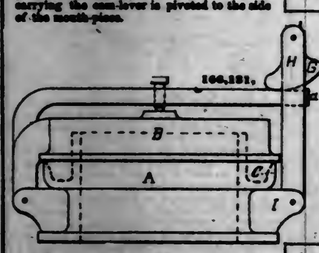
HELIOTYPE RELIEF PROCESS. JAMES R. OSGOOD & CO. BOSTON

1. The combination, with the binding-ring, of the flanged inner ring, constructed and arranged with relation to each other, substantially as described, to afford a larger space between them toward the center than toward the ends of the coupling, for the purpose described.

2. The combination, with the hose, of an externally screw-threaded binding-ring adapted to receive the running section, and a loose inner flanged ring, substantially as described, the hose being held between and by expanding or contracting the inner or outer rings, substantially as described.

3. The combination of the flanged inner ring, adapted to be expanded against the hose, with an outer or binding ring having external screw-threads, and with a removable screw-ring, substantially as set forth.

4. The loose ring D, combined with the threaded binding-ring, the removable screw-ring, and the removable screw-threaded flanged section, substantially as described.



5. The binding or hose-receiving ring, having a longitudinal space to receive the lap or seam of the hose, substantially as described.

6. The combination, with the outer and inner rings A B A B, positively secured to different pieces of hose by expansion or contraction, of coupling-sections C and F D, provided with screw-threads *c d*, and each connected, through screw-threads, with the outer or binding rings, and removable therefrom without destroying the connection of the outer and inner rings with the hose, substantially as described.

7. The combination of the screw-threaded binding-ring, adapted to contain the flange of the inner ring, and a coupling-section provided with a shoulder, *f*, to meet the outside of the flange and the end of the inner ring, with the flanged tapering and expansible inner ring, substantially as described.

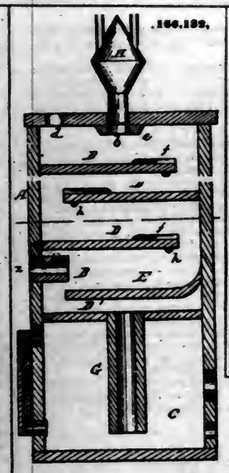
166,121. MOUTH-PIECES FOR GAS-RETORTS. Peter Mensinger, Philadelphia, Pa., assignor to Morris, Tasker & Co., same place. [Filed June 9th, 1875.]

Brief.—The knife-edge contact-piece, upon which the lid rests, is secured or cast on the side of the mouth-piece, some distance from its extended end, which acts as a guard to protect the knife-edge from injury. The bar carrying the cam-lever is pivoted to the side of the mouth-piece.

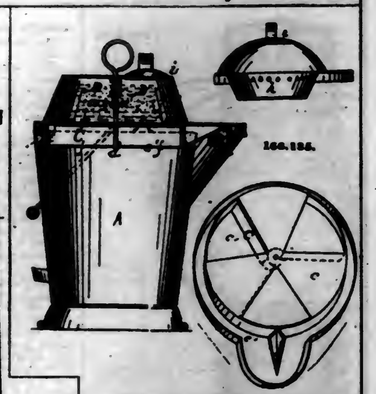
1. The combination of the retort mouthpiece A, knife-edge contact-piece G, lid D, and the guard E, as shown and described.

2. The combination of the retort mouthpiece A, lid D, eccentric G, hinged bar H, and the cross-bar J, as shown and described.

166,122. CONDENSING AND HEATING. Lane L. Stevenson, Cleveland, Ohio, and Augustus Van Cronkite, Pine Grove, Pa. [Filed Jan. 16, 1875.]



1. The flange or shoulder *e*, formed around the lower end of the exhaust-pipe *b*, for the purposes herein set forth.



2. The V-flange *f*, on top of the shelves D at their front ends, for the purposes herein set forth.

3. The steam-drag or rib *h* on the under sides of the shelves D, for the purposes herein set forth.

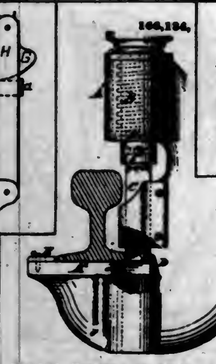
4. The combination of the condensing-chamber B, bottom plate D', condensing-pipe G, and tank C, all substantially as and for the purposes herein set forth.

5. The deflector B, arranged between the steam-inlet *a* and bottom plate D', and curved upward at its inner end, as and for the purposes herein set forth.

1. The slop-jar A, constructed with the spout *a* and double flange *b b* on the rim, forming an easy seat, and in combination with the cover B E, substantially as specified.

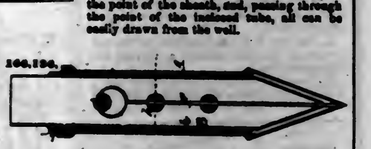
2. The top or cover B, consisting of the disinfecting-chamber D, the double open bottoms *c c'*, with the flanged valve G *e e*, operated by the spring-rod *d*, substantially as and for the purposes specified.

3. In combination with the cover B and spout *a*, the cup *g*, having a disinfectant placed therein, substantially as and for the purposes specified.



166,123. SEWING-BOTTOMS FOR CHAIRS. Timothy Noonan, Boston, Mass. [Filed Mar. 16, 1874.]

In a chair-bottom, the combination of stationary frames A C, yielding bottom board D, adjustable rods F, and spiral springs E, as and for the purposes set forth.



166,124. DISINFECTING SICK-ROOM STOP-JARS. Chas. F. Parker, Lockport, N. Y., assignor of one-half his right to A. M. Shelley, same place. [Filed June 10, 1875.]

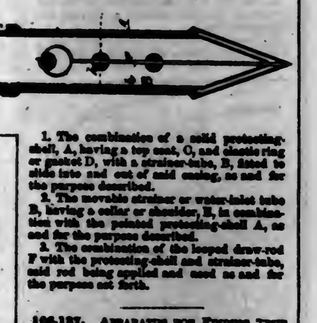
Brief.—The jar has a spout and flanged rim, for convenience of the sitter. The cover holds the earth or suitable disinfectants, the same being let into the jar by spring-valves. There is also a receptacle for chloride of lime, &c., attached to the cover and depending in the spout.

166,125. WELL-TUBING. Wm. Patterson, Constantine, Mich. [Filed May 20, 1875.]

Brief.—The strainer-tube is surrounded by a solid sheath, in which it slides. A collar on the former bears on the top of the latter in driving the well, as also does the point of the inner within the outer. A gasket upon the top of the sheath isolates the strainer-tube, and packs it by a rod attached internally to the point of the sheath, and, passing through the point of the inclosed tube, all can be easily drawn from the well.

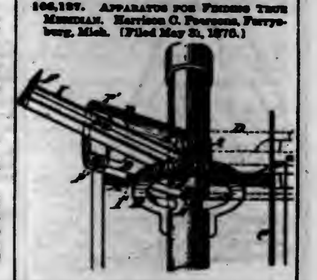
1. The combination of a solid protecting-shell, A, having a top cast, C, and elastic ring or gasket D, with a strainer-tube, B, fitted to slide into and out of said casing, as and for the purpose described.

2. The movable strainer or water-inlet tube B, having a collar or shoulder, E, in combination with the pointed protecting-shell A, as and for the purposes described.



3. The combination of the looped draw-rod F with the protecting-shell and strainer-tube, said rod being applied and used as and for the purpose set forth.

166,126. PUNCHING-MACHINES. C. Norton, Philadelphia, Pa. [Filed May 28, 1875.]



The improved portable punch for railroad-rails, consisting of the following parts in combination: The frame A with nut B', screw B, punch C, guide *a* and table A^1, substantially as hereinbefore described and set forth.

166,127. DISINFECTING SICK-ROOM STOP-JARS. Chas. F. Parker, Lockport, N. Y., assignor of one-half his right to A. M. Shelley, same place. [Filed June 10, 1875.]

Brief.—The jar has a spout and flanged rim, for convenience of the sitter. The cover holds the earth or suitable disinfectants, the same being let into the jar by spring-valves. There is also a receptacle for chloride of lime, &c., attached to the cover and depending in the spout.

166,127. APPARATUS FOR FINDING TRUE MERIDIAN. Harrison C. Pearsons, Perrysburg, Mich. [Filed May 21, 1875.]

1. The declination-plate D, arranged upon the pivot or polar axis A parallel with the optical axis of the instrument, substantially as described, and for the object herein specified.

2. The index-arm I, connected to the declination-plate D with a gimbal or universal joint, constructed substantially as herein specified, and for the purpose described.

3. The declination-plate D, graduated on both faces, constructed substantially as herein specified, and for the purpose described.

4. The combination of the pivot or polar axis A, the declination-plate D, the index-arm I, and the hour-circle H, all constructed and arranged substantially as herein specified, and for the purpose described.

166,128. BREECH-LOADING FIRE-ARMS. Jacques F. Pieri, Ghisoni, Corsica, assignor to William Smith, London, England. [Filed Apr. 30, 1875.]

1. A fire-arm with the trigger *d* at the top or upper side of the arm, attached to the breech bolt or cylinder *c*, and operating as herein specified.

2. In a breech-loading fire-arm, the trigger *d*, firing-pin *e*, and spiral spring, combined with and carried in the sliding breech bolt or cylinder *c*, and operating as herein set forth.

3. In a breech-loading fire-arm, the combination of the breech-bolt *c*, having the trigger *d* and screw b^1, the head *b*, having groove b^1 and inclined surface b^2, and the firing-pin *e*, having the shoulder *e'*, substantially as described and shown.

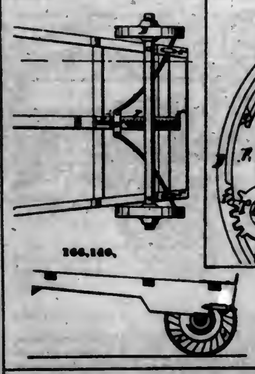
4. The safety device *f*, arranged and operating in combination with the bolt *c*, as herein set forth.

5. In a breech-loading fire-arm, the combination, with the breech-bolt *c* and head *b*, of the extractor *c*, constructed and arranged substantially as described and shown.

166,129. DENTAL PLUGGERS. A. J. Folk, Millersburg, Pa. [Filed May 15, 1875.]

Brief.—The spring which forces down the hammer is depressed by a pawl-lever, which takes over a shoulder upon the operating-stick. An opening in the case near the tool end allows of rotating the tool independent of the case.

1. The spring S, adapted to be compressed by slide I, in combination with tool-holder H and hammer-rod D, substantially as specified.



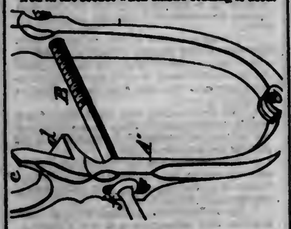
2. The lever-pawl I, in combination with slide I and actuating-spring S, substantially as specified.

3. The lever-pawl I and spring *n*, in combination with a disk, O, having eccentric segmental strip *b*, substantially as specified.

166,130. HAND-TRUCKS. Beauty L. Fleck, Le Raysville, Pa. [Filed May 17, 1875.]

Brief.—Wheels locked by pawls pressed by foot. Spring retracts them when foot is withdrawn.

A brake for warehouse-trucks and analogous vehicles, consisting of the spring-slide, head, pawls, and ratcheted wheels, as shown and described.

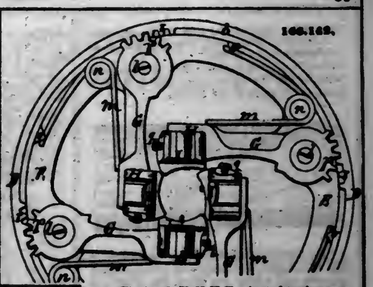


4. The locking-slide *g*, having milled annulus *f*, in combination with a latching-dog, G, and its retainer-spring *e'*, substantially as specified.

5. The cone A, having aperture *b* for operating a retaining tool-holder, B, substantially as specified.

166,131. THILL-COUPLING CLAMPS. Lyman R. Prindle, Bantam Falls, Conn. [Filed Apr. 17, 1875.]

Brief.—The clamp is used to press the thill-iron in the socket when elastic stuffing is used.

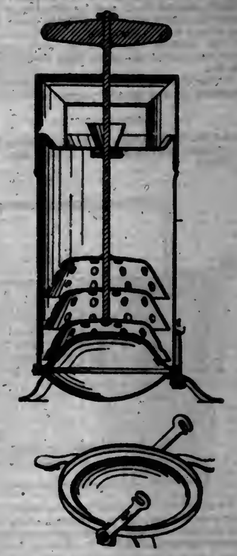


1. The combination of pivoted jaws A A', clamping-screw B, fork *c*, and cap *b*, substantially as and for the purpose set forth.

2. The clamping-jaws, provided with bracket *d*, substantially as and for the purpose set forth.

166,132. CORN-SHELLERS. Calvin D. Read and Ellis D. Read, Ayer, assignors of one-third their right to James Goodrich, Fitchburg, Mass. [Filed Apr. 7, 1875.]

Brief.—Adjustable cutting or shelling knives on pivoted bands, carried upon arms pivoted to a loose ring-plate within a ring bevel-pinion, said arms being held toward each other by springs bearing against the inner surface of the ring-pinion, so that the bands may simultaneously adjust themselves to the size of ear fed. Fixed or withdrawing rolls carried on pivoted spring-arms, one of which arms carries a small gear-wheel, for transmitting motion from a pinion on the driving-shaft to one of the rolls.



4. The heads H H H H, pivoted to the arms G G G G, and constructed with the inclined V-shaped projections *s s s s*, substantially as and for the purpose herein specified.

5. In combination with the pivoted arms G G G G, operating as described, and provided with the pivoted heads H H H H, the knives or points I I I I, attached to the said pivoted heads, constructed and arranged to operate substantially as and for the purpose herein specified.

6. The combination of the feed-roller M, mounted on one of the two swinging arms L L, and geared to the driving-wheel shaft through a cog-wheel, *s*, mounted on said arm, with the roller M, mounted on the other arm L, constructed, arranged, and operating substantially as and for the purpose herein specified.

166,133. EGG-BEATERS. Wm. Redheffer, St. Louis, assignor of two-thirds his right to W. H. Chick, St. Louis, and J. S. Chick, Kansas City, Mo. [Filed Dec. 4, 1874.]

1. An egg-beater can provided with a convex bottom, in combination with a beater composed of one or more perforated hollow frustums of cones, substantially as described, whereby the entire contents of the can may be forced through said perforations at each full downward stroke of the beater, as set forth.

2. In a rod-operating egg-beater, the combination, with the egg-beater can, of a detachable base, substantially as described.

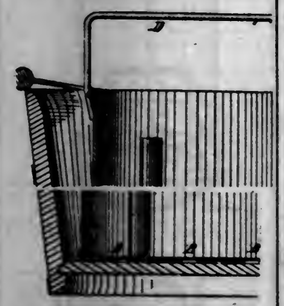
3. The egg-beater cleaner composed of a handle and a semicircular concave-convex scraper, as set forth.

166,144. MAGAZINE FOR COAL-STOVES. James P. Richardson, Washington, D. C. [Filed June 11, 1875.]

Brief.—The movable section is raised perpendicularly by its rotation, and is held in position by a notch and the pin.

The telescopic magazine for base-burning stoves, consisting of concentric tubes adapted to slide one within the other, the outer one provided with a spiral slot, one side of which is serrated or formed with teeth to engage and hold over a pin on the inner tube and lock the inner tube in any desired position, substantially as described.

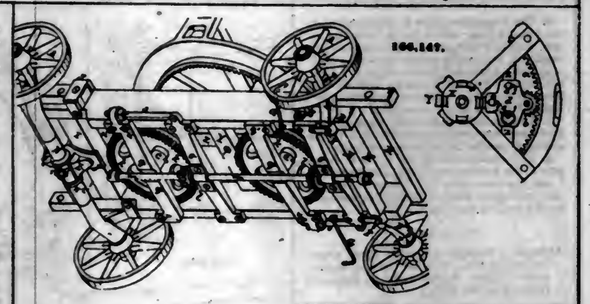
166,145. SOCKETS FOR ATTACHING ORNAMENTAL HEADS TO NAILS. Thos. C. Richards, West Winsted, Conn. [Filed Dec. 30, 1874.]



Brief.—Three lips struck from a sheet of metal, and bent outward at an acute angle, the lips *a' a'* being provided with depressions *b* to fit the nail snugly, the whole forming a socket to receive the ornamental head and the nail-head.

1. The herein-described socket for receiving the ornamental head and for attachment to the nail, struck up from a single sheet of metal, and having the lips *a' a' a'* all pointing to the common center at an acute angle from the part of the sheet from which they are cut.

2. The depressions *b* in the lips *a a'*, substantially as and for the purpose described.



166,146. VEGETABLE-WASHING. Perley P. Roberts, Morrisville, Vt. [Filed Apr. 1, 1875.]

As an article of manufacture, the vessel A, with closed sides and perforated bottom B, and having vertically placed stationary and curved stirrers C, and ball D, all as set forth.

166,147. PORTABLE HORSE-POWERS. Cyrus Roberts, Three Rivers, Mich. [Filed May 24, 1875.]

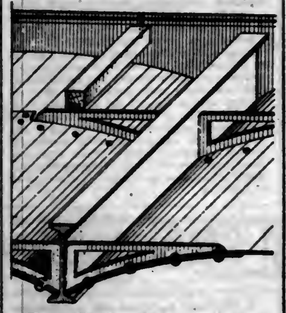
Brief.—The horse-power frame is supported on adjustable crank-axles, by means of which it can be lowered when it is intended to be used as a horse-power, and elevated for transportation. The gear-pinions are adjustable to the interior cog-gear of the main driving-sweep by an eccentric turning in brackets, by which, and by a bridge-bar at the lower side of the bed-frame, the pinion-shaft is supported.

166,147.

1. In combination with a horse-power frame, the bent or crank axles B N, made turnable in their bearings D I, to enable the frame to occupy different vertical positions while supported on the wheels, as and for the purposes set forth.

2. The combination of fore axle N, made with bent portions, and constructed to turn in a vertical plane in bearing I, said bearing turning in a horizontal plane in the fore bolster or cross-bar l, for the purpose set forth.

3. The combination of fore bolster l, bearing-block J, box I, axle N, and king-bolt K, when the king-bolt is made to form a pivot for horizontal rotary motion, and at the same time prevents the axle from turning in its bearings in box I.



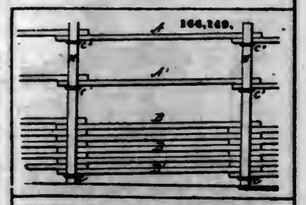
4. The combination, with the falling frames Q Q R, of the staple S, open at one side, and the slotted pin-bearing Q' T, substantially as and for the purpose set forth.

5. The combination of the pinion-shaft *s* and adjustable bracket *d* with the adjusting-eccentric *g*, locking-bolt *j*, and set-screws *e*, substantially as set forth.

6. The bridge-bar *q*, pivoted at *r*, in combination with set-screws *u u* and adjusting-screws *e*, substantially as set forth.

7. The combination of the crank-axle B with the horse-power frame and hooks G, as and for the purpose set forth.

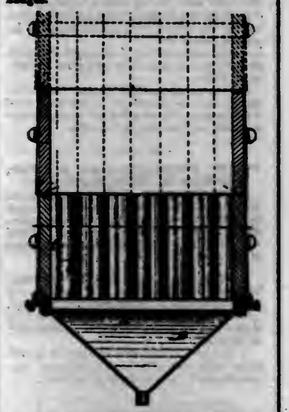
166,148. FIRE-PROOF FLOORS. L. P. Rogers, Boston, Mass. [Filed July 1, 1875.]



The combination of the **X**-shaped girders A, arched plates B, and arched brackets C, arranged and applied together substantially as described, for the purpose specified.

166,149. FARM-FENCES. Alonzo Rush and Fisher Yarbrough, Tyler, Tex. [Filed Mar. 5, 1875.]

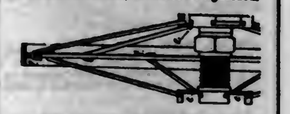
Brief.—The rails, which overlap between uprights resting on the ground, are sustained above ground by encircling wire binders, which also serve as division-rests.



The combination, with the rails A A' B B' and posts H H', of the encircling wires *c c' c'*, substantially as and for the purpose set forth.

166,149.

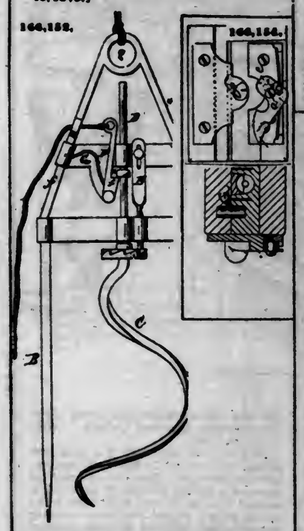
166,150. SCRAP-MOLDS. M. L. Sanderling, Jersey City, N. J. [Filed Dec. 10, 1874.]



Brief.—A mold having detachable sections, each having removable corrugated partitions and removable sides, clamped together. Joints tightened by rubber or other packing, and by flanges.

A mold divided throughout its depth by zig-zag or serpentine partitions, and constructed in sections, mounted the one upon the other with a close joint at the meeting edges of the sections, substantially as and for the purpose specified.

166,151. WHEELS FOR VEHICLES. Edward Shaw, Manchester, England. [Filed Apr. 12, 1875.]

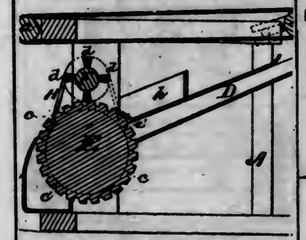


Brief.—By forcing the disks apart by means of the nut and screw, the wheel is tightened.

The combination of the felly, the disks *c c* on the hubs and spokes, connecting said disks and felly with nut and screw, substantially as described, for spreading said disks.

166,152. SPIRAL HAY-FORKS. Amos Shellenberger, Versailles, Ohio, assignor of two-thirds his right to Jos. E. Lister and John W. Singer, same place. [Filed Apr. 10, 1875.]

166,152.



166,154.

In combination with the frame A and parallel tines B B and spiral tine C, the rod D, having a shoulder, X, and capable of a vertical as well as a rotary motion, substantially as and for the purposes herein set forth.

166,153. MACHINES FOR ASSORTING PINS. J. D. Shelton, Birmingham, Conn. [Filed June 30, 1875.]

Brief.—The pins from the machine fall upon an endless apron, which carries them to the mouth of a chute leading to a revolving wheel, into the longitudinal grooves of which the straight and very slightly bent ones are completely buried, while the crooked ones, projecting upward, are struck by a revolving brush, and swept from the face of the wheel against an inclined shelf, which deflects them to the side of the machine.

1. In a machine for separating straight from crooked pins, the longitudinally-grooved roller E, in combination with the inclined chute D and feed-apron C, substantially as specified.

2. The brush-roller F, in combination with the longitudinally-grooved cylinder E and chute D, substantially as specified.

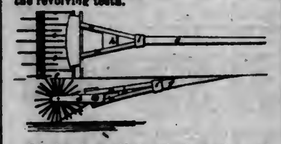
3. The shelf *h*, in combination with chute D, grooved cylinder E, and brush-roller F, substantially as specified.

4. The roller E, having beveled grooves *a*, in combination with the receptacle or box H', substantially as specified.

5. The apron C, chute D, shelf *h*, grooved roller E, brush-roller F, and receptacle, arranged, combined, and co-operating substantially as described.

166,154. CIGAR-MOLDS. S. Simonson, Bridgeport, Conn. [Filed Mar. 10, 1875.]

Brief.—The catch upon one end of the mold operates automatically to fasten them together, while it also serves as a lever to force them apart. A hinge is situated upon the opposite side to the catch.



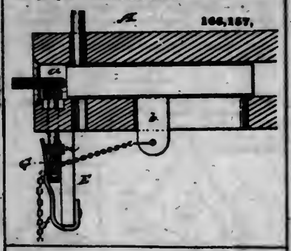
As a new article of manufacture, a cigar-mold having the two members hinged at one side or end, and fastened by the automatic-closing and mold-opening lock or latch, as set forth.

166,155. COMPOUNDS FOR FLAVORING AND PRESERVING TOBACCO. George H. Stortz, New York, N. Y. [Filed Apr. 10, 1875.]

An improved compound, for sweetening, seasoning, flavoring, and preserving tobacco, formed of powdered salt and licorice root, as set forth.

166,156. HARROWS. Leonard Study, Plum Hollow, Iowa. [Filed May 20, 1875.]

Brief.—A revolving shaft armed with radial teeth is mounted in a frame, consisting of a bar, to which a four-branched tongue is attached, and short end pieces forming bearings for the shaft. The bar has stationary teeth, which incline rearwardly and interlock with the revolving teeth.



The bar *b*, provided with the teeth *c*, and short side-pieces *a*, that form bearings for the revolving toothed bar *d*, in combination with the tongue *g*, having its end divided into four points *e' e'* attachment, *a a'* and strengthened by the block and ring, all of the said parts being constructed and arranged to form the harrow, substantially as specified.

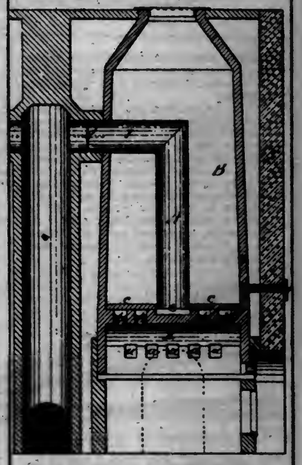
166,157. CAR-COUPLINGS. Michl Sullivan, Royalton, Wis. [Filed July 2, 1875.]

Brief.—The pivoted lever, held by a spring, raises the frame, which elevates the link.

The combination, with a draw-head, A, of the hangers E, lever G, spring *f*, and frame A *a a*, all constructed substantially as and for the purposes herein set forth.

166,157.

166,158.



166,158. MODES OF APPLYING SAMPLE-PATCHES TO COTTON-BALES. S. Sullivan, Savannah, Ga. [Filed July 14, 1875.]

Brief.—The sample-patch is secured at its corners to the bale by hooks, in such manner that the corners are held flat and secure should the bands become detached.

A device for securing sample-patches to cotton-bales, consisting of a hook or fastening-clamp adapted to hold the corners of the same, and secure them to the outer covering of the bale, substantially as described.

166,159. CALCINING-KILNS. W. J. Taylor, High Bridge, N. J. [Filed June 14, 1875.]

Brief.—Air is drawn by draft or forced by a blast through the uptake, and down through the centrally-placed downtake, and is discharged immediately above the central fire-place, so as to mingle with the flames, &c., from the latter. The ore is thus more uniformly desulphurized.

1. The combination, with an ore-roasting kiln, of an air-downtake, A, depending centrally within the kiln-chamber, whereby the heated air will be discharged and diffused therefrom at a point above the combustion-chamber, substantially as herein set forth.

2. The combination, in an ore-roasting kiln, of a centrally-located air-downtake, A, with a centrally-located fire and combustion chamber, E, beneath said downtake and separated from it, whereby the air is delivered at a point centrally upon the crown or arch of the combustion-chamber, and diffused or turned aside uniformly into the ore-chamber.

3. The combination, in an ore-roasting kiln, of a centrally-located air-downtake, A, with a centrally-located fire and combustion chamber, E, provided with lateral and top flame and gas openings *a b*, whereby the upward-issuing flames of combustion are brought into immediate contact with the inflowing currents of heated air from the downtake, to more equally distribute both the heat and the air.

4. The air downtake A, descending centrally from near the top of the kiln, and combined with the uptake C, joining the upper end of the downtake by the branch I, and extending down outside of the kiln, whereby the cold air entering at the top is caused to descend through the entire length of the central hot pipe, as and for the purpose described.

5. The combination of two kilns B B for roasting ores with an air-downtake, A, centrally located in each, supplied by a single uptake, C, built in the dividing-wall of said kilns, substantially as herein set forth.

6. The combination, in a twin kiln for roasting ores, having centrally-located air-downtakes depending in each from or near the top, of the intermediate uptake C, having greater length and double the area of the combined downtakes, as and for the purpose set forth.

7. The combination, in a twin kiln for roasting ores, of the centrally-located fire and combustion chambers E in each, the centrally-located air-downtake A therein, and the intermediate air-uptake C, having the relation to each other and co-operating to produce the results herein stated.

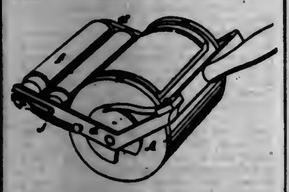
166,160. CLOTHES-PINS. George Topping, Chicago, Ill. [Filed Jan. 30, 1875.]

In a clothes-pin, the jaws A, having the recesses h, grooves i, extending outwardly to the end of the handles, and pivots d, in combination with the spring S, having loop e and legs f, arranged respectively in said recesses and grooves, as shown and described.

166,160.

166,161. SEWING-MACHINE GUIDES. John E. Trowbridge, Brooklyn, assignor to Geo. H. Wooster, New York, N. Y. [Filed Feb. 6, 1874.]

Brief.—The guide, which is tapering from the end opposite to the feed toward the same, is bent in a U form at its smaller end, for the purpose of folding the strip of cloth in the middle, and has its edges turned over in the form of an ordinary hemmer, whereby the raw edges of the material operated on may be turned under, while along the center of the device, on its inner side, projects a rib, for forming a seamen in the double edge of the folded article; the material being held against said rib by means of spring arranged along the inside of the guide.

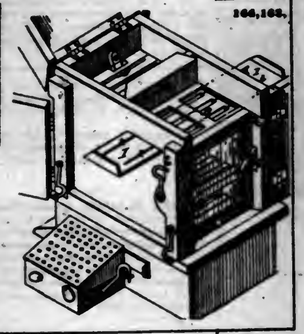


166,161.

A hand-folding guide, substantially as described, the folding-surface or channel-way of which is constructed to fold or turn in the back or doubled edge of the band in the form of a groove to receive the edge of the garment or article to which the band is designed to be applied, as specified.

166,162. MARKING-WHEELS. Francis M. Trevorthy, San Francisco, Cal. [Filed June 8, 1875.]

Brief.—The inking-rollers are both held in slot in bent frame by a spring on each bent arm.



The type-band cylinder A and side bars d, having their extremities provided with the slot i, in combination with the rollers e f, placed one above the other, radial to the center of the wheel, and the spring j, having one end secured to the side bar, while its opposite end is secured to the journal of the upper roller, substantially as and for the purpose set forth.

166,163. RUG-RIVER. William Vanauker, Westberry, Ind., assignor of one-half his right to John Frederickson. [Filed June 8, 1875.]

1. The combination of the hive, having grooves s s, the comb-frames D D, fitting into the grooves s, the mash G G, with buttons h h entering inclined grooves i i in the sides of the hive, for wedging the parts closely within the hive, substantially as and for the purpose herein set forth.

166,163.

166,164. BOBS-SPINNING. Wm. T. Voss, Newton, Mass. [Filed Mar. 24, 1875.]

Brief.—The perforated plate is separate from the head and screw-cap, and can be reversed when it becomes clogged.

166,164.

The combination of the bulb or head, A, the screw-cap C, and the reversible perforated plate B, constructed in separate pieces, adapted to operate together substantially as described.

166,165. VEHICLE-TOPS. H. W. Warner, Greenfield, Mass. [Filed July 8, 1875.]

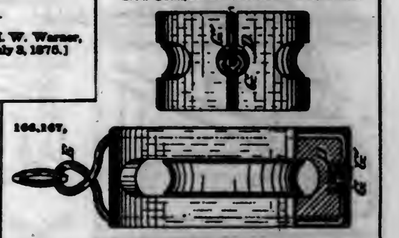
166,165.

1. The combination of a canopy-standard and a detachable bane-piece thereafter, provided with dowel-pins and holes or their equivalents, substantially as shown and described.

2. The combination of the bane-piece B, provided with the central fixed bolt and the holes, with the standard having its feet provided with the bolt holes and pins, as shown.

3. A hollow raised bane-piece, B, for a canopy-standard, adapted to take the place of the customary stuffing or cushioning under the covering, as shown and described.

166,166. METAL-SCREW MACHINES. John F. Webster, Hamilton, Canada. [Filed Apr. 10, 1875.]



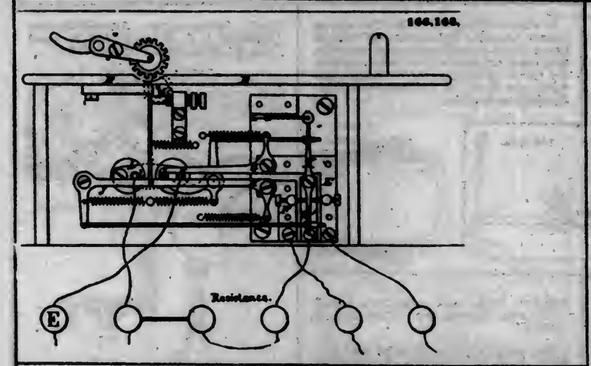
Brief.—By the movement of a hand-lever pivoted at the rear of the head-stock, and connected to the forked lever for operating the sleeve of a conical split chuck, the chuck is released from the rod, and at the same time a pair of gripers, pivoted together on a sliding bolt, are closed on the rod by a slide, provided with a V-shaped cam-groove, into which the lower extremities of the gripers project, and are carried forward, thereby feeding the requisite length of rod through the chuck. A reverse movement of the hand-lever closes the chuck, and runs back the gripers.

1. In combination with the lever H, the oscillating lever M, operating the sliding bar L, cam O, and sliding jaws P, for the purpose of feeding the blank through the hollow mandrel, substantially as herein set forth.

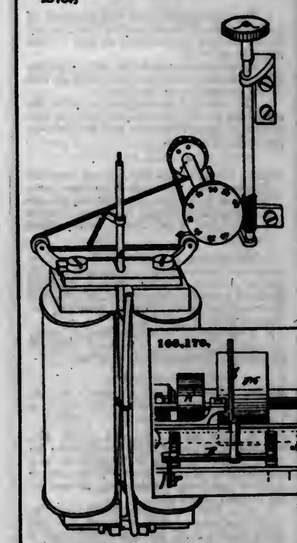
2. The combination of the hollow mandrel B, grooved sleeve and collet, and the levers F and H, connected by the rod I, cam O, and jaws P, constructed to operate substantially as herein set forth.

166,167. PULLEY-BLOCKS. John Weir, New York, N. Y. [Filed June 26, 1875.]

166,167.



In a pulley-block, the wire band C, bent at the middle to form a suspension-loop, H, and the ends interlocked at the bottom by means of the loops G G' cast in a hole, D, substantially as shown and specified.



166,168. AUTOMATIC TELEGRAPHS. Chas. Wheatstone and J. M. A. Stroh, London, England. [Filed Mar. 16, 1875.]

The means for sending a weak current into the line at the end of a dash or space, for preventing an undue elongation of short currents, consisting of the lever K, operated from the transmitting-lever, the contact-points F E, and the resistance and branch circuit, substantially as set forth.

166,168.

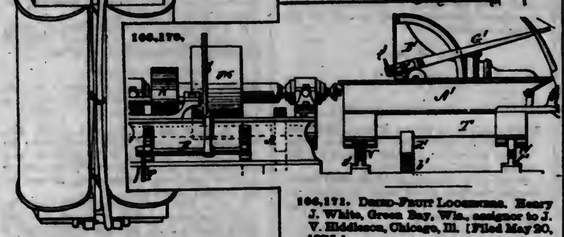
166,169. MAGNETS FOR ELECTRIC TELEGRAPHS. Chas. Wheatstone and J. M. A. Stroh, London, England. [Filed Mar. 16, 1875.]

The combination, with an armature pivoted between and acted on by two electro-magnets or coils, of a spring and means for adjusting the tension thereof, and causing it to exert its force upon either side of the pivotal bearing of the armature, substantially as set forth.

166,170. CIRCULAR-SAW MILLS. Francis N. Whitcomb, Amity, and W. R. Davis and Mary J. Rawson, Belmont, N. Y., administrators of D. Rawson, deceased. [FiledMar. 20, 1875.]

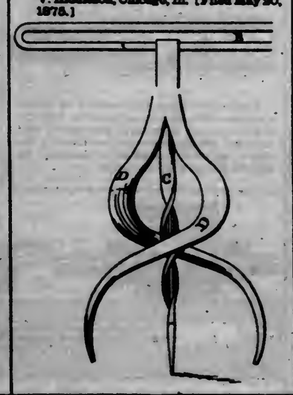
Brief.—The log-carriage is reciprocated by means of a rack and pinion, the latter being rotated in opposite directions by a system of friction-gearing.

1. In a saw-mill, the conical pulley G, adjusted upon the end of the saw-arbor B by the end screw f, as and for the purposes herein set forth.



2. The tubular box or bearing p, provided with a vertical projection, n, on its upper and lower side, and held by vertical screw-pivots o, to form the self-adjusting bearing for the inner end of the counter-shaft E, substantially as and for the purposes herein set forth.

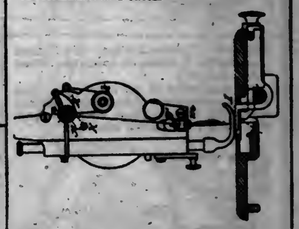
3. The combination of the counter-shaft E, eccentric bearing-box t, and the collar or sleeve v, held by the vertical pivot-screws v, substantially as and for the purposes herein set forth.



4. The combination of the eccentric bearing-box t, lever N, connecting-bar O, shaft R, with arm P and lever S, the segment s', with notch s, and the spring-hook p, all substantially as and for the purposes herein set forth.

5. In combination with the knee of a head-block for saw-mills, the stud w' and the lever G', secured near the bottom of the knee, and provided with slot w', notches G', point t, and flange v', and the curved notched ratchet w', substantially as and for the purposes herein set forth.

166,170.

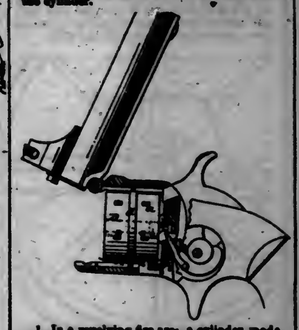


166,171. DEAD-FRONT LOCOMOTIVE. Henry J. White, Green Bay, Wis., assignor to J. V. Hiddleson, Chicago, Ill. [Filed May 20, 1875.]

A fruit-auger composed of the stock A, with a cross-piece or handle at one end, and the central guide-point C and spiral prongs D at the other, substantially as set forth.

166,172. SEWING-MACHINES. R. Whitehill, New York, N. Y. [Filed July 10, 1872.]

Brief.—The take-up is adjustably arranged upon a shaft having a pinion on its end, which gears with a rack formed upon the needle-bar, while in the forward end of such shaft is secured a projecting pin or stud, which is situated therein in a position eccentric to the axis of the shaft, and serves, in connection with the take-up, to tighten the thread after the formation of a stitch.

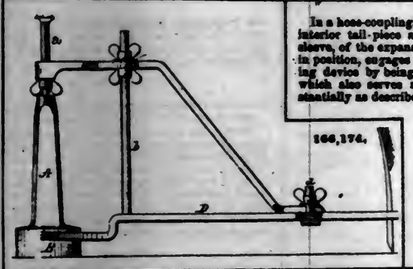


1. In combination with the oscillating take-up K, the stationary bar or pin M, arranged to occupy an eccentric position relatively with the arbor N or axis of oscillation of the take-up, whereby its inside face over which the thread is drawn will be in line with the center of the take-up, substantially as specified.

2. The oscillating take-up K, made adjustable around the arbor N, by which it is operated, substantially as described, whereby provision is made for adjusting the take-up to suit different thicknesses of fabric.

166,173. REVOLVING FIRE-ARMS. R. White, Lowell, Mass. [Filed June 26, 1875.]

Brief.—If the shoulder on the pawl should for any reason fail to engage with the shoulder on the locking-bar, to operate the latter, the pawl would thereby be thrown up, so that it could not engage with the ratchet to rotate the cylinder.



1. In a revolving fire-arm, a cylinder made wholly or in part reversible, for the insertion of cartridges in either end, as herein set forth.

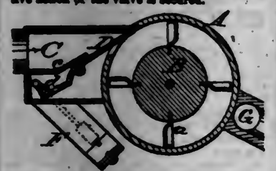
2. The combination, in a revolving fire-arm, of the ratchet-pawl n, provided with the shoulder x, and the lock-bolt lever, provided with the shoulder y, to operate as and for the purposes herein set forth.

166,174. DEVICES FOR ADJUSTING MILLSTONES AND SPINDLES. Samuel Whitehead, Reading, Pa. [Filed June 11, 1875.]

1. The combination of the spindle A, brass C, arm D, set-screw a, rod b, and bolt d, substantially as and for the purpose described.

2. The combination of the slotted brass C, set-screw a, and bifurcated arm D, substantially as set forth.

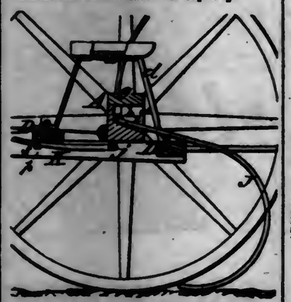
In a hose-coupling, the combination with an interior tail-piece and an exterior band or sleeve, of the expansible ring C, which, when in position, engages with the hose as a holding device by being embedded therein, and which also serves as a friction-band, substantially as described.



166,174.

166,177.

166,175. WATER-METERS. Geo. Wheaw and Richd. D. Bland, St. Louis, Mo. [Filed Jan. 9, 1875.]



Brief.—Applied to the inlet-valve, which crosses the inlet-tube obliquely, is an adjustable weight, whereby a more certain and positive action of the valve is secured.

The case A, provided with port *p* and induction-pipe C, in combination with the chest F, obliquely-arranged valve D, and lever E, having at its outer end an adjustable weight, *w*, operating substantially as and for the purpose set forth.

166,176. HORSE HAY-RAKES. Newton D. Wood and Lee Taylor, Ballston Spa, N. Y. [Filed Apr. 17, 1875.]

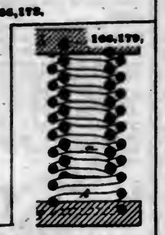
Brief.—A spring-staple on the main frame, in its normal position, holds the teeth down to their work through a notched rod pivoted beneath to the axle. When the staple is depressed by the driver's foot, the rod is released, and the axle may be tilted to raise the teeth by a hand-lever. Teeth provided with lugs, and secured by a single rod within a grooved and slotted axle covered with cap-strip.

1. The rod E, pivoted to the axle A, carrying teeth J, and notched at *p*, in combination with the sliding staple *s*, applied to thill-bar D, and acted on by a retracting-spring, *t*, substantially as described.

2. The combination of the rake-teeth J, provided with eyes, with the rod A, grooved and slotted axle A, and cap *p*, substantially as described, and for the purpose set forth.

166,177. HORSE-COUPLINGS. Abraham Wurt, Providence, R. I. [Filed Nov. 21, 1874.]

Brief.—Employs a ring of spring-able metal, with an interior tail-piece and outer ring. Expanding the ring embeds it in the fibers of the hose, and constitutes it a holding device as well as a lining, to prevent abrasion of the hose.



166,178. RAILROAD-CAR SPRINGS. John H. Wootten, Reading, Pa. [Filed Jan. 20, 1874.]

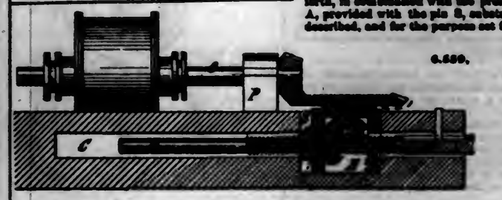
In a car-spring, an outer spiral spring, A, firmly attached at its ends to the plates B B, and having inside thereof the shorter spring *a*, free at its ends, all combined substantially as and for the purpose set forth.

166,178.

166,179.

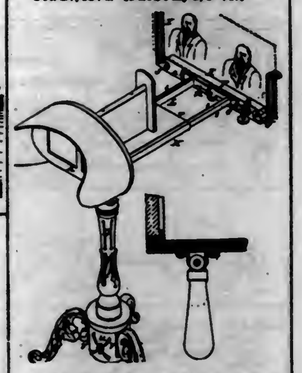
166,179. RAILROAD-CAR SPRINGS. John H. Wootten, Reading, Pa. [Filed Jan. 20, 1874.]

In a car-spring, the outer spiral spring A firmly attached to the plate B, and having inside of it the spring *a* firmly attached to the plate *b*, all substantially as and for the purpose set forth.



REISSUES.

6,646. DRIVER ON BOARD WELLS. Matthew T. Chapman and Mark C. Chapman, Aurora, Ill. Patent No. 121,500, dated Sept. 24, 1872. [Filed Aug. 14, 1874.]



Brief.—The removable valve-seat has a beveled shoulder, which, when the seat is secured to the coupling, avoids the packing against the well-tubing.

The beveled flange or shoulder *d* on the removable valve-seat, in combination with the flexible packing *a*, arranged between the said shoulder and the removable part to which the seat is adjustably attached, substantially as and for the purposes specified.

6,647. STEREOSCOPES. Antonio Quirole, Hoboken, N. J. Patent No. 156,211, dated Oct. 27, 1874. [Filed July 8, 1875.]

1. The combination, with the standard of a stereoscope, of the series of legs suitably attached thereto, substantially as and for the purposes set forth.

2. The pivoted picture-holder, upright guides I I, and their stops J J, substantially as and for the purpose herein described.

3. The spring T, in combination with the guide-rods L, and guides K, and stops E, and grooves S, substantially as and for the purpose herein described.

6,648. COMPOSITION METALS FOR CASTING PLOWS. Geo. K. Smith, Waterloo, Iowa, assignor, by mesne assignments, of one-half interest to George W. Miller. Patent No. 142,530, dated Oct. 7, 1873. [Filed Oct. 20, 1874.]

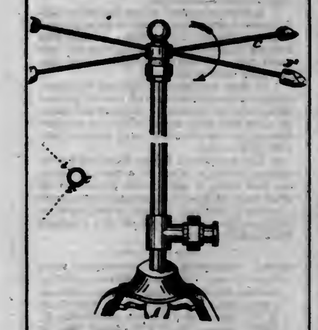
1. The process of making a composition metal by first making a conglomerate by pouring melted cast-iron upon a mass of pieces of annealed iron or steel of sufficient size to make a chill, and then remelting the conglomerate, as specified.

2. A composition metal consisting of steel, wrought-iron, cast-iron, and black oxide of manganese, substantially as specified.

6,649. COTTON-JACKS. Maurice J. Walsh, New York, N. Y. Patent No. 157,044, dated Nov. 17, 1874. [Filed July 1, 1875.]

1. A screw-jack for pressing cotton, &c., combined with an engine for reciprocating the screw to move the body of the jack, the said engine being mounted upon and secured to the said jack-body, substantially as and for the purpose described.

2. In a jack for pressing cotton, and for similar purposes, a shaft, one end of which bears upon a fixed obstacle and imparts a longitudinal motion to a pressing-head, in which it reciprocates by means of intermediate gearing operated by means of the shaft of an engine, substantially as described and for the purpose set forth.

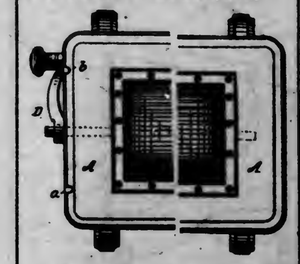


3. The pressing-block A, having the recess B and passages C D, in combination with the screw-shaft M, having a longitudinal but no rotary movement, the sleeve L, provided with a pinion on its end, gear-wheel I, pinion B, and driving-shaft O, substantially as described, and for the purpose set forth.

4. The screw-shaft M, provided with the longitudinal groove *e*, and operated as set forth, in combination with the pressing-block A, provided with the pin S, substantially as described, and for the purpose set forth.

6,650.

6,640. PORTABLE FOUNTAINS AND LAWN-SPRINKLERS. Russell Brusie, New York, N. Y. Patent No. 137,176, dated Mar. 25, 1873. [Filed July 2, 1875.]



Brief.—Combines with the radial arms of a rotary sprinkler foraminated caps upon their ends, the perforations varying in number, and in the elevation given to the jet.

1. The combination of the foraminated caps D¹ D¹, &c., with the radial arms of a portable rotary fountain or sprinkler, substantially as and for the purpose set forth.

2. In a revolving lawn-sprinkler, a series of discharge-orifices, having an inclination varying with its different arms, and of variable number, substantially as shown and described.

6,641. KNEELING-STOOLS. William Cahill, Syracuse, N. Y. Patent No. 156,703, dated Oct. 6, 1874. [Filed Jan. 6, 1875.]

1. A portable footstool constructed substantially as herein shown and described—that is to say, with the top C having upon one side a plain unenhanced surface for the feet, and on the opposite side a cushioned surface for the knees, the said top being loosely pivoted within the surrounding frame A', so as to oscillate thereon to partake of the movements of the knees, as set forth.

2. The combination of the horizontal frame A, having notches *a*, of the reversible top C and the lever D, having projections *b*, substantially as and for the purpose described.

6,642. CONVERTING IRON INTO STEEL. A. B. Carpenter, Philadelphia, Pa., assignor, by mesne assignments, of H. F. Houghton, deceased. Patent No. 139,049, dated June 16, 1873. [Filed May 19, 1875.]

Brief.—Uses the waste bone-black which has been used in filtering vacuum-oil in converting iron into steel, or hardening it by cementation.

1. A composition for case-hardening iron or converting it into steel, consisting of bone-black or other carbonaceous material impregnated with hydrocarbon-oil.

2. As an improvement in the art of case-hardening iron or converting it into steel, applying thereto in the hardening or converting process carbonaceous material impregnated with hydrocarbon-oil, as set forth.

6,643. SULKY-PLOWS. Benjamin Stoner, Sidney, Ohio, assignor to Norman Du Bois and A. P. Koop. Patent No. 90,427, dated July 20, 1869. [Filed Apr. 17, 1875.]

Brief.—Plow-beams pivoted to crank-axle, and raised by jointed lever, which permits free motion of plows upward when meeting an obstacle.

1. The combination of the crank-axle S S' P and jointed bent lever L n, for the purpose of raising the plow, and permitting it to rise automatically out of the ground, substantially as and for the purpose set forth.

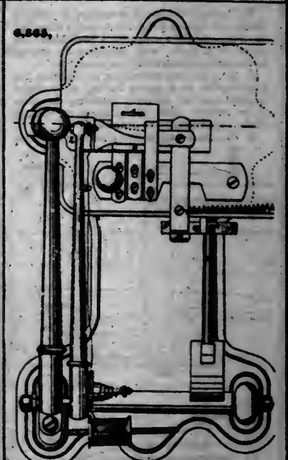
2. The combination of the crank-axle S S' P of a sulky-plow with the beam or frame of the plow, loosely pivoted thereto, to permit the plow to rise automatically out of the ground, substantially as and for the purpose described.

6,644. EXPLOSIVE COMPOUNDS. Charles A. Browne and I. S. Browne, North Adams, Mass. Patent No. 152,760, dated July 7, 1874. [Filed Sept. 12, 1874.]

Brief.—Mixes pulverized fulminate of mercury with pulverized antimony, and decreases the concussing power by adding varying quantities of antimony sulphide, iron oxide, coke, or plumbago.

An electrically-explosive compound, consisting of fulminate of mercury pulverized and intermixed with particles of metal, as and for the purpose described.

6,645. MACHINES FOR MAKING RUFFLES. John A. Pipe, New York, N. Y., assignor, by mesne assignments, to O. H. Wooster. Patent No. 97,550, dated Jan. 27, 1869. [Filed June 23, 1875.]



1. In a ruffling mechanism, a spring or flexible blade, having its acting edge turned or bent toward the surface against which it acts to form the ruffle, in combination with a carrier, to which the blade is rigidly attached, substantially as described.

2. A ruffling-blade arranged above the cloth-plate, and combined with an actuating-lever adapted to carry and press the blade on the goods in advancing and to relieve the pressure of the blade from the surface of the goods while retreating, substantially as described.

3. A blade adapted to form, but not to space a fold or plait in a strip to be ruffled, in combination with a feed to engage and move the material after the ruffle is formed, substantially as described.

4. The combination, with a flexible ruffling-blade, of an actuating-lever or rocking-shaft, to which the said blade is rigidly affixed, substantially as described.

5. The combination, with a ruffling-blade and a support for the material to be ruffled, of a guide adapted to turn the edge of a band, and present it to the action of sewing mechanism, substantially as described.

6. The combination, with a ruffling-blade and a support for material to be ruffled, of a guide adapted to turn the edge of a band, and present it to the action of sewing mechanism, substantially as described.

7. The combination, with the actuating-lever and ruffling-blade, of a regulating device to regulate the extent of backward movement of the blade without affecting the position to which the forward end of the blade moves, for the purpose set forth.

8. In a ruffling or plaiting mechanism, a spring or flexible blade rigidly affixed to its carrier, in combination with a surface opposed to the blade, and adapted to sustain the material being ruffled against the action of the blade, substantially as described.

9. In a ruffling or plaiting mechanism, a pressing or holding mechanism having a solid or unyielding surface, arranged and adapted to screw and press the whole width of the plaited fabric, substantially as described.

10. In a ruffling mechanism, the combination, with a blade and rocking lever, of a vibrating member of the needle-actuating mechanism adapted to rock the lever and move the blade to form a ruffle, substantially as described.

11. In a ruffling mechanism, a support for an elbow-lever, in combination with an elbow-lever, pivoted at its angle to the support, and adapted at one end to operate a ruffling-blade rigidly affixed thereto, and to have motion imparted to it at its other end, substantially as described.

12. The combination of the ruffling-blade and its carrier with adjusting mechanism to determine the position of the forward or working edge of the ruffling-blade with relation to its carrier, substantially as described.

13. The combination of a rocking or elbow lever and an adjustable ruffling-blade, operated by the lever, with mechanism, substantially as described, for adjusting the throw of the lever.

6,646. SEWING-MACHINES FOR MAKING RAND-RUFFLES. Geo. H. Wooster, New York, N. Y., assignor, by mesne assignments, of T. Robjohn. Patent No. 40,454, dated Feb. 14, 1863. [Filed July 19, 1875.]

Brief.—A guide provided with suitably-formed curves is arranged around the edge of a ruffling or plaiting blade, so that a strip of material may be folded and presented, with its edges turned under or hemmed, in proper relative position to said blade to receive a sewed strip, which, having been passed through a sewed guide and subjected to the action of the ruffling-blade, is ruffled or plaited, and placed between such hems, where it is secured by a row of stitching.

7. In a ruffling or plaiting mechanism, the combination of a ruffling or plaiting blade, with a folding-guide whereby a strip of any suitable fabric may be properly guided to form and fold a band about the edge of a ruffle, substantially as described.

3. The combination of a ruffling or plaiting blade and folding-guide for properly directing the strip to form and fold a band about the edges of a ruffle, with stitching or sewing mechanism, substantially as described.

4. In a plaiting or ruffling mechanism, the combination of a guide having an inclosed channel-way for properly directing the strip to be ruffled, with the plaiting or ruffling blade, substantially as described.

5. The combination of a plaiting or ruffling blade and guide for properly directing the strip to be ruffled, and a folding-guide for conducting a separate strip to form and fold a band on the edge of the said ruffled strip, with sewing mechanism adapted to unite the band and ruffle, substantially as described.

6. The combination with a ruffling or plaiting blade, of a guide for conducting a strip to form a band for the ruffle, and adapted to fold or turn both edges of said band.

7. The combination of a ruffling or plaiting blade, a guide adapted to conduct a strip to form a band and to fold both edges of said band, with a sewing mechanism, substantially as described.

8. The combination of a ruffling or plaiting blade or knife, arranged and operated above the cloth-plate, with a supporting or counter-ery plate, opposite from the cloth-plate, between which and the blade or knife the fabric to be ruffled is held and advanced by the blade, substantially as described.

9. A plaiting or ruffling blade, arranged above the cloth-plate of a sewing-machine, and adapted to operate upon a surface other than such cloth-plate, whereby a strip of goods can be plaited or ruffled in two a plain piece, substantially as described.

10. In a ruffling or plaiting mechanism, a presser or holder and screw at its lower side to permit the passage of a hem, substantially as described.

11. A folding-guide, adapted to outdent and fold a band, and provided with a nose or extended portion to direct and hold the band after it is folded, substantially as described.

12. The inclosed guide, in combination with the double tongue, adapted to press upon the goods passing through said guide to keep said goods flattened and straight, substantially as described.

13. In a ruffling mechanism, the combination of a blade, adapted to engage and fold or ruffle one piece of material, with a feeder, adapted to engage and move forward the unruffled material on which the ruffled material is delivered and secured by stitching, substantially as described.

14. In a ruffling or plaiting mechanism, the combination of a plaiting-blade, adapted to separate the material to be ruffled from the unruffled material to which it is to be attached, with a supporting blade, adapted to press upon and engage the upper side of the material to be ruffled, to move forward with such material and present a fold for the action of the needle, and on the return stroke of the blade to raise its pressure on the material to be ruffled, substantially as described.

15. The combination of the ruffling-blade, adapted to move forward beyond the end of the supporting or separating plate, with the separating-plate adapted to retain the ruffled material from returning with the ruffling-blade, substantially as described.

16. The combination of a guide adapted to control each edge of the piece to be ruffled, and a ruffling or plaiting blade, having its edge extended across the material to be ruffled, with a solid or rigid pressing surface or holder, of a width to cover and fasten the ruffled or plaited material, substantially as described.

17. The combination, with a mechanism adapted to form a ruffle or plait, of a guide, provided with an inclosed channel-way, to guide the strip intended to be ruffled or plaited.

18. The combination, with a separator and a ruffling blade, of guides adapted to control and present the band-forming edges both above and below the strip to be ruffled, whereby a piece of fabric may be ruffled between two surfaces.

6,867. SHUTTLE-BOX MECHANISM FOR LOOMS. H. Wyman, Worcester, Mass., assignor to George Crompton. Patent No. 70,309, dated Oct. 29, 1867. [Filed July 20, 1875.]

Having thus described my apparatus, I claim as my own invention—

1. The combination of a lever, one end of which is connected to shuttle-boxes, with its actuating crank-pin and connecting-rod, and with another lever pivoted thereon, and the actuating crank-pin and connecting-rod thereof, whereby four shuttle-boxes may be actuated, the combination being substantially such as described.

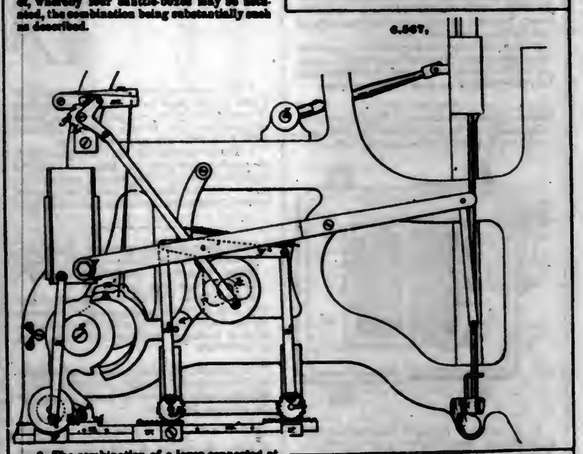
2. The combination of a lever connected at one end with shuttle-boxes, its actuating crank-pin and connecting-rod, and another lever pivoted thereon, and two crank-pins and two connecting-rods for actuating the same, whereby six shuttle-boxes may be operated, the combination being substantially as described.

3. A lever connected at one end with shuttle-boxes, its actuating crank-pin and connecting-rod, a second lever pivoted to the lever connected with the shuttle-boxes, and an actuating crank-pin and connecting-rod for it, in combination with two toothed wheels and two toothed surfaces, the toothed wheels turning the crank-pins, and the toothed surfaces moving the toothed wheels, the combination being substantially as herein set forth.

4. A lever connected at one end with shuttle-boxes, its actuating crank-pin and connecting-rod, and another lever pivoted thereon, and two crank-pins and two connecting-rods for actuating the same, in combination with three toothed wheels and three toothed surfaces, the combination being and operating substantially as described.

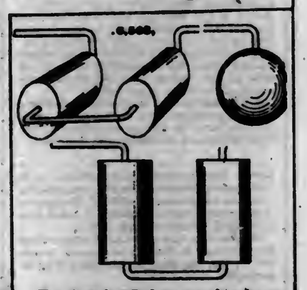
5. The combination of the two levers, a connecting-rod and crank-pin for each lever, and two toothed wheels and two toothed surfaces, with the mechanism for actuating the toothed surfaces, substantially as described, the combination lever substantially as herein described.

6. A lever connected at one end with shuttle-boxes, its actuating crank-pin and connecting-rod and another lever pivoted thereon, and two crank-pins and two connecting-rods for actuating the same, in combination with three toothed wheels and three toothed surfaces, and with mechanism substantially such as herein described for actuating the toothed surfaces, the combination being and operating substantially as described.



7. A lever connected at one end with shuttle-boxes, in combination with a lever pivoted thereon, the latter lever being combined with and actuated by two connecting-rods and two crank-pins, and the combination being substantially such as set forth.

8. A lever connected at one end with shuttle-boxes, in combination with a crank-pin and connecting-rod for moving the other end thereof, when said lever has a shifting or movable fulcrum, the combination being substantially such as described.



9. The contrivance herein described for obviating breakage, which is a two-part lever, one part being a spring-lever pivoted to the other part, as described, in combination with a series of shifting shuttle-boxes, substantially in the manner and for the purposes herein before set forth.

6,868. MAKING ILLUMINATING-GAS FROM PETROLEUM. William C. Wren and Wm. Barker, Brooklyn, assignors, by mesne assignments, to Charles P. Dunn, New York. N. Y. Patent No. 64,043, dated July 21, 1866; reissue No. 5,673, dated May 18, 1874. [Filed June 22, 1875.]

6,867.

6,868.

The above-described process of producing illuminating-gas from petroleum or its kindred products, in which a charge of liquid hydrocarbon is gradually heated in a still, and the resultant vapors are then converted from their vaporous form into permanent gas in a retort or retorts heated by independent fires, substantially as described.

NEWSTYPE RELIEF PROCESS. JAMES R. OSGOOD & Co. BOSTON

COMMISSIONER'S DECISIONS.

WILLIAM B. CARLOCK.—*Appeal.—Interlocutory.*

[*Appeal from the Principal Examiner in the matter of the application of William B. Carlock for an* "IMPROVEMENT IN MEANS FOR PREVENTING REVERBERATIONS IN PUBLIC HALLS."—*Decided July* 8, 1875.

PRACTICE UNDER RULE 32.

By neglecting to settle questions in their proper order when they arise, as the Office rules require, great confusion is caused, forming just ground for complaint.

Where the word "barrier" was employed in a specification—referring to small wires to intercept and break up sound-waves: *Held*, that the propriety of its use depended on the fact of their accomplishing the result claimed for them.

It is only those changes that affect the substance or materiality of an invention that are objectionable as new matter.

THACHER, *Commissioner:*

On January 21, 1874, the applicant, William B. Carlock, filed an application for a patent for a device, the object of which he therein stated to be—

The improvement of churches, public halls, and rooms of all kinds acoustically defective by reason of echoes, unequal reflection, dispersion of and overabundance of sound in same by means of small copper wires, or fine annealed wires, scientifically applied.

He set forth in a series of rules the best mode of applying his device, the manner of measuring the rooms, the position the wires should occupy therein, their distance apart, and the means of fastening them to the walls. His claim, like the balance of his specification, was very loosely worded, and was for—

The use of wires for curing the bad acoustics of churches, public halls, &c., and their arrangement in accordance with the drawings herewith attached, Figs. 1, 2, and 3, and the rules hereinafter following and above referred to, and which in most part grow out of the scientific basis upon which it (the invention) is founded.

April 2, 1874, the Examiner very properly rejected the application for its many informalities, stating wherein they consisted, and recommended the applicant to obtain professional assistance in amending.

Carlock's application had been called forth by reason of an application filed a month previously by Joseph P. Taylor, of New Brighton, Pennsylvania. Taylor's device was for the same purpose, and in investigating his claims to originality the Office heard of a certain experiment that had been made in that line at Bloomington, Illinois. Addressing the postmaster of that place on the subject, replies were received from Carlock, giving a history of that and several other experiments of the same kind made elsewhere, and claiming to be the original inventor of the device in question.

Carlock's letters were immediately followed by his application above referred to. His letters and application did not differ materially in the description of the essential parts of his invention. After these letters were received, but before the application was filed, the Examiner had passed Taylor's application to issue—not considering Taylor's invention to be anticipated by that of Carlock.

Taylor's patent was issued February 10, 1874. October 16, 1874, Carlock filed an amended specification and new drawings, in accordance with the suggestion of the Examiner in his letter of the previous April.

In the opinion of the Examiner, the amended specification was in violation of Office Rule 32, on account, as he contends, of new matter therein set up. Carlock had employed attorneys, who adopted in a general manner the description set forth by Taylor, and made the claim equally as broad as that of the latter. Notwithstanding his belief that Carlock had thus unwarrantably broadened his application by amendment, contrary to Rule 32, and notwithstanding Office Rule 51 requires that before the declaration of an interference all preliminary questions must be settled, and the claims of the respective parties put in such condition that they will not require alteration after the interference has been finally decided, unless the testimony

adduced upon the trial should necessitate such change, the Examiner without any hesitation or a word of objection to Carlock's amended specification, so far as the record shows, declared an interference between Carlock and Taylor.

In his answer to the reasons of the present appeal, the Examiner says in regard to Carlock's amended application:

> Carlock employed able attorneys, with the avowed intention of forcing an interference with Taylor's patent.

He gracefully yielded to the accomplishment of this measure of force, by declaring the interference without objection, upon an application which he was convinced was in violation of a rule of the Office to entertain at all. He explains his action as follows:

> Not to make it an *ex parte* affair, I declared the interference asked for—leaving the question of dissolution to come up on motion and argument, as it did.

This neglect of the salutary requirements of Rule 51, as might have been expected, gave rise to just the confusion, trouble, expense, and delay which the rule is intended to obviate, and leaves the question to be now determined, after an expensive litigation, the same as lay at the threshold of the case, and which if then settled in accordance with the Examiner's views would have rendered entirely unnecessary the long contest that has since followed.

After the interference was declared the parties filed their preliminary statements; then a time was fixed for taking testimony, and a day of hearing appointed. Carlock, ignorant of the Examiner's views as to his amended application, or misinformed by his attorneys, or both, prepared to take his testimony. His evidence had to be gathered from sources widely apart, which, of course, gave rise to much trouble and expense. While thus engaged, the motion to dissolve—foreseen by the Primary Examiner—was made. The Examiner recommended the dissolution for the reasons already indicated, and the Examiner in charge of interferences thereupon dissolved the interference.

Carlock appealed to the Commissioner. In the meantime the taking of his testimony had been completed. The Acting Commissioner, in view of the latter fact, and also being of opinion that, without doubt, the application of Carlock as originally filed really conflicted with Taylor's patent, overruled the action below, and continued the interference. Of course, entertaining the view that a valid interference existed between the original application of Carlock and the patent of Taylor, upon the declared issue, it was unnecessary for him at that stage of the case to discuss the nature of the amendment.

The testimony on behalf of Carlock having been taken and completed after the Examiner in charge of interferences had dissolved the interference, that officer rejected it upon the hearing, and Taylor having taken no evidence, the case was decided upon the record in favor of the latter. The interference case, however, was subsequently reopened, and Carlock commenced *de novo*.

The Examiner of Interferences, in view of the fact that the Acting Commissioner regarded the interference as validly existing between the patent and Carlock's original application, and not alone with the amendment, as held by the Primary Examiner, considered the evidence adduced in the light alone of Carlock's former application. Priority was decided in favor of Carlock, from which decision no appeal was taken. Upon the return of the case to the Primary Examiner he renewed his objections to Carlock's amendment, and the appeal now taken is upon that point.

I have thus set forth at length the course thus far taken in this case, for the purpose of showing how, by a neglect to settle questions as they arise in their proper order as prescribed by the rules of the Office, great confusion is caused, and the Office justly laid open to the charge of creating litigation, and dilly-dallying with the rights of inventors.

In regard to the subject-matter of Carlock's original application, the only difference—certain informalities aside—between that and the matter of his amended specification consists in the distances apart he gives for placing the wires.

In his original specification, drawings, and model, Carlock describes and shows two strata of fine wires stretched tensely across a room in the direction of its length. Between these different strata two wires are stretched diagonally across the room. The wires composing the upper and lower strata are described as being placed from four to six feet apart, according to the size of the room. Even in his crudely-drawn original specification Carlock does not necessarily confine himself to a particular distance between each wire.

The gist of the invention consists of a barrier of fine wires, and is fully comprehended by Carlock's original application, as already stated by the Acting Commissioner. Says the Examiner:

> The question of new matter, now to be decided, turns on the definition of the word "barrier." Taylor's invention and claim is a "barrier of wire." Now, does a series of wires placed from four to ten feet apart constitute a "barrier" in a legitimate sense?

It is quite clear that a double series of wires, arranged as Carlock describes, constitutes a barrier in the *ordinary* sense of the term, but whether they constitute a barrier in the "legitimate sense" mentioned by the Examiner depends, I suppose, on the fact of their accomplishing the object claimed for them, viz., the breaking up of the sound-waves in such a manner as to prevent confusing reverberations, &c.

That they did quite successfully accomplish this result is shown by the evidence adduced in behalf of Carlock in the interference case. Taylor prefers to form his wires into a sort of screen, with the wires two or three inches apart, and having expressed that preference there was just as much reason for restricting his specification and claim to that narrow ground as there now is for restricting Carlock to the precise distances he expressed a preference for in his original application.

There is no doubt in my mind that the application of the latter was intended to cover broadly the use of fine wires for the purpose specified. Carlock therein says:

> I claim to be the original inventor of the use and adaptation of these wires for the purposes set forth above—

and this allegation is substantiated by the evidence in the interference case.

In the amendment of his application the model was not changed, and his drawings only altered to more closely conform to the model. The latter changes were made in strict accordance with the suggestions of the Examiner himself, in his letter of April 2, 1874.

The adoption of the word "barrier" was a very proper verbal change, but did not affect in the slightest degree the scope of the invention. The alteration of the description to include wires placed more closely together than he had at first described, was a matter of *degree* only, and not a substantial variance. It is only those changes that affect the substance or materiality of an invention that are objectionable as new matter. Such changes, in my opinion, have not been made in this case.

The decision of the Examiner is accordingly reversed.

DECISIONS OF THE COURTS.

U. S. CIRCUIT COURT, NORTHERN DISTRICT OF NEW YORK.

GEORGE A. REED *vs.* LOUIS REED AND GEORGE FOLTS.

[*In equity.—Before* WALLACE, *J.—October*, 1874.]

The claim of letters patent for an "Improvement in Head-Linings for Barrels," granted to George A. Reed, May 11, 1873—viz: "As a new article of manufacture, barrel-head linings prepared in the manner specified, when bundled as shown and described"—is invalid.

As both head-linings and hoops had been made by machinery, and were articles of trade, and as hoops had also been crimped by machinery, the patentee merely produced an article which was the result of more mechanical skill and care in its manufacture than that previously sold and used; but this result did not involve the faculty of invention.

Although the crimped machine-made head-linings are an improvement upon the article used prior to their introduction, and, as such, have secured the approval of the trade and become a valuable commodity of manufacture and sale, the improvement is not the proper subject of a patent.

The sole merit of *bundling* the head-linings is, that it renders the commodity more attractive to purchasers, and more convenient for the purposes of sale. There is nothing in this result that is patentable.

[*James A. Allen*, for complainant.
John Van Voorhis, for defendants.]

WALLACE, *J.*:

The patent which it is alleged the defendants have infringed was issued to the complainant on the 11th of March, 1873, for an "improvement in head-linings for barrels." The specification describes the subject of the patent as follows:

> My improvement relates to the head-linings used on sugar, flour, fruit, salt, and other kinds of slack barrels; and consists in forming the lining by cutting a straight splint from the lumber, and subsequently crimping it in a suitable machine, by which it is bent to the curved shape of the barrel to which it is to be applied, the object of the improvement being to obviate the objections to the common head-linings of requiring them to be soaked before use, and bent as they are applied, necessitating the driving of a large number of nails to retain them when dry, and, also, the want of accurate fitting against the barrel head or chime, together with frequent splitting after having been applied, in consequence of having been bent the wrong way of the grain.

After describing the mode of manufacture, the specification proceeds:

> When so crimped they are put in square bundles of two hundred and fifty or five hundred, and tied or wired for transportation and use.

The claim, after stating that the applicant is aware that hoops for barrels have been crimped or permanently bent, before setting, prior to this invention, and disclaiming any right predicated upon this process, is as follows:

> What I claim, and desire to secure by letters patent, is, as a new article of manufacture, barrel-head linings, prepared in the manner specified, when bundled, as shown and described.

It appears by the proofs that the head-lining is a piece of wood applied to the chime of a barrel by the packer after the barrel has been filled for shipment, for the purpose of supporting the chime, and to retain the barrel-head more firmly in its place when subjected to the strain of transportation and handling.

It also appears that, prior to the introduction of linings similar to those described in the specification, it had been the practice of packers and shippers to make head-linings by splitting the ordinary hoop and nailing the pieces on the head of the barrel next to the chime. It was ordinarily done by taking an old hoop, or part of one, and splitting it in two parts with an adze or a knife, and required only sufficient skill to secure width sufficient to hold a nail, when driven into it, without splitting, and length sufficient to afford support to the chime. The pieces, when cut in this way, were almost necessarily somewhat irregular in width, were rough in appearance, frequently split when nails were driven into them, and were, in short, a crude and simple contrivance to give support to the barrel-head, without reference to ornament or taste, and, practically, they met the purpose for which they were used. Subsequently, head-linings were made and used as an article of trade, designed to be sold to packers in quantities, to save them the trouble of cutting out their linings, as they desired to use them. They were made of oak, split out by hand, the form of the lining following the direction of the grain of the timber, and the width and thickness being more or less variable, according to the degree of care used in cutting them, and the clearness of the grain of the timber. In using them, it was quite customary to soak or steam them, as then they were more readily bent to the curve of the barrel, and less frequently split when nails were driven into them. Subsequently, machine-made linings were introduced and became an article of trade, which were straight and of uniform width and thickness, and differed in no respect from those of which the complainant now claims to be the inventor, except that the latter are crimped. The effect of crimping them, as is alleged in the specification, is to corrugate the grain of the wood, thereby bending the head-lining so as to conform proximately to the curved head of the barrel, thus obviating partially the tendency of the timber to split when nails are driven into it, and dispensing measurably with the necessity of soaking or steaming the linings before using them.

It is quite apparent, however, that soaking or steaming the complainant's linings would lessen their liability to split, and, even then, splitting could not be entirely prevented. It is also obvious that the value of the complainant's linings, as of those previously in use, depends largely, if not mainly, on the quality of the timber used for their manufacture.

That the complainant's head-linings are an improvement on the article which had been used prior to their introduction, and, as such, have secured the approval of the trade, and become a valuable commodity of manufacture and sale, must be conceded; but I

am unable to arrive at the conclusion that such improvement is the proper subject of a patent. The proofs establish, beyond controversy, that hoops had been made by machinery, as well as head-linings, and were an article of trade, prior to the alleged invention of the complainant; and the specification of the claimant disclaims any discovery of the process of crimping such hoops. The complainant adapts the same appliances to the manufacture of head-linings that were used in the manufacture of hoops, and he thereby produces an article which is, in all its essential features, a crimped machine-made hoop on a small scale, except that it is of uniform width and thickness, and has rectangular ends. It is a hoop adapted to fit inside instead of outside the staves of the barrel, and to support the chime instead of the body of the barrel. Ignoring, as must be done, the use of the machine for cutting and crimping the timber, the article is produced by cutting a block of timber into pieces of such size and shape as will constitute a hoop of reduced dimensions, uniform in thickness, and with rectangular ends. The quality of invention is not called into exercise by adopting, to make head-linings, the machine for making and crimping hoops; and what remains of the process is accomplished by the most simple mechanical skill.

Having arrived at the conclusion that the patent cannot be sustained, so far as it rests upon the claim for head-linings "as an article of manufacture, when prepared in the manner specified," it remains to consider whether it can be supported upon the additional claim as "an article of manufacture, when bundled as shown and described." The portion of the specification relating to the bundling of the linings is as follows:

> I accomplish another result—that is, that I can pack the linings in square bundles, ready for the market, and that each lining will always retain its circular form, owing to the corrugated condition of the fibers, and at the same time I dispense with soaking.

It will be observed that the corrugation of the fibers dispenses with soaking the linings, and is accomplished by the process of crimping the timber, and in this regard the linings do not differ from the hoops. Nothing enables the linings to retain their circular form when bundled, aside from the crimping, except that they are of uniform size, and thereby fit compactly together. The hoops could be bundled as well as the linings, and are usually transported in bundles, but not so tidily or compactly as the linings, owing to their bevel and greater length. The sole merit of this feature of the improvement is that it renders the commodity more attractive to purchasers and more convenient for the purposes of sale. There is nothing in this result that is patentable. If the subject of the patent was a machine which accomplished the result of manufacturing a product more convenient for transportation and sale, as an article of trade, than that which had preceded it, such result might be important and controlling as determining the utility of the invention. But no such test is applicable when the product itself is the subject of the patent. (*Langdon* vs. *De Groot*, 1 Paine's C. C. R., 203.)

Upon the whole case, therefore, my conclusion is that the complainant has only produced an article which is the result of more mechanical skill and care in its manufacture than that previously used and sold, and that this result did not involve the faculty of invention. The case is analogous to that of *Union Paper Collar Co.* vs. *Van Deusen** (10 Blatchf. C. C. R., 109) and *Rubber Tip Pencil Co.* vs. *Howard**, (9 Id., 490.)

The bill must, therefore, be dismissed, with costs.

*See, also, for reports of these cases as decided in the Supreme Court, the decisions below being affirmed, OFFICIAL GAZETTE, Vol. I, 172 and 919.

DISCLAIMERS FILED.

52,726.—Improvement in Window-Screens.—ABNER F. MAGOUN, Philadelphia, Pa.—Patented February 20, 1866; reissue No. 4,698, dated January 2, 1872. Disclaimer filed August 13, 1875. Disclaims:

"Being aware of the 'mosquito-frame' which constitutes the subject of Letters Patent of L. S. Thompson of February 24, 1863, No. 37,779, that invention is disclaimed as being any part of the present invention, it being the object of the present Letters Patent to cover only a window-screen which remains adjustable when converted into a screen, in other words, after the gauze has been secured in place upon the frame; it not being the object of the present invention to include or claim as new the above-named invention of L. S. Thompson."

DESIGNS PATENTED DURING THE WEEK.

[Each Design bearing date August 3, 1875.]

8,354.—Chairs.—JOSEPH H. HOOPER and THEODORE JOHNSEN, Portland, Me. Application filed April 5, 1875. Term of patent 3½ years.

8,355 and 8,356.—Inkstand-Supports.—CHARLES KITSCHELT, New York, N. Y., assignor to NICHOLAS MULLER'S SONS, same place.—Cases F and G. Applications filed June 22, 1875. Term of patents 7 years each.

8,357.—Clock-Cases.—WILLIAM F. MULLER, New York, N. Y. Application filed July 24, 1875. Term of patent 7 years.

8,358.—Stove-Door Knob.—JULIUS F. QUIMBY, Troy, N. Y., assignor to SWETT, QUIMBY & PERRY, same place. Application filed May 21, 1875. Term of patent 7 years.

8,359.—Printing-Type.—JOHN K. ROGERS, Brookline, Mass. Application filed July 19, 1875. Term of patent 3½ years.

TRADE-MARKS REGISTERED DURING THE WEEK.

[Each certificate bearing date August 3, 1875.]

2,796.—Clock-Springs.—WALLACE BARNES, Bristol, Conn. (Re-registration.) Application filed August 17, 1871.

"a perspective view of one of his patent level-tempered clock-springs, the end of which spring is of a peculiar form."

2,797.—Thrashing-Machine.—JAMES BRAYLEY, Buffalo, N. Y. (Re-registration.) Application filed February 23, 1871.

"'Buffalo Pitts.'"

2,798.—Thrashing-Machines.—JAMES BRAYLEY, Buffalo, N. Y. (Re-registration.) Application filed March 3, 1871.

"a belt, within the center of which is a head representing that of a buffalo."

2,799.—Spectacles and Eyeglasses.—JOSEPH GALL, New York, N. Y. Application filed February 5, 1875.

"a spread eagle, with the words 'J. Gall's' above it, and the words 'Achromatic Spectacles and Eye-Glasses' below it."

2,800.—Wash-Blue.—HELLER & MERZ, New York, N. Y.—Case A. Application filed May 6, 1875.

"the figure of a girl with bare arms, and wearing a red skirt having a dark band around its lower part, an overskirt gathered into a puff behind, and an apron."

2,801.—Ultramarine Blue.—HELLER & MERZ, New York, N. Y.—Case B. Application filed May 8, 1875.

"'U,' surrounded with an isosceles or equilateral triangle, along one of the inclined sides of which may be printed the words 'American Ultra,' and along the other inclined side may be printed the words 'Marine Works.'"

2,802.—Washing-Crystal.—FRANCIS D. LEIDY, Philadelphia, Pa. Application filed July 26, 1875.

"words 'ANCHOR BRAND,' and the picture of an anchor."

2,803.—Steel and Iron Wares.—SWEET, BARNES & Co., Syracuse, N. Y. (Re-registration.) Application filed May 24, 1873.

"a figure formed of lines in a lozenge form, with the letters 'G. B. & Co.' placed at each of the four angles."

2,804.—Cigars.—H. K. THURBER & Co., New York, N. Y. Application filed May 8, 1875.

"pictorial representation of an alligator, represented as floating in a river bordered by tropical plants, said alligator being guarded by a female figure standing on the back of the same."

2,805.—Rope, Twine, Gilling-Thread, &c.—UHLER, ENGLISH & BOILEAU, Philadelphia, Pa. Application filed July 9, 1875.

"word 'LUCK.'"

2,806.—Baking-Powder.—GEORGE H. VICKERY, Hyde Park, Pa. Application filed May 8, 1875.

"the representation of a colored woman holding a pan with biscuit or cakes just taken from the stove."

2,807.—Fertilizer.—DUGDALE & GIRVIN, Baltimore, Md. (Re-registration.) Application filed November 9, 1870.

"the words 'Magnum Bonum,' in connection with words 'Soluble Phosphate.'"

2,808.—Fertilizer.—DUGDALE & GIRVIN, Baltimore, Md. (Re-registration.) Application filed November 9, 1870.

"word 'Excellenza,' which is intended to be used in connection with the words 'Soluble Ammoniated Superphosphate.'"

2,809.—Fever and Ague Cure.—GLADSTONE & FERGUSON, New York, N. Y. Application filed June 19, 1875.

"letters C. F. A., and the figure of a star in the upper portion of the panel inclosed by the ornamental border."

2,810.—Candles.—CHARLES HARKNESS, Cincinnati, Ohio. (Re-registration.) Application filed June 5, 1871.

"words 'Patent Wax' and a 'honey-bee.'"

2,811.—Toilet-Soap.—FREDRICK SAHLFELD & Co., Baltimore, Md. Application filed June 22, 1875.

"a phœnix with outstretched wings, immediately beneath which is a crown, and beneath the crown are olive and laurel branches secured together by a ribbon, upon the flowing ends of which is the following Latin inscription, viz., *'Scientia Mundum Regit, Quae Presit Omnibus.'* Above the representation of the phœnix is the word 'Phœnix,' and to the left of the bird the word 'Chemical,' while on its right is the word 'Works.'"

LABELS REGISTERED DURING THE WEEK.

[Each certificate bearing date August 3, 1875.]

291.—Title: **"Chart adapted for and used with Edson's Pressure Recording Gages."**—MARMENT B. EDSON, Brooklyn, N. Y. Application filed March 11, 1875.

292.—Title: **"Bull's Cough Syrup."**—A. C. MEYER & Co., Baltimore, Md. Application filed July 29, 1875.

293.—Title: **"Scott's American Cologne."**—A. W. SCOTT, Cincinnati, Ohio. Application filed July 9, 1875.

294.—Title: **"S. y Ca., La Rosa Espanola."**—SEIDENBERG & Co., New York, N. Y. Application filed January 25, 1875.

295.—Title: **"Brazilian Headache Powders."**—CHARLES H. VAN ARNAM, Troy, N. Y. Application filed May 13, 1875.

COPIES OF SPECIFICATIONS AND DRAWINGS.

Persons desiring copies of all specifications and drawings of any particular class of patents can purchase them at the rate of ten cents each, and have them mailed, free, to their address, as soon as possible after the patents are issued, by leaving a deposit of not less than three dollars with the Commissioner of Patents. The index of classes for subscribers, date of September, 1871, is furnished gratis to any applicant.

In ordering copies of any drawing or specification, the name of the inventor and patentee, the title of the invention, and the date of the patent must be given; and for any search required in consequence of the omission of any of these data a charge of one dollar may be made. So in ordering a copy of an assignment, the liber and page of the record, as well as the name of the inventor, must be given; otherwise an extra charge will be made for the time consumed in making any search that may become necessary.

Copies of the specifications and drawings of design patents will be furnished by the Patent Office at the cost of making them. All orders should be addressed to the Commissioner of Patents, Washington, D. C.

Mill spindles, bush for, N. B. Lewis	57	166 210
Millstone dress, G. T. Smith	57	166,419
Molding concrete pipe, drain tile, &c., machine for, T. E. Daniels	20	166,264
Mop head, C. B. Clark	22	166,342
Motion, machine for converting, D. C. Burson	67	166,338
Motor, J. H. Bean	67	166,331
Needle blanks, machine for trimming, P. M. Beers	104	166 245
Needle eyes, machine for polishing, P. M. Beers	104	166,246
Oil still, J. C. Dickey	47	166,349
Oils, distillation of hydrocarbon, T. McGowan	47	166,285
Organ, reed, H. K. White	106	166,437
Organ stop action, McMahel and Tracy	106	166,214
Organ stop action, reed, L. B. Norton	106	166,292
Pavement, A. B. Dean, (reissue)	110	6,570
Peg wood, machine for pointing ribbon, B. F. Sturtevant	174	166,429
Photographic camera, J. and J. Stock	111	166,315
Pianos, &c., tuning pin for, J. M. Brasig	112	166,253
Pipe, device for bending metal, M. L. Orum	125	166,293
Pipe, drain tile, &c., device for molding concrete, T. E. Daniels	20	166,264
Pipe, self-acting blow, J. M. Hancock	12	166,275
Plane, bench, D. F. Williams	29	166,239
Plane, bench, D. F. Williams	29	166,240
Planing machine, L. S. Woodbury	173	166 444
Planter, cotton, corn, and pea, Bristol and Searcy	133	166,254
Plating, manufacture of anodes for nickel, E. Weston	113	166,433
Plow, H. Krog, Sr	114	166,281
Plow, corn, A. Binder	43	166,333
Plow, steam, T. C. Stark	114	166,230
Post hole borer, O. Love	63	166,392
Printing presses, feed guide for, J. Reed	117	166 410
Power, motive, P. B Greene	67	166,271
Pulley cover, J. W. Sutton	87	166,233
Pump piston for artesian wells, T. Malcolmson	118	166,394
Railway electric signaling apparatus, F. L. Pope, (reissue)	50	6,578
Railway electric signaling apparatus, F. L. Pope, (reissue)	50	6 579
Railway frog, J. Brahn, (reissue)	120	6,573
Railway rail joint, H. Allen	120	166,243
Railway rail joint fastening, Hipkine and Rigsby	120	166,379
Railway rail joint fastening, A. Spencer	120	166,229
Railway switch, D. F. Cavanaugh	120	166,186
Railway ticket, complex coupon, T. Cook	146	166,343
Railway time signal, Dinkey, Enbody, and Bradley	120	166,194
Range, cooking, W. P. Abendroth	154	166,242
Refrigerator car, J. H. Canfield	58	166,341
Resawing machine, J. First	130	166,355
Roll, skelp forming, J. C. Getz	125	166,359
Roofs, securing flexible roofing to, J. Perry	126	166,296
Row lock, F. E. Davis	13	166,193
Rubber coated fabric, W. Cable	84	166,256
Ruler, parallel, J. M. Taylor	97	166,320
Sad iron, reversible, T. T. Smothers	91	166,421
Sand paper roll, O. Gilmore	173	166,360
Sash balance, E. H. Hannum	24	166,363
Saw gummer, M. O. Smith	131	166,313
Saw mill head block, Perry and Mote	130	166,222
Screw tap, J. E. Sweet	14	166,318
Screw, wood, S. W. Young, (reissue)	171	6,571
Screws, machine for shaping the heads of metal, C. M. Spencer	171	166,423
Separator, grain, A. B. Farquhar	159	166,354
Sewer juncture indicator, J. H. Stanley	51	166,314
Sewing machine, T. A. Weber	134	166,236
Sewing machine bobbin, G. W. H. Curtis	134	166,348
Sewing machine feeding device, I. M. Rose	134	166,302
Sewing machine looping attachment, Byrom and Clewley	134	166,340
Shelving for stores, H. T. Bestor	30	166,248
Shirt, F. A. Richardson	38	166,411
Shirt bosom, F. L. Pickett	38	166,297
Shoe tip or protector, C. T. Grilley	16	166,361
Shoe tip or protector, C. T. Grilley	16	166,362
Shovel blades, die for cutting, molding, and punching, P. B. Cunningham	141	166,347
Shutter, window, W. O. Connor	30	166,218
Skelp forming roll, J. C. Getz	125	166,359
Sleigh bell, R. and H. Marbach	72	166,396
Soda water fountain, F. W. Wiesebrock	1	166,440
Sole fastening webs, machine for severing, B. F. Sturtevant	16	166,430
Spinning frames, building mechanism for, J. M. Stone	142	166,316
Stalk cutter, Gaylord and Ayers	73	166,200
Still, oil, J. C. Dickey	47	166,349
Stone, compound for artificial, T. E. Daniels	153	166,265
Stool, R. W. Myers	62	166,402
Straw cutter, L. Schellinger	59	166,307
Stump puller, W. O. Johnson	79	166,384
Sugar into blocks, machine for pressing, J. W. Jarboe	155	166,383
Sugar sawing machine, G. P. Ockershausen	155	166,403
Sulphur, method and apparatus for separating free, S. H. Johnson	35	166,279
Table, folding, P. S. Crawford	62	166,263
Table slide, extension, Holland and Parker	62	166,204
Telegraphic circuit, W. E. Sawyer	50	166,305
Toy hoop or trundle, W. W. Wilcox	143	166,441
Trace carrier, W. H. Townsend	72	166,322
Track circuits, connector for electric, W. Robinson	50	166,225
Trap, fly, H. L. Ferris	64	166,268
Tube drawing mandrel, T. Whitehouse	163	166,435
Tubes, die for smoothing and sharpening soldered, P. Brown	163	166,337
Tubing, mandrel for bending metallic, M. L. Orum	163	166,294
Turn buckles, manufacture of, M. Merrill	21	166,286
Type, A. M. Howard	117	166,235
Umbrella, J. G. Widmann	165	166,439
Umbrella tips, &c., casting, A. Ligibel	165	166,282
Under clothing for women, S. T. Converse	38	166,190
Valve, globe, F. Lunkenheimer	152	166,303
Vehicle hub, J. H. Lindsay	31	166,283

	Class No.	No. of Patent.
Vehicle spring, C. Nielson	31	166,291
Vehicle wheel, F. H. Green	31	166,272
Veneer cutting machine, C. T. Fairchild	176	166,353
Vessels, attaching handles to, G. W. Hartwell	136	166,364
Wagon rack, J. Bolt	31	166,250
Wagons, king bolt for, W. Truax	31	166,323
Wagons, weighing apparatus for, J. J. D. Kingsbury	132	166,389
Washing machine, J. H. Carroll	91	166,185
Washing machine, S. L. Denney	91	166,266
Washing machine, J. M. Oakley	91	166,217
Water closets, pan for, E. A. Leland	8	166,209
Water wheel, current, W. W. Cleaveland	168	166,187
Water wheel, turbine, G. H. Jones	168	166,206
Well petroleum, E. M. Stevenson	51	166,425
Well, petroleum, L. Stewart	51	166,426
Wood work, machine for carving and ornamenting, M. T. Boult, (reissue)	173	6,572
Wrench, pipe, H. C. Stouffer	100	166,428

INDEX OF PATENTEES TO WHOM PATENTS WERE GRANTED AUGUST 3, 1875.

	Patent No.
Abendroth, W. P., Cooking range	166,242
Allen, H., Railway rail joint	166,243
American Tube Works, assignee	166,438
Armstrong, J., Book backing machine	166,328
Armstrong, J., Book sewing machine	166,329
Ashley, J. N., assignee, (reissue)	6,578, 6,579
Ayers and Gaylord	166,200
Bailey, H., Fire tube for steam boilers	166,180
Bailey Tool Company, assignee	166,239, 166,240
Baker Brothers & Co., assignees	166,390
Barden, J. L., and S. Crudden, Rotary churn	166,181
Bayliss, J., Bellows	166,244
Bean, H. and B. F., Fence	166,330
Bean, J. H., Motor	166,331
Bedell and Shepard	166,311
Beers, P. M., Machine for trimming needle blanks	166,245
Beers, P. M., Machine for polishing needle eyes	166,246
Benao, A., Forge for blacksmiths	166,247
Bennett, J. M., assignee	166,183
Bestor, H. T., Shelving for stores	166,248
Biedenfeld, T., Medical composition	166,249
Binder, A., Corn plow	166,333
Black, J. T., and J. Truax, Meat pounder	166,332
Bolt, J., Wagon rack	166,250
Bonta, J. W., Chain	166,334
Bonta, J. W., Furnace for blanks	166,335
Bonta, J. W., Furnace for blanks	166,336
Boult, M. T., Machine for carving and ornamenting wood work, (reissue)	6,572
Bowen, J., Cider mill	166,251
Bradford, H., Separating coal from slate, &c	166,252
Bradley, Dinkey, and Enbody	166,194
Brahn, J., Railroad frog, (reissue)	6,573
Brandon, C. E., assignee	166,417
Brasig, J. M., Tuning pin for pianos, &c	166,253
Breneman, A. N., Boot holder	166,182
Bridge, E. W., Box fastening	166,183
Bristol, D. W., and J. F. B. Searcy, Cotton, corn, and pea planter	166,254
Brown, P., Die for smoothing and sharpening soldered tubes	166,337
Buehler, H., Machine for shaping chair backs	166,184
Burge, J., Time lock	166,255
Burrell, Ives & Co., assignees	166,353
Burson, D. C., Machine for converting motion	166,338
Bussey, W. C., Basin faucet	166,339
Byrom, S., and F. Clewley, Looping attachment for sewing machines	166,340
Cable, W., Rubber coated fabric	166,256
Canfield, J. H., Refrigerator car	166,341
Carrell, J. H., Washing machine	166,185
Cavanaugh, D. F., Railroad switch	166,186
Church, J. S., Tailor's measure	166,257
Cheek, M. C., Seed cotton cleaner	166,258
Childs, J., assignee	166,428
Church, H. B., Door check	166,259
Clark, C. B., Mop head	166,342
Clark, R. M., Device for destroying bugs upon plants	166,260
Cleaveland, W. W., Current water wheel	166,187
Clewley and Byrom	166,340
Coggin, F. G., assignee	166,444
Cohné, S., Manufacture of material for bearings	166,188
Collier, W. F., Wire dish stand	166,346
Comstock, G. R., Meat tenderer	166,189
Conant, H. B., Dust brush	166,261
Connor, W. O., Window shutter	166,218
Converse, S. T., Under clothing for women	166,190
Cook, L. A., assignee, (reissue)	6,571
Cook, T., Complex coupon railroad ticket	166,343
Cornell, G. B., assignee	166,218
Corwin, W. E., Imitation quilted fabric	166,262
Crandall, J. A., Castanet	166,344
Crawford, P. S., Folding table	166,263
Crawshaw, J., Jr., Show rack for carpets	166,345
Crossley, H. A., assignee, (reissue)	6,581
Crowell, W. H., assignee, (reissue)	6,581
Crudden and Barden	166,181
Culp, J. A., assignee	166,208
Cunningham, P. B., Die for cutting, molding, and punching shovel blades	166,347
Curtis, G. W. H., Sewing machine bobbin	166,348
Cushman, D., Carriage wheel	166,191
Daggett, H. S., assignee	166,431
Daniels, T. E., Machine for molding concrete pipe, drain tile, &c	166,264
Daniels, T. E., Composition for artificial stone	166,265
Darling, S., Inkstand, (reissue)	6,574
Darneal, H., Game board	166,192
Davis, F. E., Row lock	166,193
Dean, A. B., Pavement, (reissue)	6,570
Denio, A. G., assignee	166,259
Denney, S. L., Washing machine	166,266
Dickey, J. C., Oil still	166,349
Dinkey, J. A., N. Enbody, and S. Bradley, Railroad time signal	166,194
Dodge, W. C., Cup for effervescing drinks	166,350
Dodge, W. F., assignee	166,213
Donbleday, S., Car brake	166,351
Douglas, J. W., Water hydrant	166,195
Dunn, G. R., assignee	166,213
Eichbaum, F. H., and A. G. Hunter, Manufacturing illuminating gas	166,352
Eigelberner, T. F., & Co., assignees	166,401
Enbody, Bradley, and Dinkey	166,194
Esty, J., & Co., assignees	166,437
Evans, L., Feed cutting machine	166,196
Fairchild, C. T., Veneer cutting machine	166,353
Farquhar, A. B., Grain separator	166,354
Fasoldt, E. M., Faucet	166,197
Fenner, F. A., and J. H. Power, Apparatus for destroying the cutting ant	166,267
Ferguson, W. K., assignee	166,183
Ferris, H. L., Fly trap	166,268
First, S., Convertible rocking chair and swing	166,269
First, J., Resawing machine	166,355
Forrester, I. N., Game board	166,198
Foster, A. G. W., Meat tenderer	166,199
Fonllon, J., Glove	166,270
Fraser, E. J., Amalgamator	166,356
Gandolfo, J., assignee	166,383
Gardner, R., assignee	166,436
Gaylord, C. H., and E. M. Ayers, Stalk cutter	166,200
Gerfen, F., Grain fork	166,201
Getz, J. C., Skelp forming roll	166,359
Gilmore, O., Sand paper roll	166,360
Githens, J. C., Buffer for steam rock drills	166,273
Goodyear's India Rubber Glove Manufacturing Company, assignees	166,306
Gray, C. E., Fire plug	166,357
Gray, J. R., Horse power	166,358
Gray, M., Derrick	166,202
Greason, J. A., assignee	166,378
Green, F. H., Vehicle wheel	166,272
Greene, P. B., Motive power	166,271
Gribben, J., assignee, (reissue)	6,581
Gribble, J. B., Candlestick	166,274
Grilley, C. T., Shoe tip or protector	166,361
Grilley, C. T., Shoe tip or protector	166,362
Haley, J. J., assignee	166,232, 166,422
Hanbury, C., assignee	166,365
Hancock, J. M., Self-acting blow pipe	166,275
Hannum, E. H., Sash balance	166,363
Harding, W. W., Combined fire plug and automatic pump	166,203
Hartwell, G. W., Attaching handles to vessels	166,364
Hawker, E., Confectionery	166,365
Hayden, D. W., Stopping mechanism for drawing frames	166,276
Hebdon, W., Cloth testing machine	166,366
Hendrickson, S. C., assignee, (reissue)	6,578, 6,579
Hermann, A., and W. H. Taylor, Electroplating with nickel	166,367
Herrick, C. F., Reversible latch for cupboards, &c	166,368
Hershey, B., Machine for welding chain links	166,369
Hershey, B., Machine for welding chain links	166,370
Hershey, B., Machine for welding chain links	166,371
Hershey, B., Machine for welding chain links	166,372
Hershey, B., Machine for welding chain links	166,373
Hershey, B., Machine for welding chain links	166,374
Hershey, B., Machine for bending chain links	166,375
Hershey, B., Machine for welding chain links	166,376
Hershey, B., Machine for welding chain links	166,377
Heuber and Little	166,391
Hicks, M. S., assignee	166,229
Higgins, S. W., Auger	166,378
Hill, E. A., Hotel annunciator and fire alarm, (reissue)	6,575
Hill, E. A., Hotel annunciator and fire alarm, (reissue)	6,576
Hill, E. A., Hotel annunciator and fire alarm, (reissue)	6,577
Hipkins, S., Jr., and J. W. Rigsby, Railroad rail joint fastening	166,379
Hoard, J. W., assignee, (reissue)	6,571
Holland, W. S., and J. W. Parker, Slide for extension tables	166 204
Hornick, W., Button	166,277
How, C. D., Holder for preserve cans	166,380
Howard, A. M., Type	166,205
Hudgens, R. H., Harrow and sower	166,381

	Patent No.
Hunter and Eichbaum	166,352
Irrgang, R., Letter block apparatus	166,382
Jarboe, J. W., Machine for pressing sugar into blocks	166,383
Jenkins, J. C., Cultivator	166,278
Johnson, J., Fruit drier	166,385
Johnson, S. H., Method and apparatus for separating free sulphur	166,279
Johnson, W. O., Stump puller	166,384
Jolley, J. G., assignee	166,278
Jones, G. H., Turbine water wheel	166,206
Jones, W. D., Air brake	166,386
Jouniaux, E., & Co., assignees	166,270
Katté, W., Splice plate for metallic truss bridges	166,387
Kauper, J., Carpet sweeper	166,388
Keating, J., assignee	166,217
Kingsbury, J. J. D., Weighing apparatus for wagons	166,389
Knox and Palmer	166,295
Knox, O. M., Compound for destroying hop grubs, &c	166,307
Krog, H., Sr., Plow	166,281
Kreune, F. W., Bung for barrels and casks	166,280
Langwell, W., Machine for finishing bottle necks	166,390
Lathrop, L. W., assignee	166,236
Lehman, D. A., Button hole cutter	166,208
Leland, E. A., Pan for water closets	166,209
Lewis, N. B., Bush for mill spindles	166,210
Ligibel, A., Casting umbrella tips, &c	166,282
Lincoln, J. D., assignee, (reissue)	6,578, 6,579
Lindsay, J. H., Vehicle hub	166,283
Little, O. H. P., and F. J. Heuber, Furnace grate	166,391
Lobree, L., Fancet	166,211
Love, O., Post hole borer	166,392
Lovell, M. N., Index	166,284
Lankenheimer, F., Globe valve	166,393
Macqueen, A., Jr., Shower bath	166,212
Malcolmson, T., Pump piston for artesian wells	166,394
Marbach, R. and H., Sleigh bell	166,396
Marks, M., Cap	166,395
Mayo, L. C., assignee	166,193
McBride, T., Hydraulic car brake	166,397
McDonough, T., Car starter	166,213
McGowan, T., Distillation of hydrocarbon oils	166,285
McKee, J. D., assignee	166,340
McLaughlin, G. T., Steam generator	166,398
McMahel, J. F., and S. Tracy, Organ stop action	166,214
McNair, W. L., Furnace for heating tubes	166,399
Meeker, J. R., assignee	166,378
Merrill, M., Manufacture of turn buckles	166,286
Messer, L., Spring catch for boxes	166,400
Meyer, J., Basket	166,215
Mieg, C. T., Fixing and developing colors on fabrics	166,287
Mitchell, J. C., Gas generator	166,288
Mooney, J. E., Hydrant	166,401
Morris, A., Bed lounge	166,289
Morrison, A. A., assignee	166,436
Morse, H. C., assignee	166,232, 166,422
Mote and Perry	166,222
Mulloway, J. F., and T. S. Shaw, Gage cock	166,216
Myers, R. W., Stool	166,402
Nauman, E., Cultivator	166,290
Nichols, B. S., assignee	166,444
Nielsen, C., Vehicle spring	166,291
Norton, L. B., Reed organ stop action	166,292
Oakley, J. M., Washing machine	166,217
Ockershausen, G. P., Sugar sawing machine	166,403
Orum, M. L., Device for bending metal pipes	166,293
Orum, M. L., Mandrel for bending metallic tubing	166,294
Otis, N. P., Hoisting machine	166,219
Palmer, W. L., and I. W. Knox, Rotary pressure blower	166,295
Palmer, W. S., assignee	166,234
Parker and Holland	166,204
Parker, C. C., Eyeglass	166,220
Parson, T. D., Auger	166,221
Perrine, H. L., Air brake	166,404
Perrine, H. L., Air brake	166,405
Perrine, H. L., Air brake	166,406
Perry, B. P., and O. S. Mote, Saw mill head block	166,222
Perry, J., Securing flexible roofing to roofs	166,296
Pickett, F. L., Shirt bosom	166,297
Pittsburg Chain and Car Link Manufacturing Company, assignee	166,369, 166,370, 166,371, 166,372, 166,373, 166,374, 166,375, 166,376, 166,377
Plantron, C. N., Cylinder for carding machines	166,407
Pope, F. L., Electric signaling apparatus for railways, (reissue)	6,578
Pope, F. L., Electric signaling apparatus for railways, (reissue)	6,579
Poulin, L., assignee	166,217
Power and Fenner	166,267
Pratt, Z. I., Candlestick	166,223
Proctor, J. K., Mechanism for operating doffer combs	166,408
Rand, A. C., Process and apparatus for manufacturing gas	166,409
Rawson, D. W., Clothes pounder	166,224
Reed, G. E., Bottle stopper	166,298
Reed, J., Feed guide for printing presses	166,410
Reessing, Wolff, and Sellman	166,308
Richardson, F. A., Shirt	166,411
Richardson, L., assignee	166,209
Riegel, S. D., Adjustable handle for harrows	166,299
Rigsby and Hipkins	166,379
Robinson, W., Connector for electric track circuits	166,225
Rolfhaus, P., Jr., Fire place heater	166,300
Root, L. O., Safety runner for railroad cars	166,301
Root, S. E., Clock dial, (reissue)	6,580
Rose, I. M., Feeding device for sewing machines	166,302
Rote, J. F., Egg beater	166,412
Roth, J., Apparatus for fish culture	166,413
Rulon, T. D., Car axle box bearing	166,414
Russell, J., assignee	166,238
Russell, J., Horseshoe	166,226
Russell, J., Pile for horseshoe blank bars	166,227
Rust, O., Earth auger	166,303

TITLES, DRAWINGS, AND CLAIMS

OF

PATENTS GRANTED AUG 3, 1875.

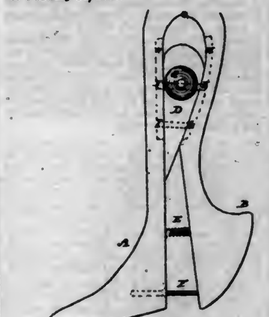
166,180. FIRE-TUBES FOR STEAM-BOILERS. Henry Bailey, New York, N. Y. [Filed July 1, 1875.]

Brief.—The spaces between the spirals permit the products of combustion to commingle.

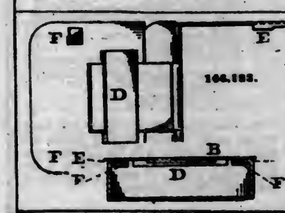
166,180.

1. In combination with the spiral sections B, the combustion-chamber D, for the purposes described.

2. The connecting link or rod C, in combination with the spiral sections B, for the purposes described.



166,181. ROTARY CHURNS. James L. Barden and Samuel Crudden, Hamilton, Ohio. [Filed May 17, 1875.]



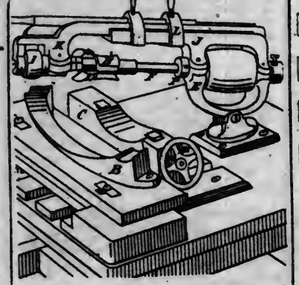
The combination and arrangement of the agitators *b c* and deflectors *i*, when the former are provided with the notches *s*, substantially as described, for the purpose specified.

166,182. BOOT-HOLDERS. A. N. Breneman, Lancaster, Pa. (Filed July 2, 1875.)

Brief.—Improvement on Patent No. 73,228, of January 14, 1868.

The combination of the hinged parts A B, sliding wedge D, coiled spring E, and guide-rod F, as shown and described.

166,183.

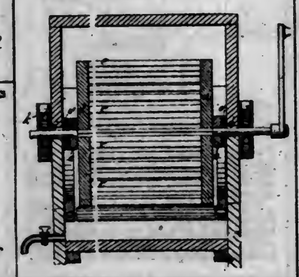


166,183. BOX-FASTENINGS. Edward W. Bridge, Philadelphia, Pa., assignor to W. K. Ferguson and James M. Bennett, same place. [Filed June 26, 1875.]

166,180.

The sliding and axial lid B and body A, connected by the tongue C and eye D, and the fastening lugs E F, combined and operating therewith, substantially as and for the purpose set forth.

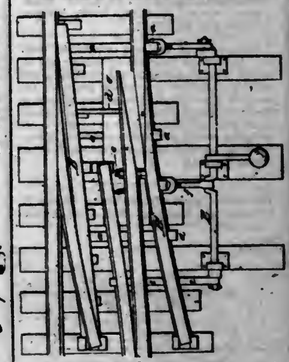
166,184. MACHINES FOR SHAPING CHAIR-BACKS. Henry Buchter, Louisville, Ky. [Filed Apr. 6, 1875.]



Brief.—Chair-backs and similar articles can be formed by means of a cutter-carrying frame, which is longitudinally adjustable by a slide working in a groove in the upper part of the swiveled frame, and secured by stirrups and set-screws, and the cutter-spindle adjustable through bearings in the frame by loose collars and set-screws, and provided at its outer end with a guide-roller, and having its inner end attached by a universal joint to the table, in connection with a raised and removable curved guideway, upon which the roller travels, and suitable dragging mechanism.

1. The combination of the adjustable tool-spindle F, roller I, rest C, and removable and adjustable guideway B, constructed, arranged, and operating substantially as and for the purpose described.

2. The combination of the swivel frame E, frame J, and adjustable frame K with the tool-spindle F, constructed and arranged substantially as shown.



166,185. WASHING-MACHINES. John H. Carroll, Dubuque, Iowa. [Filed Nov. 9, 1874.]

The rubber sliding blocks *j* in combination with their inclosing-boxes *k*, and the cylinder C, substantially as and for the purpose described.

166,186. RAILROAD-SWITCHES. Dennis F. Cavanaugh, Greensburg, Pa. [Filed July 15, 1875.]

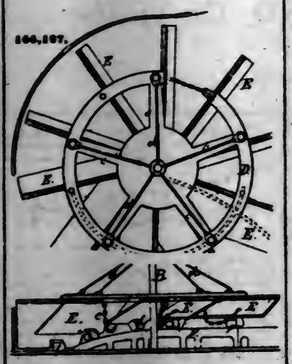
Brief.—A railroad switch having three movable rails—*A*, *a*, the two siding-rails and one section of one of the main rails, the last named closing on a diagonal splice-lap against the contiguous section of the main-line rail when the main line is clear. The switch-rails are operated by hand through a crank-shaft, and in case a train is coming along the main line in direction from the siding, and the main line is closed, the flanges of the wheels operate a push-lever, and open the main line. The outer movable rail is re-enforced or braced by a rod attached to the crank-shaft.

1. In combination with the laterally-adjustable rail A' of the main or direct track, the movable switch-rails B' B and pivoted guide-rail D, said rails being connected by means substantially as described, whereby, when the switch is open and rails B' B in connection with the rails A A', the impact or pressure of the wheels against rail D will effect the closing of the switch, substantially as specified.

2. The laterally-movable switch-rail B', pivoted at one end only, and direct rail A', connected together by means of the adjusting tie-rod *c*, substantially as and for the purposes set forth.

3. In combination with the pivoted trip-rail D, movable switch-rails B B', and movable direct rail A', the crank-shaft E, and connecting-arms *a*, *c*, *e*, *c*, and *d*, as shown and described.

4. In combination with switch-rail B' and the elbowed crank-shaft E, the operating and brace lever *f*, supporting the rail B' at its first point of junction with the permanent rail A', as shown.

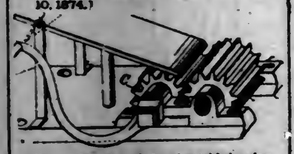


166,187. CURRENT WATER-WHEELS. W. W. Cleaveland, Coldwater, Mich. [Filed July 8, 1875.]

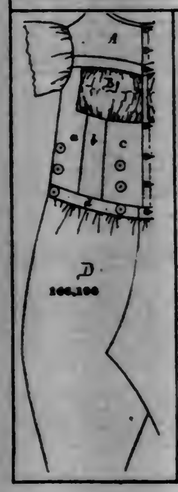
Brief.—Consists of the combination of the hinged buckets or wings with their chain braces or supports and friction-rollers on their rear or under sides, to change their position and bring them edgewise to the current when the water rises in the stream so as to overflow its channel and submerge the wheel.

The hinged wings or buckets E, provided with chain-supports *e* and friction-rollers *f*, in combination with the curved bridge or track F, operating substantially in the manner as herein shown and described, for the purpose specified.

HELIOTYPE RELIEF PROCESS. JAMES R. OSGOOD & Co. BOSTON



166,187.



166,188. PROCESSES FOR THE MANUFACTURE OF MATERIAL FOR BEARINGS. Sigismund Cohen, London, Great Britain. [Filed Apr. 21, 1875.]

The process of making a material for bearings for general purposes by mixing well together ground asbestos and plumbago, and making therefrom a semi-dry paste by the mixture therewith of liquid silicate of soda or liquid silicate of potash, then drying the said paste and immersing it in, or causing it to absorb, hot melted paraffine or ceocerite, or a solution of paraffine in benzole; substantially as herein specified.

166,189. MEAT-TENDERER. George E. Comstock, Mankato, Minn. [Filed June 10, 1874.]

The combination of the adjustable bearing-blocks and the wheels U C', the blocks being adapted for adjustment at fixed distances, but rigidly holding the wheels in any position in which they may be secured, as described.

166,190

166,191.

166,190. UNDER-CLOTHING FOR WOMEN. Susan Taylor Converse, Woburn, Mass. [Filed Oct. 31, 1874.]

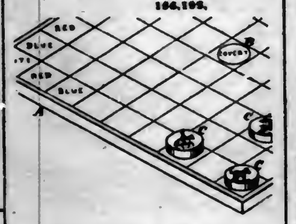
1. The garment above described, consisting of the body A, the breast-pieces B B, and leg-pieces D D, constructed and arranged together as described.

2. In combination with a body-garment, the breast-pieces B B, curved and gathered at top or bottom, or both, and having the front end cut shorter than the rear end, all as and for the purpose specified.

3. The body composed of the waist pieces a b c, back-piece c, band d, and suitable neck-pieces A, and breast-pieces B, the band extending below the abdomen, and the whole fitted closely to the form, and acting as an abdominal supporter.

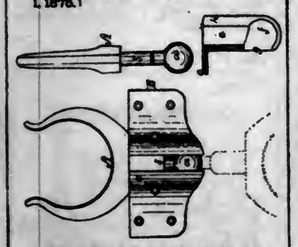
166,191. CARRIAGE-WHEELS. D. Cushman, Milford, Mass. [Filed May 22, 1875.]

The ferrule C, provided with the partition a and the female screw, to receive and support the separate male screw D, in combination with said screw D, the spoke B, the nut E, and the tire provided with the recess b and spanner G, all as set forth.



166,192. GAME-BOARDS. Harvey Darnell, San Francisco, Cal. [Filed June 12, 1875.]

Brief.—To play a game called "the chase," in which each party tries to capture the other's "game," or pieces having deer or other objects of prey upon them.

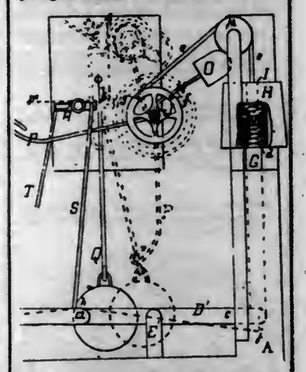


1. The board A, having squares or spots painted in three different colors, and provided with a "covert" or independent spot, B, in its center.

2. In combination with the checkered board A, with its covert or center spot B, the playing-pieces C, when said pieces are marked or otherwise constructed to represent a party of hunters and animals of the chase or game, substantially as and for the purpose described.

166,192.

166,193. ROWLOCKS. Frank E. Davis, Gloucester, Mass., assignor to himself and Israel C. Mayo, same place. [Filed June 1, 1875.]

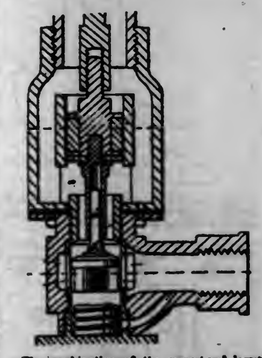


1. The rowlock A, provided with the ball a and the fastened shank c, as described, for use with a bracket, constructed substantially as specified.

2. For use with such a rowlock, the bracket B, provided with the ball-socket f, open at bottom and in rear, and with the shank-socket e, open in front, and opening out of the ball-socket f, all being substantially as set forth.

166,194. TIME-SIGNALS FOR RAILROADS. James A. Oinkey, Nehemiah Embody, and Saml. Bradley, Mauch Chunk, Pa. [Filed June 23, 1875.]

Brief.—The index being set at the starting-point and the clock-work wound up, it is automatically started by a passing train. After running a certain length of time it stops, and is again wound up, the index set back to the starting-point, and the clock-work again started by the next passing train. The index points the time which has elapsed since the passage of a train.

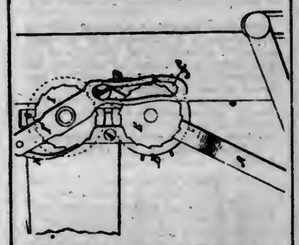


1. The combination, with a clock-movement, of the spring B, levers D D', lifting-bar G, winding-weight H, cord e, pulley J, arbor K, and spring L, as shown and described.

2. The combination, with a clock-movement, of the pulley M, rod and weight N O, and the trip-lever P, as shown and described.

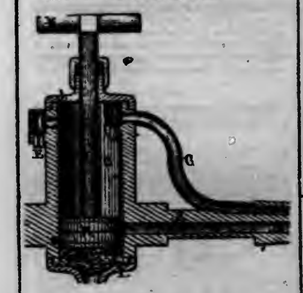
3. The combination, with a clock-movement, of the spring B, lever D, rod S, lever E, and the trip T, as shown and described

166,195. WATER-HYDRANTS. Joseph W. Douglas, Middletown, Conn., assignor of one-half his right to Benj. Douglas, same place. [Filed Apr. 20, 1875.]



Brief.—By screwing down the valve-stem, the cylindrical orifice in the lower part closes over the spindle of the lower valve, the two being held by the friction. The lower valve may now be drawn up to its seat. When the upper portion of the hydrant is removed for repairs, &c., the lower valve is held fast by the pressure of the water.

The combination of the upper and lower valves, acting together by their mutual embrace, in connection with the upward pressure of the water against the bottom of the lower valve, holding it firmly to its seat, to cut off the flow, as specified.



166,196. FEED-CUTTING MACHINES. Lucius Evans, Fayetteville, N. Y. [Filed July 1, 1874.]

Brief.—From one end of the horizontal driving-shaft proceeds a jointed lever, which imparts a rotary motion to the lower feed-roller, and through a slotted connecting-link, which permits the upper roller to yield vertically, the upper roller is simultaneously rotated. A pawl on the slotted link engages with the ratcheted end of the upper roller, and another on the upper end of the jointed lever engages with the ratcheted end of the lower roller, to produce an intermittent feed of the material to the reciprocating cutters.

The slotted and pivoted arm E f, with pawl H, reciprocating arm A, with pawl D and stud G, in combination with the ratchet I on yielding roller G, and ratchet E on roller B, for feeding the material to the cutting-knives, as set forth.

166,197. FAUCETS. R. Max Fascidt, Albany, N. Y. [Filed Dec. 4, 1874.]

1. The combination of the faucet A with the air-pump C, when arranged as herein described, and in such manner that each stroke of the piston H will reciprocally inject air into a vessel containing liquid, and eject an equal quantity of liquid therefrom, as herein specified.

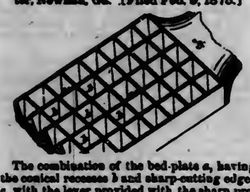
2. The faucet A, having the air-pump C and piston H arranged in relation to the air-passage G and outlet-passage E, and constructed to operate in the manner and for the purpose herein specified.

3. The combination of the faucet A and air-pump C with the filtering material F, substantially as and for the purpose set forth.

166,198. GAME-BOARDS. Isaac N. Pentecoster, Baltimore, Md. [Filed June 16, 1875.]

1. The arrangement, upon the board or bed over which a ball is played, as herein before set forth, of the central group of curved guides, having concave outer faces, and the outer or marginal guides, having concave inner faces located at intervals around said central group, substantially as and for the purpose set forth.

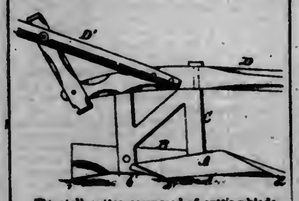
2. In combination with a game board or bed, the curved guides D E F G H I, arranged relatively to each other, substantially in the manner and for the purpose set forth.



3. The combination, with the guides C H, of the directing-pins K K', arranged upon the bed or board, as set forth, to guide the ball in its passage between the concave faces of the guides.

166,199.

4. The combination of the curved ball-guides and the gaging-pins J, arranged upon the bed or board relatively to each other, as set forth, whereby the ball is caused to follow the concave surface of the guide against which it is played inside of and around the pin.



166,199. MEAT-TENDERER. A. G. W. Foster, Newnan, Ga. [Filed Feb. 9, 1875.]

The combination of the bed-plate a, having the conical recesses b and sharp-cutting edges c, with the lever provided with the sharp projections c, the projections being enough smaller than the recesses b to leave a space all around them, substantially as shown and described.

166,200. STALK-CUTTERS. Chas. H. Gaylord and Edward M. Ayers, Osceola, Ark. [Filed May 6, 1875.]

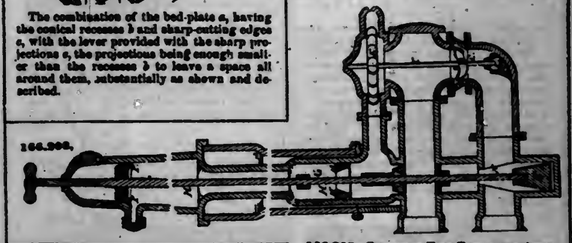
Brief.—A low-cutting mower, the edge slightly curved upward in its center, and having a landside with a rear point or rudder to keep it in position.

The stalk-cutter composed of cutting-blade A, placed and secured in a nearly flat or slightly-inclined position, constructed or formed with curved sharp cutting-edge A' and projecting points a a', upon which it rests, land-side B, formed with a rear projecting sharp point, b, standard C, and ordinary plow-beam and handles D D', as and for the purposes described.

166,201. GRAIN-FORKS. Frederick Gerlen, Locust Grove, Pa. [Filed Feb. 20, 1875.]

Brief.—The head of the fork is composed of metal, and fitted to receive the handle. The tines are each separate from the others, the upper end being provided with a screw-thread, which screws into a threaded hole in the head. The body of the tine is square next to the head, and is kept from turning, by a lock-plate that fits over all the tines, and is secured in place by screws.

The fork head A, with its shoulder a and screw-holes c, in combination with the prongs T, provided with shouldered screw-ends, and lock-plate B, provided with a notched flange, b, substantially as and for the purpose specified.



166,202. DERRICKS. Martin Gray, Mentor, Ohio. [Filed Feb. 2, 1875.]

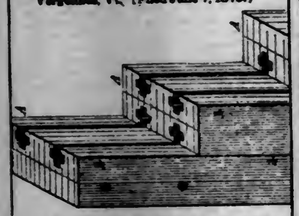
Brief.—The back leg or support is adapted, by a notch and hook, to ready adjustment and removal.

The brace D, with its angle c, notch a, and hook b on its upper end, in combination with the derrick A, substantially as and for the purpose as herein before set forth.

166,202.

166,203. COMBINED FIRE-PLUGS AND AUTOMATIC PUMPS. William W. Harding, Philadelphia, Pa. [Filed June 21, 1875.]

Brief.—The plug has within it a motor and pump. By the arrangement shown, of the screw-threaded rod and the disk and upper valve, the lower valve may be closed, stopping the motor, and allowing the hydrant to be used in ordinary way. Both valves may, however, be closed when desired.



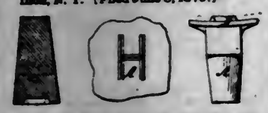
1. The combination, with a fire-plug or hydrant, of an automatic rotary motor and force-pump within it, and a rod and check to close, or open the supply of water through the motor, so as to use or stop the pump at pleasure, substantially as described.

2. The combination, with a plug or hydrant having within it an automatic force-pump, of a screw-threaded rod to open the ordinary water-passage alone or separately, or also to open the supply of water to the water-motor of the pump at will, substantially as and for the purposes described.

3. A combined water-plug or hydrant, and an automatic force-pump in its interior, which plug or hydrant can, at will, by means of checks, be used either in the ordinary way as a simple water-plug, or as a combined plug and force-pump, substantially as described.

4. The combination of rod H, disk O, rod checks I and K, to open and close the plug or pump, or both, substantially as described.

166,896. SLIDES FOR EXTENSION-TABLES. Wallace S. Holland and Josiah W. Parker, Vergennes, Vt. [Filed June 7, 1875.]

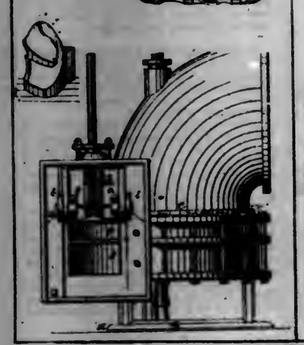


1. The metallic slide B, having the extension *b'* beyond the right-angled projections *b'' b''* of body *b*, in the manner and for the purpose substantially as described.

2. The runner-bars A, having the grooves *a* formed with the extensions *a'* beyond the upright and right-angled grooves *a''*, in the manner and for the purpose substantially as described.

3. The combination, in extension-tables, of the metal slides B, having the extension ends *b'*, with the runner-bars A, having the grooves *a* and the terminal grooves *a''* to receive the metal slides, in the manner substantially as specified.

166,906. TYPES. Anson Merrick Howard, Ilion, N. Y. [Filed June 3, 1875.]



Single metal type, having their lettered ends made in form of a segment of a cylinder, substantially as and for the purpose described.

166,906. TURBINE WATER-WHEELS. Geo. H. Jones, Ross, N. Y. [Filed May 1, 1875.]

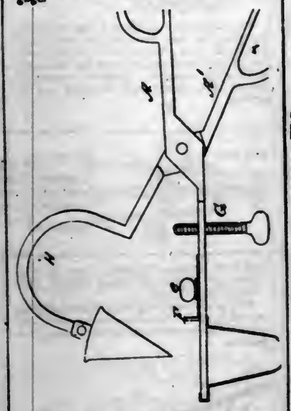
Brief.—The bucket has a raised dividing edge to the water flowing back and reacting from the bucket, for the purpose of causing a smoother flow and diminishing its backward pressure. The seat upon which the gate works is so arranged and extended that, by the use of a single gate, either of the different-sized compartments or chambers may be used separately or together. The slide-gate has adjustable bearing- or bores. There is also a siphon draft-tube arranged above the wheel, and connected thereto in a manner that admits of adjustment.

1. The water-wheel bucket, substantially as herein described, having the increased depth downward from the concave face of the same, for the purpose specified.

2. The water-wheel bucket, formed with a raised dividing-edge, *a'*, to the water flowing back and reacting from the bucket, for the purpose of causing a smoother flow and diminishing its backward pressure, substantially as described.

3. The combination, with a suitable gate, and the different size compartments *c c*, of the seat extended above and below said compartments in a manner that will admit of either being used separately, or both simultaneously, by the use of a single gate, substantially as and for the purpose set forth.

4. The combination, with a water-wheel, of a siphon draft-tube, arranged above the same and connected thereto in a manner that will admit of adjustment, substantially as and for the purpose set forth.



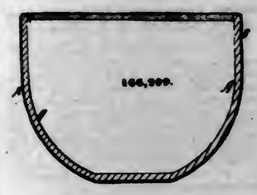
5. The gate *k*, provided with friction-rollers *l*, and adjustable bearings *k*, substantially as and for the purpose set forth.

166,907. COMPOUNDS FOR DESTROYING HOP-GRUBS, &c. Orville M. Knox, Knoxborough, N. Y. [Filed Feb. 8, 1873.]

The within and foregoing described compound, consisting of sulphur, pulverized plaster, and common salt, mixed in about the proportion of ten parts sulphur, ten parts pulverized plaster, and two hundred parts of common salt, all substantially as and for the purposes specified.

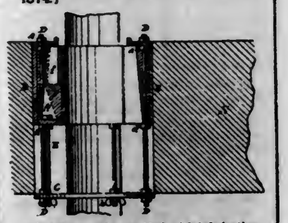
166,908. BUTTON-HOLE CUTTERS. Daniel A. Lehman, Wakarusa, Ind., assignor of one-half his right to Joseph A. Culp, same place. [Filed May 2, 1874.]

Brief.—The gage has a notched shoulder, and is applied upon the slotted arm of the button-hole cutter. The straight shank of the cutting-shears has a set-screw to regulate the angle of opening, and the other shank is bowed to pass over the set-screw which adjusts the gage.



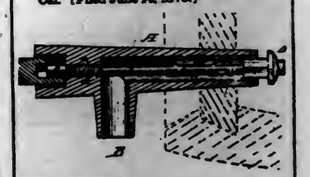
1. The gage F, having a notched shoulder or abutment, applied upon the slotted arm of a button-hole cutter, substantially as and for the purpose set forth.

2. The button-hole cutter having the straight shank A slotted to receive the knife, and provided with the set-screw C, clamp-screw *c*, and notched gage-plate F, and the pivoted knife-shank A', bowed at E over the clamp-screw *c*, as specified.



166,909. PANS FOR WATER-CLOSETS. E. A. Leland, Pittsfield, Mass., assignor to L. Richardson, Brooklyn, N. Y. [Filed June 5, 1875.]

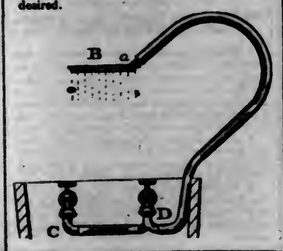
Brief.—A water-closet pan having the interior of porcelain, and the exterior being a metallic shell, the metal is brought over the edge of the porcelain to protect it.



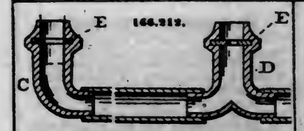
The water-closet pan constructed with the inner portion A of porcelain, and the outer portion B of sheet metal, the edge of the sheet metal being tapped or spun over the edge of the porcelain, substantially as and for the purpose herein set forth.

166,910. BUSHES FOR MILL-SPINDLES. N. B. Lewis, Columbia, Pa. [Filed Nov. 11, 1874.]

The followers F, provided with lubricating-chamber *f* and recess *f' f'*, in combination with screws E, basal ring G, having slotted lugs *g*, shell B, cover A, and screw-rods D, all constructed and arranged to operate substantially in the manner described.



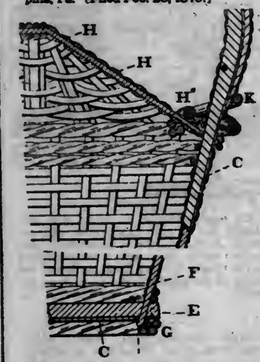
166,911. FAUCETS. Isaac Lobree, Antioch, Cal. [Filed June 14, 1875.]



The plug A, formed of a single piece, having spout B, nut *c*, and recess *b*, for a key, C, in combination with the screw-rod C, having valve D, extending beyond the plug, all constructed as and for the purpose herein set forth.

166,912. SHOWER-BATHS. A. Macqueen, Jr., Philadelphia, Pa. [Filed May 31, 1875.]

Brief.—The flexible tube and sprinkler is attached to the couplings, as shown. The couplings have transverse embracing-washers, which hold them to the bath-tub cocks. The temperature of the water can be adjusted as desired.

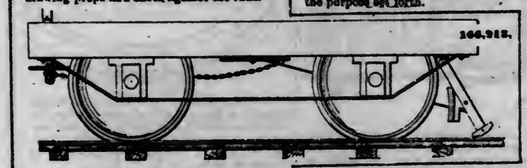


166,912.

1. As a new article of manufacture, a portable shower-bath, as herein set forth, the same consisting of the flexible tube A and sprinkler B, in combination with the coupling-tube, having an embracing-washer, E, extending transversely therein, substantially as and for the purpose specified.

2. The tube A, with end coupling C, in combination with the coupling D, intermediate of the sprinkler B and the said coupling C, substantially as and for the purpose set forth.

3. The portable shower-bath herein described, the same consisting of the flexible tube A and sprinkler B, in combination with the end coupling C and the coupling D, intermediate of the sprinkler and said coupling C, substantially as and for the purpose set forth.



166,913. BASKETS. Julius Meyer, Philadelphia, Pa. (Filed Feb. 26, 1875.)

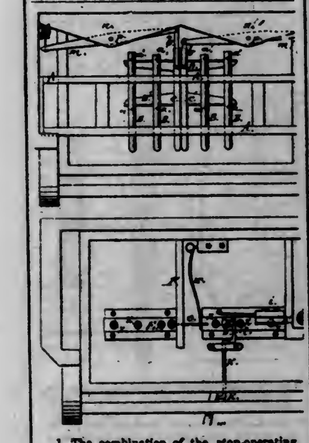
1. The combination, with a basket having a handle, of the bracing-strip C extending continuously around the handle, sides, and bottom of the basket, substantially as and for the purpose set forth.

166,914. CAR-STARTERS. Thomas McDonough, Mont Clair, assignor of two-thirds his right to W. F. Dodge and G. R. Dunn, Newark, N. J. [Filed May 3, 1875.]

Brief.—Raises weight of rear end of car by drawing props and shoes against the rails.

The lever L and gears G, in combination with the props and shoes, substantially as and for the purpose set forth.

166,915.

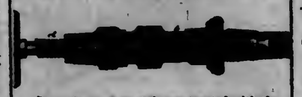


2. The combination, with a basket, of the wooden bottom E, having a series of perforations near its outer edge, and the rods or wands F passing through the perforations and woven below the bottom into the foot G, substantially as and for the purpose set forth.

3. The combination, with the basket-lid J, of the bracing-piece H, extending transversely and formed into ring-engaging loops H' H'', substantially as and for the purpose set forth.

4. The combination, with a basket-lid formed with loops H' H'', of the soft-rubber rings K K', substantially as and for the purpose set forth.

166,916. ORGAN STOP-ACTIONS. James F. McMahel and Saml. Tracy, Oxford, Ohio. [Filed Feb. 12, 1875.]

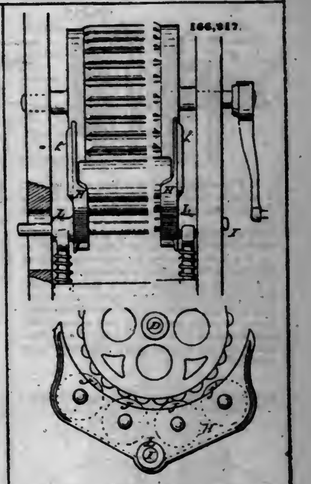


Brief.—Particular mechanism for throwing on or off the entire set of stop-registers. Holes connecting the bellows with the wind-chest are controlled by a slide-valve and knee-lever.

1. The combination of the stop-operating mechanism C C', D D', *m m'*, arranged and connected with pedals *v w*, as described, for the purpose specified.

2. The valves E, in combination with crank-rod K, hinged knee-lever T, and spring W, arranged as described, for the purpose specified.

166,916. GAGE-COCKS. John F. Mullowny, Pittsburg, and Thomas S. Shaw, Connellsville, Pa. [Filed May 18, 1875.]

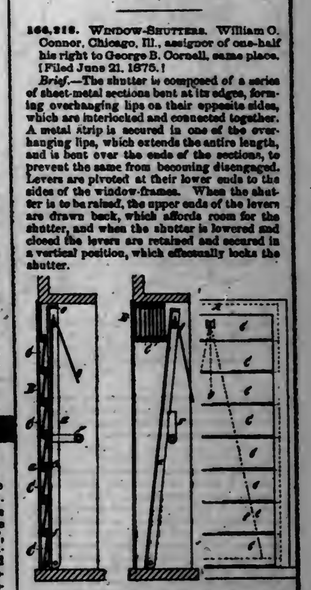


In a steam gage-cock constructed with the herein-described lower independent valve-chamber and spring-valve disconnected from and operated by an upper valve-stem, the shell A, having a weak and brittle portion, *b'*, the latter part constituting the point of breakage between the flange and screw-thread, and located with reference to the conical valve-seat *i*, for the purpose specified, all substantially as shown and set forth.

166,917. WASHING-MACHINES. John M. Oakley, Brooklyn, N. Y., assignor of one-half his right to John Keating, same place. [Filed June 10, 1875.]

1. In combination with the revolving ribbed cylinder and oscillating roller-frame, the guiding-guards *h'* arranged inside of the main frame or in front of the cylinder, for the purpose and substantially as described.

2. The curved journal-carriers having their ends extended outward and upward, to form the guiding-guards, as described.

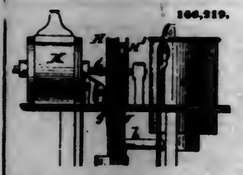


3. The metallic journal-carriers with guiding-guards, and provided with trunnions I, and adapted to oscillate on a rod, I, arranged to play in slots in the main frame, as set forth.

166,917.

166,918. WINDOW-SHUTTERS. William O. Connor, Chicago, Ill., assignor of one-half his right to George B. Cornell, same place. [Filed June 21, 1875.]

Brief.—The shutter is composed of a series of sheet-metal sections bent at its edges, forming overhanging lips on their opposite sides, which are interlocked and connected together. A metal strip is secured in one of the overhanging lips, which extends the entire length, and is bent over the ends of the sections, to prevent the same from becoming disengaged. Levers are pivoted at their lower ends to the sides of the window-frames. When the shutter is to be raised, the upper ends of the levers are drawn back, which affords room for the shutter, and when the shutter is lowered and closed the levers are retained and secured in a vertical position, which effectually locks the shutter.



1. A sheet-metal window-shutter, consisting of the series of sections C, provided with the overhanging lips *c c'*, the lip *c'* provided with the bar *b*, extending its entire length, and bent at its ends to form the lips *d d*, arranged to lap about the ends of the adjacent section, substantially as specified.

2. In combination with the shutter B, made in sections, as specified, the stops E E and levers F F, as and for the purpose specified.

166,919. HOISTING-MACHINES. N. P. Otis, Yonkers, N. Y. [Filed Jan. 6, 1875.]

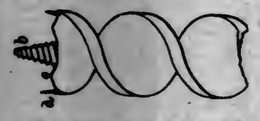
Brief.—The load is counterbalanced, and the speed of the load and counter-balance is regulated by means of the fluid retarder K on shaft G, which latter is connected with the load, and counterbalanced by chains secured to reverse sides thereof.

166,219.

1. The combination of a fluid retarder with a variable counter balance, controlled directly by the fluid retarder, substantially as specified.

2. The combination, with a variable counter-balance and the car or load controlled by it, of a fluid retarder, for regulating the velocity of both, essentially as described.

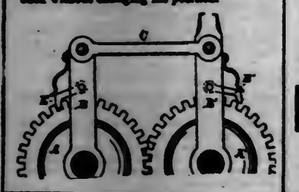
3. The combination, with a fluid retarder, for controlling both the variable counter-balance and the car or load, of the independent chains or ropes connecting said counter-balance and load with reverse sides of the shaft controlled by the retarder, substantially as specified.



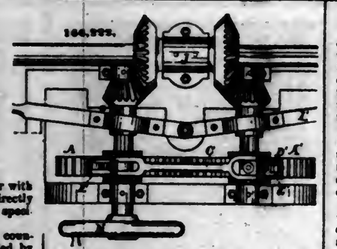
166,220. Steam-Lamps. Chauncey C. Parker, Brooklyn, N. Y. (Filed July 6, 1875.)

The spring-clamps or nose-piece *f f*, secured to the frame near its lower ends, and curved at its upper ends, as shown at *g*, and provided with elongated slots A, engaging with the pins *i i*, substantially as and for the purpose specified.

166,221. Augers. Thos. D. Parsons, Bristol, Conn., assignor to himself and Geo. T. Steele, same place. (Filed July 12, 1875.)



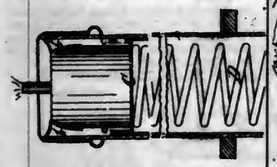
Brief.—The auger is provided with two receding concave-shaped floor-lips, and with two spur-cutters arranged on the outer edge of the body of the auger, a short distance back from the edge of the cutting-lip.



A bit or auger provided with the receding concave shape cutter-lips *c*, the cutting-spurs *d*, and center point or screw *b*, substantially as and for the purpose set forth.

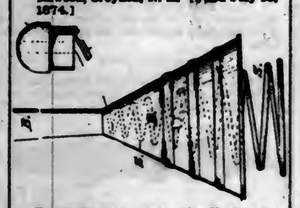
166,222. Head-Blocks for Saw-Mills. Benj. P. Perry and Orrin S. Mote, Richmond, Ind. (Filed Mar. 3, 1874.)

Brief.—A simultaneous and double-acting movement is communicated, at each stroke of a lever-handle, to two gear-wheels of equal diameter, which move the shafts that operate the knees of the head-block, by means of two upright levers attached to the axis of the wheels, and connected together by a pivoted bar, the whole operated by one of the levers, which is extended to form a handle, in connection with spring-pawls attached to the upper part of the levers. The operator can move either or both knees of the block forward or back without changing his position.



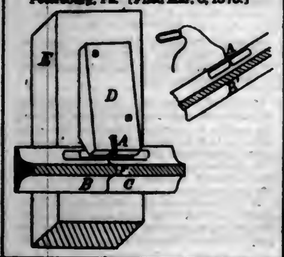
166,223.

The combination of the levers B B', connecting-bar C, and pawls E E' with the wheels A A', whereby a simultaneous and double-acting movement is communicated to the wheels A A' at both right and left strokes of the handle F, substantially as described.



166,224. Candlesticks. Elmer I. Pratt, New York, N. Y. (Filed Apr. 14, 1876.)

1. A cap of a candlestick, provided with a recess both of whose walls shall lie outside of the top of the candle when the candle is brought into position by adjusting the cap to the holder, substantially as and for the purpose set forth.

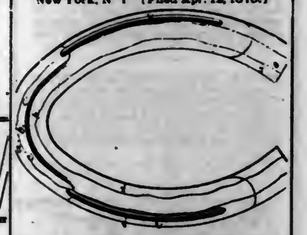


2. The combination of a recess formed in the cap of a candlestick and the upturned rim surrounding the candle-seat, substantially as and for the purpose described.

166,225. Clothes-Pounders. David W. Rawson, Croydon, N. H. (Filed July 18, 1874.)

The combination of the valve V, the tube or handle B, the expanded foot D, and the spiral spring S, all constructed and operating substantially as and for the purpose described.

166,226. Connectors for Electric Track-Circuits. William Robinson, St. Petersburg, Fla. (Filed Mar. 6, 1875.)

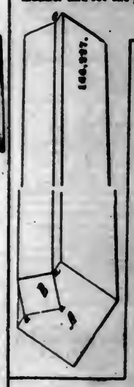


1. The combination with the adjacent rails of the track, of the spring A, having a bearing upon or against said rails, so that the rails being deflected by the weight of a passing car or train frictional contact will be secured between the spring and rails, for the purpose of maintaining reliable electrical connection between said rails, essentially as described.

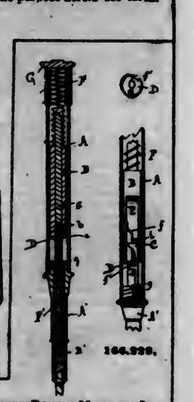
2. In combination with the adjacent rails B C, the spring A and the block or plate D, the latter holding said spring in frictional contact with said rails, for the purpose of electrically connecting the same, substantially as described.

3. The spring A, making rubbing contact with the rail B' when said rail is deflected, in combination with the magnet M or battery K, and electrically connecting said magnet or battery to said rail, essentially as described.

166,226. Horseshoes. Jacob Russell, New York, N. Y. (Filed Apr. 12, 1876.)



A horseshoe constructed with an inwrought central or internal rib of steel, continuous from one heel extremity to the other, and projecting at the toe and heel to provide wearing-surfaces of the calks, substantially as herein set forth.



166,227. Piles for Horseshoe-Blank Bars. Jacob Russell, New York, N. Y. (Filed Apr. 12, 1876.)

The pile for the manufacture of horseshoes herein described, composed of the rectangular steel bar B, arranged in the angular groove *c* of the rectangular iron bar A, in the manner and for the purpose herein set forth.

166,227.

166,228.

166,228. Automatic Dental Mallets. Ira A. Salmon, Boston, Mass. (Filed Jan. 6, 1875.)

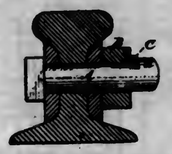
Brief.—The cap upon the upper end of the case has an outer sleeve and an inner tube, the latter furnished with a double screw-thread. The hammer is loaded with quicksilver, and cushioned with lead at the point where it strikes the hammer. A pivoted spring-catch plate takes into a notch in the spindle, which projects upward into the central opening of the hammer.

1. In combination with the hammer B, the leaden cushion *c*, substantially as and for the purpose set forth.

2. The hammer, drilled and loaded, substantially as shown.

3. The stud O, the slot A, and the small stud *g* and stop *i*, constructed and operating substantially as and for the purpose set forth.

4. The double thread or groove on the inside of the upper end of the case A, whereby I secure a quicker adjustment without loss of bearing.

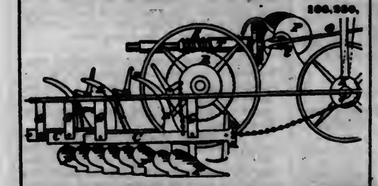


5. The cap, with its double screw and protecting-sleeve, constructed and operating in the manner substantially as described.

6. The combination of the hammer B, catch D, and spring *f*, or their equivalent, operating in conjunction with the shoulder, notch, or hole in the spindle, substantially as shown.

7. The combination of the catch, its spring, the hammer, spring F, and cap G, substantially as described, and for the purpose set forth.

166,229. Railroad-Rail-Joint Fastenings. Abel Spencer, Penn Yan, N. Y., assignor of two-thirds his right to Martin S. Hicks, same place. (Filed June 4, 1875.)

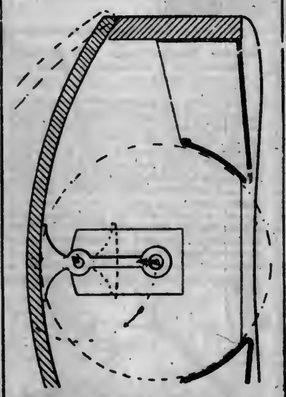


Brief.—A railroad-rail-joint fastening in which the fish-plates are held to the rails by means of a notched bolt, a channeled washer, and a wedge-shaped key, which fits the angular notch in the bolt, and the channel in the washer. The key, being driven home, tightens the joint, and it is then knocked over to prevent accidental displacement.

The bolt A, washer B, and key C, when made and used to hold plates and rails together, substantially as herein specified.

166,230. Steam-Plows. Theo. C. Stark, Vallejo, Cal. (Filed June 12, 1876.)

Brief.—Two or more gangs of plows are arranged upon beams which slide backward and forward between guides. Attached to each plow-beam is a chain passing around its pulley upon the forward wheel-shaft. A rigid lever or post on the pulleys has an eccentric connection with the geared propelling-shaft. The eccentrics are on opposite sides of the latter shaft, so that as the machine moves forward, the plows upon each beam work alternately.



Two or more guided plow-beams, C, with their attached plows F arranged to be operated in alternation from one main power by means of the chains I, pulley or cranks K, levers M, connecting-rods O, and eccentrics P, all combined and arranged to be driven by the shaft Q, substantially as and for the purpose described.

166,231. Reciprocating Churn-Dashers. Henry A. Shearer, Lincoln, R. I. (Filed July 10, 1876.)

A churn-dasher having conical inclined holes B, circularly arranged with the larger ends below, opening into recess *d*, and small ends above into recess F, and similar holes C, interiorly arranged, with smaller ends opening into the cavity E, and large ends opening into recess F', all constructed substantially as and for the purpose described.

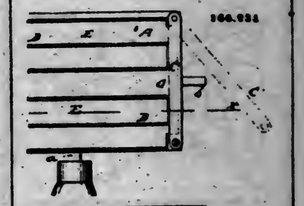
166,232. Carpet-Sweepers. Alexander W. Stewart, Boston, assignor to John J. Haley, Newton, and Henry C. Morse, Boston, Mass. (Filed June 27, 1874.)

The adjustable bearing-plate A, pivoted to the end of the box, or sloted, and held by a set-screw, and adapted to receive and release the spindle B of the brush-shaft, and to hold it firmly against displacement when brought into a proper working position, substantially as set forth.

166,233. Pulley-Covers. J. W. Linton, New York, N. Y. (Filed May 22, 1876.)

The endless pulley-cover composed of one or more layers of bias canvas inclosed between concentric layers of rubber, the whole being united by vulcanization, substantially as and for the purpose set forth.

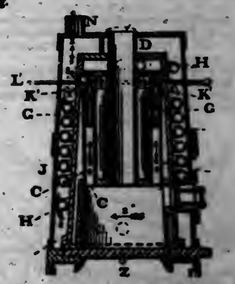
166,233.



166,234. Churn-Cranks. Robert P. Van Horne, Gratiot, Ohio, assignor of one-half his right to W. S. Palmer, Brownsville, Ohio. (Filed Mar. 9, 1876.)

Brief.—The comb-plate is removable from the beat, and is held in place by a pivoted bar on one side of the beat.

1. The carry-comb beat A, constructed as described, with the stationary bar C at one end, and the movable bar C' at the other end, for fastening the card to the beat, the movable bar C' being held by a screw, *d*, substantially as herein set forth.

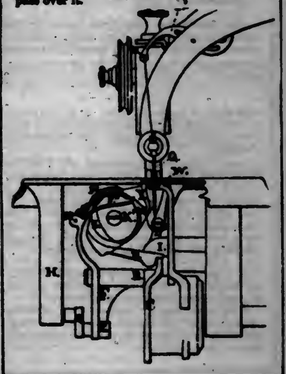


2. The combination of the beat A, handle B, stationary bar C, movable bar C', with screw *d*, and card D E C, all constructed substantially as and for the purposes herein set forth.

166,234.

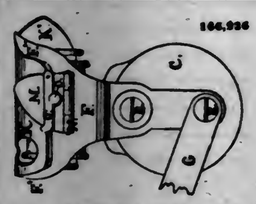
166,235. Water-Tube Boilers. James Warner, Philadelphia, Pa. (Filed Mar 18, 1875.)

Brief.—Drop-tubes from the upper chamber descend into the vertical fire-tubes in the boiler proper. A water-coil extends around the boiler, from the upper chamber to the water-leg.



1. In a steam-generator, the combination of the suspended water-coil H, drum D, water-legs G, fire-flues C, into which said legs project, and the damper K, substantially as described.

2. The inner casing A and outer shell J, in combination with the wall N, bars W, and damper K, substantially as and for the purpose described.



3. The drum D, provided with water-legs G, located above and in combination with the fire-flues, so as to leave a space between the said drum and flues, substantially as shown and described.

166,236. Sewing-Machines. Theodore A. Weber, New York, N. Y., assignor of three-fourths his right to Benoivil Gardner and Lebbeus W. Lathrop, same place. (Filed Jan. 12, 1876.)

Brief.—The shuttle, carried in an elliptical path, has a projecting beveled nose, that increases the size of the loop after it leaves the looper, which is confined across the track of the shuttle by a cam and spring. The shuttle is supported at either end loosely, and bears down on them by a spring that bears on top of the shuttle, allowing the thread to pass over it.

166,936

1. The combination of looper D and cam G, with shuttle K, its holder F, crank-pin B, link G, and stationary post H, as and for the purpose set forth.

2. The combination, with shuttle K, of carrier F, provided with resting-places F' and F'', finger M, notched projection O, and catch O', as and for the purpose specified.

166,937. CHILDREN'S CARRIAGES. FRANCIS W. Whitney, Leominster, Mass., assignor to F. A. Whitney Carriage Company, same place. [Filed May 14, 1875.]

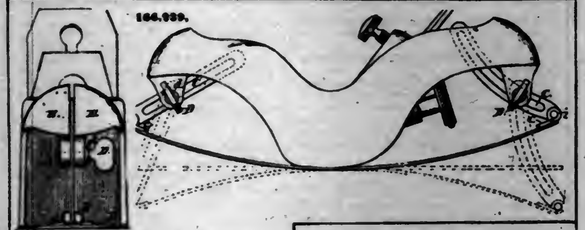
Brief.—The handle is centrally pivoted, and may be fastened either to front or rear by means of a swinging latch attached to handle.

1. In combination with the reversible handles a, the bar A, pivoted to said handles, and the latch f, hinged to said bar, so as to latch said handles at or to either end of the carriage, substantially as described and represented.

2. In combination with the pivoted or swinging handles a and bar A, the holes or eyes m, or hooks or angles in the bar, and the hooks n n on the rearches or axles, for locking the handles to the carriage, so that the latter may be raised up and let down by the former, as and for the purpose described.

166,938. BASE FOR HORSESHOE-BLANKS. John Wike, Phillipsburg, N. J., assignor to Jacob Russell, New York, N. Y. [Filed June 15, 1875.]

The blank for horseshoes, more or less diamond-shaped in its cross-section, and constructed with the rounded longitudinal corner a, substantially as and for the purpose herein set forth.



166,939. BENCH-PLANE. D. F. Williams, Woonsocket, R. I., assignor to Bailey Tool Company, same place. [Filed May 24, 1875.]

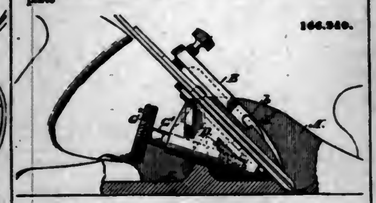
Brief.—The plane is provided with a flexible cast shoe, having at either end a hinged and slotted arm, and each end is split to form a clamp, in connection with clamping-jaws projecting from the under side of the stock. The shoe can be adjusted to any desired position by means of a set-screw operating through the jaws and slots of the hinged arms.

1. A bench plane having a flexible face, in which the stock is split at either end to form a clamp, substantially as described.

2. The combination of the flexible shoe B, slotted arms C C hinged thereto, clamping-jaws E, and set-screws D, substantially as described.

166,939.

1. In a bench-plane, a clamping-plate having open bearings in its side edges, with channels leading thereto in its under side, substantially as and for the purpose set forth.

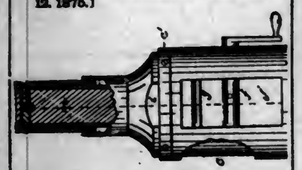


2. The combination of the stock A, with studs a', the bit and its cap, and the clamping-plate B, with channeled openings b b', substantially as described.

3. In a bench-plane, the combination of the sliding plate, crank-pin, worm, and worm-wheel, substantially as described.

4. The combination of the plane-iron and its cap, the wedging-screw, and the slotted sliding plate with means for operating the same, substantially as described.

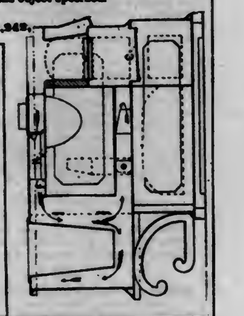
5. The sectoral worm-wheel F, having shoulders at f' f', in combination with the stop-pin f'' and the worm G G', substantially as described.



166,940.

1. In combination with the oven of a stove or cooking-range, a dividing-plate under the oven, pivoted at one end, and constructed to be moved vertically, either with or without a forked end, substantially as described, and for the purpose set forth.

2. The combination, in a cooking-stove constructed with a water-reservoir, of the division-plates extending under and over the oven, and the division-plate arranged centrally in the reservoir-chamber, and forming a continuation of the plates extending over and under the oven, substantially as shown and described, whereby the entire space around the oven and the reservoir is divided into two parts, for the object specified.

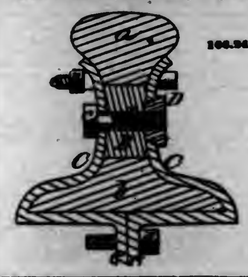


166,941. REELS FOR FISHING-RODS. Hezekiah Winslow, Portland, Me. [Filed May 12, 1875.]

The combination, in the handle of a fishing-rod, of the reel-box b, inner and outer cylinders c d, having their apertures, as described, and the rod f, all combined and arranged to operate substantially as and for the purposes set forth.

166,942. COOKING-RANGES. William P. Abendroth, Port Chester, N. Y. [Filed June 19, 1875.]

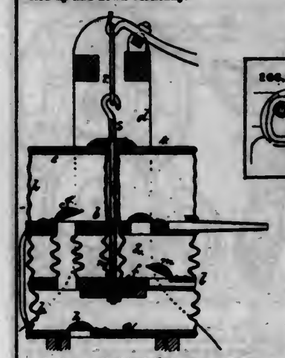
166,942.



166,943. RAILWAY-RAIL JOINTS. H. Allen, Titusville, Pa. [Filed June 10, 1875.]

Brief.—A rail-joint support consisting of a pair of clamping-plates secured together under center of base of the rails, and to the rails by bolts passing through both under the head of the rails, the rails being recessed at their meeting ends, and having a bearing-block inserted, which is secured to the clamps by a bolt provided with a nut which has a screw-threaded rabbet, which screws into a threaded perforation in one of the clamp-plates.

1. In a railroad-chair, the combination, with the rails A A', and the joint-block B, of the sectional chair C C, having flanges c' upon its under side, adapted to be clamped around and about the web of the said rails, substantially as specified.

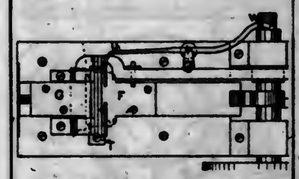


2. The nut D, having screw-threaded rabbet f, in combination with the bolt b and section C of a railroad-chair, having a screw-threaded aperture, g, adapted to receive the rabbet on the nut, substantially as specified.

166,943.

166,944. BELLOWS. John Bayliss, New York, N. Y. [Filed Oct. 26, 1874.]

Brief.—The weight is attached to the moving follower itself inside the bellows. The power is applied to the follower through vertical rods, acted upon by a lever above the bellows, so that the moving follower is carried up and down vertically.



1. In a cylindrical bellows containing two diaphragms or followers a b / c, valves k m p, tube t, and lateral inlet l, the weight r attached directly to the diaphragm f, inside the bellows, and the connecting rod or rods passing from each diaphragm to a lever above each bellows, substantially as set forth.

2. In a cylindrical bellows the follower f, weighted and moving between the diaphragms or followers a and b, in combination with the central connecting-rod c and flexible tube n, substantially as set forth.

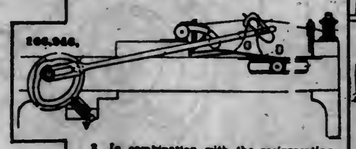
166,945. MACHINES FOR TRIMMING NEEDLE-BLANKS. Philo M. Beers, Bridgeport, Conn. [Filed July 30, 1875.]

Brief.—A hopper and chute, each having one end adjustable for different thicknesses of blanks; a pressing-lever, U, for pressing the blank against an adjustable gage or stop, T, and a pair of guides or holder, F G, operated by cam and spring, to, first, take the blank from under the hopper; second, hold it while being cut by the shear B'; and, third, to open when over a hole in the table and drop the blank.

1. In a machine for trimming needle-blanks, &c., the combination of the cutting-shears, the hopper, and chute with the guides F and G, as and for the purpose set forth.

2. In combination with the shears or cutters the stop T, and the pressure-lever U, as and for the purpose set forth.

3. The adjustable hopper and chute in combination, constructed and arranged substantially as described, and for the purposes set forth.

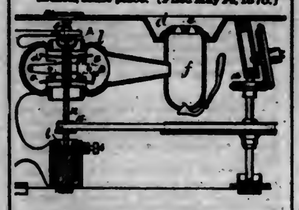


166,946. MACHINES FOR POLISHING THE EYES OF NEEDLES. Philo M. Beers, Bridgeport, Conn. [Filed July 8, 1875.]

Brief.—A crank on the shaft, which carries the cam, having its rod rigidly attached to the carriage, reciprocates, and, by virtue of each rigid attachment, causes the carriage to rise and fall at each reciprocation. At each rise the carriage operates a pawl on the winding-drum, to intermittingly wind up the polishing-thread. The needle-clamp, pivoted to the reciprocating carriage, is caused to vibrate by its crank, the crank-rod, the cam, and crank-pin; the cam operating to shorten and lengthen the stroke of the rod.

1. The combination, with the carriage D and clamp M, of mechanism, substantially as shown and described, for reciprocating the carriage, and causing it to rise and fall at each reciprocation, as and for the purpose set forth.

2. The combination, with the reciprocating carriage and needle-clamp, of the slotted connecting-rod R, cam U, and crank-pin S, as and for the purpose set forth.



166,946.

3. In combination with the reciprocating carriage and needle-clamp, the winding mechanism for moving and polishing threads at each reciprocation, substantially as described.

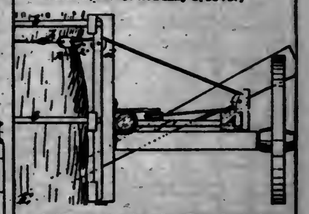
4. The needle-clamp M, constructed of two bars, one of which is mounted in bearings, so as to partially rotate, in combination with the link O and its set-screw, for binding the bars together, substantially as described.

166,947. FURNACE FOR BLACKENING. Augusto Bonna, New York, N. Y., assignor to himself, Louise Foutin, and E. Von Hordtmann, same place. [Filed May 14, 1875.]

The rotary blower consisting of the case l, vertical shaft s, oil-cup 3, screw s, adjustable bearing-block t, fans o, and disks r, of larger diameter than the openings in the case l, in combination with the wind-chamber f, tuyere 4, handle 9, shaft 10, and gearing connecting to the blower, as set forth.

166,948. SEED-VIBES FOR STOVES. Henry T. Baxter, San Francisco, Cal. [Filed June 12, 1875.]

1. The carrying-girder A and the front finish C, arranged in combination with the posts B, to suspend the hangers D, and receive the covering columns F, as specified.



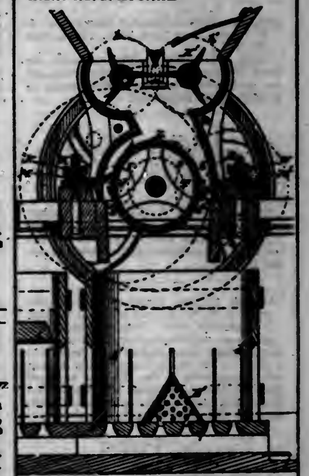
2. The metal suspension-bars D and bearers E for the shelves, combined with the carrying-girder A and finish C, substantially as specified.

3. The suspension-bars placed outside of the finish, to receive the covering columns and their capitals outside of the line of finish, substantially as specified.

166,949. MEDICAL COMPOSITIONS. Thalberg Bloodchild, New York, N. Y. [Filed May 20, 1875.]

A compound for medical purposes, composed of lobia cassia, herba taxus, pentandria monogynia, (panel,) herba mutisus, radix althæa, flores lavendulæ, flores rhœados, flores millefolii, radicles nobilis, (yarrow-flowers,) herba rubus fruticosus, (blackberry-leaves,) herba verbenæ, semen anisi, semen fœniculi, semen coriandri, radix liquiritiæ, flores malvæ vulgaris, flores cambuci, semen carui, and cream of tartar, in about the proportions specified.

166,950. WAGON-RACKS. Joseph Bell, Warsaw, Ill. [Filed May 6, 1875.]

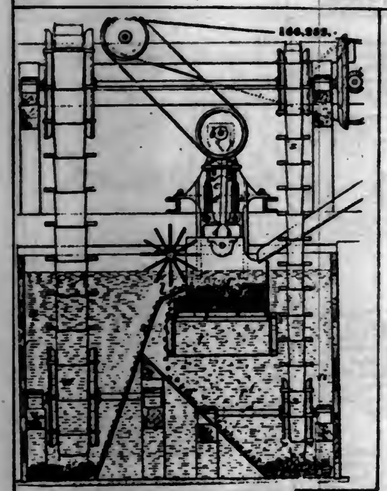


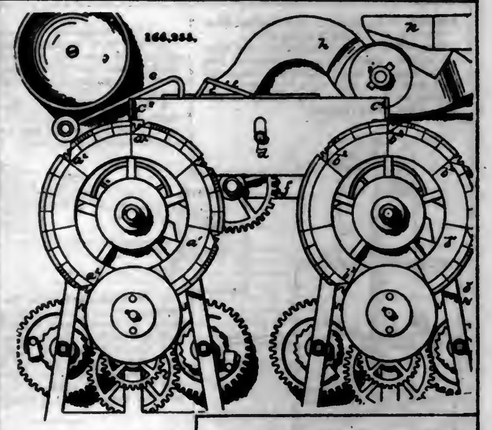
1. The combination of a tilting frame, having one side extended beyond the rack-frame and the other side provided with a pulley and cord, having check-fastening and hook and sliding pulley-block, with the winding roller and ratchet mechanism at the end of rack-frame, for carrying load and tilting frame back, and retaining both securely, substantially as set forth.

2. The combination of rack-frame, having lateral guide-pieces and side-rest blocks, with inclined brace-bars extending in opposite direction to the ground for supporting the rack-frame during loading, substantially in the manner and for the purpose specified.

166,951. GRAIN-MILLS. James Bowen, Lancaster, Ohio. [Filed Aug. 23, 1874.]

Brief.—The fruit passes between a pair of revolving bladed spindles onto a mangling-cylinder, having on its periphery diagonal rows of teeth with adjoining depressions. The press-cages below are slotted upwardly a short distance on their walls, and have each a perforated cone at the bottom.





1. The crushing-cylinder I, when formed with teeth F and cavities F', constructed and arranged substantially as and for the purpose specified.

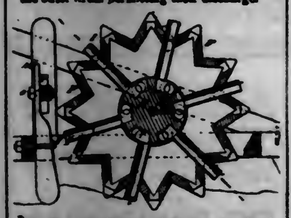
2. In combination with the annular grooves O' O'', the conical perforated metallic strainers E E', constructed and operating substantially as and for the purpose specified.

166,952. SEPARATING COAL FROM SLATE, &c. Hezekiah Bradford, Philadelphia, Pa. [Filed Oct. 2, 1874.]

Brief.—The coal and slate are fed into the reciprocating jig through the chute q, and pass out over the two dams f and e. These are arranged at such a height with relation to each other that the heavy and light materials balance each other when the former is as high as e and the latter as f.

A reciprocating fig, substantially as described, having a perforated bottom, and so done with delivery edges at different centres for retaining materials that are balanced according to their respective specific gravities, and delivering the surplus automatically and separately according to gravity, as set forth.

166,862. Tubing-Pins for Pianos, &c. J. M. Brenig, New York, N. Y. [Filed July 10, 1875.]



Brief.—The collar bushing preserves the teeth or threads of the pin from wear, and the pin is locked in position after tuning by a wedge driven in beside it.

The open bushing B, made of brass or other metal softer than the pins C, and the wedge F, in combination with the plate A and the tuning-pins C, substantially as herein shown and described.

166,864. Cotton, Corn, and Pea Planters. D. W. Bristol and Jno. F. B. Searcy, Pleasant Hill, Miss. [Filed May 26, 1875.]

Brief.—A seed-wheel composed of an outer angular-faced drum, and an inner drum with a wheel in the center, having taken leading out through holes in the alternate angles of the outer drum. The space between the two drums is for the reception of seed, orifices in the outer drum permitting their discharge.

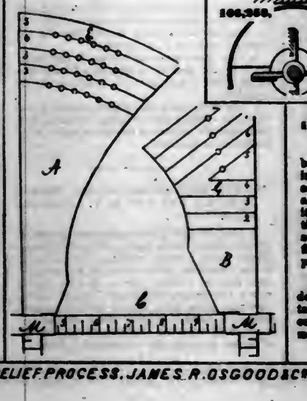
1. The combination of the angular-faced drum F, the inner drum G, the recessed wheel H, and the tubes I with each other and with the frame A of the planter, substantially as herein shown and described.

2. The combination of the perforated disks J and the rod K with the wheel H and the drums F G, substantially as herein shown and described.

166,865. Tube-Locks. John Burge, Circleville, Ohio. [Filed Aug. 22, 1873.]

Brief.—An alarm mechanism is connected to the bolt-releasing devices, so that when the bolt is being released an alarm will be sounded.

1. The combination of the notched disk or disks a' b', the slotted detent-plate c, clapper-lever c, clock-work mechanism f, pinion g, and lever h, substantially as and for the purpose set forth.



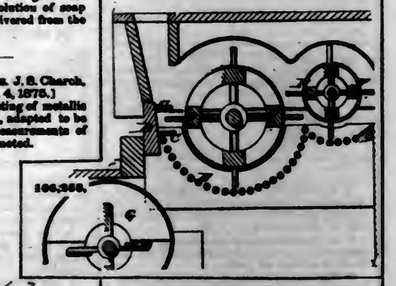
2. The clock-work mechanism a, disk a', detent-plate c, and clapper-lever c, in combination with the clock-work f, pinion g, lever h, and pawl k, substantially as described.

166,866. Rubber-Coated Fabrics. W. Cable, Boston, Mass. [Filed Dec. 26, 1874.]

The mode, substantially as herein described, of finishing the surfaces of rubber-coated fabrics, the same consisting in treating the surface of such goods with a solution of soap while the same are being delivered from the calendering-rolls, as set forth.

166,867. Tailors' Measures. J. S. Church, Dayton, Ohio. [Filed Feb. 4, 1876.]

Brief.—An apparatus consisting of metallic plates and measuring-stripe, adapted to be fitted to the body and the measurements of the different parts accurately noted.

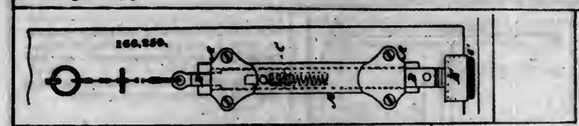


1. The front shoulder-plate A, having a series of holes, E, and numerals on lines, as described, the rear shoulder-plate B having a series of holes, F, and corresponding lines and numerals, as described, and the relation of these to the breast-measure C, for the purpose specified.

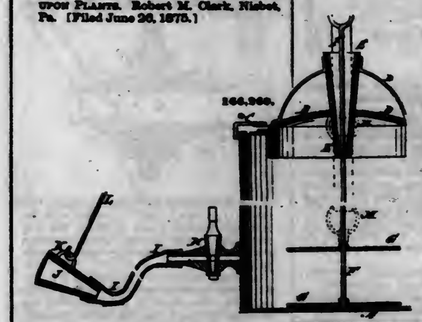
2. The combination and arrangement of the shoulder-plates A and B, the breast-measure C, the waist-measure D, and bust-measure H, substantially as and for the purpose specified.

166,868. Seed-Cotton Cleaners. M. C. Cheek, Mansfield, Tenn. [Filed July 8, 1876.]

Brief.—The secondary cylinder detaches the cotton from the main cylinder, and directs the air-blast, which is increased by a centrifugal fan, downwardly through the cotton in its passage over the open concave.



The combination of the secondary spiked cylinder F, concave-grates or screen E, and the centrifugal fan G with the cylinder D and stationary spikes C, substantially as specified.

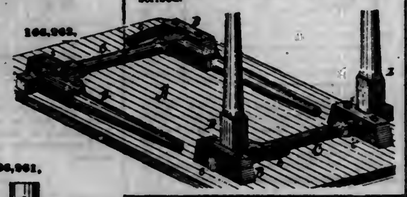


166,869. Door-Checks. Horace B. Church, Jefferson City, Mo. [Filed May 6, 1876.]

Brief.—The ordinary sliding spring door-bolt is provided with a socket or hollow foot, in which a pad or block of india-rubber is inserted. The foot or shoe piece is attached by a downwardly-projecting curved arm, holding it and the elastic pad in nearly horizontal position, and, being forced down by the spring, serves, by frictional contact with the carpet or floor, to hold the door automatically in desired position.

The combination, with the sliding spring door-bolt B, of the socket or hollow foot E, containing the elastic block e', the parts B E being constructed separate, and connected by the means shown and described.

166,860. Devices for Destroying Bugs upon Plants. Robert M. Clark, Nisbet, Pa. [Filed June 26, 1875.]



The combination of the vessel A, the cover E, provided with the arched handle D and funnel F, the dasher F G, the faucet H, the rubber tube I, and the flaring nozzle J, with each other, substantially as herein shown and described.

166,861. Dust-Brushes. Henry B. Conant, Geneva Lake, Wis. [Filed May 22, 1875.]

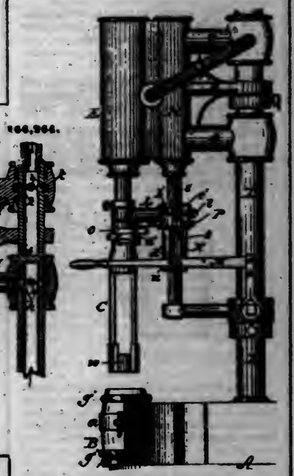
Brief.—The wires that the feathers are fastened to have their lower ends bent inward, to enter holes in the head to hold them in place, while a vertical groove and outside ring bind them upon the head in a secure manner.

1. In a dusting-brush, the combination of the springs A, having bent ends and the band G, with the head B', constructed as shown and described.

2. The combination, with the head B', having socket K, of the handle H, and wire I wound spirally around the part J, as shown and described.

3. The combination, with the springs A and head B', of the cord E, as and for the purpose specified.

166,862. Imitation Quilted Fabrics. W. R. Corwin, New York, N. Y. [Filed Sept. 2, 1874.]



An imitation quilted fabric, composed of an exterior fabric, a lining, and a layer of india-rubber, united, as shown, and only at the lines forming the imitation stitch, substantially as described.

166,863. Folding Tables. P. S. Crawford, Woodstock, Ill. [Filed July 16, 1875.]

1. The combination of the rock-shaft C, legs D, and spring c, with the notched blocks B, constructed and operating substantially as described.

2. The blocks B, having the notches b and b', and bore b'', as and for the purposes described.

166,864. Machines for Molding Concrete Pipe, Drain-Tile, &c. Taylor R. Daniels, Detroit, Mich. [Filed May 13, 1875.]

Brief.—A steam-hammer or tamp is made to enter any one of a series of detachable molds arranged on the periphery of a circular table.

1. In combination with the circular table A, provided with the series of molds B, the steam-hammer, mounted upon and swinging around the central standard D, substantially as shown and described.

2. In combination with the steam-cylinder B, the hollow standard D, serving both to support the cylinder and conduct steam thereto, substantially as shown and described.

3. In a pipe-molding machine constructed and operating substantially as shown and described, the steam-cylinder, provided with the ports g, and the valve-chest H, provided with the ports e, in combination with the hollow rotary valve G, having the openings n and channels n, as shown.

4. In combination with the stem b' of the rotating valve G, the sleeve K, provided with the inclines c, and the arm L, attached to the piston-rod, and provided with pins to act upon the inclines of the sleeve.

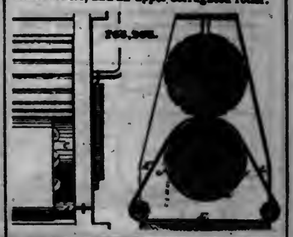
5. In combination with the cylinder and piston, operating the hammer, and the rotary valve, constructed as shown, to control the admission of the steam, the vertically-sliding sleeve K, held and controlled by a hand-lever, and provided with the inclines c, and the arm L, attached to the piston-rod and provided with projections, to impart a rotary motion to the sleeve, as described, whereby the operator is enabled to control the rise and fall of the hammer, as required.

6. In combination with the hammer, having a recess, w, in the side of its head, the arm O and dog o', operating substantially as described, to give the head a rotary motion.

7. The molds B, made in two parts, and secured together by the outside bands g', as shown, the ends of the mold being tapered, and the edges of the parts jointed together, as described.

8. The vertically-sliding cores f, mounted in the table A, and connected to the springs f, in combination with a catch for sustaining them in position.

9. The detachable molds B, in combination with the table A, recessed in the manner shown, to receive and sustain them, and the band s or other fastening, for retaining them in place.

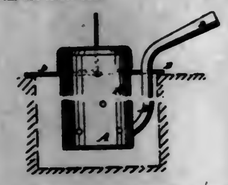


10. In a pipe-molding machine, the combination of a vertical mold, a steam-hammer working therein, and a vertically-adjustable valve-gear controlled by a hand-lever, constructed and operating substantially as shown and described, so that by gradually moving said lever the descent of the hammer may be limited as the mold fills up without changing the length of its stroke.

166,865. Compounds for Artificial Stone. Taylor R. Daniels, Detroit, Mich. [Filed July 6, 1876.]

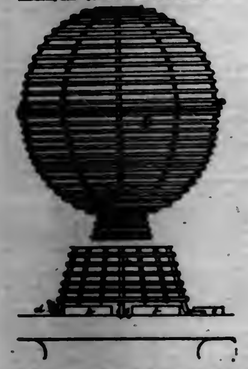
A composition for artificial stone consisting of beeswax, borax, resin, alum, sugar, linseed-oil, cement, and water, in substantially the proportions specified, with or without the application of silicate of soda.

166,866. Washing-Machines. Samuel L. Denney, Gap, Pa. [Filed June 1, 1876.]



Brief.—A lower roller with channels arranged alternately, an endless belt with two small rollers, and an upper corrugated roller.

The combination of the roller e, having chain-cords d d, rollers f f, endless band e, and roller b, as and for the purpose specified.

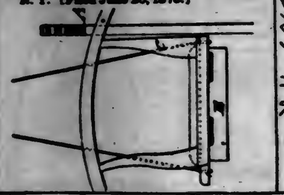


166,967. Apparatus for Destroying the Cutting Ant. Ferdinand A. Fenner and J. H. Power, Mission Valley, Tex. [Filed May 28, 1875.]

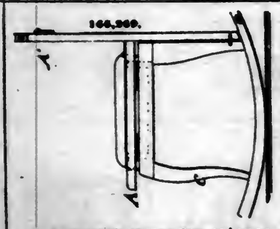
Brief.—A perforated tube having a closely-fitting top and a broad flange near the top, and supplied with an air-tube passing through the flange, and entering the perforated tube near the lower end.

The perforated and closely-covered cylinder A, provided with a pipe, D, having one end attached to its lower end, rising up the side through a collar, B, and bent outwardly therefrom, as and for the purpose specified.

166,968. Fly-Traps. Henry L. Ferris, Alden, Ill. [Filed June 19, 1875.]



1. The combination of the base A, cleats b, recess a, staple d, bent ends of the upright rods, and button c, substantially as described, and for the purpose set forth.

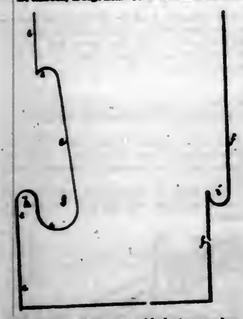


2. The combination of the sphere D and cone-passage G, projecting within said sphere, and constructed with longitudinal ribs of large wire, and spiral coils of small wire, substantially as shown and described.

3. The conical cap-supporter C, having longitudinal wire ribs, and a surrounding coil of small wire, four of said ribs projecting above and below its open end base, to form a guide to the entrance at one end, and means of fastening the trap to the base-plate at the other end, substantially as specified.

166,969. Convertible Rocking-Chairs and Settees. Sigmund Feust, New York, N. Y. [Filed June 30, 1875.]

166,969.

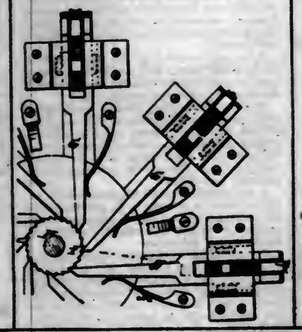


1. A convertible rocking chair and swing, substantially as above and described.

2. The combination of a seat with hinged leg and rocker sections, that may be rigidly secured in position either as rockers for a chair or as side arms for a swing-seat, substantially as specified.

3. In combination with a chair, the suspension-cords, the hinged seat, and the box or receptacle below the seat to allow the storing of the cords, substantially as specified.

4. The combination of the seat-frame A, perforations a, grooves a', and receptacle E, substantially as and for the purpose specified.



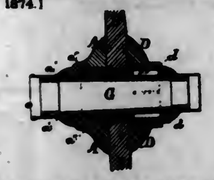
166,970. Gloves. Jules Foulon, Grenoble, France, assignor to Ed. Jeanniaux & Co., Brussels, Belgium. [Filed June 28, 1875.]

The glove-pattern, provided at one edge, a, above the thumb-opening, with the downwardly-projecting tongue b, and at the opposite edge f with the upwardly-projecting tongue f, said tongues being constructed to overlap, and all arranged to form a closed slit, substantially as specified and shown.

166,971. Motive Powers. P. B. Greene, Centerville, Iowa. [Filed May 28, 1875.]

Brief.—The circular platform tilts by means of a weight being drawn around its circumferential trunk, and operates a series of rising and falling arms, which have pawls connected thereto, operating a ratchet on the shaft, by means of which it is rotated.

166,972. Buffers for Steam Hoop-Drills. Jos. C. Githens, New York, N. Y. [Filed June 10, 1875.]

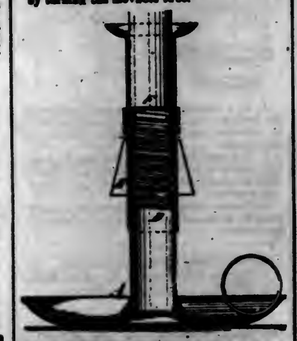


Brief.—An elastic disk is placed between a loose cylinder-head and a follower, which is secured to the opposite cylinder-head by tie-bolts. This arrangement allows each cylinder-head to yield to the blows of the piston.

1. The combination of the tilting platform A, roller B, cam plates F, pawls G, ratchet-wheel I, and shaft H, substantially as specified.

2. The shaft C, arm D, roller B, and tilting platform A, substantially as specified.

166,973. Wheels for Vehicles. Francis H. Green, Eau Claire, Wis. [Filed Dec. 9, 1874.]

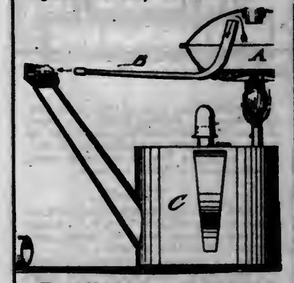


1. In combination with the thimble G, the sleeve C and the collar D, provided with the tapering threaded recess d, which fits over and compresses the divided threaded portion c' of said sleeve, substantially as and for the purpose shown.

2. In combination with the spokes E E, &c., fitted into the radial recesses c c, &c., of the collar A, the sleeve C, provided with the threaded portion c, that fits into the threaded recess c' of said collar, and having a tapered portion, c', which bears against the inner ends of said spokes, substantially as and for the purpose set forth.

166,974. Candlesticks. John B. Gribble, Green Valley, Cal. [Filed Nov. 7, 1874.]

Brief.—The candle can be raised or lowered by turning the movable tube.



As an improvement in candlesticks, a movable tube, C, having short motion-thread working over the stationary tube-thread, as and for the purpose specified.

HELIOTYPE RELIEF PROCESS. JAMES R. OSGOOD & Co. BOSTON

166,975. Self-Acting Blow-Pipe. John Martin Hancock, Lansing, Iowa. [Filed June 5, 1875.]

Brief.—The vapor-vessel and the lamp are separate, as shown, so that the heat may be regulated as desired, or at once removed.

The combination of vapor-chamber A, having blow-pipe B and the hood movable also-heat-vessel C, having one burner at the top and another at the side, as shown and described, to enable jewelers, in brazing or soldering gold or silver articles, to guide the flame to the work, regulate accurately the degree of heat, and then instantaneously remove the flame when it has performed its function.

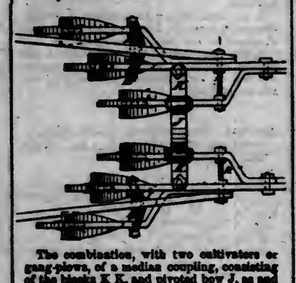
166,976. Stopping Mechanism for Drawing-Frames. Daniel W. Hayden, Providence, R. I. [Filed June 21, 1875.]

Brief.—Variations in the size of the sliver passing through the trumpet are communicated, by the connecting-rod, directly to the suspended arc, causing the latter to engage the stop-gear, and arrest the motion of the machine.

1. The combination, with the revolving stop-gear g and the suspended arc d, provided with the adjustable weight h, of the trumpet-arm b and the connecting-rod i, the whole adapted to operate substantially as and for the purpose set forth.

2. The combination of the hinged arm H, provided with the stop K and adjustable weight L, with the suspended arc d and stop-gear g, substantially as described.

3. The combination of the trumpet a, the arm b, the connecting-rod i, the suspended arc d, provided with the adjustable weight h, and the weighted arm H with the stop K, the whole adapted to operate substantially as specified.



166,977. Buttons. Wm. Hornish, Newark, N. J. [Filed June 10, 1875.]

Brief.—The cloth shank of a cloth-covered button is re-enforced with a metal eye.

As an improvement in buttons, the combination, with the inner fibre-disk, of a bent wire, projecting, by its central loop or eye part, through the perforation of the lower shell to re-enforce the cloth section by which the button is sewed on, substantially in the manner and for the purpose set forth.

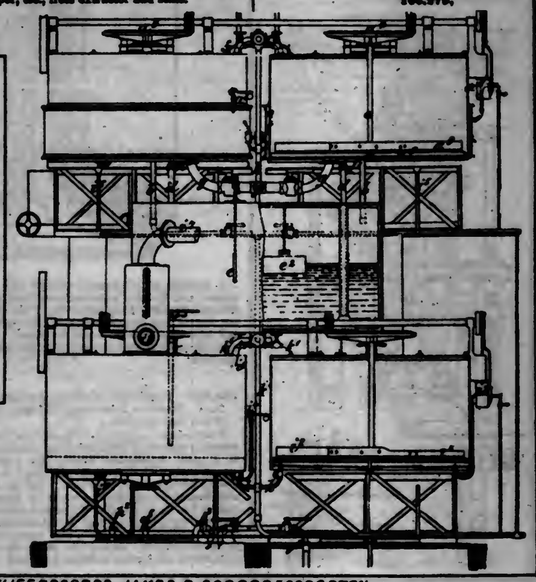
166,978. Cultivators. Joseph C. Jenkins, Lebanon, Tenn., assignor to himself and James C. Jolley, same place. [Filed Apr. 17, 1875.]

Brief.—A middle loosely-jointed coupling for a pair of cultivators.

The combination, with two cultivators or gang-plows, of a median coupling, consisting of the blocks K K, and pivoted bow J, as and for the purpose specified.

166,979. Method of and Apparatus for Separating Free Sulphur. Samuel H. Johnson, Lea Bank Works, Stratford, England. [Filed July 13, 1874.]

Brief.—The dried material is placed in the extractor, and CS_2 admitted at bottom, the CS_2 vapor displacing the air. The air-cock is closed, the extractor steam-heated, and agitator started. After solution of the sulphur the agitator is stopped, when a graduated filter is formed by the action of gravity on the suspended particles. The solution is run off into the tank or reservoir below, from which it is drawn into the stills and distilled by steam heat. The distillate passes to the first condenser, from which the condensed CS_2 passes to the pure-spirit receiver, while the uncondensed portions pass to a second condenser, from which additional CS_2 flows to the same receiver, and the permanent gas formed during the process passes to a gas-holder. The residue in the extractor is washed with CS_2, and the washings run to a second receiver, to be reused with next charge. Air is removed from the stills by gas from the holder before distilling. The CS_2 is forced up into the extractor from the receiver by water-pressure. Steam is used to sweep out residual vapor, &c., from extractor and stills.

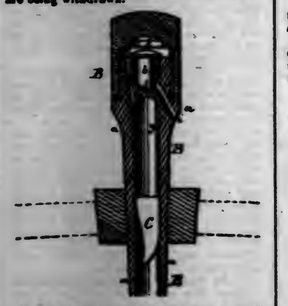


1. The herein-before-described improvement in the art of separating free sulphur from substances with which it is mixed; which improvement consists in mixing the sulphur-bearing substance in a dry state with bisulphide of carbon in a close vessel or extractor, heating the mixture to the boiling-point, agitating it, stopping the agitation, and allowing the granular residuum to form a filter, through which the liquid contents of the extractor are forced by the pressure of vapor generated in the extractor itself.

2. The herein-before-described improvement in the art of separating free sulphur from substances with which it is mixed; which improvement consists in mixing a charge of sulphur-bearing substances with bisulphide of carbon in a closed vessel or extractor, heating, agitating, filtering, and discharging the liquid contents; then subsequently admitting a fresh charge of bisulphide of carbon into the extractor, mixing it by agitation with the residuum remaining therein, allowing the contents of the extractor to subside; then discharging the liquid contents into a receiver separate from the first one, and applying the resultant product to a fresh charge of sulphur-bearing substance, then securing the strongest practicable solution for evaporation.

3. The herein-before-described improvement in the art of separating free sulphur from substances with which it is mixed; which improvement consists in mixing the sulphur-bearing substance in a dry state with bisulphide of carbon in a closed vessel or extractor, provided with an escape-pipe leading to a condenser, and a return-pipe leading from the condenser through a gas-holder to the extractor, raising the temperature of the mixture in the extractor to a boiling-point, whereby that portion of the bisulphide-of-carbon vapor driven from the extractor during the first stage of the process may be saved and returned to the extractor after the insertion of a fresh charge of sulphur-bearing substance.

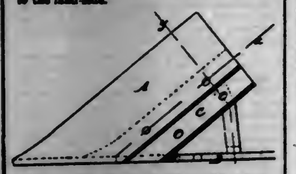
4. The herein-before-described improvement in the art of separating free sulphur from substances with which it is mixed; which improvement consists in discharging the washings from the extractor through a pipe inclosed in a larger one, both extending closely to the bottom of a receiver, and below the surface of water contained therein, whereby any globules of bisulphide-of-carbon vapors carried down through the pipe in the form of vapor will rise up between the outer and inner pipes, and be saved.



166,980. Cabinet-Organs. Alfred Dolge, Brooklyn, N. Y. [Filed June 10, 1875.]

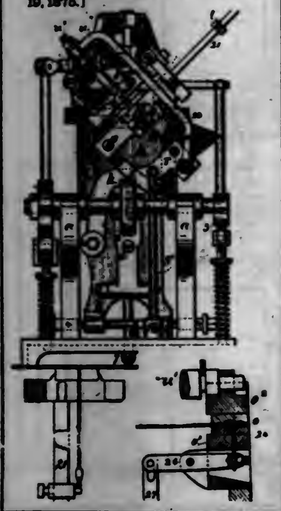
HELIOTYPE RELIEF PROCESS. JAMES R. OSGOOD & Co. BOSTON

166,920. BUNGS FOR BARRELS AND CASKS. F. Wilhelm Ehmsen, New York, N. Y. (Filed June 30, 1875.)



Brief.—As the air enters the barrel through the vent-bung, the reed whistle makes a noise, and warns the proprietor that the contents are being withdrawn.

In combination with the vent-passage *g* of a bung, B, the reed, whistle, or tongue C, substantially as specified.

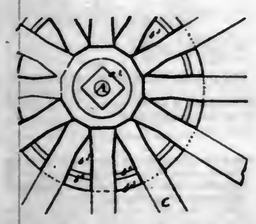


166,921. PLOWS. Henry Krog, Sr., Washington, Mo. (Filed May 22, 1875.)

Brief.—The outer end of the share bolted to the cast, and the inner ends of both welded to the land-side.

In a plow, the combination of share A, landside-bar B, and cast C, the connecting ends of these parts being welded together, while the outer ends of plates A C are riveted or bolted together, all substantially as and for the purpose specified.

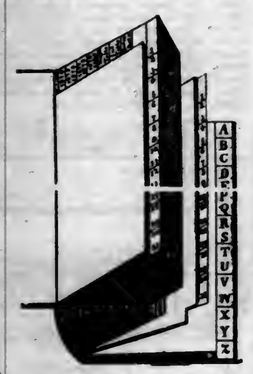
166,922. CASTING UMBRELLA-TIPS, &c. A. Ligibel, Jersey City, N. J., assignor to Winter & Ball, same place. (Filed Apr. 19, 1875.)



1. The two-part mold *a*, connected respectively to the swinging mold-frame *h* and swinging head *a'*, in combination with such frame *h*, swinging head *a'*, bent lever *r*, and link *u*, for opening and closing the mold, substantially as specified.

2. In combination with the two-part mold *a*, the pin 24, lever 26, link 27, lever *r*, and link *a'*, as and for the purposes set forth.

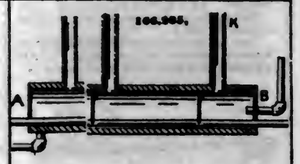
3. The combination, with the molds *a* and casting mechanism, of the adjustable gage *t* and arm 21, for positioning and holding the rib, as set forth.



166,923. VEHICLE-HUBS. Jos. H. Lindsay, Freehold, (Woodside P. O.,) Pa. (Filed May 1, 1875.)

1. The chamber E, having a median automatic valve, *c'*, and raised hollow valve-seat *d'* over the inlet-port *c'*, as and for the purpose specified.

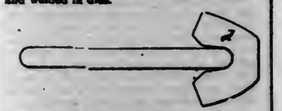
2. The segmental ring-flange *b'*, formed upon the projections *b'* of the part B, in connection with the ring groove *d'*, formed in the part D of the hub, substantially as herein shown and described.



166,924. INDEXES. Melvin N. Lovell, Erie, Pa. (Filed Dec. 1, 1874.)

A book for daily reference, divided into divisions, and provided with a series of marginal indexes, whereby the initial letter of the subject-matter, and the date, month, and year of any given entry can instantly be found, substantially as described, as and for the purposes specified.

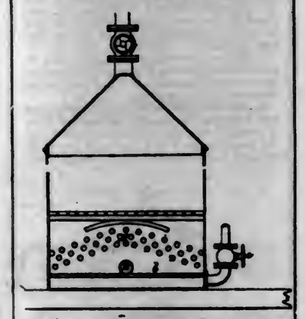
166,925. DISTILLATION OF HYDROCARBON OILS. Thomson McGowan, Meredith, Pa. (Filed Jan. 26, 1875.)



Brief.—Into a slightly-inclined elongated vessel at one end is admitted oil; at the other, in a pipe, superheated steam. By nearly-closed partitions the oil is prevented from readily flowing down the vessel. The graduated heat from the pipe serves to lift hydrocarbon vapors of different degrees of density into the vapor-flues situated at the extremity of each division of the still, said flues leading to condensers. Object: To secure in one distillation oils having different gravities.

The combination, in an oil-still, of the elongated vessel A B, having a series of partitions, steam-pipe I. M, extending throughout the length of the vessel, and vapor-pipes G, H, I, and K, projecting from the elongated vessel, all substantially as herein described.

166,926. MANUFACTURE OF TURK-BUCKLES. Manning Merrill, New York, N. Y., assignor to himself and Edwd. W. Merrill, same place. (Filed Nov. 12, 1874.)

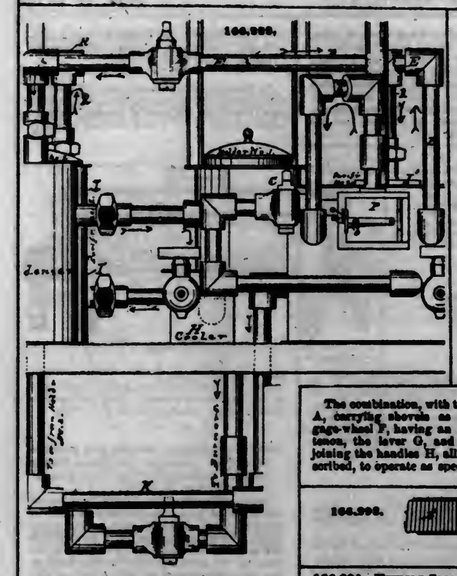


Brief.—A prepared block of metal is placed over each end of a link, and the whole heated and welded in dies.

The method of preparing the link shown in Fig. 1, and adding to the bent ends thereof the block *d*, so as to encompass said bent ends, and welding said block to said ends, as hereinbefore specified.

166,927. METHODS OF FIXING AND DEVELOPING COLORS ON FABRICS. C. T. Mieg, Paris, France. (Filed May 26, 1875.)

Brief.—Exposes the cloth to the joint action of steam and hot air in a closed vat.

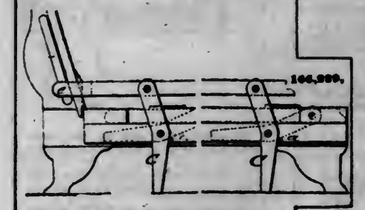


The process herein described of fixing and developing colors on fabrics by exposing the same in a closed vat to the joint action of steam and of heated air, as set forth.

166,928. GAS-GENERATORS. J. C. Mitchell, Lancaster, N. H. (Filed May 26, 1875.)

Brief.—A pipe provided with a stop-cock conducts gas directly from the retort into the fire-chamber of the furnace, thus preventing escape of gas into the room when the retort-door is opened. Uses wood, coal, fats, or gas material. Gas from retort passes successively through condenser, cooler, up through one purifier, and down through another, (the two being connected by a removable pipe and covers,) and thence into either holder.

1. The combination, with retort B, having a smooth face, of a door, F, having a corresponding smooth face, the latch *c*, spring *b*, and catch *e*, for the purpose of maintaining the door closed with an air-tight connection, substantially as described.

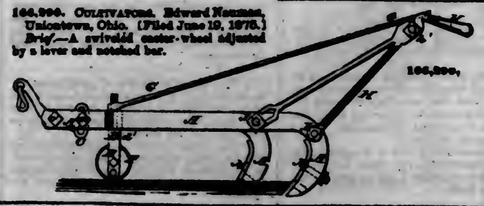


2. The combination, with the purifiers I I', having water-troughs O, of the detachable tube E and the covers T, as and for the purpose set forth.

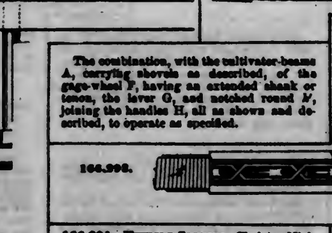
3. The combination, in a gas-generator, with the pipe K, terminating in the gas-holder, of a ball-valve, N, resting in the end of said pipe, for the purpose of preventing back pressure, as described.

4. The method of freeing air-tight gas-retorts of their gaseous contents before opening the retort-door, and of disposing of such contents by conducting the same, without admixture of air, directly from the closed gas-retort into the furnace to be burned, substantially as herein described.

166,929. BED-LOUNGE. Abraham Morris, New York, N. Y. (Filed May 26, 1875.)



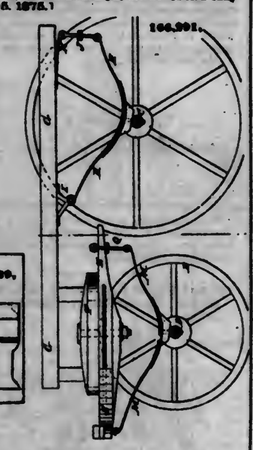
1. The hinged section of a bed-lounge, provided with pivoted upward-extended legs, and a connecting guard-rail pivoted thereto, substantially as and for the purpose set forth.



2. The combination of the detachable head-piece of the hinged section with a raised strip of the main head-piece and the grooved end of the guard-rail, as described, for securing rigid position of head-piece and guard-rail, substantially as specified.

166,930. CULTIVATORS. Edward Neuman, Uniontown, Ohio. (Filed June 19, 1875.)

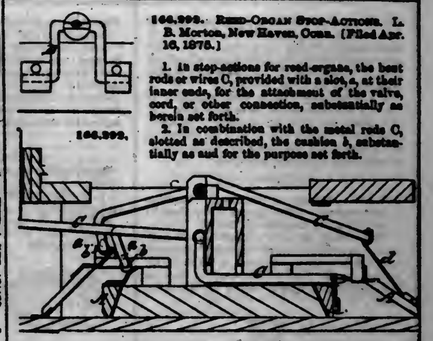
Brief.—A swiveled caster-wheel adjusted by a lever and notched bar.



The combination, with the cultivator-beams A, carrying shovels as described, of the gage-wheel F, having an extended shank or tenon, the lever G, and notched round *h'*, joining the handles H, all as shown and described, to operate as specified.

1. The combination, with rear springs H, of brackets I, shackles J, eye-straps K, and brace-bars L, all arranged substantially as and for the purpose specified.

2. The combination, with front springs M, of bars O P Q, serving both as coupler and brace, as set forth.



166,931. VEHICLE-SPRINGS. Christen Nielsen, South Brooklyn, N. Y. (Filed May 18, 1875.)

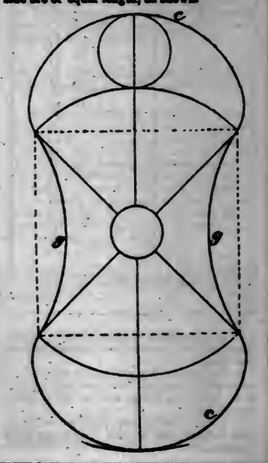
166,932. REED-ORGAN STOP-ACTIONS. L. B. Morton, New Haven, Conn. (Filed Apr. 16, 1875.)

1. Its stop-actions for reed-organs, the bent rods or wires C, provided with a slot, *a*, at their inner ends, for the attachment of the valve, cord, or other connection, substantially as herein set forth.

2. In combination with the metal rods C, slotted as described, the cushion *b*, substantially as and for the purpose set forth.

166,933. DEVICES FOR BENDING METAL PIPES. Morris L. Crum, Philadelphia, Pa. (Filed May 22, 1875.)

In a device for bending metal pipe, the combination of a spiral-wire mandrel and flexible plates interposed between the mandrel and the sides of the pipe, substantially as set forth.

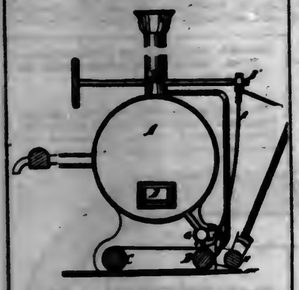


166,934. MANDRELS FOR BENDING METALLIC TUBES. Morris L. Crum, Philadelphia, Pa. (Filed Mar. 30, 1875.)

A flexible mandrel for bending metallic pipe, consisting of a spiral coil of wire, the exterior surface of which is flattened, substantially as set forth.

166,935. ROTARY PRESSURE-BLOWERS. W. L. Palmer and Israel W. Knox, San Francisco, Cal. (Filed July 13, 1875.)

Brief.—The pistons are constructed upon epicycloidal curves, so as to make an exact fit between them. The chords of the heads and side are of equal length, as shown.

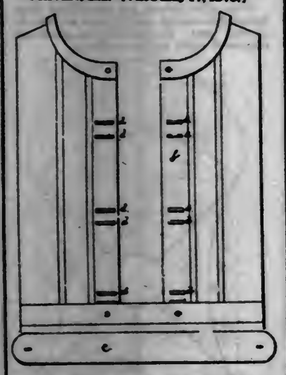


1. The rotating pistons, each consisting of the convex heads *c c* and the concave sides *g g*, said heads and sides being constructed upon epicycloidal curves, for the purpose of making an exact fit between the pistons as they rotate, substantially as herein described.

2. The rotating pistons, each consisting of the convex heads *c c* and the concave sides *g g*, said heads and sides being constructed upon epicycloidal curves, and having the chords of the heads *c c* and the sides *g g* of equal length, substantially as herein described.

166,896. MODES OF SECURING FLEXIBLE ROOFING TO ROOFS. James Perry, Brooklyn, N. Y. (Filed Oct. 2, 1874.)

Brief.—Felt as it is applied to the roof-boards is covered on the under side with coal-tar from a heating-reservoir. A hot roller attached to the front of the machine imparts heat to the roof-boards before the felt is applied.

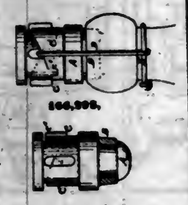


1. The improved process of laying sheet material upon the roof-boards of roofs by applying the molten coal-tar or cement to the sheet material simultaneously and in conjunction with the application of heat to the roof-boards, substantially as and for the purpose set forth.

2. The organized machine for laying flexible roofing, comprising the receiver A, the roller C, for carrying the web, and the roller D, provided beneath the system of pipes *e*, constructed for use substantially as and for the purpose set forth.

3. The combination of the roller H with the organized machine, constructed for operation as set forth, for the purpose specified.

166,897. SEWER-STRUCTURE. Francis L. Fitzhugh, Florence, Ala. (Filed May 17, 1875.)



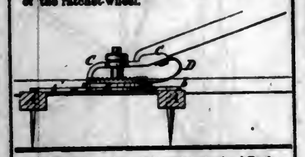
1. The detachable fastening-band *c*, in combination with a shirt-front, substantially as described.

2. The band *c*, in combination with the two sides of an open shirt-front, provided, respectively, with slots *d d*, as and for the purposes specified.

3. An open shirt-front provided with the slots *d d*, arranged as and for the purposes specified.

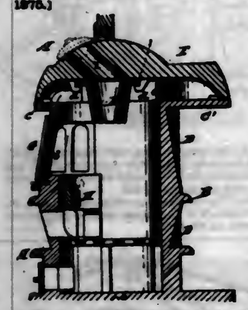
166,898. BOTTLE-STOPPER. Geo. B. Reed, Brooklyn, N. Y. (Filed July 17, 1875.)

Brief.—The body of the stopper has two grooves, the upper one having the metallic band supplied with handles, the lower having the rubber ring. By turning the metal band so that the inclines slide under the bail, the stopper is firmly held in place; a reverse movement releases it.



166,898.

An improved bottle-stopper formed of the body A, provided with ring-grooves upon its lower and upper parts, and the slot *a'*, the rubber band B, and the metal band C, provided with the inclines *c'*, the handles *d'*, and the notches *e'*, in combination with the wire loop D and wire band E, substantially as herein shown and described.

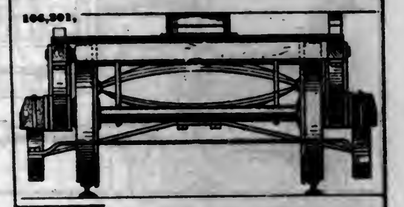


166,899. ADJUSTABLE HANDLES FOR HARROWS. Samuel D. Ringel, Adelphi, Ohio. (Filed June 10, 1875.)

Brief.—A ratchet-wheel is secured to the harrow-frame. A spindle rises from its center, upon which is pivoted the handle. An arm from the pivoted handle, being an extension of the same, fits into the teeth of the ratchet-wheel, and is held in contact by a counter-spring upon the opposite side, and which is attached to the under side of the handle, with its free end resting upon the rim of the ratchet-wheel.

The combination of the ratchet-wheel B, the pivoted handle C, and the spring D with the frame of a harrow, substantially as herein shown and described.

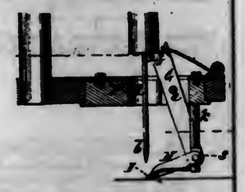
166,900. FIRE-PLACE HEATERS. Philip Rollhaus, Jr., Brooklyn, N. Y. (Filed July 16, 1875.)



1. The top plate C, having smoke-pipe D, and provided with the curved flue-plates *a a*, extending from the rear to a point near the front, in combination with the cap E, all constructed and arranged substantially as and for the purpose specified.

2. The removable girder A, in combination with the bisected front A, doors G G, front grate H, and magazine I, all as and for the purpose set forth.

166,901. SAFETY-RUNNERS FOR RAILROAD-CARS. Lawrence O. Root, Minneapolis, Minn. (Filed June 11, 1875.)



In combination with a car-track, the runners O O, consisting of narrow bars suspended edge downward from each side of the track or pedestals outside of the wheels, forming a substantial guard to prevent persons from falling between the wheels of the cars, and confining the cars to the road-bed in case the wheels are thrown from the rails, substantially as described.

166,901.

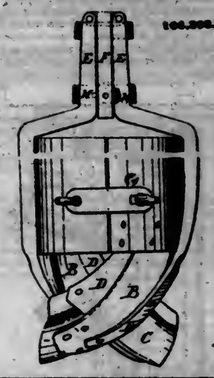
166,902. FEEDING DEVICES FOR SEWING-MACHINES. Israel M. Rose, Brook Haven, assignor to Joseph I. West, New York, N. Y. (Filed Nov. 19, 1874.)

Brief.—The presser and feeding mechanism are attached to a ring, which is adapted to revolve within a second ring, having a projection on one side, by means of which, through the medium of a rod, it is connected to the head of the machine; the feeding mechanism being constructed in such a manner that when the feed-dog is urged forward the studs on the side of the same pass under and beyond the springs composing the presser-foot, by means of which the dog is firmly held against the cloth, while on its backward movement the studs ride over the tops of such springs, holding the dog away from the cloth until near the end of the stroke, when the studs drop through recesses in the springs, and the dog is thereby brought in proper position for the next forward movement.

1. The combination, with the feed-carrier F, constructed to rotate in a horizontal plane around the needle-bar, of the lever G, pivoted to the feed-carrier, the dog H, and the yielding presser I, substantially as and for the purpose described.

2. The combination of the dog H, pivoted to the rocking lever G, and having the cam *a*, with the spring-presser I, constructed of springs attached at one end to the projections K on the carrier, substantially as and for the purpose described.

166,903. MAGIC-AUTOMA. Oscar Rust, Mechanicville, Me. (Filed June 10, 1875.)

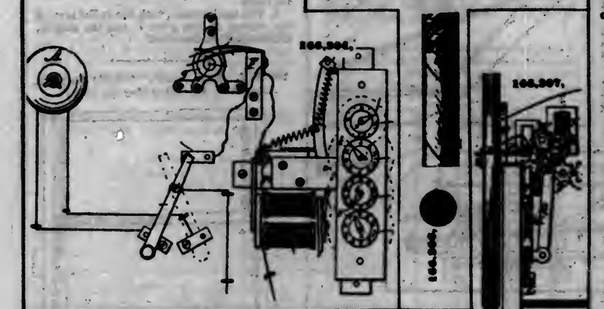


Brief.—The basket is made elliptical in cross-section in two parts, and is provided with concaved jaws, boring on their outer edge round-cornered concaved bits, which are adjacent by braces on their outer sides. The basket is held together by hasps and basket earing-pins.

1. The basket or shell A of an earth-auger, made elliptical in its cross-section, and in two parts, the plane of division passing through the longer axis of the ellipse, substantially as herein shown and described.

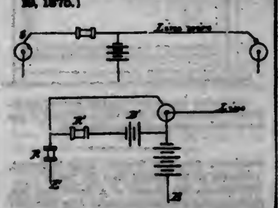
2. The round-cornered oval-edged concaved bits C, having their outer ends bent upward, in combination with the jaws B of the basket A, substantially as herein shown and described.

3. The combination of the braces D with the turned-up outer ends of the bits C, and with the lower ends of the parts of the basket A, substantially as herein shown and described.



4. The combination of the hasps I with the parts of the basket or shell A of an earth-auger, substantially as herein shown and described.

166,903.



166,904. ELECTRIC GAS-LIGHTING APPARATUS. Frank V. Smithard, Chelsea, Mass. (Filed July 14, 1875.)

The combination, with an electrical gas-lighting apparatus, of a time-registering mechanism, substantially as herein described, for the purpose specified.

166,904. 166,906. 166,907.

166,905. TELEGRAPHIC CIRCUITS. Wm. R. Sawyer, Washington, D. C. (Filed June 10, 1875.)

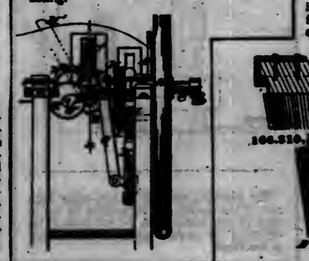
1. The method of operating a line of telegraph, consisting in placing the transmitting-battery at or near the receiving end of the line-wire, and effecting the record or actuating the receiving instrument by making and breaking the line-wire circuits at the transmitting end, whereby the battery-current passing through the receiving-instrument is alternately, equally, or unequally divided and restored to its normal strength or required maximum value, as set forth.

2. The method of operating a line of telegraph, consisting of the employment of two circuits, the line-wire circuit and an artificial line-circuit, in the latter of which is placed the receiving-instrument, which is actuated, or in which the record is effected, by causing an increment and decrement, through breaking and making the line-wire circuit of the quantity or force of the battery-current flowing in the artificial line-circuit, as set forth.

3. The artificial circuit at the receiving end of a line of telegraph, in which the battery-current flows at its required maximum of quantity or force, consisting when a greater or less portion of the battery-current is diverted into the line-wire by establishing the line-wire circuit, as set forth.

4. The method of effecting a record at the receiving-instrument, or of actuating the receiving-instrument, consisting in wholly or partially short-circuiting the main battery, which is placed at the receiving-station, by wholly or partially diverting its current from an artificial circuit into the line-wire circuit.

166,906. RUBBER-COATED CORD AND CORDAGE. Hermann Gehlerbaum, Clifton, N. Y., assignor to Goodyear's India-Rubber Glove Manufacturing Company. (Filed May 1, 1875.)



Brief.—Rope is incased in a covering of rubber, which is then vulcanized externally, leaving the interior of the coating in a plastic state.

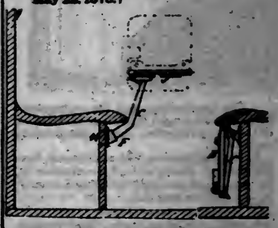
1. As a new article of manufacture, fibrous cord or rope covered with a continuous sheet of rubber, which forms a lap-joint, substantially as specified.

2. In the art of covering fibrous cord or rope with rubber, the process which consists in applying a raw sheet of rubber around said cord or rope, and subsequently vulcanizing the rubber to an extent which will leave the inner part of the rubber comparatively raw, as it will constitute a cement, substantially as specified.

166,907. STRAW-CUTTERS. L. Schollinger, Milwaukee, Ind. (Filed June 10, 1875.)

Brief.—A saddle presses upon the hay or straw to be cut, the saddle being connected with gearing for rocking and reversing it. The pressure of the saddle is adjusted by a bow-spring, which has a suitable device for increasing or diminishing the tension of the spring. By means of an eccentric, the feed-rolls only feed the hay or straw when the knife is not acting.

166,907.



1. In a straw-cutter, the combination, with the saddle P and bar N, of the curved spring O, rod M, and nuts *n' n'*, for adjusting the tension of the spring, as shown and described.

2. In a straw-cutter, the combination of the eccentric-wheel J, meshing-gears H and I, and arm K, through which motion is transmitted to feed-rolls, as shown and described.

166,908. COMPOUNDS FOR PREMISTER PENS. Henry Gellenson, Hoboken, N. J., and Herman Benning and Julius Weiß, New York, N. Y. (Filed June 10, 1875.)

A compound of vinegar, allspice, pepper, onions, horseradish, bay-leaves, cloves, ginger, coriander-seed, Chili pepper, and sugar, in about the proportions specified.

166,909. FOLDING SEATS FOR HORSE-CARS. C. B. Sheldon, New York, N. Y. (Filed May 28, 1875.)

1. The combination, with the ordinary car or omnibus seat, of an extra seat, B, supported above and in front of it by a single folding standard mounted on the rear for its support, and which, together with the said extra seat, folds down and under the main seat, substantially as specified.

2. The combination, with the ordinary seat of a car or omnibus, of an extra seat, B, supported above and in front of it by a single folding standard, and jointed to said standard to fall sideways thereon when adjusted in the position for use, substantially as specified.

3. The combination, with a single standard, C, of seat B, held in position for use by joint F, and folding upon the said standard, the latter being secured to the plate M, and jointed to the slot formed in arm of said plate, substantially as shown and described.

4. The single-jointed and folding standard, jointed to metal-plate M of the rear, said standard projecting above the seat, and supporting the hinged plate J, to which the seat is suitably adjusted, substantially as set forth.

5. The combination, with seat B and standard C, of the plate J, having the seat-hinged thereon, said plate being itself hinged to the standard, as and for the purpose specified.

6. The standard C, jointed to the seat-plate M, and having the seat B jointed to it, substantially as specified.

166,910. BOTTLE-PACKAGES. C. B. Sheldon, New York, N. Y. (Filed June 12, 1875.)

1. The combination of removable protecting-jacket H and metallic body A, distributing from top to bottom, and secured together by forcing the wooden jacket over the metallic lining, all substantially as described.

2. In a bottle-package, the combination of this metallic body A, re-entering jacket H, and the heavy stamped metallic bottom having flange B, the wooden jacket being chamfered on its lower and inner edge, and sprung over the flange, as set forth.

166,910.

166,211. Garbage-Vaults. Geo. L. Shepard and William Bedell, New York, N. Y. [Filed July 10, 1875.]

1. The combination, with the garbage-vessel H and the hinged door F of chamber D, of the spring-supported shoe I, substantially as specified.

2. The combination, with a coal-vault, having inclined abutment J, of the chamber D, having hinged vertically vibrating bottom F, substantially as specified.

166,212. Dumping-Cars. Benj. Skinner, Sidney, Ohio. [Filed Jan. 16, 1875.]

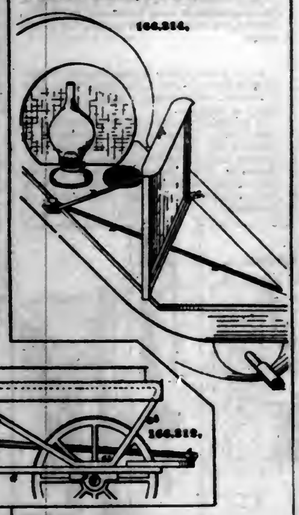
Brief.—On loosening and withdrawing rod, the toggle-arms drag down the end of the pivoted car or wagon body, and in so doing release the swinging door from its latch.

1. The combination of flat bars *c*, *c'*, and *c''*, bent and united to constitute frame C, as and for the purpose set forth.

2. The combination of wagon or car body, metallic frame to which the body is pivoted, toggle, and rod jointed to center of toggle, as and for the purpose set forth.

3. The combination of wagon or car body, metallic frame to which the body is pivoted, and weighted levers, and tail-board latches, as and for the purpose set forth.

1. In a saw-gumming machine, the combination of the ring A', provided with the flanges *a''*, jaws A, having dovetail grooves *a* and slots *a'*, carriage-way B, provided with slides *c*, and cross-head B', arbor C, cutter C', boxes *c''*, spiral pinion *c'*, feed-screw D, cam-lever D', movable box *d*, leg *d'*, and stop D'', when the several parts are arranged to operate substantially as described, and for the purpose set forth.

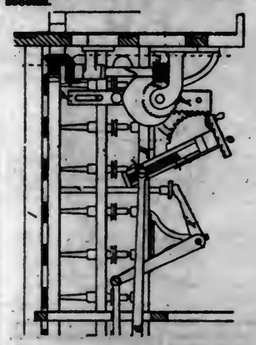


2. In a saw-gumming machine, the combination of the rim A', provided with the flanges *a''*, with the jaws A, having the dovetailed grooves *a* and slots *a'*, said rim A' being adapted for adjustment within the jaws A, to suit the different angles necessary in gumming saws, substantially as described and shown.

3. In a saw-gumming machine, the combination of the arbor C and cutter C' with the spiral pinion *c'*, secured near the base of the feed-screw D, substantially as and for the purpose described.

166,214. Sewer-Junction Indicators. John H. Stanley, Chicago, Ill. [Filed May 24, 1875.]

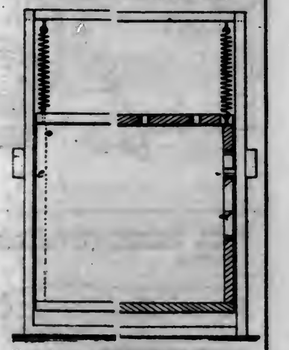
Brief.—Allowed to float down a main sewer, measured rods or cords being attached. Sides of main sewer illuminated by the lamp, and shown in a mirror by reflection.



166,214.

The sewer-junction indicator, consisting of a floor supporting a lamp and reflectors adjustably arranged thereon, and operating substantially as and for the purposes set forth.

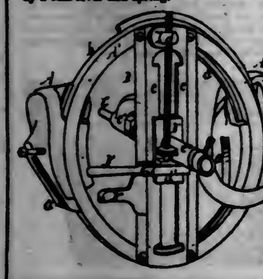
166,215. Building Mechanisms for Spinning-Frames. Joseph M. Stone, North Andover, Mass. [Filed Apr. 27, 1875.]



Brief.—A heart-cam reciprocates vertically a sliding rack, and the latter vibrates a radial arm, to the nut of which is pivoted a rod, which is connected at one end to one of a pair of rocker-arms, whereby vertical up-and-down movements are imparted to the ring-rail. A pawl on the sliding rack operates a ratchet on the lower end of the screw of the radial arm, and by varying the position of the nut shortens gradually the traverse of the ring-rail, so that a yarn-load with conical ends is built upon the bobbins.

1. The combination, substantially as shown and described, of the ring-rail and its connected mechanism, the heart-cam, the radial arm provided with the screw, the movable block and the ratchet, and the slide K, provided with the pawl P, as and for the purpose set forth.

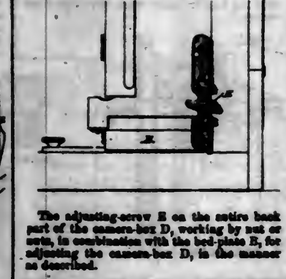
2. The combination, with the radial arm, of the ratchet O, the pawl P, and the slide K, substantially as described.



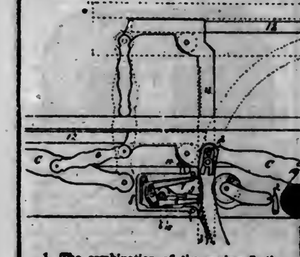
166,217. Egg-Boxes. Othello Sutphen, Albany, N. Y. [Filed May 26, 1875.]

The spring-suspended egg-box, having guide-slots, in combination with the pivot-pins of the outer case, substantially as specified.

166,218. Screw-Taps. John R. Sweet, Ithaca, N. Y. [Filed Apr. 20, 1875.]



Brief.—In the thread of a four-fluted tap, the following changes are made: One diameter in length at each end remains as usual; in the first section the threads are reduced on both sides, to form a less angle than the intended thread; the second section is reduced on one side, and the third on the opposite side; the fourth section retains the full width of thread. After the end of the tap has passed the outline of the thread, the first cutter takes a chip from the bottom, the next from the one side, and the third from the other side, while the fourth finishes both sides and the bottom.



166,212.

166,213.

166,216.

A screw-tap formed with cutting-threads or sections thereof, relieved on the sides alternately, and with threads or cutting-points working centrally, as described, and for the purposes set forth.

166,219. Machinery for Making Blinds. William H. Toppan, New York, N. Y., assignor to Charles Whitlock, same place. [Filed Dec. 30, 1874.]

Brief.—The position of the blind-stile is indicated by means of a spring-pawl falling into the notches of a movable rack.

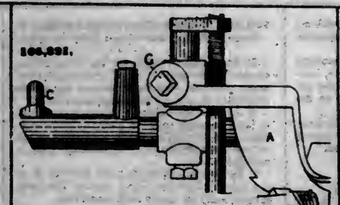
The standard *d*, arm *f*, adjustable pawl-bar A, and pawl *i*, in combination with the rack-bar *l*, applied to the blind-stile, for the purposes and as set forth.

166,220. Parallel Rulers. J. M. Taylor, Boston, Mass. [Filed Apr. 14, 1875.]

166,220.

1. The combination of the spring 5, the toothed rack 13 or 14, and an escapement, substantially as described, with the two rules A B, connected by links O O, all being to operate essentially as specified.

2. The said escapement, substantially as described, composed of the lever 6, pawls 7 8, lever 15, guides *g h*, and springs 1 and 2, arranged and combined as specified.



3. The adjustable abutment or screw 14, in combination with the escapement, and to operate therewith, as and for the purpose explained.

4. The straight rack 13, applied to the rule A, to slide rectilinearly thereon, and connected to the link O by the shorter link *a*, all being substantially as described.

166,221. Knitting-Machines. Ira Tompkins and Albert Tompkins, Troy, N. Y. [Filed Mar. 20, 1875.]

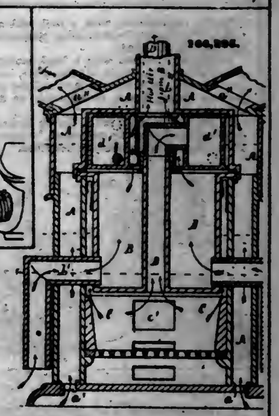
Brief.—For adjusting the barbs into their proper position relatively to the needles.

166,222.

The combination, with the bracket A, the heart-support C, and stud D, having the projection E, provided with the nut, of the adjusting-screw F, provided with the right and left screw-threads and the set-screw G, the whole constructed and arranged to operate as herein shown and described.

166,223. Trace-Carriers. William H. Townsend, Goodland, Ind. [Filed May 20, 1875.]

The improved trace-carrier, formed of the frame A, adapted for attachment of harness-straps, as shown and described, having the rigid trace-supporting arms D extending inward from its rear corners in a plane parallel, or nearly so, to the side bars, and the spring arms or snaps C, pivoted to the transverse bridge-piece B, and coinciding with arms D, as set forth.



166,224. King-Bolts for Wagons. Wm. Treat, Hamilton, Mich. [Filed July 3, 1875.]

Brief.—The headless king-bolt rests upon a plate, which is held up by bolts passing through the sand-board and axle.

The headless king-bolt E and the plate F, in combination with the axle-tree A, the sand-board B, the bolster C, and the sand-board bolts D, substantially as herein shown and described.

166,225.

166,226.

166,227.

166,228. Air-Heating Furnaces. John M. Wilson, Philadelphia, Pa. [Filed Feb. 24, 1875.]

1. The hot-air chamber B, inside of the body of the heater and above the fire, as described, and surrounded by the annular space C, which forms the upper portion of the combustion-chamber, as described, in combination with the annular hot-air space A, as described, the said chambers A and B receiving their fresh air through *a'* and *b'*, respectively, and discharging the same, heated, through their respective outlets *a''* and *b''*, as set forth, thus forming a double or duplex heater having but one combustion-chamber.

2. In combination with the hot-air chamber B and annular or gas flue D, the series of drums *d' d'* in the upper part of the fire-chamber C, for the purpose of increasing the radiation of heat into the said chamber B.

166,229. Bale-Ties. H. J. Wright, Society Hill, S. C. [Filed Feb. 12, 1875.]

The bale-tie or buckle, composed of the plate A, having slot C and the end cam-bar D in a different plane from the part to which the band is riveted, and the plate H, having slot I to receive the free end of the band, and tenon E, to engage it for locking with plate A, as shown and described.

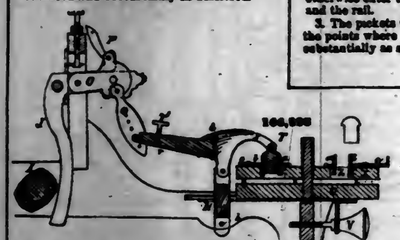
166,230. Car-Couplings. J. Q. A. Young and J. D. Young, Cedar Mill, Oreg. [Filed Apr. 9, 1875.]

The draw-head A, provided with recessed jaw-chapel front end, in combination with the swinging front-weighted jaw B, cam *d* of the lateral shaft D, and the conically-headed coupling-link C, for coupling and uncoupling the link by the action of the cam, substantially as and for the purpose set forth.

166,231. Book-Backing Machines. Jos. Armstrong, Cambridge, Mass. [Filed May 21, 1875.]

Brief.—The book is placed in the rotary holder, and a double oscillatory movement is given to the lever carrying the backing-roll through the medium of the right-angled lever, while a vibratory movement is given to it by the rocking fulcrum operated from the main shaft.

166,232.



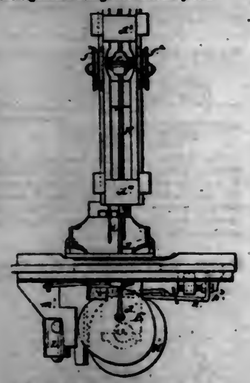
The chill for mold-boards, consisting of the fixed bars A, detachable bars C, joined together by means of the rim B, the cleats E, gas-ducts D, and ears F, all constructed substantially as described.

HELIOTYPE RELIEF PROCESS. JAMES R. OSGOOD & Co. BOSTON

1. The combination, with a boot-backing roller, of a rotating boot-holding plate, substantially as described.

2. The combination, with a boot-backing roller, of a rotating boot-holding plate, having adjustable boot-holding jaws and the adjustable sliding frame, substantially as described.

3. The boot-backing roll T, having a double oscillatory and vibratory movement, by means of mechanism substantially as described.



4. The combination of the oscillatory lever R, carrying the backing-roll T and the rocking fulcrum H, substantially as described.

5. The combination of the cam I, right-angled lever J, pendant Q, and lever R, for producing a double oscillatory movement of the backing-roll, substantially as described.

6. The combination of the lever J, latch O, cam-lever F, pendant Q, with the lever R, for raising the backing-roller, as and for the purpose described.

166,280. BOOK-SEWING MACHINES. James Armstrong, Cambridge, Mass. [Filed Mar. 9, 1875.]

Brief.—The needle-bar carries a positively-rotating drill, which forms the hole while the stitch is being formed in the preceding hole, the signature being intermittently fed.

1. In combination with a stitch-forming mechanism, the reciprocating rotating drill, as and for the purpose described.

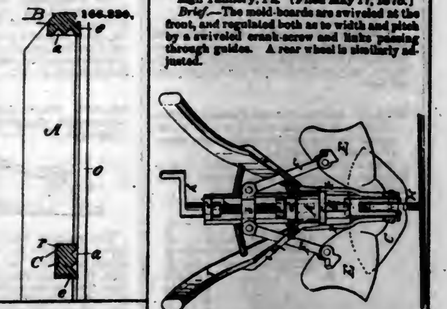
2. The rotating drill F, provided with pulley f, in combination with the reciprocating standard D, carrying the needle f, as described.

3. The combination of the rotating drill F, reciprocating standard D, carrying the needle f and spool F, with the rod d and cam-wheel E on the main shaft, as described.

4. In combination with the stitch-forming mechanism, the reciprocating rotating drill F, and the intermittent feed mechanism, operating substantially as described.

5. The pivoted arm H, carrying the adjustable bent strip h^1 and bar h^2, in combination with cam-wheel H^1 and pivoted frame n^1, whereby the length of the stitch is controlled, substantially as described.

6. The intermittent feed mechanism, consisting of the plate M, constructed substantially as described, provided with the bar m^1 and standard m^2, carrying the pivoted clamping-bar m^3, operating as described.

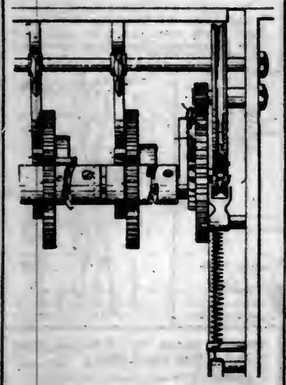


166,281. FENCES. Henry Bean and Benj. F. Bean, Pawling, Pa. [Filed Apr. 16, 1875.]

1. As an improvement in the construction of fences, the rails B C, having their sides and edges provided with the grooves *a* and *c*, substantially as and for the purpose set forth.

2. A fence-rail having a gutter or groove, *b*, in its upper edge near the pickets, for the purpose of conveying away the water that would otherwise enter the joint between the pickets and the rail.

3. The pickets O, having the groove *b* at the points where they bear against the rails, substantially as shown and described.

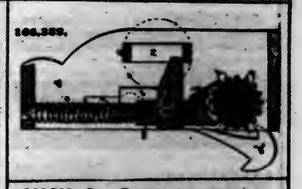


166,280.

The combination of a series of independent springs, a series of independent clutches, the non-rotating shaft, and a single winding and retaining shaft, substantially as described.

166,282. METERS. Joseph H. Bean, Cincinnati, Ohio. [Filed July 20, 1875.]

Brief.—Two parallel shafts, only the front one rotating, a series of loose tooth-wheels on both. The front ones have each a clutch, the back ones each a spiral spring and a ratchet and pawl, to be wound up by the former either separately or combined. A friction-roller for binding on the belt-wheel is operated by a spring and treadle.



166,283. MEAT-POUNDERS. Jas. T. Black and Job Trane, Mount Union, Pa. [Filed June 2, 1875.]

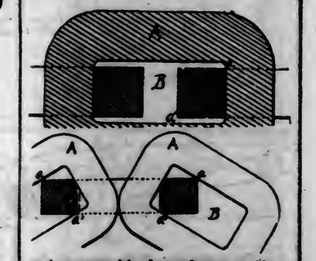
1. The combination of the fluted roller *b*, ratchet *c*, dog *d*, bar *h*, and slide *e*, substantially as described.

2. The combination of the fluted roller *b*, bar *h*, ratchet *c*, dog *d*, projection *r*, stem *i*, spring *l*, flat bar *o*, slides *e*, and crank *p*, the parts being arranged for operation substantially as shown and described.

3. The flat bar *o*, in combination with the crank *p*, projection *r*, block *m*, stem *i*, spring *l*, and bar *h*, substantially as specified.

166,284.

166,285. CORN-PLOWS. Anton Binder, Lehigh Tannery, Pa. [Filed May 17, 1875.]

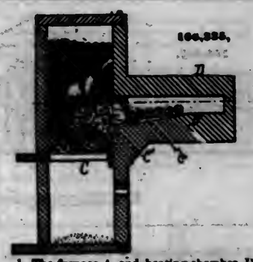


Brief.—The mold-boards are swiveled at the front, and regulated both as to width and pitch by a swiveled crank-screw and links passing through guides. A rear wheel is similarly adjusted.

1. In a plow, the combination of the pivoted mold-boards B, their adjusting links F, screw I, traveler *h*, guide-braces *i j*, and depth-regulating wheel H, constructed and arranged as shown and described.

2. The combination of the guide-braces *i j* with the adjusting links and mold-boards, substantially as shown and described.

166,286. CHAINS. James W. Beatie, New Brighton, Pa. [Filed Mar. 20, 1875.]

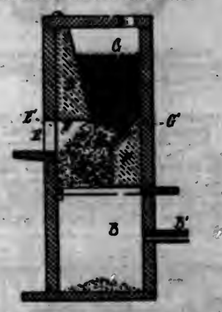


Brief.—The links are formed from square bars of iron. The slot of each link is of a less width than the diagonal diameter of the link with which it is connected, and, consequently, does not allow the link to turn crosswise.

As a new article of manufacture, a cable or draft-chain composed of links A A, having rectangular edges, when the width or breadth of the slot B of the link is less than the diagonal diameter of of the bar, as and for the purpose specified.

166,287. FURNACES FOR BLAKES. James W. Beatie, New Brighton, Pa. [Filed Apr. 6, 1875.]

Brief.—The heating-chamber is connected with the furnace through a series of openings, and is provided with an inclined bed-plate, upon which the blanks are placed. The bed-plate is formed with grooves or channels, one extending from each of the openings, in virtue of which the flame, as it issues in through said openings, surrounds the blanks upon all sides. The blanks slide down the inclined bed-plate as each heated one is removed, and thus are subjected to a gradually-increasing heat, until brought directly in contact with the blast.



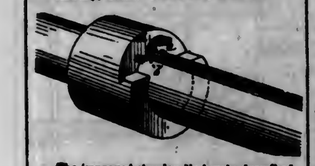
166,288.

1. The furnace A and heating-chamber D, having an inclined bed-piece, D', connected through a series of openings, C' C', the whole being combined and arranged to operate substantially as described.

2. The chamber D, having a bed-piece, D', formed with an inclined section, and grooves or channels *d d*, that connect with the openings C' C' leading from the furnace, substantially as described.

166,289. FURNACES FOR BLAKES. James W. Beatie, New Brighton, Pa. [Filed Apr. 6, 1875.]

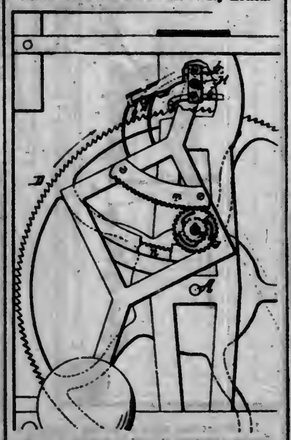
Brief.—The construction of the furnace is such, mainly in virtue of the bosher, as to cause the fuel to be deflected forward toward the mouth of the furnace and over the grate only after it shall have become ignited, thus permitting the blank to be embedded in the hottest portion of the fire, and avoiding any possible contact with it of the raw coal.



1. In combination with the walls of the furnace, the chocks or beshes D F, arranged with relation to the grate and feed-opening, substantially as herein shown and described.

2. A furnace for heating blanks, consisting of the chocks or beshes D F, of the form and arrangement shown, movable door H, blast-tube F, and mouth E, the whole being constructed and arranged to operate substantially as described, as and for the purpose specified.

In testimony whereof I have signed my name to this specification in the presence of two subscribing witnesses.



166,287. DIES FOR SMOOTHING AND SHAPING SOLDERED TUBES. Philo Brown, Waterbury, Conn. [Filed July 1, 1875.]

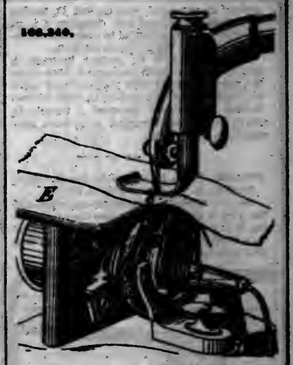
The improved circular die herein described, for smoothing and shaping soldered metal tubes, constructed with the cutting-edge *b* at one portion only in front, for the purpose of scraping the surplus solder from the exterior of the tube as the latter is drawn in through the die, substantially as specified.

166,288. MACHINES FOR CONVERTING MOTION. David C. Burson, Philadelphia, Pa. [Filed July 8, 1875.]

Brief.—The vibratory motion of a pendulum is converted into a continuous rotary motion.

The combination of the main wheel D, driven by a spring or weight, the escapement, and the pendulum, having two toothed segments, *n* and *n*, with the shaft L, cog-wheels J J', each having pawls, and the ratchet-wheels K K', all substantially as set forth, for the purpose specified.

166,290. RAMS-FAUCETS. Wm. C. Bussey, San Francisco, Cal. [Filed May 17, 1875.]

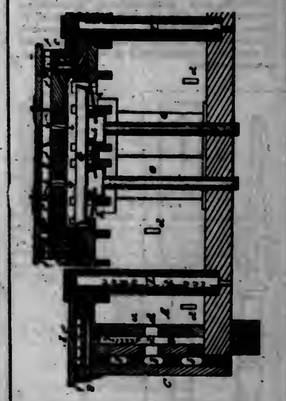


1. A swivel-head for gas, water, and steam cocks, consisting of an india-rubber block, D, surrounded by a metallic shell, E, substantially as and for the purpose described.

2. The swivel metallic shell E, with its filling D of india-rubber, and having the nozzle J, when the water-pipe B passes through a hole in the india-rubber filling, and has a passage, *c*, connecting the interior of the water-pipe with the nozzle J, substantially as and for the purpose above described.

166,289. LOOPING ATTACHMENTS FOR SEWING-MACHINES. Saml. Byrom and Francis Clowsley, Philadelphia, Pa., assignors of one-third their right to Joseph D. McKee, same place. [Filed May 24, 1875.]

Brief.—Loops of yarn or thread are formed by a loop-carrier. This is a conical or cylindrical piece of metal formed with or secured to the lower bobbin, and when in position presents at right angles to the plane of the rotating head. At its outer extremity an eye is formed for holding the end of a cord, upon which the loops are strung. The slide-holder is open at the top to admit of the passage of the loops, and a slot is formed in the cloth-plate for a similar purpose. Loops are formed by the hook, and pass over the bobbin to the loop-carrier without being shortened or closed up.



1. A loop-carrier for sewing-machines, provided with a cylindrical or conical projection, whereby a series of loops are formed and prevented from being drawn into the cloth, substantially as set forth.

2. The combination of a looping-hook, C, and a loop-carrier, A, substantially as set forth.

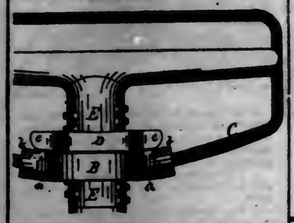
3. The combination of the loop-carrier A, the bobbin B, the looping-hook C, the open-topped slide-holder D, and the slotted cloth-table E, the combination being and operating substantially as set forth.

166,291. REFRIGERATOR-CANS. Joseph H. Canfield, St. Louis, Mo. [Filed July 17, 1875.]

Brief.—Between the middle and the outer shell of the sides and ends of the can, and of the ice-box, and of the top of the ice-box, are straight passages, (valved or not,) through which air rushes as the car moves. From such passages in the top of the ice-box, air passes downward through the ice into the car. All of the side and end passages communicate with the interior of the car.

1. A refrigerating-car composed of three shells, A B C, the space between the two inner shells being filled with non-conducting material, and the space between the two outer ones forming air-passages *h*, communicating with the interior of the car through ports *d*, and with the air outside through ports *e*, at both ends and both sides of the car, all constructed and arranged to operate substantially as herein described.

2. The ice-box D, provided with the air-passage *f* longitudinally through its top, and said passage having ports *i* and valves *n*, substantially as and for the purposes herein set forth.



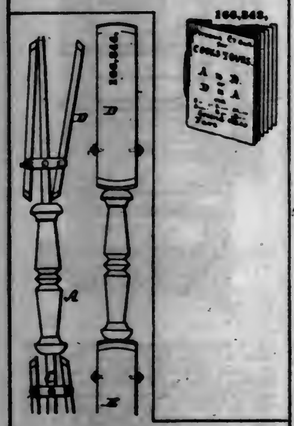
3. The ice-pan G, inclined bottom *h*, and

pipes *d d*, connected with ice-box D, having air-valved passages *f* and openings *i i*, all constructed and arranged to operate substantially as and for the purposes set forth.

4. The car A B C, packed between A and B, and having air-passages *b*, with ports *d e*, communicating with the inner and outer air, as described, the ice-box D, with inclined bottom *h*, air-valved passages *f*, ice-pan G, and cylinder I, all arranged to operate substantially as set forth.

166,342. Map-Heads. Charles B. Clark, Buffalo, N. Y. [Filed July 6, 1875.]

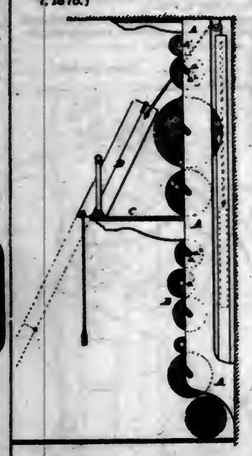
Brief.—The collar is made in one piece, and the wire is held in the cavities therein by being bent down. The movable jaw is operated by a thumb-nut under it, having a flange that rests in a recess therein.



1. The solid collar B, provided with the cavities *d* and hollow arms *b*, whereby the wire C is received and the ends *e* bent down, as described and shown.

2. The combination of the nut D, having flange *p*, the solid collar B, having the annular seat *f* and the cavities *d*, and a fixed and movable jaw, as set forth.

166,343. Complex-Coupon Railroad-Tickets. Thos. Cook, London, England. [Filed Sept. 22, 1873.]

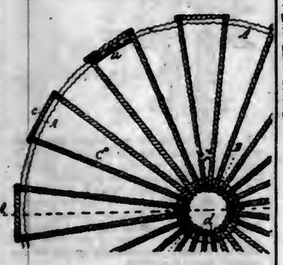


A complex-coupon route-ticket, composed of a set or series of passage-tickets which are available over geographically consecutive routes, and a stub which is common to all of them, and from which each of the several tickets may be separately detached, in or out of sequence, substantially as and for the purpose specified.

166,344. Carpenters. James A. Crandall, Brooklyn, N. Y., assignor to himself and Sylvenus White, same place. [Filed July 30, 1875.]

A double carpenter consisting of a handle, A, provided at each end with clippers D E, substantially as specified.

166,345. Snow-Racks for Carpets. Jos. Crawshaw, Jr., St. Louis, Mo. [Filed June 7, 1875.]

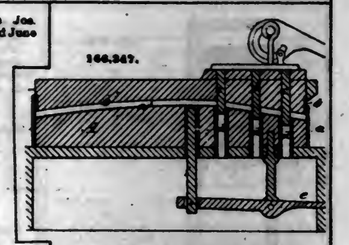


1. The vertical posts A, having bearings *a* for the gudgeons of rolls of carpet, in combination with the balcony C, as and for the purposes set forth.

2. The hollow gudgeon G, in combination with the removable conical point H, substantially as and for the purposes set forth.

3. The hollow gudgeon G, in combination with the conical point H, having reduced neck *h*, and wire or cord *h'*, as set forth.

166,346. Wire Dish-Stands. W. F. Collier, Worcester, Mass. [Filed July 13, 1875.]



1. The combination, with the outer and inner rings A and B, of horizontal wires C, having bends *b*, *c*, and *e*, substantially as and for the purposes set forth.

2. The wire C, bent at *c* in the form shown, to unite the legs of the said wire C and provide a projecting flange for the tray, substantially as described.

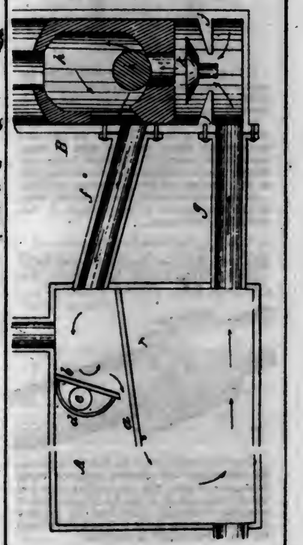
166,347. Dies for Cutting, Molding, and Punching Shovel-Blades. Peter B. Cunningham, Bethlehem, Pa. [Filed May 4, 1875.]

Brief.—Two die-blocks present faces or dies that properly mold the plate, and these are insured at their edges with cutters that shear the plate to the proper size and shape. Punches operated by a lever make the rivet-holes, and an ejector loosens the blank in the die.

1. The combination of the female die, having knives or cutters *a a'*, and a formed face, *a''*, with the die B, having knives *b b'*, and a correspondingly-formed face, *b''*, substantially as shown and described.

2. In combination with the cutting and forming dies A and B, the punches *c* and sockets *d*, located in said dies A and B, for punching the blanks while in the forming-dies, substantially as shown and set forth.

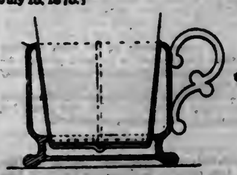
166,348. Bobbins for Sewing-Machines. Geo. W. H. Curtis, Brooklyn, N. Y. [Filed Apr. 26, 1875.]



Brief.—A bobbin provided with two or more grooves for carrying the under thread.

A bobbin provided with two or more grooves for carrying the under thread for ornamental stitching, substantially as described.

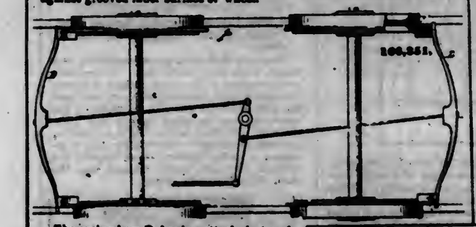
166,349. Oil-Stills. Julius G. Dickey, Franklin, Pa. [Filed Nov. 4, 1874.]



Brief.—Heat is applied to the bottom of the still. The pump starts a circulation, drawing the oil from the bottom of the still and forcing it into the top, whence it flows down the inclined partition. Midway upon the partition the oil meets a deflecting-plate, breaking up the heavy oil, and liberating the volatile products.

1. The tank A, provided with an inclined partition, *c*, in combination with a pump or other forcing apparatus, substantially as and for the purpose set forth.

2. The tank A, provided with a deflecting-plate, *b*, and inclined partition *c*, in combination with a suitable pump or forcing apparatus, substantially as and for the purpose described.



166,350. Cups for Effervescing Drinks. Wm. C. Dodge, Washington, D. C. [Filed July 10, 1875.]

In a cup or cup-holder for effervescing drinks, a receptacle constructed and arranged to receive the overflowing liquid, and retain the same when the cup or holder is used in the act of drinking, substantially as described.

166,351. Car-Brakes. Saml. Doubleday, Baltimore, Md. [Filed May 15, 1875.]

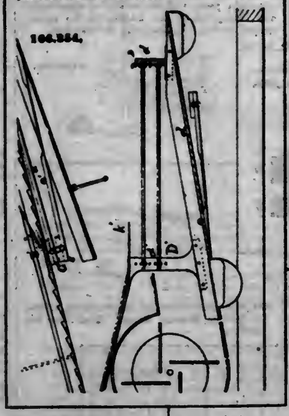
Brief.—Draft on center of semi-elliptic spring forces shoes on either end thereof against grooved inner surface of wheel.

The spring-bow D, having attached at each of its ends a brake-shoe, provided with a shoulder, I, in combination with a mechanism connected with said spring-bow for operating the same, the whole being constructed to operate in connection with car-wheels having grooves cut in their inner face, substantially as shown and described.

166,352. Processes of Manufacturing Illuminating-Gas. Frederick H. Blackmore and Andw. George Hunter, Detroit, Mich. [Filed Aug. 20, 1874.]

The process described, consisting of vaporizing hydrocarbons in a retort, and at the same time distilling wood in another retort, then in conducting the vapors of the hydrocarbons and the wood-gases into another retort at a red heat, then in removing quickly the combined resultant gas, all substantially as described.

166,353. Veneer-Cutting Machines. C. T. Fairchild, Hartford, N. Y., assignor to Burrell, Ives & Co. [Filed Jan. 21, 1871.]



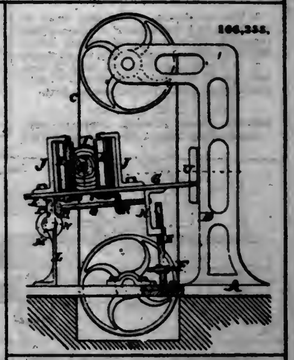
Brief.—An additional roll is placed in advance of the cutting-knife, to prevent the tearing of the wood when in a loose or shaky condition by the cutting device.

The roller F, arranged in a veneer-cutting machine as described, in relation to the knife, its support, and the supporting centers, as and for the purpose specified.

166,354. Grain-Separators. A. B. Farquhar, York, Pa. [Filed May 13, 1875.]

Brief.—Special construction of separator-shoe for thrashing-machines. Feed-board and screens carried upon metallic standards supported from floor of shoe.

The standards D', formed with projections *d'*, to hold the forward ends of the riddles, and inclined forwardly-projecting arms *g*, for supporting the feed-board *h*, constructed and operating as shown and described.

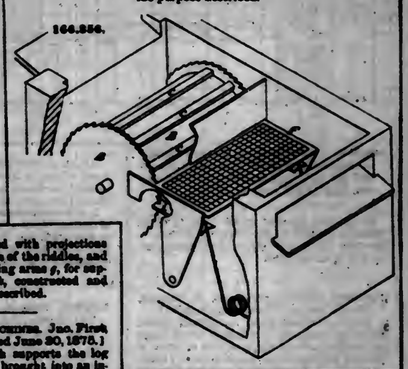


166,355. Rebawing-Machines. Jno. First New York, N. Y. [Filed June 30, 1875.]

Brief.—The table which supports the log and the feed-rolls can be brought into an inclined position, at the same time that an oblique cut of the log is obtained, without throwing the feed mechanism out of gear, by means of a hinge-joint, whose leaves are fastened, respectively, to the table and the base-piece, and the center of which coincides with the center of a shaft, from which motion is transmitted to the feed-shaft and feed-rollers, in connection with a vertical screw-spindle turning in a bracket attached to the under part of the inner end of the table. The feed-rolls are rotated by bevel-wheels upon the lower ends of their shafts, which engage with corresponding wheels mounted upon a horizontal shaft under the table, and operated by worm-gear at the outer end of the same.

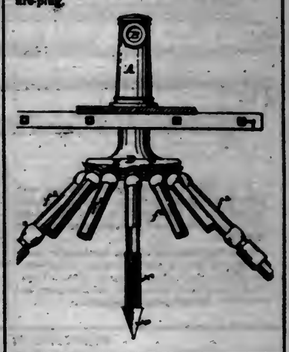
1. The combination, substantially as hereinbefore set forth, of a hinged log-supporting table, G, with the fixed rollers I I, and mechanism, as described, for rotating the rollers, and for inclining the table without disconnecting the gear-wheels, substantially as set forth.

2. The log-supporting table, provided with feed-rollers, and carrying the shaft and gear for operating the same, and connected by a hinge with its supporting-frame, in combination with an adjusting mechanism, substantially as described, whereby the table, its feed-rollers, and gear can be inclined without disconnecting said gear, as set forth.



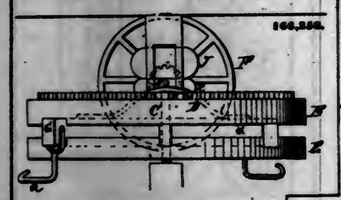
3. The combination of the table G, feed-rollers I I, screw-spindle R, hinge-joint K, worm N, worm-wheel P, driving-shaft Q, and bevel-wheels R S S S, all combined and operating substantially as set forth.

166,356. Amalgamators. E. J. Fraser, San Francisco, Cal. [Filed Feb. 10, 1875.]



Brief.—Combines a submerged oscillating sieve with the backed cylinder described in Patent No. 153,263.

In combination with the cylinder or cylinders E, with their wings *a*, rotated inside of a tank which is partially filled with quicksilver, the shaking screen F, substantially as and for the purpose described.



166,357. Fire-Plugs. Carroll H. Gray, St. Louis, Mo. [Filed Apr. 12, 1875.]

Brief.—The tubes are driven from the bottom of an excavation in a radial direction, and connected with the plug by means of flexible tubes. In this way the water is drawn from a considerable area, and the pipes lying in any direction can be easily connected to the fire-plug.

1. The combination of the spring head or casting A, and weft-tubes F communicating therewith, and extending radially and downwardly therefrom, substantially as set forth.
2. In combination with the head A, and weft-pipes F, the flexible connections f, substantially as and for the purpose set forth

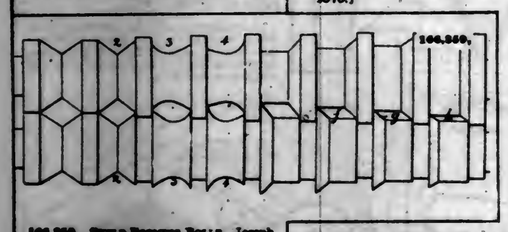
166,856. Hoops-Fowers. James R. Gray, Chesterville, Miss. (Filed Apr. 10, 1875.)

166,856.

The combination of the wheels E E', crossbar G, clamped between the two, and having hooks c c, the pinion I, bridge D, shafts C c, and wheel F, all constructed substantially as forth.

166,857. Shoe Tips or Protectors. Chas. T. Grilley, Boston, Mass. (Filed June 24, 1875.)

The process of forming leather tips or protectors for uppers, consisting in cutting out the inner portion of the blank, as described, and then pressing and hardening the tip so shaped in dies, substantially as described.

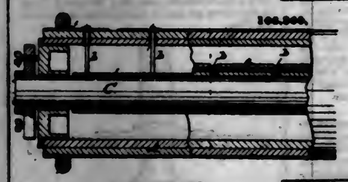


166,857.

166,858.

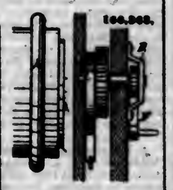
166,858. Shoe Tips or Protectors. Chas. T. Grilley, Boston, Mass. (Filed June 24, 1875.)

1. A tip or protector for boots or shoes, composed of one or more strips of leather, compressed, hardened, and conformed to the shape of a toe or upper, substantially as described.
2. In the manufacture of shoe-tips from strips of leather, bending and forming the heart-strip as described, and then uniting the shoulder-strip to the heart strip by means of fastenings, substantially as described.



166,859.

166,859. Sizing-Fourning Rolls. Joseph G. Gehr, Philadelphia, Pa., assignor of one-half his right to Ann O. Danle, Wilmington, Del. (Filed Apr. 12, 1875.)

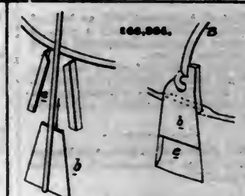


Sheip-rolls grooved as set forth, so as to reduce a bar first to the form Fig. 2, then to the form Fig. 3, and then to that represented by Fig. 4, as specified.

166,860. Sand-Paper Rolls. O. Gibbens, Boston, Mass. (Filed June 26, 1875.)

Brief.—The sand-paper is fastened to and about the periphery of a hollow roll of paper or similar material by means of a series of pivoted gripping-jaws arranged exteriorly along the roll, and adapted to be operated from the inside. The jaws are provided at their outer ends with sharp prongs for securing the paper sheet to the roll, and are connected to the roll-shaft, so as to swing in circular lines and draw the sheet close about the roll. The sand-paper is held around the roll by bands of rubber, which encircle the ends of the same.

166,860.



166,860.

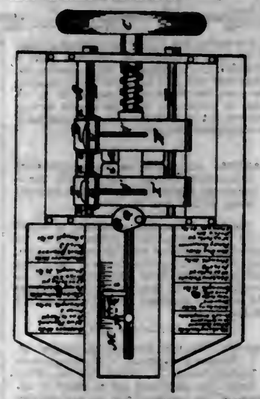
1. A hollow roll, A, in combination with jaws d, arranged exteriorly along the roll, and adapted to be operated from the inside of the roll, substantially as described, for the purpose specified.
2. In combination with a sand-paper roll, the gripping jaws d, having prongs f, and connected to a shaft, C, to swing in circular lines when operated by said shaft, substantially as described, for the purpose specified.

In combination with the window-sash operated by the rack-pinion and spring, the ratchet D, pinned outside the casing on the spindle of the pinion, and the automatic detent F G, substantially as set forth.

166,862. Attaching Handles to Vessels. G. W. Hartwell, Cincinnati, Ohio. (Filed July 19, 1875.)

Brief.—The bail or handle is readily detachable.

166,864.



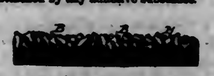
1. A vessel having at the sides tapering sockets c c, adapted to tapering plates b, secured to the ends of a handle, B, substantially as set forth.
2. The combination of a vessel having sockets c c and a handle provided with plates b b, adapted to said sockets, as set forth.

166,865. Confectionery. Edwin Hawker, Lee, assignor to Cornelius Hanbury, London, England. (Filed Nov. 28, 1874.)

1. The process herein described of coating jujubes and other sticky confections in a solution of gelatine or isinglass, (fish gelatine,) substantially as and for the purpose set forth, to prevent adhesion or absorption of water or loss of water.
2. Jujubes or gum confections, having a coat of gelatine or isinglass, (fish gelatine,) substantially as herein described.

166,866. Cloth-Testing Machines. Wm. Hebdon, Boston, Mass. (Filed Jan. 20, 1875.)

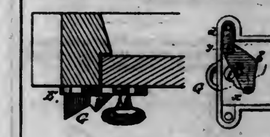
Brief.—A cloth-testing machine having two chaps, which slide on the rods. These chaps are corrugated on the upper surface, and have two plates, which are hinged at one end, and lap over and hold down to the chaps by the cams, so that the cloth cannot slip when strained. Working in the chap is a screw for producing the strain. To the other chap is attached a spring-balance, which records the number of pounds tensile strength that the cloth will stand when strained.



166,866.

1. In a cloth-testing machine, two sliding jaws or clamps adapted to hold a piece of cloth or other material between them, one jaw being connected directly to a screw-shaft, which gives it motion, and the other to a spring indicating mechanism, substantially as described.
2. In a cloth-testing machine, the combination of the traveling chaps D I, corrugated on their upper surfaces, the hinged portions F F', corrugated on their lower surfaces, and the cams G, journaled in the swinging arms a c, and provided with handles G', all arranged and operating substantially as and for the purpose specified.
3. The chaps D I, having the projections or shelves d d', substantially as and for the purpose specified.

4. The combination of the traveling chaps D I and their attachments with the screw-shaft B and spring-balance s, all arranged and operating substantially as described.
5. The cam Q, adapted to prevent the sudden recoil of the chap I, substantially as described.



166,867. Anodes for Electroplating with Nickel. August Hermann and W. H. Taylor, Stamford, Conn. (Filed June 26, 1875.)

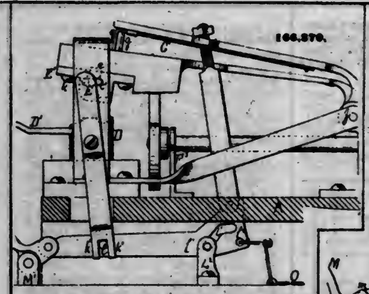
Brief.—The particles of metal are compressed into the nasal carbon anode while it is yet plastic. To a metallic anode the particles are attached by any adhesive substance.

An anode for electroplating, composed of a plate, A, with particles of metal B B united to the outer surface thereof, substantially as herein set forth.

166,868. Reversible Latches for Cupboards, &c. Chas. F. Herrick, Independence, Iowa. (Filed June 26, 1875.)

The combination, with the latch G and latch-case E, of the plate b, fastened by means of a rivet, a, to the latch, and provided with holes x x, and the suspending-plate d, provided with the pin y, all substantially as and for the purpose herein set forth.

166,869. Machines for Welding Chain-Links. Benj. Hershey, Erie, Pa., assignor to Pittsburg Chain and Car-Link Manufacturing Company. (Filed Mar. 26, 1875.)

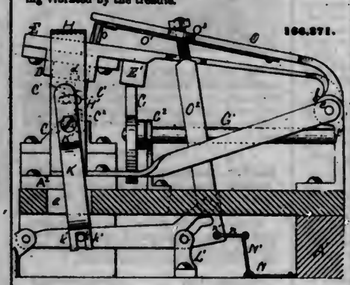


Brief.—The peculiarly-shaped cavities are intended to allow for and control the spread of the excess of metal due to the lapping the ends of the blank.

The dies A B for welding chain-links, constructed as shown and described—that is to say, the cavity being of a somewhat oblong or elliptical contour, its major axis lying oblique to a plane passing through its two limbs, in virtue of which form the greater portion of the metal acted upon by the die A is thrown laterally inside the center of its cavity, while the greater portion of the metal acted upon by the die B is thrown laterally outside the center of its cavity, substantially as and for the purpose set forth.

166,870. Machines for Welding Chain-Links. Benj. Hershey, Erie, Pa., assignor to Pittsburg Chain and Car-Link Manufacturing Company. (Filed Mar. 26, 1875.)

Brief.—The improvement consists in mounting the lower die upon an upright axis, and providing it with a horizontal arm with an upright pin; said arm and pin acting as a handle for rotating the die, (to present different parts of the link to the action of the narrow-faced upper die,) and as a support for the link being operated upon.

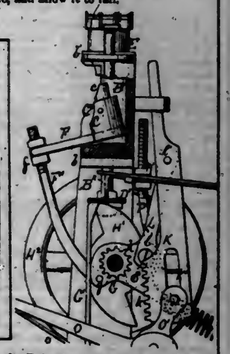


166,870.

1. In a chain-link-welding machine, the rotating die D and the movable swage-die E, the same being combined as described, to operate substantially as and for the purpose specified.
2. In combination with the movable swage-die E, a rotating die, D, having an arm, D', with a bearing-pin, d', attached, as and for the purpose specified.

166,871. Machines for Welding Chain-Links. Benj. Hershey, Erie, Pa., assignor to Pittsburg Chain and Car-Link Manufacturing Company. (Filed Mar. 16, 1875.)

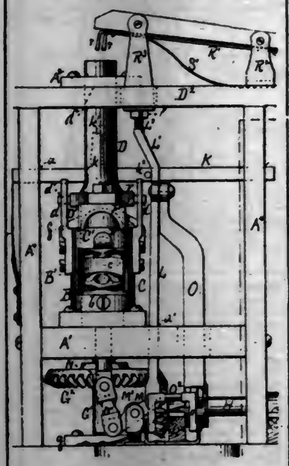
Brief.—Instead of using a drop, in this case a helve-hammer is used, having a flanged vertically-notched head working in a stirrup horizontally notched, the vertical notch allowing the head to move freely up and down when the stop-pin is in one position, and catching under the flange in the other, the stop-arm being vibrated by the treadle.



166,871.

1. The hinged hammer arm E, having a flanged head, D, in which there is a vertical slot, d, stirrup H, having horizontal slot d', stop-arm K, having bearing-pin i, the lever L, spring N, and treadle M, the whole being constructed, combined, and arranged to operate substantially as described.
2. The hinged hammer arm E, cam G, horizontal shaft G', the bed-plate O, having a spring, O', attached, arms O² O³, lever L, spring N, and treadle M, the whole being combined and arranged to operate substantially as described.

166,872. Machines for Welding Chain-Links. Benj. Hershey, Erie, Pa., assignor to Pittsburg Chain and Car-Link Manufacturing Company. (Filed Mar. 12, 1875.)



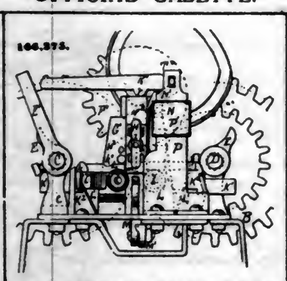
Brief.—A pivoted die tilted forward to release the link from its frog by means of plate and link, the latter attached to a bell-crank lever, connected through link and the lever to the pinion on the main shaft, the object being, when the lever is brought into gear by depressing the treadle, that the bell-crank lever may operate to tilt the die, draw down the link, (and with it the spring,) and push the stop-spring bar from under the frame of the upper die, and allow it to fall.

166,872.

1. The die E, having an opening to receive the permanent tongue or frog of the lower die C, in combination with said die C, provided with the permanent tongue, and mounted in the sleeve C' on a horizontal axis, to admit of its being tilted forward, substantially as and for the purposes set forth.
2. The combination of the rocking die C, plate F, adjusting-arm F', bell-crank lever G, pinion A, ratchet-arm K, and link L, the whole being constructed as shown, whereby, through the action of the treadle, they are thrown into gear, so as to tilt the die forward to aid in releasing the finished link, substantially as described.
3. The combination of the rocking die C, plate F, adjusting-arm F', bell-crank lever G, pinion A, arm K, link L, and spring M', the whole being constructed and arranged as shown, whereby, when the ratchet-arm is disengaged, the die, which had previously been tilted forward, shall be automatically returned, substantially as described.
4. The combination of the spring stop-bar G', bell-crank lever G, and its operating mechanism, cam H', and gate D, the whole being constructed and arranged as shown, whereby the traveling die is operated and retained, substantially as described.
5. The combination of the spring-bed N and spring N', gate D, link L, arm F, and bell-crank lever G, and its operating mechanism, the whole being constructed and arranged to operate substantially as described.

166,376. MACHINES FOR WELDING CHAIN-LINKS. Benj. Hershey, Erie, Pa., assignor to Pittsburg Chain and Car-Link Manufacturing Company. [Filed Mar. 17, 1875.]

1. The dies C C', having cavities of such outline as will give to the welded section of the link an obovate form in cross-section, the thicker portion being at the inside of the link, said cavities being of semi-obovate form at the center of their curved portions, and gradually approaching the original form of the blank, until, at the junction of their curved and their straight portion, they are of said original form, as and for the purpose specified.



2. In combination with dies C C', having cavities of a semi-obovate contour, the finishing-dies F F', the same being connected, respectively, with the sleeve B and traveling plunger D, to operate substantially as described, as and for the purpose specified.

3. The sliding stop-bar K and plunger D, having bearings *k k'*, lever L, having an inclined bearing, L', arranged in connection with a bearing-pin, k^3, on the stop-bar, as shown, spring K', and treadle M, the latter secured to the lever L through a suitable connection, the whole being combined and arranged to operate substantially as described.

4. In combination with the stop-arm K, pin k, and the plunger D, having bearings, as shown, the lever L, having inclined bearing L', pivoted lever M, and traveling teagre N, the whole being combined and arranged as shown, to operate substantially as described.

5. The bed-plate R, spring R', lever L, rod O, having an center bent-bearing, P, cam P', and lever O', the whole being combined and arranged to operate substantially as described.

166,375.

2. The combination of the horizontal arm K, having its upper face recessed, as shown at *k'*, roller O, mandrel H, and arm E, when the whole are constructed and arranged to operate substantially as described.

3. In combination with the plunger H', that carries the mandrel, the lever R', movable knife T', and stationary knife T, the whole being constructed and arranged to operate substantially as described.

166,376. MACHINES FOR WELDING CHAIN-LINKS. Benj. Hershey, Erie, Pa., assignor to Pittsburg Chain and Car-Link Manufacturing Company. [Filed Apr. 9, 1875.]

Brief.—The bending is effected by two grooved rolls attached to slides that move past one another in parallel planes. The mandrel, rectangular in cross-section, is carried by a frame reciprocated by a cam, which, when descending, first strikes the blank lying upon the rolls, then descends with it until the two ends of the doubled blank have passed below, and have been bent by the rolls over its top. An arm then strikes the cam-lever, which latter forces the mandrel inward, where it is caught by a detent, and retained until, just as the frame reaches the top of its throw, it strikes a trigger, that releases the mandrel, and it is again forced out by a spring.

1. The combination of the sliding plate or plunger H', mandrel or former H, spring *h'*, spring-latch N, inclined shoulder *n*, levers R' and R, and dies L L, the whole being constructed and arranged as shown, and so as to operate substantially as described.

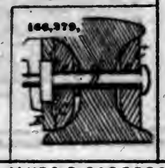
166,377.

The dies A A, having cavities of the form described, and which, through their joint section, upset the excess of metal at the welded section of the link, imparting to the same a print or form such as is shown at B', Figs. 2 and 3.

166,377. MACHINES FOR WELDING CHAIN-LINKS. Benj. Hershey, Erie, Pa., assignor to Pittsburg Chain and Car-Link Manufacturing Company. [Filed Mar. 15, 1875.]

Brief.—The dies perform the welding, properly working the excess of metal due to the lapping of the ends of the link, and the other set of dies finish the welded section.

The dies B B', having cavities *b b'* of the form shown, for welding chain-links, in combination with finishing-dies C C', the whole being constructed and arranged to operate substantially as described, as and for the purpose specified.



166,378. ADZES. Sylvester W. Higgins, St. Louis, assignor of three-fourths his right to James A. Greeson, Ironton, and Joseph B. Meeker, St. Louis, Mo. [Filed May 10, 1875.]

As a new article of manufacture, a detachable point for augers, constructed as shown and specified.

166,378.

166,379.

166,379. RAILROAD-RAIL JOINT FASTENINGS. Stephen Hipkins, Jr., and John W. Rigsby, Wheeling, W Va. [Filed July 8, 1875.]
